DETECTION CONDITION	• The PCM monitors the differences between the intake manifold vacuum and atmospheric pressure at idle, which the EGR boost sensor detects by switching the EGR boost sensor solenoid. If the difference is **6.4 kPa {48 mmHg, 1.9 inHg} or below**, the PCM determines that there is a EGR boost sensor performance problem. **Diagnostic support note** • This is a continuous monitor (CCM). • MIL illuminates if the PCM detects the above malfunction condition in two consecutive drive cycles or in one drive cycle while the DTC for the same malfunction has been stored in the PCM. • PENDING CODE is available if the PCM detects the above malfunction condition during the first drive cycle. • FREEZE FRAME DATA is available. • DTC is stored in the PCM memory.
POSSIBLE CAUSE	• EGR boost sensor malfunction or substandard performance • EGR boost sensor solenoid valve malfunction • Loosed, damaged, misconnected, clogged or frozen moisture in vacuum hose from EGR boost sensor solenoid valve to EGR boost sensor • Loosed, damaged, misconnected, clogged or frozen moisture in vacuum hose from EGR boost sensor solenoid valve to EGR pipe • PCM malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
3	**VERIFY STORED DTC** • Turn ignition switch to OFF, then ON (Engine off). • Have DTC P2144 or P2145 been stored?	Yes	Inspect and repair DTC P2144 or P2145. (See 01–02C–191 DTC P2144 [AJ].) (See 01–02C–193 DTC P2145 [AJ].)
		No	Go to the next step.
4	**IDENTIFY TRIGGER DTC FOR FREEZE FRAME DATA** • Is DTC P2227 on FREEZE FRAME DATA?	Yes	Go to the next step.
		No	Go to troubleshooting procedures for DTC on FREEZE FRAME DATA.
5	**INSPECT CONNECTION OF EGR BOOST SENSING RELATED VACUUM HOSES** • Inspect the following vacuum hoses for loose, damage, improper connection and clogging. — From EGR boost sensor to EGR boost sensor solenoid valve — From EGR boost sensor solenoid valve to EGR pipe. • Are they normal?	Yes	Go to the next step.
		No	Repair or replace vacuum hose, then go to Step 9.
6	**INSPECT EGR BOOST SENSOR SOLENOID VALVE AIR FILTER FOR CLOG** • Is EGR boost sensor solenoid valve air filter clogged?	Yes	Repair air clogging, then go to Step 9.
		No	Go to the next step.
7	**INSPECT EGR BOOST SENSOR SOLENOID VALVE** • Inspect EGR boost sensor solenoid valve. (See 01–16A–20 EGR BOOST SENSOR SOLENOID VALVE INSPECTION [AJ].) • Is there any malfunction?	Yes	Replace EGR boost sensor solenoid valve, then go to Step 9.
		No	Go to the next step.
8	**INSPECT EGR BOOST SENSOR** • Inspect EGR boost sensor. (See 01–40C–37 EGR BOOST SENSOR INSPECTION [AJ].) • Is there any malfunction?	Yes	Replace EGR boost sensor, then go to the next step.
		No	Go to the next step.

STEP	INSPECTION		ACTION
9	**VERIFY TROUBLESHOOTING OF DTC P2227 COMPLETED** • Make sure to reconnect all disconnected connectors. • Turn the ignition switch to the ON position. • Clear the DTC from the memory using the WDS or equivalent. • Run DRIVE MODE except MODE 4. (See 01–02C–8 OBD-II DRIVE MODE [AJ].) • Stop vehicle. • Is same DTC present?	Yes	Replace PCM, go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
10	**VERIFY AFTER REPAIR PROCEDURE** • Perform "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Are any DTCs present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2228 [AJ]

E6U010200000WA8

DTC P2228	EGR boost sensor circuit low input
DETECTION CONDITION	• The PCM monitors the input voltage from the EGR boost sensor. If the input voltage at PCM terminal 1AL is **0.35 V or below**, the PCM determines that the EGR boost circuit has a malfunction. **Diagnostic support note** • This is a continuous monitor (CCM). • MIL illuminates if the PCM detects the above malfunction condition during the first drive cycle. • FREEZE FRAME DATA is available. • DTC is stored in the PCM memory.
POSSIBLE CAUSE	• EGR boost sensor malfunction • Connector or terminal malfunction • Open circuit between EGR boost sensor terminal C and PCM terminal 1AZ • Short to ground circuit between EGR boost sensor terminal A and PCM terminal 1AL • PCM malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
3	**INSPECT EGR BOOST SENSOR CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect the EGR boost sensor connector. • Check for poor connection (such as damaged, pulled-out pins, and corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 9.
		No	Go to the next step.
4	**INSPECT EGR BOOST SENSOR POWER CIRCUIT FOR OPEN CIRCUIT** • Turn the ignition switch to the ON position. • Measure voltage between EGR boost sensor terminal C and body ground. • Is there voltage?	Yes	Go to the next step.
		No	Repair or replace harness for open circuit, then go to Step 9.
5	**INSPECT EGR BOOST SENSOR SIGNAL CIRCUIT FOR SHORT TO GROUND** • Turn the ignition switch off. • Check continuity between EGR boost sensor terminal A and body ground. • Is there continuity?	Yes	Repair or replace harness for short to ground, then go to Step 9.
		No	Go to the next step.
6	**INSPECT EGR BOOST SENSOR** • Inspect EGR boost sensor. (See 01–40C–37 EGR BOOST SENSOR INSPECTION [AJ].) • Is there any malfunction?	Yes	Replace EGR boost sensor, then go to Step 9.
		No	Go to the next step.
7	**INSPECT PCM CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect PCM connector. • Check for poor connection (such as damaged, pulled-out pins, and corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 9.
		No	Go to the next step.
8	**INSPECT EGR BOOST SENSOR SIGNAL CIRCUIT FOR OPEN CIRCUIT** • Turn the ignition switch off. • Check for continuity between EGR boost sensor terminal A and PCM terminal 1AL. • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace harness for open circuit, then go to the next step.
9	**VERIFY TROUBLESHOOTING OF DTC P2228 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOEO or KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
10	**VERIFY AFTER REPAIR PROCEDURE** • Perform "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Are any DTCs present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2229 [AJ]

E6U010200000WA9

DTC P2229	EGR boost sensor circuit high input
DETECTION CONDITION	• The PCM monitors the input voltage from the EGR boost sensor. If the input voltage at PCM terminal 1AI is **4.9 V or above**, the PCM determines that EGR boost sensor circuit has a malfunction. **Diagnostic support note** • This is a continuous monitor (CCM). • MIL illuminates if the PCM detects the above malfunction condition during the first drive cycle. • FREEZE FRAME DATA is available. • DTC is stored in the PCM memory.
POSSIBLE CAUSE	• EGR boost sensor malfunction • Connector or terminal malfunction • Short to power circuit between EGR boost sensor terminal A and PCM terminal 1AL • Open circuit between EGR boost sensor terminal B and PCM terminal 1BD • PCM malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
3	**INSPECT EGR BOOST SENSOR CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect the EGR boost sensor connector. • Check for poor connection (such as damaged, pulled-out pins, and corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 8.
		No	Go to the next step.
4	**INSPECT EGR BOOST SENSOR SIGNAL CIRCUIT FOR SHORT TO POWER** • Turn the ignition switch to the ON position. • Measure voltage between EGR boost sensor terminal A and body ground. • Is voltage **B+**?	Yes	Repair or replace harness for short to power, then go to Step 8.
		No	Go to the next step.
5	**INSPECT EGR BOOST SENSOR** • Inspect EGR boost sensor. (See 01–40C–37 EGR BOOST SENSOR INSPECTION [AJ].) • Is there any malfunction?	Yes	Replace EGR boost sensor, then go to Step 8.
		No	Go to the next step.
6	**INSPECT PCM CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect PCM connector. • Check for poor connection (such as damaged, pulled-out pins, and corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 8.
		No	Go to the next step.
7	**INSPECT EGR BOOST SENSOR GROUND CIRCUIT FOR OPEN CIRCUIT** • Turn the ignition switch off. • Check for continuity between EGR boost sensor terminal B and PCM terminal 1BD. • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace harness for open circuit, then go to the next step.
8	**VERIFY TROUBLESHOOTING OF DTC P2229 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOEO or KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
9	**VERIFY AFTER REPAIR PROCEDURE** • Perform "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Are any DTCs present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2401 [AJ]

E6U010200000WB0

DTC P2401	EVAP system leak detection pump control circuit low
DETECTION CONDITION	• The PCM monitors the pump load current (EVAP line pressure) when the EVAP leak monitor is operating. If the pump load current is lower than specified, the PCM determines that the EVAP system leak detection pump motor circuit has a malfunction. **Diagnostic support note** • This is an intermittent monitor (CCM). • MIL illuminates if the PCM detects the above malfunction condition in two consecutive drive cycles or in one drive cycle while the DTC for the same malfunction has been stored in the PCM. • PENDING CODE is available if the PCM detects the above malfunction condition during the first drive cycle. • FREEZE FRAME DATA is available. • DTC is stored in the PCM memory.
POSSIBLE CAUSE	• EVAP system leak detection pump malfunction • Connector or terminal malfunction • Open circuit between main relay terminal C and EVAP system leak detection pump terminal A • Short to ground circuit between the EVAP system leak detection pump terminal D and PCM terminal 1Y • Open circuit between EVAP system leak detection pump terminal D and PCM terminal 1Y • PCM malfunction

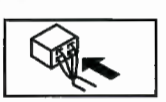
1BH	1BD	1AZ	1AV	1AR	1AN	1AJ	1AF	1AB	1X	1T	1P	1L	1H	1D



Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
3	**VERIFY RELATED PENDING CODE OR STORED DTCs** • Turn ignition switch to OFF, then ON (Engine off). • Verify related pending code or stored DTCs. • Is DTC P2405 present?	Yes	Go to appropriate DTC inspection. (See 01–02C–220 DTC P2405 [AJ].)
		No	Go to the next step.
4	**INSPECT EVAP SYSTEM LEAK DETECTION PUMP CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect the EVAP system leak detection pump connector. • Check for poor connection (such as damaged, pulled-out pins, and corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 10.
		No	Go to the next step.
5	**INSPECT EVAP SYSTEM LEAK DETECTION PUMP POWER CIRCUIT FOR OPEN CIRCUIT** • Turn the ignition switch off. • Disconnect main relay. • Disconnect EVAP system leak detection pump connector. • Check continuity between EVAP system leak detection pump terminal A and main relay terminal C. • Is there continuity?	Yes	Repair or replace harness for open circuit, then go to Step 10.
		No	Go to the next step.
6	**INSPECT EVAP SYSTEM LEAK DETECTION PUMP SIGNAL CIRCUIT FOR SHORT TO GROUND** • Turn the ignition switch off. • Disconnect EVAP system leak detection pump connector. • Check continuity between EVAP system leak detection pump terminal D and body ground. • Is there continuity?	Yes	Repair or replace harness for short to ground, then go to Step 10.
		No	Go to the next step.
7	**INSPECT EVAP SYSTEM LEAK DETECTION PUMP** • Inspect EVAP system leak detection pump. (See 01–16A–11 EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTION PUMP INSPECTION [L3, AJ].) • Is there any malfunction?	Yes	Replace EVAP system leak detection pump, then go to Step 10. (See 01–16A–5 EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM COMPONENT REMOVAL/ INSTALLATION [L3, AJ].)
		No	Go to the next step.
8	**INSPECT PCM CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect PCM connector. • Check for poor connection (such as damaged, pulled-out pins, and corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 10.
		No	Go to the next step.
9	**INSPECT EVAP SYSTEM LEAK DETECTION PUMP SIGNAL CIRCUIT FOR OPEN CIRCUIT** • Turn the ignition switch off. • Disconnect EVAP system leak detection pump connector. • Check continuity between EVAP system leak detection pump terminal D and PCM terminal 1Y. • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace harness for open circuit, then go to Step 10.

STEP	INSPECTION		ACTION
10	**VERIFY TROUBLESHOOTING OF DTC P2401 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
11	**VERIFY AFTER REPAIR PROCEDURE** • Perform "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Are any DTCs present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2402 [AJ]

E6U010200000WB1

DTC P2402	EVAP system leak detection pump control circuit high
DETECTION CONDITION	• The PCM monitors the pump load current (EVAP line pressure) when the EVAP leak monitor is operating. If the pump load current is higher than specified, the PCM determines that the EVAP system leak detection pump motor circuit has a malfunction. **Diagnostic support note** • This is an intermittent monitor (CCM). • MIL illuminates if the PCM detects the above malfunction condition in two consecutive drive cycles or in one drive cycle while the DTC for the same malfunction has been stored in the PCM. • PENDING CODE is available if the PCM detects the above malfunction condition during the first drive cycle. • FREEZE FRAME DATA is available. • DTC is stored in the PCM memory.
POSSIBLE CAUSE	• EVAP system leak detection pump malfunction • Connector or terminal malfunction • Short to power circuit between EVAP system leak detection pump terminal D and PCM terminal 1Y • PCM malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnostic according to the available repair information. • If the vehicle is not repaired, then go to the next step.
		No	Go to the next step.
3	**VERIFY RELATED PENDING CODE OR STORED DTCs** • Turn ignition switch to OFF then ON (Engine off). • Verify related pending code or stored DTCs. • Are other DTCs present?	Yes	Go to appropriate DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Go to the next step.
4	**INSPECT EVAP SYSTEM LEAK DETECTION PUMP CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect the EVAP system leak detection pump connector. • Check for poor connection (such as damaged, pulled-out pins, and corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 7.
		No	Go to the next step.
5	**INSPECT EVAP SYSTEM LEAK DETECTION PUMP SIGNAL CIRCUIT FOR SHORT TO POWER** • Turn the ignition switch to the ON position. • Measure voltage between EVAP system leak detection pump terminal D and body ground. • Is voltage reading?	Yes	Repair or replace harness for short to power, then go to Step 7.
		No	Go to the next step.
6	**INSPECT PCM CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect PCM connector. • Check for poor connection (such as damaged, pulled-out pins, and corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to the next step.
		No	Go to the next step.
7	**VERIFY TROUBLESHOOTING OF DTC P2402 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
8	**VERIFY AFTER REPAIR PROCEDURE** • Perform "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Are any DTCs present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2404 [AJ]

E6U010200000WB2

DTC P2404	EVAP system leak detection pump sense circuit malfunction
DETECTION CONDITION	• The PCM monitors the pump load current (EVAP line pressure) when the EVAP leak monitor is operating. After obtaining the reference current value, if the time in which the pump load current reaches the reference current value is less than the specification, the PCM determines that the air filter is clogged. **Diagnostic support note** • This is an intermittent monitor (CCM). • MIL illuminates if the PCM detects the above malfunction condition in two consecutive drive cycles or in one drive cycle while the DTC for the same malfunction has been stored in the PCM. • PENDING CODE is available if the PCM detects the above malfunction condition during the first drive cycle. • FREEZE FRAME DATA is available. • DTC is stored in the PCM memory.
POSSIBLE CAUSE	• Air filter clogging • EVAP hose bending • PCM malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnostic according to the available repair information. • If the vehicle is not repaired, then go to the next step.
		No	Go to the next step.
3	**CHECK EVAP HOSE BENDING** • Inspect EVAP hose for bending. • Is EVAP hose normal?	Yes	Go to the next step.
		No	Repair or replace hose, then go to Step 5.
4	**CHECK AIR FILTER FOR CLOGGING** • Inspect air filter for clogging. • Is air filter normal?	Yes	Go to the next step.
		No	Replace air filter, then go to the next step.
5	**VERIFY TROUBLESHOOTING OF DTC P2404 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
6	**VERIFY AFTER REPAIR PROCEDURE** • Perform "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Are any DTCs present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2405 [AJ]

E6U010200000WB3

DTC P2405	EVAP system leak detection pump sense circuit low input
DETECTION CONDITION	• The PCM monitors the pump load current (EVAP line pressure) when the EVAP leak monitor is operating. If the current is lower than the specification when the PCM obtains the reference current value, the PCM determines that the EVAP system leak detection pump orifice has malfunction. **Diagnostic support note** • This is an intermittent monitor (CCM). • MIL illuminates if the PCM detects the above malfunction condition in two consecutive drive cycles or in one drive cycle while the DTC for the same malfunction has been stored in the PCM. • PENDING CODE is available if the PCM detects the above malfunction condition during the first drive cycle. • FREEZE FRAME DATA is available. • DTC is stored in the PCM memory.
POSSIBLE CAUSE	• EVAP system leak detection pump orifice fallen off • EVAP system leak detection pump motor malfunction • PCM malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Replace EVAP system leak detection pump, then go to the next step. (See 01–16A–5 EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM COMPONENT REMOVAL/ INSTALLATION [L3, AJ].)
3	**VERIFY TROUBLESHOOTING OF DTC P2405 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
4	**VERIFY AFTER REPAIR PROCEDURE** • Perform "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Are any DTCs present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2407 [AJ]

E6U010200000WB4

DTC P2407	EVAP system leak detection pump sense circuit intermittent
DETECTION CONDITION	• The PCM monitors the pump load current (EVAP line pressure) when the EVAP leak monitor is operating. When either of the following is detected **6 times or more** successively, the PCM determines that the EVAP system leak detection pump heater has a malfunction: — When obtaining the reference current value, the change in pump load current exceeds the specification. — After obtaining the reference current value, the pump load current is kept lower than the maximum pump load current for more than the specified time. **Diagnostic support note** • This is an intermittent monitor (CCM). • MIL illuminates if the PCM detects the above malfunction condition in two consecutive drive cycles or in one drive cycle while the DTC for the same malfunction has been stored in the PCM. • PENDING CODE is available if the PCM detects the above malfunction condition during the first drive cycle. • FREEZE FRAME DATA is available. • DTC is stored in the PCM memory.
POSSIBLE CAUSE	• EVAP system leak detection pump heater malfunction • PCM malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
3	**INSPECT EVAP SYSTEM LEAK DETECTION PUMP HEATER** • Inspect EVAP system leak detection pump. (See 01–16A–11 EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTION PUMP INSPECTION [L3, AJ].) • Is there any malfunction?	Yes	Replace EVAP system leak detection pump, then go to the next step. (See 01–16A–5 EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM COMPONENT REMOVAL/ INSTALLATION [L3, AJ].)
		No	Go to the next step.
4	**VERIFY TROUBLESHOOTING OF DTC P2407 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
5	**VERIFY AFTER REPAIR PROCEDURE** • Perform "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Are any DTCs present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2502 [AJ]

E6U010200000WB5

DTC P2502	Generator terminal B circuit open
DETECTION CONDITION	• The PCM determines that the generator output voltage is **17 V or above**, or the battery voltage is **11 V or below** when the engine is running. **Diagnostic support note** • This is a continuous monitor (Other). • The MIL does not illuminate. • PENDING CODE is available if the PCM detects the above malfunction condition. • FREEZE FRAME DATA is not available. • DTC is stored in PCM memory.
POSSIBLE CAUSE	• Open circuit between generator terminal B and the battery positive terminal • Battery malfunction • PCM malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME PID DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
3	**INSPECT BATTERY** • Turn the ignition switch off. • Inspect battery. (See 01–17A–2 BATTERY INSPECTION [L3, AJ].) • Is there any malfunction?	Yes	Replace battery, then go to Step 7. (See 01–17A–1 BATTERY REMOVAL/INSTALLATION [L3, AJ].)
		No	Go to the next step.
4	**INSPECT GENERATOR TERMINAL FOR POOR INSTALLATION** • Turn the ignition switch off. • Check for looseness of generator terminal B installation nut. • Is nut loose?	Yes	Tighten generator terminal B installation nut, then go to Step 7.
		No	Go to the next step.
5	**INSPECT BATTERY POSITIVE TERMINAL FOR POOR INSTALLATION** • Turn the ignition switch off. • Check for looseness of battery positive terminal. • Is terminal loose?	Yes	Connect battery positive terminal correctly, then go to Step 7.
		No	Go to the next step.
6	**INSPECT BATTERY CHARGING CIRCUIT** • Start engine. • Disconnect battery positive terminal. • Does engine stall?	Yes	Repair or replace harness between generator terminal B and battery positive terminal, then go to the next step.
		No	Go to the next step.
7	**VERIFY TROUBLESHOOTING OF DTC P2502 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
8	**VERIFY AFTER REPAIR PROCEDURE** • Perform "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Are any DTCs present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2503 [AJ]

E6U010200000WB6

DTC P2503	Generator output voltage signal no electricity
DETECTION CONDITION	• The PCM needs **20 A or more** from the generator, and determines the generator output voltage to be **8.5 V or below** when the engine is running. **Diagnostic support note** • This is a continuous monitor (Other). • The MIL does not illuminate. • PENDING CODE is available if the PCM detects the above malfunction condition. • FREEZE FRAME DATA is not available. • DTC is stored in PCM memory.
POSSIBLE CAUSE	• Generator malfunction — Rectifier circuit malfunction — Brush abrasion • Connector or terminal malfunction • Open or short to ground circuit between generator terminal D and PCM terminal 2AP • Open or short to ground circuit between generator terminal P and PCM terminal 2AU • Cut drive belt off or came drive belt off • PCM malfunction

DTC P2503	Generator output voltage signal no electricity

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
3	**INSPECT DRIVE BELT CONDITION** • Verify that drive belt auto tensioner indicator mark in not exceeding limit. (See 01–10C–3 DRIVE BELT INSPECTION [AJ].) • Is front drive belt normal?	Yes	Go to the next step.
		No	Replace or adjust drive belt, then go to Step 9.
4	**INSPECT GENERATOR CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect generator connector. • Check for poor connection (damaged, pulled-out pins, corrosion, etc.). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 9.
		No	Go to the next step.
5	**INSPECT GENERATOR CIRCUIT FOR SHORT TO GROUND** • Turn the ignition switch off. • Check continuity between the following circuits: — Generator terminal D and body ground — Generator terminal P and body ground • Is there continuity?	Yes	Repair or replace harness for short to ground, then go to Step 9.
		No	Go to the next step.
6	**INSPECT GENERATOR** • Inspect generator. (See 01–17A–5 GENERATOR INSPECTION [L3, AJ].) • Is there any malfunction?	Yes	Replace generator, then go to Step 9. (See 01–17A–4 GENERATOR REMOVAL/INSTALLATION [L3, AJ].)
		No	Go to the next step.
7	**INSPECT PCM CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect PCM connector. • Check for poor connection (such as damaged, pulled-out pins, and corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 9.
		No	Go to the next step.
8	**INSPECT GENERATOR CIRCUIT FOR OPEN CIRCUIT** • Turn the ignition switch off. • Check continuity between the following circuits: — Generator terminal D and PCM terminal 2AP — Generator terminal P and PCM terminal 2AU • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace harness for open circuit, then go to the next step.
9	**VERIFY TROUBLESHOOTING OF DTC P2503 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.

STEP	INSPECTION		ACTION
10	**VERIFY AFTER REPAIR PROCEDURE** • Perform "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Are any DTCs present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2504 [AJ]

E6U010200000WB7

DTC P2504	Battery overcharge
DETECTION CONDITION	• The PCM determines that the generator output voltage is **18.5 V or above**, or the battery voltage is **16.0 V or above** when the engine is running. **Diagnostic support note** • This is a continuous monitor (Other). • The MIL does not illuminate. • PENDING CODE is available if the PCM detects the above malfunction condition. • FREEZE FRAME DATA is not available. • DTC is stored in PCM memory.
POSSIBLE CAUSE	• Generator malfunction • Connector or terminal malfunction • Short to power circuit between generator connector terminal D and PCM terminal 2AP • PCM malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
3	**INSPECT GENERATOR CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect generator connector. • Check for poor connection (such as damaged, pulled-out pins, and corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 8.
		No	Go to the next step.
4	**CLASSIFY GENERATOR MALFUNCTION OR OTHER MALFUNCTION** • Turn the ignition switch to the ON position. • Measure voltage between generator terminal D and body ground. • Is voltage **B+**?	Yes	Go to the next step.
		No	Malfunction at the generator. Go to step 7.
5	**INSPECT PCM CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect PCM connector. • Check for poor connection (such as damaged, pulled-out pins, and corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 8.
		No	Go to the next step.
6	**INSPECT GENERATOR CONTROL CIRCUIT FOR SHORT TO POWER** • Turn the ignition switch to the ON position. • Measure voltage between generator terminal D and body ground. • Is voltage **B+**?	Yes	Repair or replace harness for short to power, then go to Step 8.
		No	Go to step 8.
7	**INSPECT GENERATOR CONTROL TERMINAL FOR SHORT TO POWER** • Turn the ignition switch to the ON position. • Measure voltage between generator terminal D and body ground. • Is voltage **B+**?	Yes	Replace generator, then go to the next step. (See 01–17A–4 GENERATOR REMOVAL/INSTALLATION [L3, AJ].)
		No	Go to the next step.
8	**VERIFY TROUBLESHOOTING OF DTC P2504 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
9	**VERIFY AFTER REPAIR PROCEDURE** • Perform "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Are any DTCs present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2507 [AJ]

E6U010200000WB8

DTC P2507	PCM B+ voltage low
DETECTION CONDITION	• The PCM monitors the voltage of back-up battery positive terminal at PCM terminal 1E. If the PCM detected battery positive terminal voltage **below 2.5 V** for **2 s**, the PCM determines that the backup voltage circuit has malfunction. **Diagnostic support note** • This is a continuous monitor (CCM). • MIL illuminates if the PCM detects the above malfunction condition during the first drive cycle. • FREEZE FRAME DATA is available. • DTC is stored in PCM memory.
POSSIBLE CAUSE	• Melt down EEC fuse • Open circuit in wiring between EEC fuse and PCM terminal 1E • Short to ground between EEC fuse and PCM terminal 1E • Poor connection of PCM connector • PCM malfunction

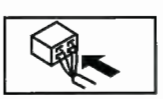
1BH	1BD	1AZ	1AV	1AR	1AN	1AJ	1AF	1AB	1X	1T	1P	1L	1H	1D



Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME PID DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME PID DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
3	**INSPECT EEC FUSE** • Turn the ignition switch off. • Inspect EEC fuse for failure and proper. • Is it normal?	Yes	Go to step 6.
		No	• If EEC fuse has been melt down, then go to the next step. • If EEC fuse is not installed correctly, install it correctly then go to Step 7.
4	**INSPECT MONITOR CIRCUIT FOR SHORT TO GROUND** • Disconnect battery cables. • Inspect for continuity between EEC fuse terminal and body ground. • Is there continuity?	Yes	Repair or replace the wiring harness for short to ground and install new fuse, then go to Step 7.
		No	Go to step 7.
5	**INSPECT PCM CONNECTOR FOR POOR CONNECTION** • Disconnect PCM connector. • Inspect for poor connection (such as damaged/ pulled-out pins, corrosion). • Is there any malfunction?	Yes	Repair terminals, then go to Step 7.
		No	Go to the next step.
6	**INSPECT MONITOR CIRCUIT FOR OPEN CIRCUIT** • Disconnect battery cables. • Inspect for continuity between EEC fuse terminal and PCM terminal 1E. • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace the wiring harness for open circuit, then go to the next step.
7	**VERIFY TROUBLESHOOTING OF DTC P2507 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOEO or KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace the PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
8	**VERIFY AFTER REPAIR PROCEDURE** • Perform "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Is any DTC present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2610 [AJ]

E6U010200000WD0

DTC P2610	PCM internal engine off timer performance
DETECTION CONDITION	• PCM internal engine off timer is damaged. **Diagnostic support note** • This is a continuous monitor (CCM). • MIL illuminates if the PCM detects the above malfunction condition in two consecutive drive cycles or in one drive cycle while the DTC for the same malfunction has been stored in the PCM. • PENDING CODE is available if the PCM detects the above malfunction condition during the first drive cycle. • FREEZE FRAME DATA is available. • DTCs are stored in the PCM memory.
POSSIBLE CAUSE	• PCM internal engine off timer is damaged.

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has the FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record the FREEZE FRAME DATA on the repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Verify related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform the repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
3	**VERIFY TROUBLESHOOTING OF DTC P2610 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear the DTC from the PCM memory using the WDS or equivalent. • Run Drive Mode 1 and 3. (See 01–02C–8 OBD-II DRIVE MODE [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace the PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
4	**VERIFY AFTER REPAIR PROCEDURE** • Perform the "AFTER REPAIR PROCEDURE". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Are any DTCs present?	Yes	Go to the applicable DTC troubleshooting. (See 01–02C–13 DTC TABLE [AJ].)
		No	DTC troubleshooting completed.

DTC P2676 [AJ]

E6U010200000WB9

DTC P2676	Variable air duct (VAD) control solenoid valve circuit low input
DETECTION CONDITION	• The PCM monitors the VAD solenoid valve control signal voltage. If the following conditions are met, the PCM determines that there is the VAD control circuit problem. — The PCM turns the VAD solenoid valve off, but the voltage of the VAD solenoid valve control signal remains low. **Diagnostic support note** • This is a continuous monitor (Other). • The MIL does not illuminate. • PENDING CODE is available if the PCM detects the above malfunction condition. • FREEZE FRAME DATA is not available. • DTC is stored in the PCM memory.
POSSIBLE CAUSE	• VAD solenoid valve malfunction • Open circuit in wiring between main relay and VAD solenoid valve terminal A • Open circuit in wiring between VAD solenoid valve terminal B and PCM terminal 1BB • Short to ground in wiring between VAD solenoid valve terminal B and PCM terminal 1BB • Connector or terminal malfunction • PCM malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any related repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
3	**INSPECT VAD SOLENOID VALVE CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect VAD solenoid valve connector. • Inspect for poor connection (such as damaged/pulled-out pins, corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 9.
		No	Go to the next step.
4	**INSPECT VAD SOLENOID VALVE MALFUNCTION** • Perform VAD solenoid valve inspection. (See 01–13C–5 VARIABLE AIR DUCT (VAD) CONTROL SOLENOID VALVE INSPECTION [AJ].) • Is VAD solenoid valve normal?	Yes	Go to the next step.
		No	Replace VAD solenoid valve, then go to step 9.
5	**INSPECT VAD SOLENOID VALVE POWER SUPPLY CIRCUIT FOR OPEN CIRCUIT** • Turn the ignition switch to the ON position (Engine off). • Measure voltage between VAD solenoid valve terminal A and body ground. • Is voltage **B+**?	Yes	Go to the next step.
		No	Repair or replace wiring harness for open circuit, then go to Step 9.
6	**INSPECT VAD SOLENOID VALVE CONTROL CIRCUIT FOR SHORT TO GROUND** • Inspect continuity between VAD solenoid valve terminal B and body ground. • Is there continuity?	Yes	Repair or replace wiring harness for short to ground, then go to Step 9.
		No	Go to the next step.
7	**INSPECT PCM CONNECTOR FOR POOR CONNECTION** • Disconnect the PCM connector. • Inspect for poor connection at terminal 1BB. (such as damaged/pulled-out pins, corrosion). • Is there any malfunction?	Yes	Repair terminal, then go to Step 9.
		No	Go to the next step.
8	**INSPECT VAD SOLENOID VALVE CONTROL CIRCUIT FOR OPEN CIRCUIT** • Inspect for continuity between VAD solenoid valve terminal B and PCM terminal 1BB. • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace wiring harness for open circuit, then go to the next step.
9	**VERIFY TROUBLESHOOTING OF DTC P2676 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOEO or KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace the PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
10	**VERIFY AFTER REPAIR PROCEDURE** • Perform the "After Repair Procedure". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Is any DTC present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

DTC P2677 [AJ]

E6U010200000WC0

DTC P2677	Variable air duct (VAD) solenoid valve circuit high input
DETECTION CONDITION	• The PCM monitors the VAD solenoid valve control signal current. If the following conditions are met, the PCM determines that there is the VAD control circuit problem. — The PCM turns the VAD solenoid valve on, but the current of the VAD solenoid valve control signal remains high. **Diagnostic support note** • This is a continuous monitor (Other). • The MIL does not illuminate. • PENDING CODE is available if the PCM detects the above malfunction condition. • FREEZE FRAME DATA is not available. • DTC is stored in the PCM memory.
POSSIBLE CAUSE	• VAD solenoid valve malfunction • Short to power supply between VAD solenoid valve terminal B and PCM terminal 1BB • Shorted VAD solenoid valve or PCM connector • PCM malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY FREEZE FRAME DATA HAS BEEN RECORDED** • Has FREEZE FRAME DATA been recorded?	Yes	Go to the next step.
		No	Record FREEZE FRAME DATA on repair order, then go to the next step.
2	**VERIFY RELATED REPAIR INFORMATION AVAILABILITY** • Check for related Service Bulletins and/or on-line repair information availability. • Is any repair information available?	Yes	Perform repair or diagnosis according to the available repair information. • If the vehicle is not repaired, go to the next step.
		No	Go to the next step.
3	**INSPECT VAD SOLENOID VALVE CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect VAD solenoid valve connector. • Inspect for poor connection (such as damaged/pulled-out pins, corrosion). • Is there any malfunction?	Yes	Repair or replace the terminal, then go to Step 7.
		No	Go to the next step.
4	**INSPECT VAD SOLENOID VALVE MALFUNCTION** • Perform VAD solenoid valve inspection. (See 01–13C–5 VARIABLE AIR DUCT (VAD) CONTROL SOLENOID VALVE INSPECTION [AJ].) • Is VIS solenoid valve normal?	Yes	Go to the next step.
		No	Replace VAD solenoid valve, then go to Step 7.
5	**INSPECT PCM CONNECTOR FOR POOR CONNECTION** • Turn the ignition switch off. • Disconnect the PCM connector. • Inspect for poor connection at terminal 1BB. (such as damaged/pulled-out pins, corrosion). • Is there any malfunction?	Yes	Repair terminal, then go to Step 7.
		No	Go to the next step.
6	**INSPECT VAD SOLENOID VALVE CONTROL CIRCUIT SHORT TO POWER SUPPLY** • Turn the ignition switch to the ON position (Engine off). • Measure voltage between VAD solenoid valve terminal B and body ground. • Is voltage **B+**?	Yes	Repair or replace wiring harness for open circuit, then go to the next step.
		No	Go to the next step.
7	**VERIFY TROUBLESHOOTING OF DTC P2677 COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from PCM memory using WDS or equivalent. • Perform the KOEO or KOER SELF TEST using the WDS or equivalent. (See 01–02C–8 KOEO/KOER SELF TEST [AJ].) • Is the PENDING CODE same DTC present?	Yes	Replace the PCM, then go to the next step. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
8	**VERIFY AFTER REPAIR PROCEDURE** • Perform the "After Repair Procedure". (See 01–02C–7 AFTER REPAIR PROCEDURE [AJ].) • Is any DTC present?	Yes	Go to the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
		No	Troubleshooting completed.

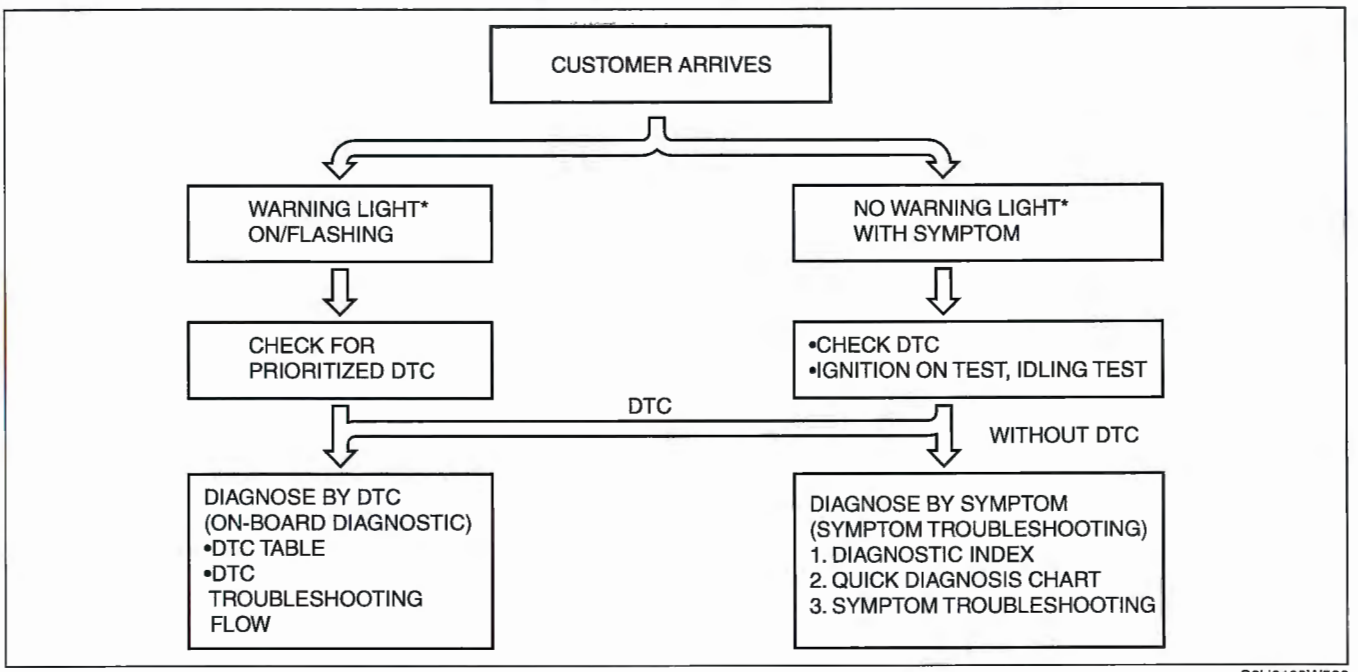
FOREWORD [L3]

E6U010318881W02

- When the customer reports a vehicle malfunction, check the malfunction indicator lamp (MIL) indication and diagnostic trouble code (DTC), then diagnose the malfunction according to the following flowchart:
  - — If a DTC exists, diagnose the applicable DTC inspection. (See 01–02A–18 DTC TABLE [L3].)
  - — If no DTC exists and the MIL does not illuminate or flash, diagnose the applicable symptom troubleshooting. (See 01–03A–11 QUICK DIAGNOSTIC CHART [L3].)



C6U0103W500

*: Malfunction Indicator Lamp (MIL), Generator Warning Light, Security Light

INTERMITTENT CONCERN TROUBLESHOOTING [L3]

E6U010318881W03

Vibration Method

- If malfunction occurs or becomes worse while driving on a rough road or when engine is vibrating, perform the steps below.

Note

- There are several reasons vehicle or engine vibration could cause an electrical malfunction. Check the following:
  - — Connectors not fully seated.
  - — Wiring harnesses not having full play.
  - — Wires laying across brackets or moving parts.
  - — Wires routed too close to hot parts.
- An improperly routed, improperly clamped, or loose harness can cause wiring harness to become pinched between parts.
- The connector joints, points of vibration, and places where wiring harnesses pass through the firewall and body panels are the major areas to be checked.

Inspection Method for Switch Connectors or Wires

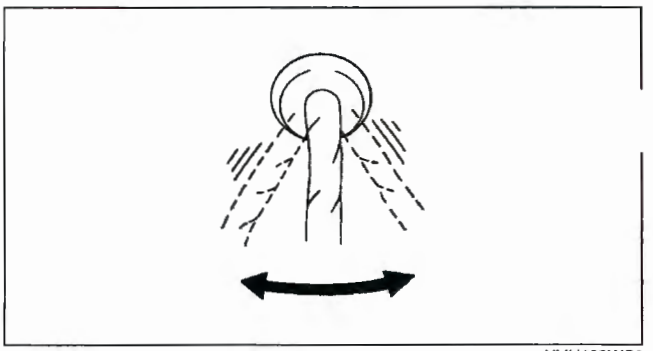
1. Connect WDS or equivalent to DLC-2.
2. Turn ignition switch to ON position (Engine off).

Note

- If engine starts and runs, perform the following steps during idle.

3. Access PIDs for the switch you are inspecting.
4. Turn switch on manually.

5. Slightly shake each connector or wiring harness vertically and horizontally while monitoring the PID.
   - If PID value is unstable, check for poor connection.



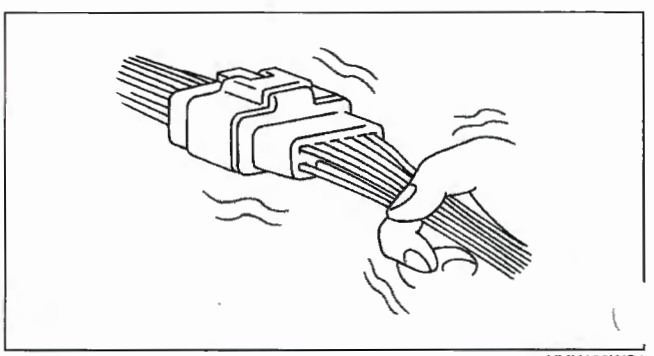
YMU103WC0

Inspection Method for Sensor Connectors or Wires

1. Connect WDS or equivalent to DLC-2.
2. Turn ignition switch to ON position (Engine off).

Note
- If engine starts and runs, perform the following steps during idle.

3. Access PIDs for the switch you are inspecting.
4. Slightly shake each connector or wiring harness vertically and horizontally while monitoring the PID.
   - If PID value is unstable, check for poor connection.



YMU103WC1

Inspection Method for Sensors

1. Connect WDS or equivalent to DLC-2.
2. Turn ignition switch to ON position (Engine off).

Note
- If engine starts and runs, perform the following steps during idle.

3. Access PIDs for the switch you are inspecting.
4. Vibrate the sensor slightly with your finger.
   - If PID value is unstable or malfunction occurs, check for poor connection or poorly mounted sensor or both.

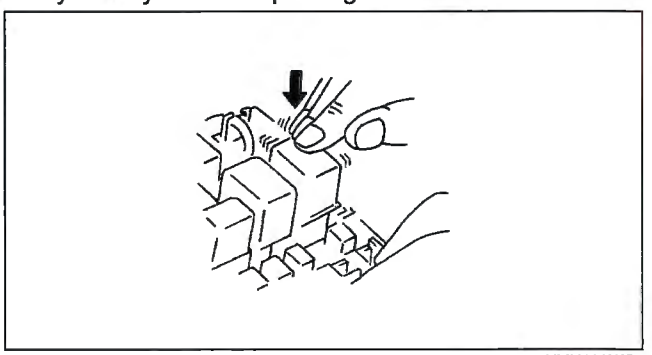
Inspection Method for Actuators or Relays

1. Connect WDS or equivalent to DLC-2.
2. Turn ignition switch to ON position (Engine off).

Note
- If engine starts and runs, perform the following steps during idle.

3. Prepare the output state control function for actuators or relays that you are inspecting.
4. Vibrate the actuator or relay with your finger for 3 seconds after output state control function is activated.
   - If variable click sound is heard, check for poor connection or poorly mounted actuator or both, or the relay.

Note
- Vibrating relays too strongly may result in open relays.



YMU103WC2

Water Sprinkling Method

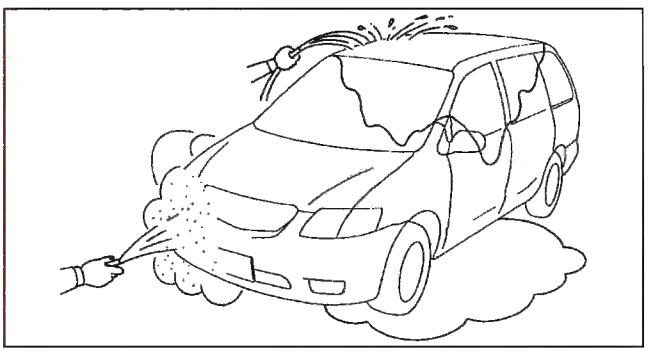
If malfunction occurs only during high humidity or rainy/snowy weather, perform the following steps:

Caution
- **Indirectly change the temperature and humidity by spraying water onto the front of the radiator.**
- **If a vehicle is subject to water leakage, the leakage may damage the control module. When testing a vehicle with a water leakage problem, special caution must be used.**

1. Connect WDS or equivalent to DLC-2 if you are inspecting sensors or switches.
2. Turn ignition switch to ON position (Engine off).

Note
- If engine starts and runs, perform the following steps at idle.

3. Access PIDs for sensor or switch if you are inspecting sensors or switches.
4. If you are inspecting the switch, turn it on manually.
5. Spray water onto the vehicle or run it through a car wash.
   - If PID value is unstable or malfunction occurs, repair or replace part if necessary.



YMU103WC3

ENGINE SYMPTOM TROUBLESHOOTING [L3]

E6U010318881W04

- Confirm trouble symptom using the following diagnostic index, then go to appropriate troubleshooting chart.

Diagnostic Index

No.	TROUBLESHOOTING ITEM		DESCRIPTION
1	Melting of main or other fuses		—
2	MIL illuminates		MIL is illuminated.
3	Will not crank		Starter does not work.
4	Hard to start/long crank/erratic start/erratic crank		Starter cranks engine at normal speed but engine requires excessive cranking time before starting.
5	Engine stalls.	After start/at idle	Engine stops unexpectedly at idle or after start or both.
6	Cranks normally but will not start		Starter cranks engine at normal speed but engine will not run.
7	Slow return to idle		Engine takes more time than normal to return to idle speed.
8	Engine runs rough/rolling idle		Engine speed fluctuates between specified idle speed and lower speed and engine shakes excessively.
9	Fast idle/runs on		Engine speed continues at fast idle after warm-up. Engine runs after ignition switch is turned to OFF.
10	Low idle/stalls during deceleration		Engine stops unexpectedly at beginning of deceleration or recovery from deceleration.
11	Engine stalls/quits.	Acceleration/cruise	Engine stops unexpectedly at beginning of acceleration or during acceleration. Engine stops unexpectedly while cruising.
	Engine runs rough.	Acceleration/cruise	Engine speed fluctuates during acceleration or cruising.
	Misses	Acceleration/cruise	Engine misses during acceleration or cruising.
	Buck/jerk	Acceleration/cruise/ deceleration	Vehicle bucks/jerks during acceleration, cruising, or deceleration.
	Hesitation/stumble	Acceleration	Momentary pause at beginning of acceleration or during acceleration
	Surges	Acceleration/cruise	Momentary minor irregularity in engine output
12	Lack/loss of power	Acceleration/cruise	Performance is poor under load. (e.g., power down when climbing hills)
13	Knocking/pinging	Acceleration/cruise	Sound is produced when air/fuel mixture is ignited by something oth than spark plug. (e.g., hot spot in combustion chamber)
14	Poor fuel economy		Fuel economy is unsatisfactory.
15	Emission compliance		Fails emissions test.
16	High oil consumption/leakage		Oil consumption is excessive.
17	Cooling system concerns	Overheating	Engine runs at higher than normal temperature/overheats.
18	Cooling system concerns	Runs cold	Engine does not reach normal operating temperature.
19	Exhaust smoke		Blue, black, or white smoke from exhaust system
20	Fuel odor (in engine compartment)		Gasoline fuel smell or visible leakage
21	Engine noise		Engine noise from under hood
22	Vibration concerns (engine)		Vibration from under hood or driveline
23	A/C does not work sufficiently.		A/C compressor magnetic clutch does not engage when A/C is turned on.
24	A/C is always on or A/C compressor runs continuously.		A/C compressor magnetic clutch does not disengage.
25	A/C is not cut off under WOT conditions.		A/C compressor magnetic clutch does not disengage under WOT.
26	Exhaust sulphur smell		Rotten egg smell (sulphur) from exhaust
27	Fuel refill concerns		Fuel tank does not fill smoothly.
28	Fuel filling shut off issues		Fuel does not shut off properly.
29	Spark plug condition		Incorrect spark plug condition
30.	ATX concerns	Upshift/downshift engagement	ATX concerns not related to engine performance

QUICK DIAGNOSTIC CHART [L3]

E6U010318881W05

X: Applied

Troubleshooting item			Possible factor: Starter motor malfunction (Mechanical or electrical)	Starter circuit including ignition switch is open.	Starter interlock switch malfunction (MTX)	Improper engine oil level	Low or dead battery	Charging system malfunction	Improper engine compression	Improper valve timing	Hydrolocked engine	Improper engine oil viscosity	Improper dipstick	Base engine malfunction	Drive plate or flywheel are seized.	Improper tension or damaged drive belts	Improper engine coolant level	Water and anti-freeze mixture is improper.	Cooling system malfunction (Radiator, hoses, overflow system, thermostat, etc.)	Cooling fan system malfunction	Engine or transaxle mounts are improperly installed.	Cooling fan or condenser fan seat are improper.	Cruise control system operation improperly	Fuel quality
1	Melting of main or other fuses																							
2	MIL illuminates

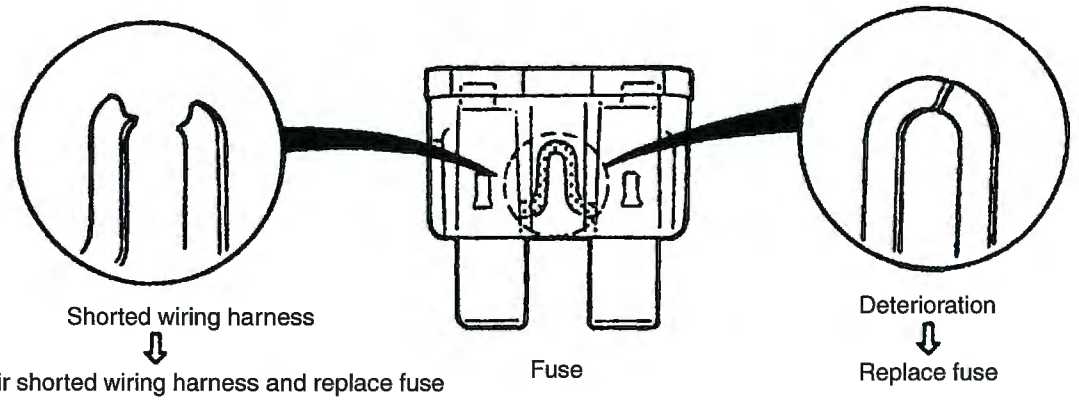
NO.1 MELTING OF MAIN OR OTHER FUSES [L3]

E6U010318881W06

1	MELTING OF MAIN OR OTHER FUSES

TROUBLESHOOTING HINTS]
Inspect condition of fuse.



Damaged fuse	Related wiring harness
MAIN (100A)	**MAIN fuse** • IG KEY2 fuse • AD FAN fuse • FAN fuse • BTN fuse • Generator
ENG +B (10A)	**ENG +B fuse** • PCM
IG KEY1 (40A)	**IG KEY1 fuse** • Ignition switch — ENGINE IG fuse — METER IG fuse
IG KEY2 (30A)	**IG KEY2 fuse** • Ignition switch • Starter relay
ETC (7.5A)	**ETC fuse** • ETC relay — PCM
AD FAN (30A)	**AD FAN fuse** • Cooling fan relay No.1 — Cooling fan motor No.1 — Cooling fan motor No.2
FAN (30A)	**FAN fuse** • Cooling fan relay No.2 — Cooling fan motor No.1 • Cooling fan relay No.3 — Cooling fan motor No.2
ENGINE IG (15A)	**ENGINE IG fuse** • PCM • Ignition coil • Capacitor
METER IG (15A)	**METER IG fuse** • Cooling fan relay No.1 — PCM • Cooling fan relay No.2 — PCM • Cooling fan relay No.3 — PCM • Cooling fan relay No.4 — PCM • Heated oxygen sensor heater (front)*1 • Heated oxygen sensor heater (rear)*1

Damaged fuse	Related wiring harness
ENG BAR (10A)	**ENG BAR fuse** • EGR valve • Purge solenoid valve • MAF/IAT sensor • Variable air duct control solenoid valve • OCV • Variable intake air system control solenoid valve • Variable tumble solenoid valve • EVAP system leak detection pump
ENG BAR2 (15A)*2	**ENG BAR2 fuse** • Heated oxygen sensor heater (front) • Heated oxygen sensor heater (rear)
INJ (15A)	**INJ fuse** • PCM • Fuel pump relay — PCM — Check connector • Fuel injectors • ETC relay — PCM
FUEL PUMP (15A)	**FUEL PUMP fuse** • Main relay — PCM • Fuel pump relay — Fuel pump
BTN (40A)	**BTN fuse** • ROOM fuse
ROOM (15A)	**ROOM fuse** • DLC

*1 : California emission regulation applicable ATX model
*2 : Except for California emission regulation applicable ATX model

NO.2 MIL ILLUMINATES [L3]

E6U010318881W07

2	MIL ILLUMINATES
DESCRIPTION	MIL is illuminated.
POSSIBLE CAUSE	• PCM illuminates for emission-related concern (DTC is stored in PCM) • Instrument cluster malfunction **Note** • If MIL blinks at steady rate, misfire condition could possibly exist.

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Inspect for open or short circuit for between following PCM terminal and instrument cluster. — PCM terminal 1AI and instrument cluster terminal 2W — PCM terminal 1AM and instrument cluster terminal 2X • Inspect instrument cluster operation. See Section 09.
2	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.3 WILL NOT CRANK [L3]

E6U010318881W08

3	WILL NOT CRANK
DESCRIPTION	Starter does not work.
POSSIBLE CAUSE	• Open starter circuit between ignition switch and starter • TR switch malfunction (ATX) • TR switch misadjustment (ATX) • Low or dead battery. • Charging system malfunction. • Starter interlock switch malfunction (MTX). • Starter malfunction • Seized/hydrolocked engine, flywheel or drive plate • Immobilizer system (PATS) and/or circuit malfunction.

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect WDS or equivalent to DLC-2. Do the following conditions appear? • Engine is not completely started. • DTC B1681 is displayed.	Yes	**Both conditions appear:** Go to Step 4.
		No	**Either or other condition appears:** Go to the next step.
2	Is coil connector securely connected to coil?	Yes	Go to the next step.
		No	Connect coil connector securely. Return to Step 1.
3	Does security light illuminate?	Yes	Go to the next step.
		No	Inspect instrument cluster and wiring harness.
4	Connect WDS or equivalent to DLC-2 and retrieve DTC. **DTC** **B1213, B1342, B1600, B1601, B1602, B1681, B2103, B2431**	Yes	Go to appropriate DTC test.
		No	Go to the next step.
5	Is there continuity between PCM GND terminals 1AZ, 1BB, 1BD, 1BH and GND?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
6	Measure voltage between PCM GND terminals 1AZ, 1BB, 1BD, 1BH and coil terminal C. Is the voltage **below 1.0 V**?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
7	Turn ignition switch to ON position. Access VPWR PID. Is VPWR PID normal? **Specification** **Battery voltage**	Yes	Go to the next step.
		No	Repair or replace wiring harness.
8	Disconnect coil connector. Turn ignition switch to ON position. Is there battery voltage at coil connector terminal D (harness-side)?	Yes	Go to the next step.
		No	Repair or replace wiring harness between coil connector terminal D and fuse panel.
9	Inspect for the following wiring harnesses and connectors: • Between coil terminal A and PCM terminal 1F. • Between coil terminal B and PCM terminal 1E. Is there any malfunction?	Yes	Repair or replace wiring harness.
		No	Go to the next step.
10	Is there continuity between PCM terminal 1B and starter relay with clutch pedal depressed (MTX with starter interlock system), P or N position (ATX)?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
11	Inspect the following: • Battery connection • Battery condition • Transaxle is in Park or Neutral. (ATX) • Clutch is fully depressed. (MTX) • Fuses Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 11.
12	Is clicking sound heard from starter when ignition switch is turned to START?	Yes	Go to the next step.
		No	Go to Step 14.

STEP	INSPECTION	RESULTS	ACTION
13	Inspect starting system. (See 01–19A–4 STARTER INSPECTION [L3, AJ].) Is starting system normal?	Yes	Inspect for seized/hydrolocked engine, flywheel or drive plate. (See 05–10–32 FLYWHEEL INSPECTION [G35M-R, A65M-R].)
		No	Repair or replace components if required.
14	Do any other electrical accessories work?	Yes	Go to the next step.
		No	Inspect charging system. (See 01–17A–2 BATTERY INSPECTION [L3, AJ].) (See 01–17A–5 GENERATOR INSPECTION [L3, AJ].)
15	**Note** • The following test should be performed on ATX only. For MTX, go to the next step. Connect WDS or equivalent to DLC-2. Access TR PID. Turn ignition switch to ON position. Is TR PID indicated P/N when selecting P or N position?	Yes	Go to the next step.
		No	Inspect adjustment of TR switch. If TR switch is adjusted properly, inspect for open circuit between TR switch and TCM terminal 2H or starter.
16	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test. **Communication error message is displayed:** Inspect for the following: • Open circuit between main relay and PCM terminal 1BE or 1AW* • Open circuit between main relay terminal E and PCM terminal 1Q • Main relay is stuck open. • Open or poor GND circuit (PCM terminal 1AZ, 1BB, 1BD or 1BH) • Poor connection of vehicle body GND
		No	**No DTC is displayed:** Inspect the following: • START circuit in ignition switch • Open circuit between ignition switch and starter • Starter interlock switch (MTX)
17	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.

NO.4 HARD TO START/LONG CRANK/ERRATIC START/ERRATIC CRANK [L3]

E6U010318881W09

4	HARD TO START/LONG CRANK/ERRATIC START/ERRATIC CRANK
DESCRIPTION	• Starter cranks engine at normal speed but engine requires excessive cranking time before starting. • Battery is in normal condition.
POSSIBLE CAUSE	• Vacuum leakage • Poor fuel quality • Starting system malfunction • Erratic signal to ignition coil • Spark plug malfunction • Air leakage from intake-air system • Erratic signal from CKP sensor • Erratic signal from CMP sensor • Improper air/fuel mixture ratio control • Air cleaner restriction • Improper operation of electronic throttle control system • PCV valve malfunction • Inadequate fuel pressure • Purge solenoid valve malfunction • MAF sensor contamination • Restriction in exhaust system • EGR valve malfunction • Pressure regulator malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before servicing the fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Inspect for the following: • Vacuum leakage • Proper fuel quality (e.g. proper octane, contamination, winter/summer blend) • Loose bands on intake-air system • Cracks on intake-air system parts • Air cleaner restriction Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
2	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
3	Is engine overheating?	Yes	Go to symptom troubleshooting "No.17 Cooling system concerns – Overheating".
		No	Go to the next step.
4	Inspect ignition coil related harnesses condition (intermittent open or short circuit) for all cylinders. Are all harnesses condition normal?	Yes	Go to the next step.
		No	Repair suspected wiring harness.

STEP	INSPECTION	RESULTS	ACTION
5	Inspect spark plug conditions. Is spark plug wet, covered with carbon or grayish white?	Yes	**Spark plug is wet or covered with carbon:** Inspect for fuel leakage from fuel injector. **Spark plug is grayish white:** Inspect for clogged fuel injector.
		No	Install spark plugs on original cylinders. Go to the next step.
6	Visually inspect CKP sensor and teeth of crankshaft pulley. Are CKP sensor and teeth of crankshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts.
7	Remove and shake PCV valve. Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
8	Attempt to start engine at part throttle. Does engine run smoothly at part throttle?	Yes	Inspect electronic throttle control system operation.
		No	Go to the next step.
9	Install fuel pressure gauge between fuel pipe and fuel distributor. Short check connector terminal F/P to body GND using a jumper wire. Turn ignition switch to ON position. Is fuel line pressure correct with ignition switch ON? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	**Zero or low:** Inspect fuel pump relay and fuel pump circuit. Inspect for clogged fuel line. If okay, replace fuel pump unit. **High:** Replace fuel pump unit.
10	Is fuel line pressure held after ignition switch is turned OFF? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	Inspect fuel injector. If fuel injector is okay, replace fuel pump unit.
11	Disconnect a vacuum hose from purge solenoid valve and plug opening end of vacuum hose. Attempt to start engine. Is starting condition improved?	Yes	Inspect if purge solenoid valve is stuck open.
		No	Go to the next step.
12	Inspect MAF sensor for contamination. Is there any contamination?	Yes	Replace MAF sensor.
		No	Go to the next step.
13	Is there restriction in exhaust system?	Yes	Inspect exhaust system.
		No	Go to the next step.
14	Inspect engine condition while tapping EGR valve housing. Does engine condition improve?	Yes	Replace EGR valve.
		No	Go to the next step.
15	Inspect starting system. (See 01–19A–4 STARTER INSPECTION [L3, AJ].) Is starting system normal?	Yes	Inspect for loose connectors or poor terminal contact. If okay, remove EGR valve and visually inspect for mechanically stuck EGR valve.
		No	Repair or replace components as required.
16	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.5 ENGINE STALLS-AFTER START/AT IDLE [L3]

E6U010318881W10

5	ENGINE STALLS—AFTER START/AT IDLE
DESCRIPTION	• Engine stops unexpectedly.
POSSIBLE CAUSE	• A/C system operation is improper • Air leakage from intake-air system parts • Purge solenoid valve malfunction • Improper operation of electronic throttle control system • EGR valve malfunction • No signal from CKP sensor due to sensor, related wire or wrong installation • Vacuum leakage • Engine overheating • Low engine compression • Ignition system malfunction • Poor fuel quality • PCV valve malfunction • Air cleaner restriction • Restriction in exhaust system • Electrical connector disconnection • Open or short circuit in fuel pump body and related harness • No battery power supply to PCM or poor GND • Inadequate fuel pressure • Fuel pump body mechanical malfunction • Fuel leakage from fuel injector • Fuel injector clogging • Ignition coil malfunction • Improper air/fuel mixture ratio control • Improper valve timing • Improper operation variable valve timing control system • Immobilizer system (PATS) and/or circuit malfunction • Pressure regulator malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before servicing the fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect WDS or equivalent to DLC-2. Do the following conditions appear? • Engine is not completely started. • DTC B1681 is displayed.	Yes	**Both conditions appear:** Go to Step 3.
		No	**Either or other condition appears:** Go to the next step.
2	Does engine stall after **approx. 2 seconds** since engine is started?	Yes	Go to the next step.
		No	Immobilizer system is okay. Go to Step 10.
3	Is coil connector securely connected to coil?	Yes	Go to the next step.
		No	Connect coil connector securely. Return to Step 2.
4	Does security light illuminate?	Yes	Go to the next step.
		No	Inspect instrument cluster and wiring harness.
5	Connect WDS or equivalent to DLC-2 and retrieve DTC. Are any of the following DTCs displayed? **DTC** **B1213, B1342, B1600, B1602, B1681, B2103, B2431**	Yes	Go to appropriate DTC test.
		No	Go to the next step.
6	Is there continuity between PCM GND terminals 1AZ, 1BB, 1BD, 1BH and GND?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
7	Measure voltage between PCM GND terminals 1AZ, 1BB, 1BD, 1BH and coil terminal C. Is voltage **below 1.0 V**?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
8	Turn ignition switch to ON position. Access VPWR PID. Is VPWR PID normal? **VPWR PID** **Battery voltage**	Yes	Go to the next step.
		No	Repair or replace wiring harness.
9	Disconnect coil connector. Turn ignition switch to ON position. Is there battery voltage at coil connector terminal D?	Yes	Inspect for the following: • Open or short circuit between coil terminal A and PCM terminal 1F. • Open or short circuit between coil terminal B and PCM terminal 1E.
		No	Repair or replace wiring harness between coil connector terminal D and fuse panel.
10	Verify the following: • Vacuum connection • Air cleaner element • No air leakage from intake-air system • No restriction of intake-air system • Proper sealing of intake manifold and components attached to intake manifold: EGR valve • Ignition wiring • Fuel quality: proper octane, contamination, winter/summer blend • Electrical connections • Smooth operation of throttle valve Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 10.
11	Turn ignition switch to OFF position. Disconnect TP sensor connector. Measure voltage at TP sensor connector terminal B with ignition switch ON. **Voltage** **4.5—5.5 V** Is voltage normal?	Yes	Go to the next step.
		No	Inspect and repair open or short circuit between PCM terminal 2AO and TP sensor terminal B.

STEP	INSPECTION	RESULTS	ACTION
12	Turn ignition switch to OFF position. Disconnect accelerator position sensor connector. Measure voltage at accelerator position sensor connector VREF terminals with ignition switch to ON position. **Voltage** **4.5—5.5 V** Is voltage normal?	Yes	Go to the next step.
		No	Inspect and repair open or short circuit for the following: • PCM terminal 1AJ and accelerator position sensor terminal A • PCM terminal 1AL and accelerator position sensor terminal D
13	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test. **Communication error message is displayed:** Inspect for the following: • Open circuit between main relay and PCM terminal 1BE or 1AW* • Open main relay terminal E and PCM terminal 1Q • Main relay is stuck open. • Open or poor GND circuit (PCM terminal 1AZ, 1BB, 1BD or 1BH) • Poor connection of vehicle body GND
		No	**No DTC is displayed:** Go to the next step.
14	Start engine at part throttle. Does engine run smoothly at part throttle?	Yes	Inspect electronic throttle control system operation. (See 01–03A–66 Electronic Throttle Control System Inspection.)
		No	Go to the next step.
15	Connect WDS or equivalent to DLC-2. Access RPM PID. Is RPM PID indicating engine speed during engine cranking?	Yes	Go to the next step.
		No	Inspect for the following: • Open or short circuit in CKP sensor • Open or short circuit between CKP sensor and PCM terminal 2W or 2AQ • Open or short circuit in between CKP sensor and GND • Open or short circuit in CKP sensor harnesses If CKP sensor and harness are okay, go to the next step.
16	Visually inspect CKP sensor and teeth of crankshaft pulley. Are CKP sensor and teeth of crankshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts.
17	Inspect ignition coil related harnesses condition (intermittent open or short circuit) for all cylinders. Are all harnesses condition normal?	Yes	Go to the next step.
		No	Repair suspected wiring harness.
18	Perform Spark Test. (See 01–03A–69 Spark Test.) Is the strong blue spark visible at each cylinder?	Yes	Go to the next step. • If symptom occurs with A/C on, go to Step 23.
		No	Repair or replace malfunctioning part according to spark test results.
19	Inspect spark plug condition. Is spark plug wet, covered with carbon or grayish white?	Yes	**Spark plug is wet or covered with carbon:** Inspect for fuel leakage from injector. **Spark plug is grayish white:** Inspect for clogged fuel injector.
		No	Install spark plugs on original cylinders. Go to the next step.
20	Remove and shake PCV valve. Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
21	Inspect for restriction in the exhaust system. Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.

STEP	INSPECTION	RESULTS	ACTION
22	Install fuel pressure gauge between fuel pipe and fuel distributor. Short check connector terminal F/P to body GND using a jumper wire. Turn ignition switch to ON position. Is fuel line pressure correct with ignition switch ON? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ])	Yes	Go to the next step.
		No	**Zero or low:** Inspect fuel pump relay and fuel pump circuit. Inspect for clogged fuel line. If okay, replace fuel pump unit. **High:** Replace fuel pump unit.
23	Visually inspect for fuel leakage at fuel injector O-ring and fuel line. Service if necessary. Is fuel line pressure held after ignition switch is turned off? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ])	Yes	Go to the next step.
		No	Inspect fuel injector. If fuel injector is okay, replace fuel pump unit.
24	**Note** • The following test is for stall concerns with A/C on. If other symptoms exist, go to the next step. Connect pressure gauges to A/C low and high pressure side lines. Turn A/C on and measure low side and high side pressures. Are pressures within specifications? (See 07–10–4 REFRIGERANT PRESSURE CHECK [L3, AJ].)	Yes	Go to the next step.
		No	If A/C is always on, go to symptom troubleshooting "No.24 A/C is always on or A/C compressor runs continuously". For other symptoms, inspect the following: • Refrigerant charging amount • Condenser fan operation
25	Disconnect vacuum hose between purge solenoid valve and intake manifold from purge solenoid side. Plug opening end of vacuum hose. Start engine. Is engine stall now eliminated?	Yes	Inspect if purge solenoid valve sticks open. Inspect EVAP control system.
		No	Go to the next step.
26	Is air leakage felt or heard at intake-air system components while racing engine to higher speed?	Yes	Repair or replace.
		No	Go to the next step.
27	Inspect engine condition while tapping EGR valve housing. Does engine condition improve?	Yes	Replace EGR valve.
		No	Go to the next step.
28	Inspect variable valve timing control system operation. (See 01–03A–72 Variable Valve Timing Control System Operation Inspection.) Does variable valve timing control work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts according to variable valve timing control system operation inspection results.
29	Is engine compression correct?	Yes	Inspect valve timing.
		No	Inspect for cause.
30	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

* : California emission regulation applicable ATX model

NO.6 CRANKS NORMALLY BUT WILL NOT START [L3]

E6U010318881W11

6	CRANKS NORMALLY BUT WILL NOT START
DESCRIPTION	• Starter cranks engine at normal speed but engine will not run. • Refer to symptom troubleshooting "No.5 Engine stalls" if this symptom appears after engine stall. • Fuel is in tank. • Battery is in normal condition.
POSSIBLE CAUSE	• No battery power supply to PCM • Air leakage from intake-air system • Open PCM GND or vehicle body GND • Improper operation of electronic throttle control system • EGR valve malfunction • No signal from CKP sensor due to sensor, related wire or incorrect installation • No signal from CMP sensor due to sensor, related wire or incorrect installation • Low engine compression • Engine overheating • Vacuum leakage • Ignition system malfunction • Improper air/fuel mixture ratio control • Poor fuel quality • PCV valve malfunction • Air cleaner restriction • Restriction in exhaust system • Disconnected electrical connector • Open or short circuit in fuel pump body and related harness • Inadequate fuel pressure • Fuel pump mechanical malfunction • Fuel leakage from injector • Fuel injector is clogged. • Purge solenoid valve malfunction • Spark plug malfunction • Ignition coil malfunction • Improper variable valve timing control system operation • Improper valve timing • Immobilizer system (PATS) and/or circuit malfunction • Pressure regulator malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before servicing the fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect WDS or equivalent to DLC-2. Do any of the following conditions appear? • Engine does not completely start. • DTC B1681 is displayed.	Yes	**Both conditions appear:** Go to Step 3.
		No	**Either or other condition appears:** Go to the next step.
2	Does engine stall after **approx. 2 s** from when it is started?	Yes	Go to the next step.
		No	Immobilizer system is okay. Go to Step 10.
3	Is coil connector securely connected to coil?	Yes	Go to the next step.
		No	Connect coil connector securely. Return to Step 2.
4	Does security light illuminate?	Yes	Go to the next step.
		No	Inspect instrument cluster and wiring harness.
5	Connect WDS equivalent to DLC-2 and retrieve DTC. Are any of the following DTCs displayed? **DTC** **B1213, B1342, B1600, B1601, B1602, B1681, B2103, B2431**	Yes	Go to appropriate DTC test.
		No	Go to the next step.
6	Is there continuity between PCM GND terminals 1AZ, 1BB, 1BD, 1BH and GND?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
7	Measure voltage between PCM GND terminals 1AZ, 1BB, 1BD, 1BH and coil terminal C. Is voltage **below 1.0 V**?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
8	Turn ignition switch to ON position. Access VPWR PID. Is VPWR PID normal? **VPWR PID** **Battery voltage**	Yes	Go to the next step.
		No	Repair or replace wiring harness.
9	Disconnect coil connector. Turn ignition switch to ON position. Is there battery voltage at coil connector terminal D?	Yes	Inspect for the following: • Open or short circuit between coil terminal A and PCM terminal 1F • Open or short circuit between coil terminal B and PCM terminal 1E
		No	Repair or replace wiring harness between coil connector terminal D and fuse panel.
10	Verify the following: • Vacuum connection • External fuel shut off or accessory (such as kill switch, alarm) • Fuel quality: proper octane, contamination, winter/summer blend • No air leakage from intake-air system • Proper sealing of intake manifold and components attached to intake manifold: EGR valve • Ignition wiring • Electrical connections • Fuses • Smooth operation of throttle valve Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 10.
11	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test. **Communication error message is displayed:** Inspect for the following: • Open circuit between main relay and PCM terminal 1BE or 1AW* • Open main relay terminal E and PCM terminal 1Q • Main relay is stuck open. • Open or poor GND circuit (PCM terminal 1AZ, 1BB, 1BD or 1BH) • Poor connection of vehicle body GND
		No	**No DTC is displayed:** Go to the next step.

STEP	INSPECTION	RESULTS	ACTION
12	Turn ignition switch to OFF position. Disconnect TP sensor connector. Measure voltage at TP sensor connector terminal B with ignition switch to ON position. **Voltage** **4.5—5.5 V** Is voltage normal?	Yes	Go to the next step.
		No	Inspect and repair open or short circuit between PCM terminal 2AO and TP sensor terminal B.
13	Turn ignition switch to OFF position. Disconnect accelerator position sensor connector. Measure voltage at accelerator position sensor connector VREF terminals with ignition switch to ON position. **Voltage** **4.5—5.5 V** Is voltage normal?	Yes	Go to the next step.
		No	Inspect and repair open or short circuit for the following: • PCM terminal 1AJ and accelerator position sensor terminal A • PCM terminal 1AL and accelerator position sensor terminal D
14	Does engine start with throttle closed?	Yes	Go to Step 29.
		No	Go to the next step.
15	Will engine start and run smoothly at part throttle?	Yes	Inspect electronic throttle control system operation. (See 01–03A–66 Electronic Throttle Control System Inspection.)
		No	Go to the next step.
16	Connect WDS or equivalent to DLC-2. Access RPM PID. Is RPM PID indicating engine speed when cranking engine?	Yes	Go to the next step.
		No	Inspect for the following: • Open or short circuit in CKP sensor • Open or short circuit between CKP sensor and PCM terminal 2W or 2AQ • Open or short circuit in between CKP sensor and GND • Open or short circuit in CKP sensor harnesses If CKP sensor and harness are okay, go to the next step.
17	Visually inspect CKP sensor and teeth of crankshaft pulley. Are CKP sensor and teeth of crankshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts.
18	Inspect ignition coil related harnesses condition (intermittent open or short circuit) for all cylinders. Are all harnesses condition normal?	Yes	Go to the next step.
		No	Repair suspected wiring harness.
19	Perform Spark Test. (See 01–03A–69 Spark Test.) Is the strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to spark test results.
20	Inspect spark plug conditions. Is spark plug wet, covered with carbon or grayish white?	Yes	**Spark plug is wet or covered with carbon:** Inspect for fuel leakage from injector. **Spark plug is grayish white:** Inspect for clogged fuel injector.
		No	Install spark plugs on original cylinders. Go to the next step.
21	Remove and shake PCV valve. Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
22	Inspect for restriction in exhaust system.	Yes	Inspect exhaust system.
		No	Go to the next step.
23	Install fuel pressure gauge between fuel pipe and fuel distributor. Short check connector terminal F/P to body GND using a jumper wire. Turn ignition switch to ON position. Is fuel line pressure correct when ignition switch is turned on/off **five times**? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	**Zero or low:** Inspect fuel pump relay and fuel pump circuit. Inspect for clogged fuel line. If okay, replace fuel pump unit. **High:** Replace fuel pump unit.

STEP	INSPECTION	RESULTS	ACTION
24	Visually inspect for fuel leakage at fuel injector O-ring and fuel line. Service if necessary. Is fuel line pressure held after ignition switch is turned off? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	Inspect fuel injector. If fuel injector is okay, replace fuel pump unit.
25	Disconnect vacuum hose between purge solenoid valve and intake manifold from purge solenoid valve side. Plug opening end of vacuum hose. Attempt to start engine. Is starting condition improved?	Yes	Inspect if purge solenoid valve sticks open mechanically. Inspect EVAP control system.
		No	Go to the next step.
26	Is air leakage felt or heard at intake-air system components while racing engine to higher speed?	Yes	Repair or replace.
		No	Go to the next step.
27	Inspect engine condition while tapping EGR valve housing. Is engine condition improved?	Yes	Replace EGR valve.
		No	Go to the next step.
28	Inspect variable valve timing control system operation. (See 01–03A–72 Variable Valve Timing Control System Operation Inspection.) Does variable valve timing control work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
29	Is engine compression correct?	Yes	Inspect valve timing.
		No	Inspect for causes.
30	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibratio.. is available. Retest.

NO.7 SLOW RETURN TO IDLE [L3]

E6U010318881W12

7	SLOW RETURN TO IDLE
DESCRIPTION	Engine takes more time than normal to return to idle speed.
POSSIBLE CAUSE	• ECT sensor malfunction • Thermostat is stuck open. • Throttle body malfunction • Air leakage from intake-air system

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
2	Remove thermostat and inspect operation. (See 01–12A–9 THERMOSTAT REMOVAL/ INSTALLATION [L3, AJ].) (See 01–12A–10 THERMOSTAT INSPECTION [L3, AJ].) Is thermostat normal?	Yes	ECT and thermostat are okay. Go to the next step.
		No	Access ECT PID on WDS or equivalent. Inspect for both ECT PID and temperature gauge on instrument cluster readings. If temperature gauge on instrument cluster indicates normal range but ECT PID is not same as temperature gauge reading, inspect ECT sensor. If temperature gauge on instrument cluster indicates cold range but ECT PID is normal, inspect temperature gauge and heat gauge unit.
3	Is throttle body free of contamination?	Yes	Inspect for air leakage from intake-air system components while racing engine to higher speed.
		No	Clean or replace throttle body.
4	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.8 ENGINE RUNS ROUGH/ROLLING IDLE [L3]

E6U010318881W13

8	ENGINE RUNS ROUGH/ROLLING IDLE
DESCRIPTION	• Engine speed fluctuates between specified idle speed and lower speed and engine shakes excessively. • Idle speed is too slow and engine shakes excessively.
POSSIBLE CAUSE	• Air leakage from intake-air system parts • A/C system operation is improper • Erratic signal to ignition coil • Spark plug malfunction • Purge solenoid valve malfunction • Improper operation of electronic throttle control system • EGR valve malfunction • Erratic or no signal from CMP sensor • Low engine compression • Improper valve timing • Improper variable valve timing control system operation • Erratic signal from CKP sensor • Poor fuel quality • PCV valve malfunction • Air cleaner restriction • Restriction in exhaust system • Disconnected electrical connectors • Inadequate fuel pressure • Fuel pump body mechanical malfunction • Improper load signal input • Fuel line restriction or clogging • Improper fuel injection control operation • Fuel leakage from fuel injector • Fuel injector clogging • Engine overheating • Vacuum leakage • Pressure regulator malfunction **Warning** **The following troubleshooting flow chart contains fuel system diagnosis and repair procedures. Read following warnings before servicing the fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Verify the following: • External fuel shut off or accessory (such as kill switch, alarm.) • Fuel quality (e.g. proper octane, contamination, winter/summer blend) • No air leakage from intake-air system • Proper sealing of intake manifold and components attached to intake manifold: EGR valve • Ignition wiring • Electrical connections • Fuses • Smooth operation of throttle valve Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
2	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
3	Is engine overheating?	Yes	Go to symptom troubleshooting "No.17 Cooling system concerns - Overheating".
		No	Go to the next step.
4	**Note** • The following test is for engine running at rough idle with A/C on. If other symptoms exist, go to the next step. Connect pressure gauge to A/C low and high pressure side lines. Start engine and idle it. Turn A/C switch on. Measure low side and high side pressures. Are pressures within specifications? (See 07–10–4 REFRIGERANT PRESSURE CHECK [L3, AJ].)	Yes	Go to the next step.
		No	If A/C is always on, go to symptom troubleshooting "No.24 A/C is always on or A/C compressor runs continuously". For other symptoms, inspect the following: • Refrigerant charging amount • Condenser fan operation
5	**Note** • The following test is for engine running rough with P/S on. If other symptoms exist, go to the next step. Start engine and idle it. • Measure voltage at PCM terminal 2T. (See 01–40A–9 PCM INSPECTION [L3].) • Is voltage normal?	Yes	Go to the next step.
		No	Inspect power steering pressure switch operation and wiring harness between P/S pressure switch connector and PCM terminal 2T.
6	Visually inspect CKP sensor and teeth of crankshaft pulley. Are CKP sensor and teeth of crankshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts.
7	Inspect ignition coil related harnesses condition (intermittent open or short circuit) for all cylinders. Are all harnesses condition normal?	Yes	Go to the next step.
		No	Repair suspected wiring harness.
8	Inspect spark plug condition. Is spark plug wet, covered with carbon or grayish white?	Yes	**Spark plug is wet or covered with carbon:** Inspect for fuel leakage from injector. **Spark plug is grayish white:** Inspect for clogged fuel injector.
		No	Install spark plugs on original cylinders. Go to the next step.
9	Perform electronic throttle control system operation inspection. (See 01–03A–66 Electronic Throttle Control System Inspection.) Does electronic throttle control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to electronic throttle control system operation inspection results.

STEP	INSPECTION	RESULTS	ACTION
10	Install fuel pressure gauge between fuel pipe and fuel distributor. Start engine and idle it. Measure fuel line pressure during idle. Is fuel line pressure correct during idle? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	**Zero or low:** Inspect for clogged fuel line. If okay, replace fuel pump unit. **High:** Replace fuel pump unit.
11	Visually inspect for fuel leakage at fuel injector, O-ring, and fuel line. Service if necessary. Does fuel line pressure hold after ignition switch is turned off? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ])	Yes	Go to the next step.
		No	Inspect fuel injector. If fuel injector is okay, replace fuel pump unit.
12	Connect WDS or equivalent to DLC-2. Start the engine and idle it. Access LONG FT1 PID. Measure LONG FT1 PID during idle. Is PID value between **–14% and +14%**?	Yes	Go to the next step.
		No	LONG FT1 PID is out of specification. Less than specification (too rich): • Inspect EVAP control system. — If system is okay, go to Step 14. Greater than specification (too lean): • Inspect for air leakage at intake-air system components. — If system is okay, go to the next step.
13	Disconnect vacuum hose between purge solenoid valve and intake manifold from purge solenoid valve side. Plug opening end of vacuum hose. Start engine. Does engine condition improve?	Yes	Check if purge solenoid valve sticks open mechanically. Inspect EVAP control system.
		No	Go to the next step.
14	Remove and shake PCV valve. Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
15	Inspect for restriction in exhaust system. Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.
16	Visually inspect CMP sensor and teeth of camshaft. Are CMP sensor and teeth of camshaft normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts.
17	Inspect engine condition while tapping EGR valve housing. Does engine condition improve?	Yes	Replace EGR valve.
		No	Go to the next step.
18	Inspect variable valve timing control system operation. (See 01–03A–72 Variable Valve Timing Control System Operation Inspection.) Does variable valve timing control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
19	Is engine compression correct?	Yes	Inspect valve timing.
		No	Inspect for causes.
20	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.10 LOW IDLE/STALLS DURING DECELERATION [L3]

E6U010318881W15

10	LOW IDLE/STALLS DURING DECELERATION
DESCRIPTION	• Engine stops unexpectedly at beginning of deceleration or recovery from deceleration.
POSSIBLE CAUSE	• Vacuum leakage • Improper operation of electronic throttle control system • Air leakage from intake-air system • Improper air/fuel mixture ratio control • EVAP control system malfunction • Accelerator position sensor or related circuit malfunction • Accelerator position sensor misadjustment • TP sensor or related circuit malfunction • MAF sensor or related circuit malfunction • Brake switch or related circuit malfunction • Neutral/clutch pedal position switch or related circuit malfunction (MTX) • TR switch or related circuit malfunction (ATX) • Improper A/C magnetic clutch operation

NO.9 FAST IDLE/RUNS ON [L3]

E6U010318881W14

9	FAST IDLE/RUNS ON
DESCRIPTION	• Engine speed continues during fast idle after warm-up. • Engine runs after ignition switch is turned off.
POSSIBLE CAUSE	• ECT sensor malfunction • Air leakage from intake-air system • Throttle body malfunction • Accelerator position sensor misadjustment • Cruise control system operation improperly • Improper load signal input • Improper operation of electronic throttle control system

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect WDS or equivalent to DLC-2. Access ECT PID. Start and warm up engine to normal operating temperature. Is ECT PID reading between **82—112°C {180—234°F}**?	Yes	Go to the next step.
		No	**ECT PID is higher than 112°C {234°F}:** Go to symptom troubleshooting "No.17 Cooling system concerns - Overheating". **ECT PID is less than 82°C {180°F}:** Go to symptom troubleshooting "No.18 Cooling system concerns - Runs cold".
2	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
3	Connect the WDS or equivalent to DLC-2. Inspect the value at the following PCM and TCM (ATX) PIDs. **PCM PIDs:** • AC_REQ • COLP • CPP (MTX) • CPP/PNP (MTX) • PSP **TCM PID:** • TR Are the PID values normal?	Yes	Go to the next step.
		No	**If the AC_REQ PID is not specified:** Inspect A/C switch, refrigerant pressure switch (low/high) and fan switch. **If the COLP PID is not specified:** Inspect refrigerant pressure switch (middle). **If the CPP PID is not specified:** Inspect clutch switch. **If the CPP/PNP PID is not specified:** Inspect neutral switch. **If the PSP PID is not specified:** Inspect power steering pressure switch. **If the TR PID is not specified:** Inspect TR switch.
4	Is there air leakage felt or heard at intake-air system components while racing engine to higher speed?	Yes	Repair or replace parts if necessary.
		No	Inspect the following: • Electronic throttle control system operation • Accelerator position sensor adjustment
5	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Does engine idle roughly?	Yes	Go to symptom troubleshooting "No.8 Engine runs rough/rolling idle".
		No	Go to the next step.
2	Turn off A/C switch and fan switch. Does A/C magnetic clutch engage?	Yes	Go to symptom troubleshooting "No.24 A/C is always on or A/C compressor runs continuously."
		No	Go to the next step.
3	Verify the following: • Proper routing of and no damage to vacuum lines • No air leakage from intake-air system Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 3.
4	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
5	Perform electronic throttle control system operation inspection. (See 01–03A–66 Electronic Throttle Control System Inspection.) Does electronic throttle control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to electronic throttle control system operation inspection results.
6	Disconnect vacuum hose between purge solenoid valve and intake manifold from purge solenoid valve side. Plug opening end of vacuum hose. Drive vehicle. Does engine condition improve?	Yes	Inspect EVAP control system.
		No	Go to the next step.
7	Connect WDS or equivalent to DLC-2. Access the following PCM and TCM (ATX) PIDs. **PCM PIDs:** • APP1 • APP2 • BOO • CPP (MTX) • CPP/PNP (MTX) • TP_REL • MAF • VSS **TCM PID:** • TR • VSS Drive the vehicle with monitoring PIDs. Are the PID values within specified?	Yes	Go to the next step.
		No	**If the APP1 or APP2 PID is not specified:** Inspect accelerator position sensor. **If the BOO PID is not specified:** Inspect brake switch. **If the CPP PID is not specified:** Inspect clutch switch. **If the CPP/PNP PID is not specified:** Inspect neutral switch. **If the TP_REL PID is not specified:** Inspect TP sensor. **If the MAF PID is not specified:** Inspect MAF sensor. **If the VSS PID for PCM is not specified:** Inspect VSS sensor. (MTX without ABS) Inspect ABS wheel speed sensors. (except for MTX without ABS) **If the TR PID is not specified:** Inspect TR switch. **If the VSS PID for TCM is not specified:** Inspect VSS sensor.
8	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.11 ENGINE STALLS/QUITS, ENGINE RUNS ROUGH, MISSES, BUCK/JERK, HESITATION/STUMBLE, SURGES [L3]

E6U010318881W16

11	**ENGINE STALLS/QUITS — ACCELERATION/CRUISE** **ENGINE RUNS ROUGH — ACCELERATION/CRUISE** **MISSES — ACCELERATION/CRUISE** **BUCK/JERK — ACCELERATION/CRUISE/DECELERATION** **HESITATION/STUMBLE — ACCELERATION** **SURGES — ACCELERATION/CRUISE**
DESCRIPTION	• Engine stops unexpectedly at beginning of acceleration or during acceleration. • Engine stops unexpectedly while cruising. • Engine speed fluctuates during acceleration or cruising. • Engine misses during acceleration or cruising. • Vehicle bucks/jerks during acceleration, cruising, or deceleration. • Momentary pause at beginning of acceleration or during acceleration • Momentary minor irregularity in engine output
POSSIBLE CAUSE	• A/C system operation is improper. • Erratic signal or no signal from CMP sensor • Air leakage from intake-air system parts • Purge solenoid valve malfunction • Improper operation of electronic throttle control system • EGR valve malfunction • Erratic signal from CKP sensor • Low engine compression • Vacuum leakage • Poor fuel quality • Main relay intermittent malfunction • Throttle body malfunction • Engine overheating • Spark plug malfunction • Improper air/fuel mixture ratio control operation • Improper Variable tumble system operation • Air cleaner restriction • PCV valve malfunction • Improper valve timing due to jumping out timing chain • Restriction in exhaust system • Intermittent open or short in fuel body pump circuit • Inadequate fuel pressure • Fuel pump mechanical malfunction • Fuel leakage from fuel injector • Fuel injector clogging • Fuel line restriction or clogging • Pressure regulator malfunction • Accelerator position sensor misadjustment • TP sensor misadjustment • Intermittent open or short of MAF sensor, TP sensor, Accelerator position sensor and VSS • ATX malfunction (ATX) • Clutch slippage (MTX) • Improper Variable intake air system operation **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before servicing the fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign materi**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Verify the following: • Vacuum connection • Air cleaner element • No air leakage from intake-air system • No restriction of intake-air system • Proper sealing of intake manifold and components attached to intake manifold: such as EGR valve • Ignition wiring • Fuel quality (e.g. proper octane, contamination, winter/summer blend) • Electrical connections • Smooth operation of throttle valve Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
2	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
3	Is engine overheating?	Yes	Go to symptom troubleshooting "No.17 Cooling system concerns - Overheating".
		No	Go to the next step.
4	Connect WDS or equivalent to DLC-2. Access the following PCM PIDs. • APP1 • APP2 • RPM • VPWR • MAF • TP_REL • VSS Drive the vehicle with monitoring PIDs. Are the PID values within specified?	Yes	Go to the next step.
		No	**If APP1, APP2 PIDs is not specified:** Inspect if output signal from accelerator position sensor changes smoothly. **If RPM PID is not specified:** Inspect CKP sensor and related harness for vibration or intermittent open/short circuit. **If VPWR PID is not specified:** Inspect for open circuit intermittently. **If MAF PID is not specified:** Inspect for open circuit of MAF sensor and related wire harness intermittently. **If TP_REL PID is not specified:** Inspect if output signal from TP sensor changes smoothly. **If VSS PID is not specified:** Inspect for open circuit of VSS and related wire harness intermittently.
5	Visually inspect CKP sensor and teeth of crankshaft pulley. Are CKP sensor and teeth of crankshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts.
6	Inspect spark plug conditions. Is spark plug wet, covered with carbon or grayish white?	Yes	**Spark plug is wet or covered with carbon:** Inspect for fuel leakage from fuel injector. **Spark plug is grayish white:** Inspect for clogged fuel injector.
		No	Install spark plugs on original cylinders. Go to the next step.
7	Remove and shake PCV valve. Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
8	Perform electronic throttle control system operation inspection. (See 01–03A–66 Electronic Throttle Control System Inspection.) Does electronic throttle control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to electronic throttle system operation inspection results.
9	Inspect for restriction in the exhaust system. Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.

STEP	INSPECTION	RESULTS	ACTION
10	Install fuel pressure gauge between fuel pipe and fuel distributor. Short check connector terminal F/P to body GND using a jumper wire. Turn ignition switch to ON position. Is fuel line pressure correct with ignition switch to ON position? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	**Zero or low:** Inspect fuel pump relay and fuel pump circuit. Inspect for clogged fuel line. If okay, replace fuel pump unit. **High:** Replace fuel pump unit.
11	Visually inspect for fuel leakage at fuel injector O-ring and fuel line. Service if necessary. Is fuel line pressure held after ignition switch is turned off? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	Inspect fuel injector. If fuel injector is okay, replace fuel pump unit.
12	**Note** • The following test is for engine stalling with A/C on. If other symptom exists, go to the next step. Connect a pressure gauge to A/C low and high pressure side lines. Turn A/C on and measure low side and high side pressure. Are pressures within specifications? (See 07–10–4 REFRIGERANT PRESSURE CHECK [L3, AJ].)	Yes	Go to the next step.
		No	If A/C is always on, go to symptom troubleshooting "No.24 A/C is always on or A/C compressor runs continuously". For other symptoms, inspect the following: • Refrigerant charging amount • Condenser fan operation
13	**Note** • The following test should be performed for symptom with cruise control ON. If other symptoms exist, go to the next step. Inspect cruise control system. Is cruise control system normal?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
14	Disconnect vacuum hose between purge solenoid valve and intake manifold from purge solenoid valve side. Plug opening end of vacuum hose. Drive vehicle. Does engine condition improve?	Yes	Go to the next step. Inspect if purge solenoid valve sticks open mechanically. Inspect EVAP control system.
		No	Go to the next step.
15	Visually inspect CMP sensor and projections of camshaft pulley. Are CMP sensor and projections of camshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts.
16	Inspect Variable tumble system operation. (See 01–03A–67 Variable Tumble System Operation Inspection.) Is Variable tumble system normal?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
17	Inspect EGR system. (See 01–03A–70 EGR Control System Inspection.) Is EGR system normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts.
18	Is engine compression correct?	Yes	Inspect the following: • Valve timing • Internal transaxle part (ATX) • Clutch (MTX)
		No	Inspect for cause.
19	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.12 LACK/LOSS OF POWER-ACCELERATION/CRUISE [L3]

E6U010318881W17

12	LACK/LOSS OF POWER — ACCELERATION/CRUISE
DESCRIPTION	Performance is poor under load (e.g., power down when climbing hills).
POSSIBLE CAUSE	• Improper A/C system operation • Erratic signal or no signal from CMP sensor • Air leakage from intake-air system parts • Improper Variable intake air system operation • Improper Variable tumble system operation • Improper operation of electronic throttle control system • Purge control solenoid malfunction • EGR valve malfunction • Brake dragging • Erratic signal from CKP sensor • Low engine compression • Vacuum leakage • Poor fuel quality • Engine overheating • Throttle body malfunction • Spark plug malfunction • Air cleaner restriction • PCV valve malfunction • Improper valve timing due to jumping out of timing chain • Improper variable valve timing control operation • Restriction in exhaust system • Intermittent open or short in fuel pump related circuit • Inadequate fuel pressure • Fuel pump mechanical malfunction • Fuel line restriction or clogging • Fuel leakage from fuel injector • Fuel injector clogging • Intermittent open or short circuit in MAF sensor, Accelerator position sensor, TP sensor and VSS • ATX malfunction (ATX) • Clutch slippage (MTX) **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before servicing the fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Verify the following: • Vacuum connection • Air cleaner element • No air leakage from intake-air system • No restriction of intake-air system • Proper sealing of intake manifold and components attached to intake manifold; such as EGR valve • Fuel quality (e.g. proper octane, contamination, winter/summer blend) Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
2	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
3	Is engine overheating?	Yes	Go to symptom troubleshooting "No.17 Cooling system concerns - Overheating".
		No	Go to the next step.
4	Connect WDS or equivalent to DLC-2. Access the following PCM PIDs. • APP1 • APP2 • RPM • VPWR • MAF • TP_REL • VSS Drive the vehicle with monitoring PIDs. Are the PID values within specified?	Yes	Go to the next step.
		No	**If APP1, APP2 PIDs is not specified:** Inspect if output signal accelerator position sensor changes smoothly. **If RPM PID is not specified:** Inspect CKP sensor and related wiring harness for vibration or intermittent open/short circuit or both. **If MAF PID is not specified:** Inspect for intermittent open circuit of MAF sensor and related wiring harness. **If TP_REL PID is not specified:** Inspect if output signal TP sensor changes smoothly. If **VSS PID is not specified:** Inspect for intermittent open circuit of VSS and relate wiring harness.
5	Visually inspect CKP sensor and teeth of crankshaft pulley. Are CKP sensor and teeth of crankshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts.
6	Inspect spark plug condition. Is spark plug wet, covered with carbon or grayish white?	Yes	**Spark plug is wet or covered with carbon:** Inspect for fuel leakage from fuel injector. Inspect spark plug and ignition coil related harness. **Spark plug is grayish white:** Inspect for clogged fuel injector.
		No	Install spark plugs on original cylinders. Go to the next step.
7	Remove and shake PCV valve. Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
8	Perform electronic throttle control system operation inspection. (See 01–03A–66 Electronic Throttle Control System Inspection.) Does electronic throttle control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to electronic throttle control system operation inspection results.
9	Inspect for restriction in exhaust system. Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.
10	Install fuel pressure gauge between fuel pipe and fuel distributor. Short check connector terminal F/P to body GND using a jumper wire. Turn ignition switch to ON position. Is fuel line pressure correct with ignition switch to ON position? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	**Zero or low:** Inspect fuel pump relay and fuel pump circuit. Inspect for clogged fuel line. If okay, replace fuel pump unit. **High:** Replace fuel pump unit.

STEP	INSPECTION	RESULTS	ACTION
11	Inspect Variable tumble system operation. (See 01–03A–67 Variable Tumble System Operation Inspection.) Does Variable tumble system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
12	Inspect Variable intake air system operation. (See 01–03A–67 Variable Intake Air System Operation Inspection.) Does Variable intake air system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
13	**Note** • The following test is for engine stalling with A/C on concern. If other symptoms exist, go to the next step. Connect pressure gauge to A/C low and high side pressure lines. Turn A/C on and measure low side and high side pressures. Are pressures within specifications? (See 07–10–4 REFRIGERANT PRESSURE CHECK [L3, AJ].)	Yes	Go to the next step.
		No	If A/C is always on, go to symptom troubleshooting "No.24 A/C is always on or A/C compressor runs continuously". For other symptoms, inspect the following: • Refrigerant charging amount • Condenser fan operation
14	Inspect for A/C cut-off operation. (See 01–03A–70 A/C Cut-off Control System Inspection.) Does A/C cut-off work properly?	Yes	Go to the next step.
		No	Inspect A/C cut-off system components.
15	Disconnect vacuum hose between purge solenoid valve and intake manifold from purge solenoid valve side. Plug opening end of vacuum hose. Drive vehicle. Does engine condition improve?	Yes	Inspect if purge solenoid valve is stuck open mechanically. Inspect EVAP control system.
		No	Go to the next step.
16	Visually inspect CMP sensor and projections of camshaft pulley. Are CMP sensor and projections of camshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts.
17	Inspect EGR system. (See 01–03A–70 EGR Control System Inspection.) Is EGR system normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts according to EGR control system operation inspection results.
18	Inspect variable valve timing control system operation. (See 01–03A–72 Variable Valve Timing Control System Operation Inspection.) Does variable valve timing control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts according to variable valve timing control system inspection results.
19	Is engine compression correct?	Yes	Inspect the following: • Valve timing • Internal transaxle components (ATX) • Clutch (MTX) • Brake system for dragging
		No	Inspect for cause.
20	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.13 KNOCKING/PINGING-ACCELERATION/CRUISE [L3]

E6U010318881W18

13	KNOCKING/PINGING - ACCELERATION/CRUISE
DESCRIPTION	Sound is produced when air/fuel mixture is ignited by something other than spark plug (e.g., hot spot in combustion chamber).
POSSIBLE CAUSE	• Engine overheating due to cooling system malfunction • ECT sensor malfunction • IAT sensor malfunction • MAF sensor malfunction • Knock sensor malfunction • Erratic signal from CMP sensor • Inadequate engine compression • Inadequate fuel pressure **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before servicing the fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect WDS or equivalent to DLC-2. Access ECT PID. Verify ECT PID is **less than 116°C {241°F}** during driving. Is ECT PID less than specification?	Yes	Go to the next step.
		No	Inspect cooling system for cause of overheating.
2	Connect WDS or equivalent to DLC-2. Access IAT and MAF PIDs. Monitor each PID. (See 01–40A–9 PCM INSPECTION [L3].) Are PIDs normal?	Yes	Go to the next step.
		No	**If IAT PID is not specified:** Inspect IAT sensor **If MAF PID is not specified:** Inspect MAF sensor
3	Connect WDS or equivalent to DLC-2. Turn key to ON (engine off). Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
4	Is engine compression correct?	Yes	Go to the next step.
		No	Inspect for cause.
5	Install fuel pressure gauge between fuel pipe and fuel distributor. Start engine and idle it. Measure fuel line pressure during idle. Is fuel line pressure correct during idle? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Inspect ignition timing.
		No	**Zero or low:** Inspect fuel pump relay and fuel pump circuit. Inspect for clogged fuel line. If okay, replace fuel pump unit. **High:** Replace fuel pump unit.
6	Inspect knock sensor. Is knock sensor normal?	Yes	Inspect ignition timing.
		No	Replace knock sensor.
7	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.14 POOR FUEL ECONOMY [L3]

E6U010318881W19

14	POOR FUEL ECONOMY
DESCRIPTION	Fuel economy is unsatisfactory.
POSSIBLE CAUSE	• Contaminated air cleaner element • Variable intake air system malfunction • Engine cooling system malfunction • Improper ATF level (ATX) • Weak spark • Poor fuel quality • Erratic or no signal from CMP sensor • Clutch slippage (MTX) • Variable tumble system malfunction • Improper variable valve timing control system operation • Improper coolant level • Inadequate fuel pressure • Spark plug malfunction • PCV valve malfunction • Brake dragging • Improper valve timing due to jumping out of timing chain • Contaminated MAF sensor • Improper engine compression • Exhaust system clogging **Warning** **The following troubleshooting flow chart contains fuel system diagnosis and repair procedures. Read following warnings before servicing fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Inspect for the following: • Air cleaner element for contamination • ATF level (ATX) • Fuel quality • Coolant level • Brake dragging • Clutch slippage (MTX) Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
2	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
3	Access ECT PID. Drive vehicle while monitoring PID. (See 01–40A–9 PCM INSPECTION [L3].) Is PID within specification?	Yes	Go to the next step.
		No	Inspect for coolant leakage, cooling fan and condenser fan operations or thermostat operation.

STEP	INSPECTION	RESULTS	ACTION
4	Perform spark test. (See 01–03A–69 Spark Test) Is strong blue spark visible at each cylinder?	Yes	Inspect for the following: • Spark plugs malfunction • CMP sensor is improperly installed. • Trigger wheel damage on camshaft • Open or short circuit on CMP sensor • Open or short circuit between CMP sensor and PCM terminal 2S or 2AM • Open or short circuit between CMP sensor and GND. Repair or replace malfunctioning parts. If okay, go to the next step.
		No	Inspect suspect ignition coil and connector.
5	Install fuel pressure gauge between fuel pipe and fuel distributor. Start engine and idle it. Measure fuel line pressure during idle. Is fuel line pressure correct during idle? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	**Zero or low:** Inspect fuel pump relay and fuel pump circuit. Inspect for clogged fuel line. If okay, replace fuel pump unit **High:** Replace fuel pump unit.
6	Inspect for Variable tumble system operation. (See 01–03A–67 Variable Tumble System Operation Inspection.) Does Variable tumble system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
7	Inspect for variable valve timing control system operation. (See 01–03A–72 Variable Valve Timing Control System Operation Inspection.) Does variable valve timing control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
8	Inspect for Variable intake air system operation. (See 01–03A–67 Variable Intake Air System Operation Inspection.) Does Variable intake air system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
9	Remove and shake PCV valve. Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
10	Inspect for restriction in the exhaust system. Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.
11	Inspect for contaminated MAF sensor. Is there any contamination?	Yes	Go to the next step.
		No	Inspect for cause.
12	Inspect MAF sensor for contamination. Is there any contamination?	Yes	Replace MAF sensor.
		No	Go to the next step.
13	Is engine compression correct?	Yes	Inspect valve timing.
		No	Inspect for cause.
14	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.15 EMISSION COMPLIANCE [L3]

E6U010318881W20

15	EMISSION COMPLIANCE
DESCRIPTION	Fails emissions test.
POSSIBLE CAUSE	• Vacuum lines leakage or blockage • Cooling system malfunction • Spark plug malfunction • Leakage from intake manifold • Erratic or no signal from CMP sensor • Inadequate fuel pressure • PCV valve malfunction or incorrect valve installation • EGR valve malfunction • Exhaust system clogging • Fuel tank ventilation system malfunction • Charcoal canister damage • Air cleaner element clogging or restriction • Throttle body malfunction • Improper air/fuel mixture ratio control operation • Catalyst converter malfunction • Engine internal parts malfunction • Excessive carbon is built up in combustion chamber • Improper engine compression • Improper valve timing **Warning** **The following troubleshooting flow chart contains fuel system diagnosis and repair procedures. Read following warnings before servicing fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Inspect for following: • Vacuum lines for leakage or blockage • Electrical connections • Proper maintenance schedule followed • Intake-air system and air cleaner element concerns: obstructions, leakage or dirtiness Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
2	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
3	Is any other driveability concern present?	Yes	Go to appropriate symptom troubleshooting.
		No	Go to the next step.
4	Connect WDS or equivalent to DLC-2. Access ECT PID. Warm up engine and idle it. Verify ECT PID is correct. (See 01–40A–9 PCM INSPECTION [L3].) Is ECT PID correct?	Yes	Go to the next step.
		No	Inspect for coolant leakage, cooling fan and condenser fan operation or thermostat operation.
5	Perform Spark Test. (See 01–03A–69 Spark Test.) Is the strong blue spark visible at each cylinder?	Yes	Inspect for the following: • Spark plugs malfunction • Improperly installed CMP sensor • Damage of trigger wheel on camshaft • Open or short circuit on CMP sensor • Open or short circuit between CMP sensor and PCM terminal 2S or 2AM • Open or short circuit between CMP sensor and GND Repair or replace malfunctioning parts. If okay, go to the next step.
		No	Inspect suspect ignition coil and connector.
6	Install fuel pressure gauge between fuel pipe and fuel distributor. Start engine and idle it. Measure fuel line pressure during idle. Is fuel line pressure correct during idle? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ])	Yes	Go to the next step.
		No	**Zero or low:** Inspect for clogged fuel line. If okay, replace fuel pump unit. **High:** Replace fuel pump unit.
7	Remove and shake PCV valve. Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
8	Inspect for fuel saturation inside charcoal canister. Is excess amount of liquid fuel present in canister?	Yes	Replace charcoal canister.
		No	Inspect fuel tank vent system. Then, go to the next step.
9	Is there restriction in exhaust system?	Yes	Inspect exhaust system.
		No	Go to the next step.
10	Inspect three-way catalytic converter. Is three-way catalytic converter normal?	Yes	Inspect EGR system. (See 01–03A–70 EGR Control System Inspection.)
		No	Replace three-way catalytic converter.
11	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.16 HIGH OIL CONSUMPTION/LEAKAGE [L3]

E6U010318881W21

16	HIGH OIL CONSUMPTION/LEAKAGE
DESCRIPTION	Oil consumption is excessive.
POSSIBLE CAUSE	• PCV valve malfunction • Improper dipstick • Improper engine oil viscosity • Engine internal parts malfunction

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Remove and shake PCV valve. Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
2	Inspect for the following: • External leakage • Proper dipstick • Proper engine oil viscosity Are all items normal?	Yes	Inspect internal engine parts such as valves, valve guides, valve stem seals, cylinder head drain passage, and piston rings.
		No	Service if necessary. Repeat Step 2.
3	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.17 COOLING SYSTEM CONCERNS-OVERHEATING [L3]

E6U010318881W22

17	COOLING SYSTEM CONCERNS-OVERHEATING
DESCRIPTION	Engine runs at higher than normal temperature/overheats.
POSSIBLE CAUSE	• Improper coolant level • Blown fuses • Coolant leakage • Excessive A/C system pressure • A/C system operation is improper • Improper water/anti-freeze mixture • Fans reverse rotation • Poor radiator condition • Thermostat malfunction • Radiator hoses damage • Condenser fan is inoperative. • Improper or damaged radiator cap • Cooling fan is inoperative. • Coolant overflow system malfunction • Improper tension of drive belt • Drive belt damage

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Inspect the following: • Engine coolant level • Coolant leakage • Water and anti-freeze mixture • Radiator condition • Collapsed or restricted radiator hoses • Radiator pressure cap • Overflow system • Fan rotational direction • Fuses Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
2	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
3	Start engine and run it at idle speed. Turn A/C switch on and set blower fan to any speed. Does A/C compressor engage?	Yes	Go to Step 5.
		No	Inspect for the following and repair or replace if necessary: • Refrigerant charging amount • Open circuit between A/C relay and PCM terminal 1I • Seized A/C magnetic clutch • A/C magnetic clutch malfunction If all items are okay, go to the next step.
4	Start the engine and run it at idle speed. Access AC_REQ PID using WDS or equivalent. Turn A/C switch on and set blower fan any speed. Does the PID turn ON and OFF properly? (See 01–40A–9 PCM INSPECTION [L3].)	Yes	Go to the next step.
		No	Inspect the following: • Refrigerant pressure switch operation • A/C switch is stuck open. • Open or short circuit between refrigerant pressure switch and PCM terminal 1AU • Open circuit of blower motor fan switch and resistc (if blower motor does not operate) • Evaporator temperature sensor and A/C amplifier
5	Inspect cooling fan control system operation. (See 01–03A–71 Cooling Fan Control System Inspection.) Does cooling fan control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
6	Is drive belt normal?	Yes	Go to the next step.
		No	Replace drive belt.
7	Is there any leakage around heater unit in passenger compartment?	Yes	Inspect and service heater for leakage.
		No	Go to the next step.
8	Is there any leakage at coolant hoses and/or radiator?	Yes	Replace malfunctioning part.
		No	Go to the next step.
9	Cool down the engine. Remove thermostat and inspect operation. (See 01–12A–9 THERMOSTAT REMOVAL/ INSTALLATION [L3, AJ].) (See 01–12A–10 THERMOSTAT INSPECTION [L3, AJ].) Is thermostat normal?	Yes	Engine coolant temperature and thermostat are okay, inspect engine block for leakage or blockage.
		No	Access ECT PID. Inspect for both ECT PID and temperature gauge readings. If temperature gauge on instrument cluster indicates normal range but ECT PID is not same as temperature gauge reading, inspect ECT sensor. If temperature gauge on instrument cluster indicates overheating but ECT PID is normal, inspect temperature gauge and heat gauge unit.
10	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.18 COOLING SYSTEM CONCERNS-RUNS COLD [L3]

E6U010318881W23

18	COOLING SYSTEM CONCERNS-RUNS COLD
DESCRIPTION	Engine takes excessive time to reach normal operating temperature.
POSSIBLE CAUSE	• Thermostat malfunction • Condenser fan system malfunction • Cooling fan system malfunction

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Is customer complaint "Lack of passenger compartment heat" only?	Yes	Inspect A/C and heater system.
		No	Go to the next step.
2	Does engine speed continue during fast idle?	Yes	Go to symptom troubleshooting "No.9 Fast idle/runs on".
		No	Go to the next step.
3	Remove thermostat and inspect operation. (See 01–12A–9 THERMOSTAT REMOVAL/ INSTALLATION [L3, AJ].) (See 01–12A–10 THERMOSTAT INSPECTION [L3, AJ].) Is thermostat normal?	Yes	Go to the next step.
		No	Replace thermostat.
4	Inspect cooling fan control system operation. (See 01–03A–71 Cooling Fan Control System Inspection.) Does cooling fan control system work properly?	Yes	Access ECT PID. Inspect for both ECT PID and temperature gauge on instrument cluster readings. If temperature gauge on instrument cluster indicates normal range but ECT PID is not same as temperature gauge reading, inspect ECT sensor. If temperature gauge on instrument cluster indicates cold range but ECT PID is normal, inspect temperature gauge and heat gauge unit.
		No	Repair or replace malfunctioning part.
5	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.19 EXHAUST SMOKE [L3]

E6U010318881W24

19	EXHAUST SMOKE
DESCRIPTION	Blue, black, or white smoke from exhaust system
POSSIBLE CAUSE	**Blue smoke (Burning oil):** • PCV valve malfunction • Engine internal oil leakage **White smoke (Water in combustion):** • Cooling system malfunction (coolant loss) • Engine internal coolant leakage **Black smoke (Rich fuel mixture):** • Air cleaner restriction • Intake-air system is collapsed or restricted. • Fuel return line is restricted. • Excessive fuel pressure • Improper engine compression • Injector fuel leakage • Ignition system malfunction **Warning** **The following troubleshooting flow chart contains fuel system diagnosis and repair procedures. Read following warnings before servicing fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign materi**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	What color is smoke coming from exhaust system?	Blue	Burning oil is indicated. Go to the next step.
		White	Water in combustion is indicated. Go to Step 3.
		Black	Rich fuel mixture is indicated. Go to Step 4.
2	Remove and shake PCV valve. Does PCV valve rattle?	Yes	Inspect for the following: • Damaged valve guide, stems or valve seals • Blocked oil drain passage in cylinder head • Piston ring is not seated, seized or worn. • Damaged cylinder bore If other driveability symptoms are present, return to diagnostic index to service any additional symptoms.
		No	Replace PCV valve.
3	Does cooling system hold pressure?	Yes	Inspect for the following: • Cylinder head gasket leakage • Intake manifold gasket leakage • Cracked or porous engine block If other driveability symptoms are present, return to diagnostic index to service any additional symptoms.
		No	Inspect for cause.
4	Inspect for the following: • Air cleaner restriction • Collapsed or restricted intake-air system • Restricted fuel return line Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 4.
5	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
6	Install fuel pressure gauge between fuel pipe and fuel distributor. Start engine and idle it. Measure fuel line pressure during idle. Is fuel line pressure correct during idle? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	**Zero or low:** • Inspect for clogged fuel line. • If okay, replace fuel pump unit. **High:** • Replace fuel pump unit.
7	Perform Spark Test. (See 01–03A–69 Spark Test.) Is the strong blue spark visible at each cylinder?	Yes	Inspect spark plugs and CMP sensor.
		No	Repair or replace malfunctioning part according to spark test results.
8	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.20 FUEL ODOR (IN ENGINE COMPARTMENT) [L3]

E6U010318881W25

20	FUEL ODOR (IN ENGINE COMPARTMENT)
DESCRIPTION	Gasoline fuel smell or visible leakage
POSSIBLE CAUSE	• Excessive fuel pressure • Purge solenoid valve malfunction • Fuel tank vent system blockage • Charcoal canister malfunction • Fuel leakage from fuel system **Warning** **The following troubleshooting flow chart contains fuel system diagnosis and repair procedures. Read following warnings before servicing fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Visually inspect for fuel leakage at fuel injector O-ring and fuel line. Service if necessary. Install fuel pressure gauge between fuel pipe and fuel distributor. Start engine and idle it. Measure fuel line pressure during idle. Is fuel line pressure correct during idle? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	Replace fuel pump unit.
2	Inspect for blockage/restriction or opening between engine vacuum port and charcoal canister. Inspect for blockage in fuel tank vent system. Is fault indicated?	Yes	Replace vacuum hose.
		No	Go to the next step.
3	Inspect purge solenoid valve. (See 01–16A–13 PURGE SOLENOID VALVE INSPECTION [L3, AJ].) Is solenoid operating properly?	Yes	Go to the next step.
		No	Replace purge solenoid valve.
4	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Inspect charcoal canister for fuel saturation. If excess amount of liquid fuel is present, replace charcoal canister.
5	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.21 ENGINE NOISE [L3]

E6U010318881W26

21	ENGINE NOISE
DESCRIPTION	Engine noise from under hood
POSSIBLE CAUSE	**Squeal, click or chirp noise:** • Improper engine oil level • Improper drive belt tension **Rattle sound noise:** • Loose parts **Hiss sound noise:** • Vacuum leakage • Loose spark plug • Air leakage from intake-air system • Improper variable air duct (VAD) control system operation **Rumble or grind noise:** • Improper drive belt tension **Rap or roar noise:** • Exhaust system looseness **Other noise:** • Camshaft friction gear noise or MLA noise • Timing chain noise

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Is squeal, click or chirp sound present?	Yes	Inspect engine oil level or drive belts.
		No	Go to the next step.
2	Is rumble or grinding noise present?	Yes	Inspect drive belts.
		No	Go to the next step.
3	Is rattle noise present?	Yes	Inspect location of rattle for loose parts.
		No	Go to the next step.
4	Is hissing noise present?	Yes	Inspect for following: • Vacuum leakage • Spark plug looseness • Intake-air system leakage • Variable air duct (VAD) control system operation (See 01–03A–72 Variable Air Duct (VAD) Control System Operation Inspection.)
		No	Go to the next step.
5	Is rap or roar noise present?	Yes	Inspect exhaust system for loose parts.
		No	Go to the next step.
6	Is knocking noise present?	Yes	Go to symptom troubleshooting "No.11 Knocking/ pinging".
		No	If noise comes from engine internal, inspect for friction gear, timing chain or MLA noise.
7	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.22 VIBRATION CONCERNS (ENGINE) [L3]

E6U010318881W27

22	VIBRATION CONCERNS (ENGINE)
DESCRIPTION	• Vibration from under hood or driveline
POSSIBLE CAUSE	• Loose attaching bolts or worn parts • Components malfunction such as worn parts

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Inspect the following components for loose attaching bolts or worn parts: • Cooling fan • Condenser fan • Drive belt and pulleys • Engine mounts All items normal?	Yes	Inspect the following systems: • Wheels • ATX • Driveline • Suspension
		No	Readjust or retighten engine mount installation position. Service if necessary for other parts.
2	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.23 A/C DOES NOT WORK SUFFICIENTLY [L3]

E6U010318881W28

23	A/C DOES NOT WORK SUFFICIENTLY.
DESCRIPTION	A/C compressor magnetic clutch does not engage when A/C switch is turned on.
POSSIBLE CAUSE	• Improper refrigerant charging amount • Open A/C magnetic clutch • Open circuit between A/C relay and A/C magnetic clutch • Poor GND of A/C magnetic clutch • Refrigerant pressure switch is stuck open. • A/C relay is stuck open. • Seized A/C compressor • Open circuit between A/C switch and PCM through both refrigerant pressure switch and A/C amplifier

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
2	Disconnect A/C compressor connector. Start engine and turn A/C switch on. Is there correct voltage at terminal of A/C compressor magnetic clutch connector? **Specification** **10.5 V or more**	Yes	Inspect for GND condition of magnetic clutch on A/C compressor. If GND condition is okay, inspect for open circuit magnetic clutch coil.
		No	Go to the next step.
3	Disconnect refrigerant pressure switch connector. Connect jumper wire between terminals of A/C high-pressure switch connector. Connect jumper wires between terminals of refrigerant pressure switch connector. Turn ignition switch to ON position. Access AC_REQ PID using WDS or equivalent. Turn A/C switch on and set blower fan to any speed. Does the PID turn ON and OFF properly?	Yes	Inspect refrigerant pressure switch operation. If switch is okay, go to the next step.
		No	Inspect for the following: • A/C switch is stuck open. • Open circuit between refrigerant pressure switch and PCM terminal 1AU • Open circuit between blower motor fan switch and resistor (if blower motor does not operate) • Evaporator temperature sensor and A/C amplifier

STEP	INSPECTION	RESULTS	ACTION
4	Remove jumper wire from switch connector. Reconnect connector to refrigerant pressure switch. Start engine and turn A/C switch on. Does fan operate?	Yes	Inspect whether A/C relay is stuck open. Replace if necessary.
		No	Inspect the following and repair or replace if necessary: • Refrigerant charging amount • A/C compressor for seizure
5	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.24 A/C IS ALWAYS ON OR A/C COMPRESSOR RUNS CONTINUOUSLY [L3]

E6U010318881W29

24	A/C IS ALWAYS ON OR A/C COMPRESSOR RUNS CONTINUOUSLY.
DESCRIPTION	A/C compressor magnetic clutch does not disengage.
POSSIBLE CAUSE	• A/C compressor magnetic clutch engagement is stuck. • A/C relay is stuck closed. • Short to GND between A/C switch and PCM • Short to GND circuit between A/C relay and PCM • A/C relay to magnetic clutch circuit shorted to battery power

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
2	Start engine and idle it. Turn A/C switch on. Remove A/C relay. Does A/C magnetic clutch disengage?	Yes	Inspect for the following: • A/C relay is stuck closed. • Short to GND circuit between A/C relay and PCM terminal 1I If both items okay, go to the next step.
		No	Inspect if circuit between A/C relay and magnetic clutch shorts to battery power circuit. If circuit is okay, inspect magnetic clutch for stuck engagement or clearance.
3	Disconnect refrigerant pressure switch connector. Start engine and turn A/C switch on. **Note** • A/C should not work when disconnecting connector. If A/C remains working, short to GND circuit may be present. Does A/C remain working?	Yes	Inspect for short to GND circuit between refrigerant pressure switch and PCM terminal 1AU
		No	Go to the next step.
4	Reconnect refrigerant pressure switch connector. Turn off A/C switch. **Note** • A/C should not work when turning A/C switch off. If A/C remains working, short to GND circuit may be present. Does A/C remain working?	Yes	Inspect following: • Short to GND circuit between A/C switch and A/C amplifier • Short to GND circuit between A/C amplifier and refrigerant pressure switch
		No	Inspect whether A/C switch is stuck closed.
5	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.25 A/C IS NOT CUT OFF UNDER WIDE OPEN THROTTLE CONDITIONS [L3]

E6U010318881W30

25	A/C IS NOT CUT OFF UNDER WOT CONDITIONS.
DESCRIPTION	A/C compressor magnetic clutch does not disengage under WOT.
POSSIBLE CAUSE	• Accelerator position sensor malfunction • Accelerator position sensor misadjustment • Loosely installed accelerator position sensor.

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Does A/C compressor disengage when A/C switch is turned off?	Yes	Go to the next step.
		No	Go to symptom troubleshooting "No.24 A/C is always on or A/C compressor runs continuously".
2	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Inspect accelerator position sensor.
3	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.26 EXHAUST SULPHUR SMELL [L3]

E6U010318881W31

26	EXHAUST SULPHUR SMELL
DESCRIPTION	Rotten egg smell (sulphur) from exhaust
POSSIBLE CAUSE	• Electrical connectors are disconnected or connected poorly • Charcoal canister malfunction • Vacuum lines are disconnected or connected improperly. • Improper fuel pressure • Poor fuel quality **Warning** **The following troubleshooting flow chart contains fuel system diagnosis and repair procedures. Read following warnings before servicing fuel system:** **• Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **• Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** **• Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Are any driveability or exhaust smoke concerns present?	Yes	Go to appropriate flow chart.
		No	Go to the next step.
2	Inspect the following: • Electrical connections • Vacuum lines • Fuel quality Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 2.
3	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
4	Install fuel pressure gauge between fuel pipe and fuel distributor. Start engine and idle it. Is fuel line pressure correct during idle? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	**Zero or low:** Inspect fuel pump relay and fuel pump circuit. Inspect for clogged fuel line. If okay, replace fuel pump unit. **High:** Replace fuel pump unit.
5	Inspect charcoal canister for fuel saturation. Is excess amount of liquid fuel present in canister?	Yes	Replace charcoal canister.
		No	Inspect fuel tank vent system. If fuel tank vent system is okay, suggest trying a different brand since sulfur content can vary in different fuels. If fuel tank vent system is not okay, repair or replace malfunctioning parts.
6	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.27 FUEL REFILL CONCERNS [L3]

E6U010318881W32

27	Fuel refill concerns
DESCRIPTION	• Fuel tank does not fill smoothly.
POSSIBLE CAUSE	• Clogged EVAP pipes • Nonreturn valve malfunction • Improper use of fuel nozzle • Inadequate fuel filling speed **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before servicing the fuel system:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
2	Remove fuel-filler pipe. Make sure nonreturn valve is installed properly. Inspect nonreturn valve operation. Is nonreturn valve normal?	Yes	Inspect for the following: • Improper use of fuel nozzle • Inadequate fuel filling speed
		No	**Nonreturn valve is installed improperly:** • Reinstall nonreturn valve to proper position. **Nonreturn valve does not operate properly:** • Replace nonreturn valve.
3	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.28 FUEL FILLING SHUT OFF ISSUES [L3]

E6U010318881W33

28	Fuel filling shut off issues
DESCRIPTION	• Fuel does not shut off properly.
POSSIBLE CAUSE	• Clogged EVAP pipes • Nonreturn valve malfunction • Fuel shut-off valve malfunction • Fuel nozzle malfunction • Fuel nozzle is not inserted correctly. **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before servicing the fuel system:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	Connect WDS or equivalent to DLC-2. Turn ignition switch to ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
2	Remove fuel-filler pipe. Make sure nonreturn valve is installed properly. Inspect nonreturn valve operation. Is nonreturn valve normal?	Yes	Inspect for the following: • Improper use of fuel nozzle • Fuel is not inserted correctly. • Inspect fuel shut-off valve.
		No	**Nonreturn valve is installed improperly:** • Reinstall nonreturn valve to proper position. **Nonreturn valve does not operate properly:** • Replace nonreturn valve.
3	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.29 SPARK PLUG CONDITION [L3]

E6U010318881W35

29	SPARK PLUG CONDITION
DESCRIPTION	Incorrect spark plug condition
POSSIBLE CAUSE	**Note** • Inspecting spark plugs condition can determine whether problem is related to a specific cylinder or possibly all cylinders. **Wet/carbon stuck on specific plug:** • Spark—Weak, not visible • Air/fuel mixture—Excessive fuel injection volume • Compression—No compression, low compression • Faulty spark plug **Grayish white with specific plug:** • Air/fuel mixture—Insufficient fuel injection volume • Faulty spark plug **Wet/carbon is stuck on all plugs:** • Spark—Spark weak • Air/fuel mixture—Too rich • Compression—Low compression • Clogging in intake/exhaust system **Grayish white with all plugs:** • Air/fuel mixture—Too lean **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before servicing the fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Remove all spark plugs. Inspect spark plug condition. Is spark plug condition normal?	Yes	Troubleshooting completed.
		No	**Specific plug is wet or covered with carbon:** Go to the next step. **Specific plug looks grayish white:** Go to Step 7. **All plugs are wet or covered with carbon:** Go to Step 9. **All plugs look grayish white:** Go to Step 15.
2	Is spark plug wet/covered with carbon by engine oil?	Yes	Working up and down inspect all areas related to oil.
		No	Go to the next step.
3	Inspect spark plug for the following: • Cracked insulator • Heat range • Air gap • Worn electrode Is spark plug normal?	Yes	Go to the next step.
		No	Replace spark plug.
4	Inspect compression pressure at suspected faulty cylinder. Is compression pressure correct? (See 01–10A–4 COMPRESSION INSPECTION [L3].)	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.

STEP	INSPECTION	RESULTS	ACTION
5	Install all spark plugs. Perform spark test at suspected faulty cylinder. Is strong blue spark visible? (Compare with normal cylinder.)	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
6	Install fuel pressure gauge between fuel filter and fuel distributor. Short check connector terminal F/P to body GND using a jumper wire. Turn ignition switch to ON position (Engine off). Is fuel line pressure correct with ignition switch at ON? **Fuel line pressure** **375—450 kPa {3.9—4.5 kgf/cm^2, 55—65 psi}**	Yes	Inspect fuel injector for the following: • Open or short in injector • Leakage • Injection volume
		No	**Zero or low:** Inspect fuel pump relay and fuel pump circuit. Inspect for clogged fuel line. If okay, replace fuel pump unit. **High:** Replace fuel pump unit.
7	Inspect spark plug for the following. • Heat range • Air gap Is spark plug normal?	Yes	Go to the next step.
		No	Replace spark plug.
8	Remove suspected fuel injector. Inspect the following: • Resistance (See 01–14A–29 FUEL INJECTOR INSPECTION [L3].) • Fuel injection volume (See 01–14A–29 FUEL INJECTOR INSPECTION [L3].) Are all above items normal?	Yes	Inspect for open circuit between suspected fuel injector connector terminal and PCM connector at the following terminals: • **For #1 cylinder: 2BB** • **For #2 cylinder: 2BC** • **For #3 cylinder: 2BD** • **For #4 cylinder: 2AZ**
		No	Replace fuel injector.
9	Is air cleaner element free of restrictions?	Yes	Go to the next step.
		No	Replace air cleaner element.
10	Perform spark test. Is strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
11	Install fuel pressure gauge between fuel filter and fuel distributor. Short check connector terminal F/P to body GND using a jumper wire. Turn ignition switch to ON position (Engine off). Is fuel line pressure correct with ignition switch at ON? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) **Fuel line pressure** **375—450 kPa {3.9—4.5 kgf/cm^2, 55—65 psi}**	Yes	Go to the next step.
		No	**Zero or low:** Inspect fuel pump relay and fuel pump circuit. Inspect for clogged fuel line. If okay, replace fuel pump unit. **High:** Replace fuel pump unit.
12	Inspect the following PIDs: • ECT • O2S11 (When engine can be started) • MAF (See 01–40A–9 PCM INSPECTION [L3].) Are PIDs normal?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
13	Perform purge control inspection. (When engine can be started) (See 01–03A–70 Purge Control System Inspection.) Is purge control correct?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
14	Perform compression inspection. Is compression correct?	Yes	Inspect for clogging in exhaust system.
		No	Repair or replace malfunctioning parts.
15	When engine cannot be started, inspect intake-air system for air leakage. When engine can be started, perform intake manifold vacuum inspection. Is air sucked in from intake-air system?	Yes	Repair or replace malfunctioning part.
		No	Go to the next step.

STEP	INSPECTION	RESULTS	ACTION
16	Install fuel pressure gauge between fuel filter and fuel distributor. Short check connector terminal F/P to body GND using a jumper wire. Turn ignition switch to ON position (Engine off). Is fuel line pressure correct with ignition switch at ON? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) **Fuel line pressure** **375—450 kPa {3.9—4.5 kgf/cm^2, 55—65 psi}**	Yes	Inspect the following PIDs: • ECT • O2S11 • MAF (See 01–40A–9 PCM INSPECTION [L3].) Inspect PCM GND condition.
		No	**Zero or low:** Inspect fuel pump relay and fuel pump circuit. Inspect for clogged fuel line. If okay, replace fuel pump unit. **High:** Replace fuel pump unit.
17	Verify test results. • If okay, return to diagnostic index to service any additional symptoms. • If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. — If vehicle is repaired, troubleshooting completed. — If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

ENGINE CONTROL SYSTEM OPERATION INSPECTION [L3]

E6U010318881W36

Input Signal System Investigation Procedure

1. Find an unusual signal. (See 01–03A–62 Finding unusual signals.)
2. Locate the source. (See 01–03A–62 Locating the source of unusual signals.)
3. Repair or replace the defective part.
4. Confirm that the unusual signal has been erased.

Finding unusual signals

While referring to 01–02A–11 ON-BOARD DIAGNOSTIC TEST [L3], use the PID/DATA monitor and record function to inspect the input signal system relating to the problem.

1. Start the engine and idle the vehicle. You can assume that any signals that are out of specifications by a wid margin are unusual.
2. When recreating the problem, any sudden change in monitor input signals that is not consciously created by the driver can be judged as unusual.

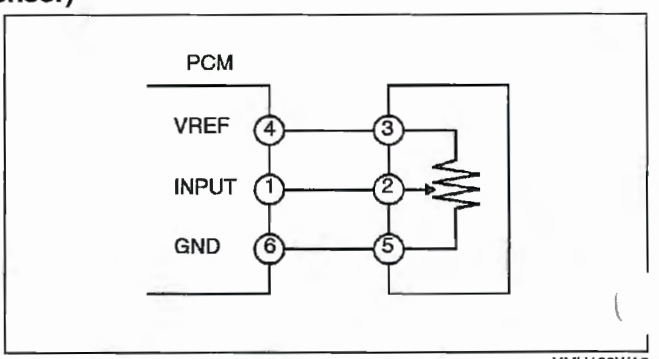
Locating the source of unusual signals

Caution

- **Compare the WDS or equivalent monitor voltage with the measurement voltage using the digital measurement system function. If you use another tester, misreading may occur.**
- **When measuring voltage, attach the tester GND to the GND of the PCM that is being tested, or to the engine itself. If this is not done, the measured voltage and actual voltage may differ.**
- **After connecting the pin to a waterproof coupler, confirming continuity and measuring the voltage, inspect the waterproof connector for cracks. If there are any, use sealant to fix them. Failure to do this may result in deterioration of the harness or terminal from water damage, leading to problems with the vehicle.**

Variable resistance type 1 (TP sensor and EGR boost sensor)

Investigate the input signal system for variable resistance type 1



YMU103WA5

1. When an unusual signal is received, measure the #1 PCM terminal voltage.
   - If the #1 terminal voltage and the WDS or equivalent monitor voltage are the same, proceed to the next step.
   - If there is a difference of **0.5 V or more**, inspect for the following points concerning the PCM connector:
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Harness/pin crimp is loose or disconnected.
2. Measure the #2 sensor terminal voltage.
   - If there is a **0.5 V or more** difference between the sensor and WDS or equivalent voltages, inspect the harness for open or short circuits.
   - If the sensor and WDS or equivalent voltages are the same, inspect for the following points concerning the sensor connector:
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
   - If there are no problems, proceed to next investigation below.

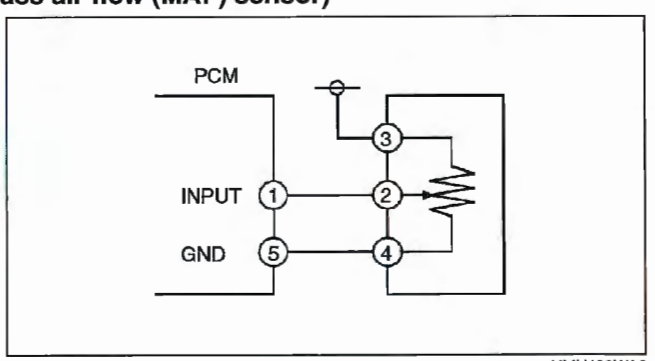
Investigate the standard power supply system for variable resistance type 1

- Confirm that the #3 terminal is at **5 V**.
  — If the measured voltage on the #3 terminal is **5 V**, inspect the following points on the sensor connector.
  — If there is no problem, inspect for the following:
    - Female terminal opening loose
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
  — If the #3 terminal measures other than **5 V**, inspect for the following:
    - Open or short circuit in harness
    - Harness/pin crimp is loose or disconnected.

Investigate the GND system for variable resistance type 1

- Confirm that terminal sensor #5 is at **0 V**.
  — If it is at **0 V**, inspect the sensor.
    - If necessary, replace the sensor.
  — If not, inspect for the following:
    - Open or short circuit in harness
    - Female terminal opening is loose causing an open or short circuit in harness
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
    - Harness/pin crimp is loose or disconnected.

Variable resistance type 2 (fuel tank level sensor and mass air flow (MAF) sensor)



YMU103WA6

Investigate the GND system for variable resistance type 2

- Confirm that terminal sensor #4 is at **0 V**.
  — If it is at **0 V**, inspect the sensor.
    - If necessary, replace the sensor.
  — If not at **0 V**, inspect for the following:
    - Open circuit in harness
    - Female terminal opening is loose.
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
    - Harness/pin crimp is loose or disconnected.

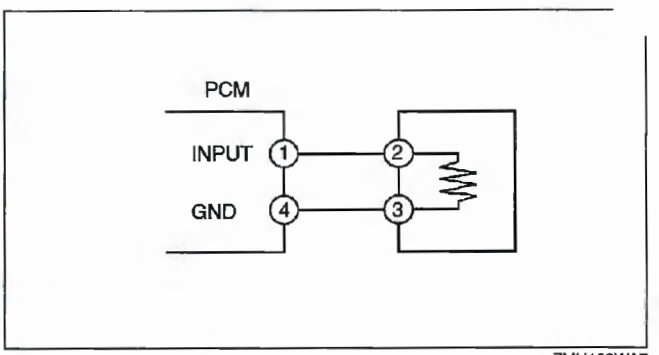
Investigate the input signal system for variable resistance type 2

1. When an unusual signal is received, measure the #1 PCM terminal voltage.
   - If the #1 terminal voltage and the WDS or equivalent monitor voltage are the same, proceed to the next step.
   - If there is a difference of **0.5 V or more**, inspect for the following points concerning the PCM connector:
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Harness/pin crimp is loose or disconnected.
2. Measure the #2 sensor terminal voltage.
   - If there is a **0.5 V or more** difference between the sensor and WDS or equivalent voltages, inspect the harness for open or short circuits.
   - If the sensor and WDS or equivalent voltages are the same, inspect the following points concerning the sensor connector:
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Harness/pin crimp is loose or disconnected.
   - If there are no problems, proceed to next investigation below.

Investigate the electrical supply system for variable resistance type 2

- Confirm that the sensor #3 terminal is **B+**.
  — If the measured voltage on the #3 terminal is **B+**, inspect the following points on the sensor connector.
  — If there is no problem, inspect for the following:
    - Female terminal opening is loose.
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
  — If the #3 terminal measures other than **B+**, inspect the following:
    - Open or short circuit in harness
    - Harness/pin crimp is loose or disconnected.

Thermistor type (IAT sensor and ECT sensor)



ZMU103WA7

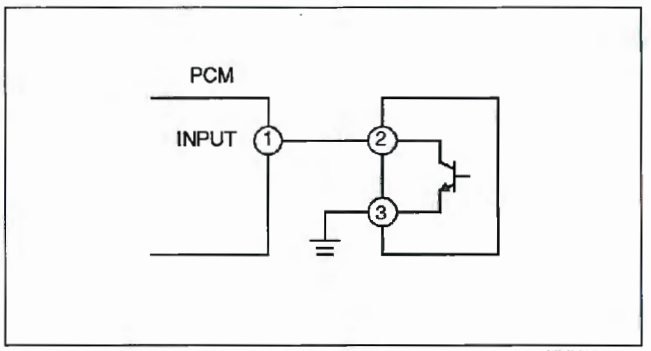
Investigate the input signal system for thermistor type

1. When an unusual signal is received, measure the #1 PCM terminal voltage.
   - If the #1 terminal voltage and the WDS or equivalent monitor voltage are the same, proceed to the next step.
   - If there is a difference of **0.5 V or more**, inspect the following points concerning the PCM connector:
     — Female terminal opening loose
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Harness/pin crimp is loose or disconnected.
2. Measure the #2 sensor terminal voltage.
   - If there is a **0.5 V or more** difference between the sensor and WDS or equivalent voltages, inspect the harness for open or short circuits.
   - If the sensor and WDS or equivalent voltages are the same, inspect the following points concerning the sensor connector:
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Harness/pin crimp is loose or disconnected.
   - If there are no problems, proceed to next investigation below.

Investigate the GND system for thermistor type

- Confirm that terminal sensor #3 is at **0 V**.
  - — If it is at **0 V**, inspect the sensor. If necessary, replace the sensor.
  - — If not, inspect for the following:
    - Open circuit in harness
    - Female terminal opening is loose.
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
    - Harness/pin crimp is loose or disconnected.

VSS



YMU103WA8

1. Measure the #1 PCM terminal voltage and confirm that it is at **0 V** or **5 V** when the ignition switch at ON and the engine at idle.
   - If it is at **0 V** or **5 V**, intermittent concern exists. (See 01–03A–7 INTERMITTENT CONCERN TROUBLESHOOTING [L3].)
   - If not, inspect the following points concerning the PCM connector.
   - If there is no problem, inspect for the following:
     - — Female terminal opening is loose.
     - — Coupler (pin holder) damage
     - — Pin discoloration (blackness)
     - — Harness/pin crimp is loose or disconnected.
2. Measure the #2 sensor terminal voltage and confirm that it is at **0 V** or **5 V** when the ignition switch at ON and the engine at idle.
   - If it is at **0 V** or **5 V**, intermittent concern exists. (See 01–03A–7 INTERMITTENT CONCERN TROUBLESHOOTING [L3].)
   - If not, inspect the following points concerning the sensor connector:
   - If there is no problem, inspect for the following.
     - — Female terminal opening is loose.
     - — Coupler (pin holder) damage
     - — Pin discoloration (blackness)
     - — Harness/pin crimp is loose or disconnected.
3. Confirm that the #3 terminal switch voltage is at **0 V**.
   - If it is at **0 V**, inspect the sensor. If necessary, replace the sensor.
     - — If necessary, replace the sensor.
   - If not, inspect for the following:
     - — Open circuit in harness
     - — Female terminal opening is loose.
     - — Coupler (pin holder) damage
     - — Pin discoloration (blackness)
     - — Harness/pin crimp is loose or disconnected.

Main Relay Operation Inspection

1. Verify that the main relay clicks when the ignition switch is turned to ON position and off.
   - If there is no operation sound, inspect the following:
     - — Main relay (See 09–21–7 RELAY INSPECTION.)
     - — Harness and connector between ignition switch and main relay terminal A.
     - — Harness and connector between PCM terminal 1Q and main relay terminal E.

Intake Manifold Vacuum Inspection

1. Verify air intake hoses are installed properly.
2. Start the engine and run it at idle.
3. Disconnect the vacuum hose between the intake manifold and purge solenoid valve from the intake manifold side.
4. Connect a vacuum gauge to the intake manifold and measure the intake manifold vacuum.
   - If not as specified, inspect the following:

Specification
More than 60 kPa {450 mmHg, 18 inHg}

Note
- Air suction can be located by engine speed change when lubricant is sprayed on the area where suction is occurring.
  - — Air suction at throttle body, intake manifold and PCV valve installation points
  - — EGR valve (stuck open)
  - — Fuel injector insulator
  - — Engine compression
    (See 01–10A–4 COMPRESSION INSPECTION [L3].)

Electronic Throttle Control System Inspection
Engine coolant temperature compensation inspection

1. Connect WDS or equivalent to the DLC-2.
2. Select the following PIDs:
   - ECT
   - IAT
   - RPM
3. Verify that the engine is cold, then start the engine.
4. Verify that the engine speed decreases as the engine warms up.
   - If the engine speed does not decrease or decreases slowly, inspect the following:
     - — ECT sensor and related harness
       (See 01–40A–35 ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [L3].)
     - — Electronic throttle body and related harness
       (See 01–13A–7 THROTTLE ACTUATOR INSPECTION [L3].)

Load compensation inspection

1. Start the engine and run it at idle.
2. Connect WDS or equivalent to the DLC-2.
3. Verify that P0506 or P0507 is not displayed.
   - If P0506, or P0507 is displayed, perform DTC inspection.
     (See 01–02A–18 DTC TABLE [L3].)
4. Select the RPM PID.

Note
- Excludes temporary idle speed drop just after the loads are turned on.

5. Verify that the engine speed is within the specification under each load condition.
   - If load condition is not as specified, inspect the following:
     - — A/C switch and related harness
       (See 07–40–33 CLIMATE CONTROL UNIT INSPECTION [L3, AJ].)
     - — Fan switch and related harness
       (See 07–40–33 CLIMATE CONTROL UNIT INSPECTION [L3, AJ].)
     - — PSP switch and related harness
       (See 01–40A–27 POWER STEERING PRESSURE (PSP) SWITCH INSPECTION [L3].)

Engine speed

Load condition		Engine speed (rpm)*1
No load		650—750
E/L operating		650—750
P/S operating		650—750
A/C operating*2	Refrigerant pressure low*3	750—850
	Refrigerant pressure high*4	750—850

*1 : Neutral or P position
*2 : A/C switch and fan switch are on.
*3 : Refrigerant pressure switch (middle pressure) is off.
*4 : Refrigerant pressure switch (middle pressure) is on.

Throttle position (TP) sweep inspection

1. Connect the WDS or equivalent to DLC-2.
2. Turn the ignition switch to ON position.
   - Verify that none of the following DTC are displayed:
     - P0122, P0123, P0222, P0223, P0638, P2100*2, P2101, P2102*2, P2103*2, P2107, P2108, P2109*1, P2112*1, P2119, P2122, P2123, P2127, P2128, P2135, P2138
       — If any one DTC is displayed, perform DTC inspection.
4. Access TP_REL PID.
5. Verify that the PID reading is within the CTP value. (See 01–40A–9 PCM INSPECTION [L3].)
   - If the PID reading is out of range, perform the following:
     — Remove the air duct from throttle valve body.
     — Verify that the throttle valve opens when accelerator pedal is depressed.
       - If the throttle valve opens, inspect the throttle position sensor and related harness.
       - If the throttle valve does not open, inspect the throttle actuator control motor and related harness.
6. Gradually depress the throttle pedal and verify that the PID reading increases lineally.
   - If the PID reading drops momentarily, inspect the following:
     — Throttle position sensor
7. Fully depress the throttle pedal and verify that the PID reading is within WOT value. (See 01–40A–9 PCM INSPECTION [L3].)
   - If the PID reading is out of range, perform the followings:
     — Remove the air duct from throttle valve body.
     — Verify that the throttle valve opens when throttle pedal is depressed.
       - If the throttle valve opens, inspect the throttle position sensor and related harness.
       - If the throttle valve does not open, inspect the throttle actuator control motor and related harness.

*1 : California emission regulation applicable ATX model
*2 : Except for California emission regulation applicable ATX model

Variable Intake Air System Operation Inspection

1. Start the engine.
2. Inspect the rod operation under the following condition:

Rod operation

Engine speed	Approx. 4,500 rpm	
	Below	Above
Shutter valve actuator	Operate	Not operate

- If the rod operation is not as specified, inspect as follows:

(1) Stop the engine.
(2) Connect WDS or equivalent to the DLC-2.
(3) Verify that DTC P0661 or P0662 is not displayed.
   - If DTC P0661 or P0662 is shown, perform DTC inspection. (See 01–02A–18 DTC TABLE [L3].)
(4) Inspect Variable intake air system control solenoid valve. (See 01–13A–8 VARIABLE INTAKE AIR SOLENOID VALVE INSPECTION [L3].)
   - If the Variable intake air solenoid valve is not okay, replace Variable intake air solenoid valve.
   - If the Variable intake air solenoid valve is okay, inspect the following:
     — Vacuum hose and vacuum chamber for looseness or damage
     — Shutter valve actuator (See 01–13A–8 VARIABLE INTAKE AIR SHUTTER VALVE ACTUATOR INSPECTION [L3].)
     — Shutter valve stuck open or closed

Variable Tumble System Operation Inspection

1. Connect the WDS or equivalent to the DLC-2.
2. Access ECT PID.
3. Verify that ECT PID is **below 60°C {140°F}**.
4. Start the engine.
5. Inspect rod operation under the following conditions:

Rod operation

Engine speed	3,750 rpm	
	Below	Above
Shutter valve actuator	Operate	Not operate

- If the rod operation is not specified, inspect as follows:

(1) Verify that DTC No. P2004, P2006, P2009 or P2010 is not displayed.
- If DTC No. P2009 or P2010 are shown, perform DTC inspection.
  (See 01–02A–18 DTC TABLE [L3].)

(2) Inspect Variable tumble solenoid valve.
(See 01–13A–9 VARIABLE TUMBLE SOLENOID VALVE INSPECTION [L3].)
- If the Variable tumble solenoid valve is not okay, replace Variable tumble solenoid valve.
- If the Variable tumble solenoid valve is okay, inspect the following:
  — Vacuum hose and vacuum chamber for looseness or damage
  — Shutter valve actuator
    (See 01–13A–9 VARIABLE TUMBLE SHUTTER VALVE ACTUATOR INSPECTION [L3].)
  — Shutter valve stuck open or closed

Fuel Injector Operation Inspection

STEP	INSPECTION	RESULTS	ACTION
1	While cranking engine, inspect for fuel injector operation sound at each cylinder using a soundscope. Is operation sound heard?	Yes	Fuel injector operation is okay.
		No	**Not heard in any cylinders:** Go to the next step. **Heard in some cylinders:** Go to Step 3.
2	Perform main relay operation inspection. Is main relay operation normal?	Yes	Inspect the following: • Fuel injector power system related wiring harness and connectors • PCM connectors • Fuel injector GND and related wiring harness and connectors
		No	Repair or replace malfunctioning parts.
3	Change fuel injector connector of not operating fuel injector and operating fuel injector. Is operation sound heard?	Yes	Go to the next step.
		No	Replace fuel injector.
4	Are wiring harness and connectors of not operation fuel injector normal? (Open or short circuit)	Yes	Inspect PCM terminal voltage of fuel injector signal.
		No	Repair or replace malfunctioning parts.

Fuel Cut Control System Inspection

1. Warm up engine and idle it.
2. Turn off the electrical loads and A/C switch.
3. Connect WDS or equivalent to the DLC-2.
4. Select RPM PID.
5. Listen for the fuel injector operation sound at all cylinders using the soundscope and monitor both PIDs while performing the following steps:
   (1) Depress the accelerator pedal and increase the engine speed to **4,000 rpm**.
   (2) Quickly release the accelerator pedal (brake pedal is not depressed) and verify that the fuel injector operation sound stops, and starts again when the engine speed drops below **1,200 rpm**.
   - If not as specified, inspect the following:
     — ECT sensor and related harness
       (See 01–40A–35 ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [L3].)
     — Neutral/clutch pedal position switch and related harness (MTX)
       (See 01–40A–25 CLUTCH PEDAL POSITION (CPP) SWITCH INSPECTION [L3].)
     — TR switch and related harness (ATX)
       (See 05–17A–12 TRANSAXLE RANGE (TR) SWITCH INSPECTION [FS5A-EL].)
       (See 05–17B–13 TRANSAXLE RANGE (TR) SWITCH INSPECTION [AW6A-EL].)

Fuel Pump Operation Inspection

Caution
- **Connecting the wrong check connector terminal may possibly cause malfunction. Carefully connect the specified terminal only.**

1. Short the check connector terminal F/P to body GND using a jumper wire.
2. Remove the fuel-filler cap.
3. Turn the ignition switch to ON position.
4. Verify that the fuel pump operation sound is heard.
   - If no operation sound heard, proceed to next step.

5. Measure voltage at harness side fuel pump connector terminal B.

Specification
B+ (Ignition switch at on)

- If the voltage is as specified, inspect the following:
  — Fuel pump continuity
  — Fuel pump GND
  — Wiring harness between fuel pump relay and PCM terminal 1H
- If not as specified, inspect the following:
  — Fuel pump relay
  — Wiring harness connector (Main relay – fuel pump relay – fuel pump.)

Fuel Pump Control System Inspection
1. Crank the engine and verify that fuel pump relay operation sound is heard.
2. If operation sound is not heard, inspect the following:
   - Fuel pump relay
   - Wiring harness and connectors (Main relay – fuel pump relay – PCM terminal 1H)

Spark Test
1. Disconnect the fuel pump relay.
2. Verify that each ignition coil and connector is connected properly.
3. Inspect the ignition system in the following procedure.

Warning
- **High voltage in the ignition system can cause strong electrical shock which can result in serious injury. Avoid direct contact to the vehicle body during the following spark test.**

STEP	INSPECTION		ACTION
1	• Disconnect the ignition coil from the spark plugs. • Remove the spark plugs. • Reconnect the spark plugs to the ignition coil. • Ground the spark plugs to engine. • Is strong blue spark visible at each cylinder while cranking?	Yes	Ignition system is normal.
		No	**Some cylinders do not spark:** • Go to the next step. **All cylinders do not spark:** • Go to Step 4.
2	• Inspect the spark plugs for damage, wear, carbon deposits and proper plug gap. • Are the spark plugs normal?	Yes	Go to the next step.
		No	Replace spark plugs, then go to Step 1.
3	• Inspect the following wiring harnesses for open or short: — Ignition coil No.1 terminal C—PCM terminal 2BA — Ignition coil No.2 terminal C—PCM terminal 2AW — Ignition coil No.3 terminal C—PCM terminal 2AX — Ignition coil No.4 terminal C—PCM terminal 2AT • Are the wiring harnesses normal?	Yes	Inspect and replace the ignition coil. (See 01–18A–3 IGNITION COIL INSPECTION [L3, AJ].)
		No	Repair or replace the malfunctioning part, then go to Step 1.
4	• Measure the voltage at terminal A in each ignition coils. • Is the voltage **B+**?	Yes	Go to the next step.
		No	Inspect power supply circuit of ignition coils.
5	• Disconnect the ignition switch connectors. • Verify that the continuity between ignition coils terminal B and GND. • Is there any continuity?	Yes	Go to the next step.
		No	Inspect GND circuit for of ignition coil.
6	• Does the PCM connector or ignition coil connectors have poor connection?	Yes	Repair or replace the connector, then go to Step 1.
		No	Go to the next step.
7	• Are the following parts normal? — CKP sensor and crankshaft pulley	Yes	Inspect for open or short circuit in wiring harness and connector of CKP sensor.
		No	Repair or replace the malfunctioning part, then go to Step 1.

EGR Control System Inspection

1. Verify that EGR valve operation (initial operation) sound is heard when the ignition switch is turned to ON position.
   - If the operation sound is not heard, connect WDS or equivalent to the DLC-2 and verify that the DTC P040 is shown. Perform DTC inspection. (See 01–02A–18 DTC TABLE [L3].)
2. Start the engine and idle it.
3. Warm up the engine to normal operating temperature.
4. Select the following PIDs:
   - ECT, RPM, SEGRP, APP1, APP2, TP_REL, VSS
5. Let the vehicle idle and verify that the SEGRP value is 0.
6. Put the vehicle in drive.
7. Depress the accelerator pedal and verify that the SEGRP value is increased.
   - If the EGR valve will increase, inspect the following:
     — EGR valve (stuck open or close)
     — Wiring harness and connectors (Main relay – EGR valve – PCM)
   - If the SEGRP value does not increase, inspect the VSS, APP1, APP2, TP_REL and ECT PIDs. (See 01–40A–9 PCM INSPECTION [L3].)
8. Stop the vehicle and verify that the SEGRP value returns to 0.

Purge Control System Inspection

1. Start the engine.
2. Disconnect the vacuum hose between the purge solenoid valve and the charcoal canister.
3. Put a finger to the purge solenoid valve and verify that there is no vacuum applied when the engine is cold.
   - If there is a vacuum, inspect the following:
     — Wiring harness and connectors (Purge solenoid valve-PCM terminal 2C)
     — Purge solenoid valve
4. Warm up the engine to the normal operating temperature.
5. Stop the engine.
6. Connect WDS or equivalent to the DLC-2 and verify that the DTC P0443 is shown. Perform DTC inspection. (See 01–02A–18 DTC TABLE [L3].)
7. Turn the ignition switch to ON position.
8. Select ECT PID.
9. Verify that the engine coolant temperature is above **60°C {140°F}**.
   - If WDS or equivalent indicates below **60°C {140°F}**, perform the ECT sensor inspection.
10. Set the vehicle on the dynamometer or chassis roller.

Warning

- **When the dynamometer or chassis roller is operating, there is a possibility that the operator may come into contact with or be caught up in the rotating parts, leading to serious injuries or death. When performing work while the dynamometer or chassis roller is operating, be careful not to contact or be caught up in any of the rotating parts.**

11. Drive vehicle at engine speed **approx. 2000 rpm** for **30 s or more.**
12. Put a finger to the purge solenoid valve and verify that there is no vacuum applied while step 2.
    - If there is no vacuum, inspect the following:
      — Wiring harness and connector (Main relay – purge solenoid valve – PCM terminal 2C)
      — Purge solenoid valve
      — MAF, APP1, APP2, TP_REL and LOAD PIDs
    - If there is vacuum, inspect the following:
      — Vacuum hose (Purge solenoid valve – charcoal canister)

A/C Cut-off Control System Inspection

1. Start the engine.
2. Turn the A/C switch and fan switch on.
3. Verify that the A/C compressor magnetic clutch actuates.
   - If it does not actuate, go to symptom troubleshooting "No.23 A/C does not work sufficiently".
4. Fully open the throttle valve and verify that the A/C compressor magnetic clutch does not actuate for **2—5 s**.
   - If it actuates, inspect as follows:
     — A/C relay
     — Open or short to GND circuit in wiring harness and connectors (Ignition switch-A/C relay-PCM terminal 1I)
     — A/C related parts
     — APP1, APP2 PIDs

Cooling Fan Control System Inspection
Cooling fan system operation (at idle)

Engine condition		Fan relay No.1	Fan relay No.2	Fan relay No.3	Fan relay No.4	Cooling fan motor No.1	Cooling fan motor No.2
.gine coolant temperature below 100°C {212°F}		OFF	OFF	OFF	OFF	OFF	OFF
Engine coolant temperature above 100°C {212°F} (until 97°C {208°F})		ON	OFF	OFF	ON	Low speed	Low speed
Engine coolant temperature above 108°C {233°F} (until 105°C {221°F})		ON	ON	ON	ON	High speed	High speed
A/C and fan switches are on.	Refrigerant pressure switch (middle pressure) is off.	ON	OFF	OFF	ON	Low speed	Low speed
	Refrigerant pressure switch (middle pressure) is on.	ON	ON	ON	OFF	High speed	Middle speed
ECT sensor malfunction		ON	ON	ON	ON	High speed	High speed

01–03A

1. Connect WDS or equivalent to DLC-2.
2. Verify that DTC P0480, P0481, and P0482 are not displayed.
   - If DTC P0480, P0481 or P0482 are displayed, perform DTC inspection.
3. Verify that ECT PID is below cooling fan operating temperature.
4. Verify that the A/C switch and fan switch are off.
5. Start the engine and idle it.
6. Verify that the cooling fans are not operating.
   - If cooling fan No.1 is operating, inspect whether cooling fan relay No.2 is stuck in the closed position.
   - If the cooling fans are operating, inspect whether cooling fan relay No.1 is stuck in the closed position.
   - If the cooling fans are operating at high speed, inspect DTC for ECT sensor (P0117, P0118).
   - If cooling fan No.1 does not operate and cooling fan No.2 is operating, inspect whether cooling fan relay No.3 is stuck in the closed.

   Start the engine.
. Verify that the cooling fans are low speed when ECT PID is **100°C {212°F} or above**.
   - If cooling fan No.1 does not operate, verify that DTC P0480 is not detected.
     — If DTC P0480 is detected, perform DTC inspection.
     — If DTC P0480 is not detected, inspect for the following:
       - Cooling fan relay No.2 is stuck in open position.
       - Open circuit in wiring harnesses or connectors or both between cooling fan relay No.2 and cooling fan motor No.1.
   - If the cooling fan No.2 does not operate, verify that DTC P0482 is not detected.
     — If DTC P0482 is detected, perform DTC inspection.
     — If DTC P0482 is not detected, inspect the following:
       - Cooling fan relay No.3 is stuck in open position.
       - Open circuit in wiring harnesses or connectors or both between cooling fan relay No.3 and cooling fan motor No.2
   - If cooling fan No.1 or cooling fan No.2 or both are operating at high speed, verify that DTC P0481 is not detected.
     — If DTC P0481 is detected, perform DTC inspection.
     — If DTC P0481 is not detected, inspect the following:
       - Cooling fan relay No.1 is stuck in closed position.
       - Cooling fan relay No.4 is stuck in closed position.
9. Turn A/C switch and fan switch on.
10. Verify that A/C is operating.
    - If A/C is not operating, inspect the following:
      — A/C switch
      — Fan switch
      — Refrigerant pressure switch
11. Verify that cooling fan No.1 is operating at high speed and cooling fan No.2 is operating other than at low speed (high or middle speed).
    - If the cooling fan relay does not operate high speed and cooling fan No.2 is operating low speed, inspect the following:
      — Cooling fan relay No.1 is stuck in open position.
      — Cooling fan relay No.4 is stuck in open position.

Variable Air Duct (VAD) Control System Operation Inspection

1. Connect WDS or equivalent to DLC-2.
2. Access ECT, TP_REL and RPM PIDs.
3. Start the engine.
4. Verify ECT PID is **70°C {158°F} or over**.
5. Inspect shutter valve operation under the following conditions.

VAD shutter valve operation

Engine speed	5,800 rpm with TP_REL PIDs 50% or over	
	Below	Above
Shutter valve	Close	Open

- If the shutter valve operation is not as specified, inspect as follows:

(1) Verify that DTC P2676 or P2677 is not displayed.
- If DTC P2676 or P2677 is shown, perform DTC inspection. (See 01–02A–18 DTC TABLE [L3].)

(2) Inspect VAD control solenoid valve. (See 01–13A–6 VARIABLE AIR DUCT (VAD) CONTROL SOLENOID VALVE INSPECTION [L3].)
- If the VAD control solenoid valve is not okay, replace VAD control solenoid valve.
- If the VAD control solenoid valve is okay, inspect the following:
  - — Vacuum hose looseness or damage
  - — Vacuum chamber cracks or damage
  - — Shutter valve actuator. (See 01–13A–5 VARIABLE AIR DUCT (VAD) SHUTTER VALVE INSPECTION [L3].)
  - — Shutter valve is stuck open or closed.

Variable Valve Timing Control System Operation Inspection

When idling cannot be continued

1. Remove the oil control valve (OCV) and verify that the spool valve is at maximum retard position.
2. Connect the oil control valve (OCV).
3. Turn the ignition switch to ON position.
4. Verify that the spool valve is at maximum retard position.
   - If the spool valve is stuck in the advance direction, inspect for the following:
     - — Short circuit in harnesses or connectors between the oil control valve (OCV) and the PCM.
5. Inspect the variable timing actuator.

When idling can be continued

1. Disconnect oil control valve (OCV) connector.
2. Warm up the engine and idle it.
3. Apply battery voltage to the oil control valve (OCV) and verify that the engine idles roughly or stalls.
   - If the engine idles roughly or stalls, inspect the timing chain component (valve timing deviation).
   - If the engine does not idle roughly or stalls, go to the next step.
4. Remove the oil control valve (OCV) and perform spool valve operation inspection. (See 01–10A–32 OIL CONTROL VALVE (OCV) INSPECTION [L3].)
   - If not as specified, inspect the following:
     - — Oil control valve (OCV)
     - — Harnesses and connectors between oil control valve (OCV) and PCM open or short.
   - If as specified, inspect the following hydraulic passages for clogging or leakage or both:
     - — Oil pressure switch – oil control valve (OCV)
     - — Oil control valve (OCV) – camshaft
     - — Camshaft internal passage
5. If they are okay, replace the camshaft pulley (with built-in variable valve timing actuator).

Evaporative Emission (EVAP) System Leak Inspection

- To verify that the problem has been fixed properly after repairs, the run drive cycle or EVAP system leak inspection must be performed.

EVAP system leak inspection using the WDS or equivalent

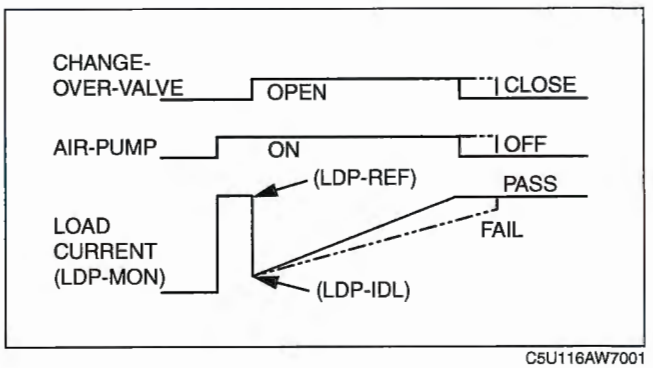
Note

EVAP system test outline

- The EVAP system test, which can substituted for the run drive cycle as an EVAP control system repair confirmation method, can be done while operating the WDS in the KOEO (Key On Engine Off) condition instead of actually driving the vehicle.

EVAP system test description

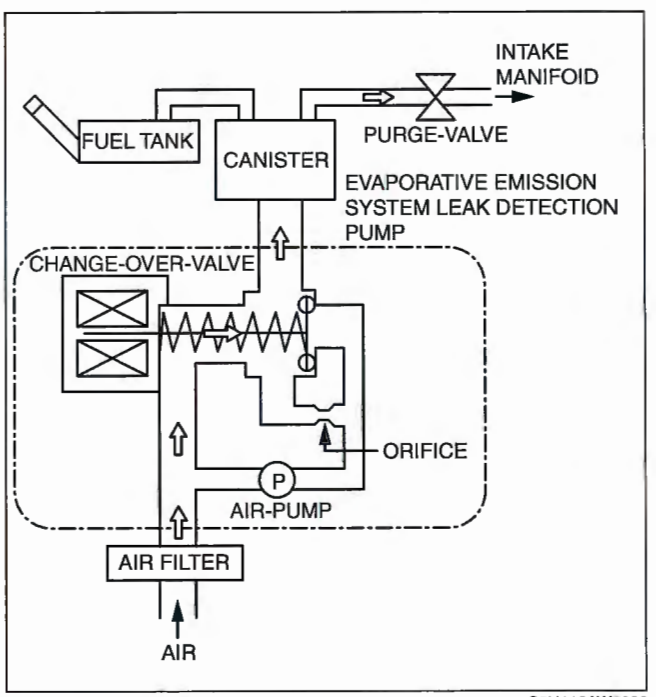
- The EVAP system test finds gas leaks in the system using the PCM to monitor changes in the air pump load current of the EVAP system leak detection pump. This test starts after sending an on-demand test signal from the WDS to the PCM. The PCM controls the air pump and change-over-valve operation and also stores the load current of the air pump as follows:
  i. The PCM commands turn the air pump on and retrieve the air pump load current value (LDP_MON PID) as a reference current (LDP_REF PID).
  ii. After retrieving a reference current value, the PCM commands the change-over-valve to open, then captures the air pump load current value (LDP_MON PID) as idle current (LDP_IDL PID). The EVAP system will be pressurized from this phase.
  iii. The PCM continues to monitor the air pump load current value (LDP_MON PID) until the end of the test.
- You can confirm whether any EVAP gas leak occurred or not by reading the test results.



C5U116AW7001

EVAP system malfunction judgment

- The PCM calculates the stored air pump load current value and send the results to the WDS as DTCs:



C5U116AW7002

DTC No.	Condition
P0442	EVAP control system leak detected (small leak)
P0446	Change over valve (COV) (EVAP system leak detection pump) stuck close
P0455	EVAP control system leak detected (gross leak)
P0456	EVAP control system leak detected (very small leak)
P2401	EVAP system leak detection pump motor circuit low
P2402	EVAP system leak detection pump motor circuit high
P2404	EVAP system leak detection pump sensor circuit malfunction
P2405	EVAP system leak detection pump sensor circuit low input
P2407	EVAP system leak detection pump sensor circuit intermittent

Evaporative system test procedure

1. Select the EVAP system test from the Toolbox on the WDS display and follow the instructions.
2. Verify that all of the following PIDs are within the specifications at the pre-test confirmation screen.

Note

- To successfully perform this procedure, all PIDs must be within the following specifications before proceeding to the next step.
- The PCM will cancel the EVAP system test if the VPWR PID value falls lower than **11.0 V** during the test.

Specification

PID	PID Range
BARO	72.2 kPa {543 mmHg, 21.3 inHg} or more
FLI	15—85%
IAT	5—45 °C {41—113 °F}
VPWR	11.0 V or more

3. Start the engine.
4. Drive the vehicle or let the engine idle more than **20 min**.
5. Turn ignition switch off, then turn it to the ON position again (Key On Engine Off).
6. Press the tick icon to start the test.
7. Verify that no DTCs present after the completion of the test.

- If any test result is indicated with red, diagnose the problem using the following DTC troubleshooting procedure or component inspection procedure.
- If any DTCs are detected, diagnose the problem using the appropriate DTC troubleshooting procedure.

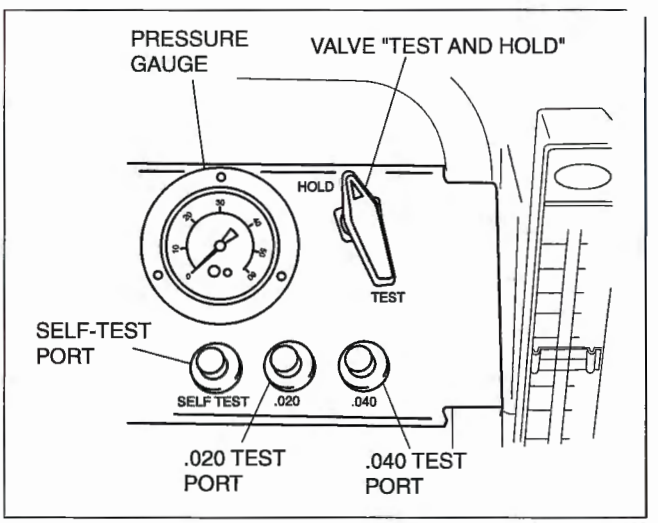
EVAP system leak inspection using leak tester

1. Perform the following **SST** (EVAP System Tester 134-01049) self-test:

Note

- If the tester does not work correctly during the self-test, refer to the tester operators manual for more detailed self-test procedure.

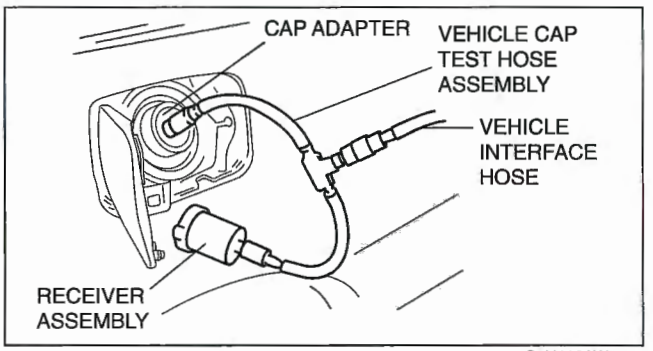
(1) Verify that the control valve on the panel is in the HOLD position then open the nitrogen bottle valve.
(2) Connect the vehicle interface hose (part of the **SST**) to the SELF TEST port located on the control panel. Hand tighten the fitting. (Do not overtighten.)
(3) Turn the control valve to the TEST position.
(4) The gauge should read **331—381 mm {13—15 in}** of water.
  - If the gauge is not reading in this range, adjust the pressure by turning the black knob on the low pressure regulator at the nitrogen bottle.
(5) Turn the control valve to the HOLD position.
(6) Verify that the gauge holds pressure and that the flow meter reads no flow.
  - If there is no drop in pressure and no flow, the tester passes the self-test.
  - If the gauge leaks down, refer to the operators manual.



C5U116AW7003

2. Connect the **SST** to the vehicle.
   (1) Verify that the control valve on the panel is in the HOLD position then open the nitrogen bottle valve.
   (2) Remove the fuel-filler cap from the vehicle.
   - If the fuel-filler cap is not a MAZDA part or equivalent, replace it.

   (3) Connect the receiver assembly (**SST**: 134-01059) to the vehicle cap test hose assembly (part of **SST**) and the fuel-filler cap from the vehicle.
   (4) Connect the cap adaptor (**SST**: 134-01058) to the vehicle cap test hose assembly (part of the **SST**) and to the fuel-filler neck.
   (5) Connect the vehicle interface hose (part of the **SST**) to the center fitting of the vehicle cap test hose assembly (part of the **SST**).



C5U116AW7004

3. Connect the WDS or equivalent to the DLC-2.
4. Turn the ignition switch to the ON position (Engine off).
5. Request the PCM on-board device control (Mode 08) using the WDS or equivalent to close the change-over valve (COV) in the EVAP system leak detection pump.

Note
- The COV is closed for **10 min** unless the following any actions are done:
  — The engine is started.
  — The ignition switch is turned off position.

6. Make sure the control valve on the 134-01049 is in the HOLD position and that the valve on the cylinder of nitrogen gas is open.
7. Turn the control valve to the open position and let the system fill. You should note a drop in the gauge pressure along with the flow meter being pegged at maximum flow for several minutes depending on how full or empty the fuel tank is, and how long it takes to completely fill and pressurize the evaporative emissions system hoses. If the gauge and the flow meter do not settle to a measurable level after **2—3 min**, then refer to the Mazda Workshop Manual to verify that the cut or vent valve is properly closed.
9. Verify the pressure gauge and flow meter reading to determine if there is an evaporative emissions leak:

NO EVAPORATIVE LEAK:
- The flow meter registers "zero flow" and the pressure gauge returns to the pre-set pressure of **356 mm {14 in}** of water (H2O).

EVAPORATIVE LEAK:
- The pressure does not return to the preset level of **356 mm {14 in}** of water (H2O) when measuring the flow. See "SETTING LEAK STANDARD FOR TESTING" (.020 to. 040 inch H2O) of the Evaporative Emissions Tester operators manual (134-01067).

Note
- Turn the control valve to the HOLD position then disconnect the **SST**.

FOREWORD [L3 WITH TC]

E6U010318881W76

- When the customer reports a vehicle malfunction, check the malfunction indicator lamp (MIL) indication and diagnostic trouble code (DTC), then diagnose the malfunction according to the following flowchart:
  - — If a DTC exists, diagnose the applicable DTC inspection. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
  - — If no DTC exists and the MIL does not illuminate or flash, diagnose the applicable symptom troubleshooting. (See 01–03B–10 QUICK DIAGNOSTIC CHART [L3 WITH TC].)

INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC]

E6U010318881W77

Vibration Method

- If a malfunction occurs or becomes worse while driving on a rough road or when the engine is vibrating, perform the steps below.

Note

- There are several reasons why the vehicle or engine vibration could cause an electrical malfunction. Check the following:
  - — Connectors are not fully seated.
  - — Wiring harnesses do not have full play.
  - — Wires laying across brackets or moving parts.
  - — Wires routed too close to hot parts.
- An improperly routed, improperly clamped, or loose harness can cause a wiring harness to become pinched between parts.
- The connector joints, points of vibration, and places where the wiring harnesses pass through the firewall and body panels are the major areas to be checked.

Inspection Method for Switch Connectors or Wires

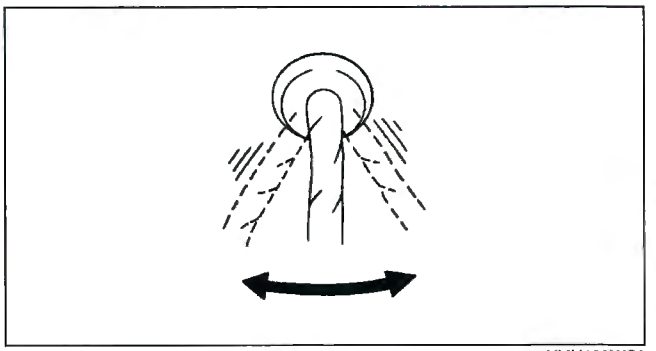
1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to the ON position (Engine off).

Note

- If engine starts and runs, perform the following steps during idle.

3. Access the PIDs for the switch you are inspecting.
4. Turn the switch on manually.

5. Slightly shake each connector or wiring harness vertically and horizontally while monitoring the PID.
   - If the PID value is unstable, check for a poor connection.



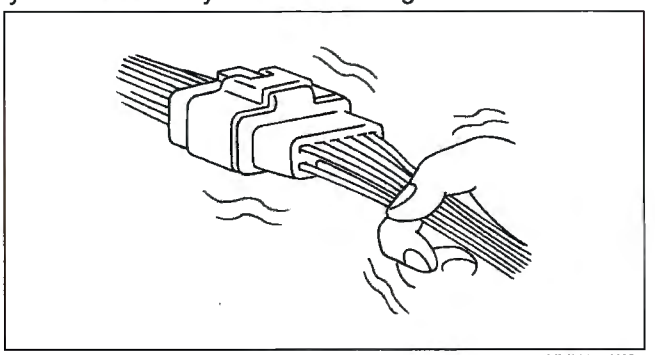
YMU103WC0

Inspection Method for Sensor Connectors or Wires

1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to the ON position (Engine off).

Note
- If the engine starts and runs, perform the following steps during idling.

3. Access the PIDs for the switch you are inspecting.
4. Slightly shake each connector or wiring harness vertically and horizontally while monitoring the PID.
   - If the PID value is unstable, check for poor connection.



YMU103WC1

Inspection Method for Sensors

1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to the ON position (Engine off).

Note
- If the engine starts and runs, perform the following steps during idle.

3. Access the PIDs for the switch you are inspecting.
4. Shake the sensor slightly with your finger.
   - If the PID value is unstable or a malfunction occurs, check for a poor connection or a poorly mounted sensor or both.

Inspection Method for Actuators or Relays

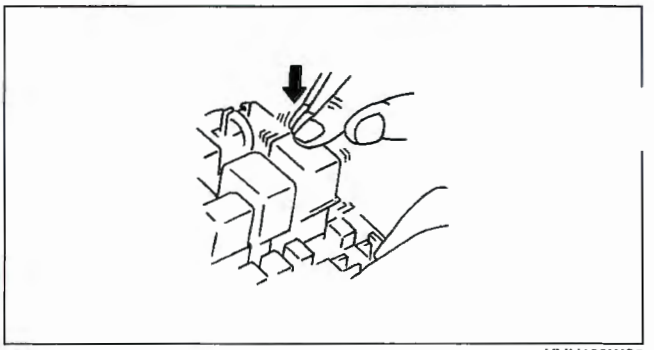
1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to the ON position (Engine off).

Note
- If engine starts and runs, perform the following steps during idling.

3. Prepare the output state control function for actuators or relays that you are inspecting.

4. Shake the actuator or relay with your finger for 3 s after the output state control function is activated.
   - If a variable click sound is heard, check for a poor connection or a poorly mounted actuator or both, or the relay.

Note
- Shake the relays too strongly may result in open circuits.



YMU103WC2

Water Sprinkling Method

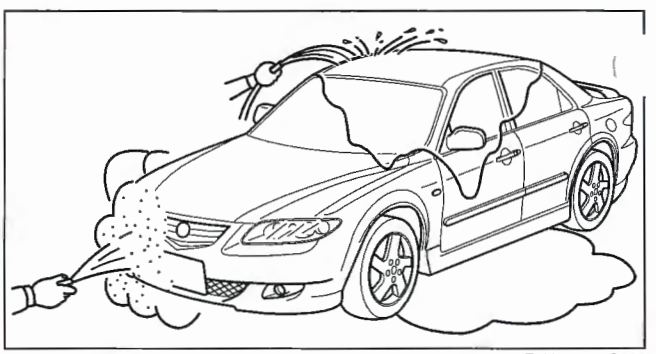
If a malfunction occurs only during high humidity or rainy/snowy weather, perform the following steps:

Caution
- **Indirectly change the temperature and humidity by spraying water onto the front of the radiator.**
- **If a vehicle is subject to water leakage, the leakage may damage the control module. When testing a vehicle with a water leakage problem, special caution must be used.**

1. Connect the WDS or equivalent to the DLC-2 if you are inspecting sensors or switches.
2. Turn the ignition switch to the ON position (Engine off).

Note
- If the engine starts and runs, perform the following steps is idling.

3. Access the PIDs for the sensor or the switch if you are inspecting sensors or switches.
4. If you are inspecting the switch, turn it on manually.
5. Spray water onto the vehicle or run it through a car wash.
   - If the PID value is unstable or a malfunction occurs, repair or replace parts if necessary.



E6U103ZWC003

ENGINE SYMPTOM TROUBLESHOOTING [L3 WITH TC]

E6U010318881W78

- Verify malfunction symptoms using the following diagnostic index, then go to the appropriate troubleshooting chart.

Diagnostic Index

No.	TROUBLESHOOTING ITEM		DESCRIPTION
1	Melting of main or other fuses		—
2	MIL illuminates		MIL is illuminated.
3	Will not crank		Starter does not work.
4	Hard to start/long crank/erratic start/erratic crank		Starter cranks engine at normal speed but engine requires excessive cranking time before starting.
5	Engine stalls.	After start/at idle	Engine stops unexpectedly at idle or after start or both.
6	Cranks normally but will not start		Starter cranks engine at normal speed but engine will not run.
7	Slow return to idle		Engine takes more time than normal to return to idle speed.
8	Engine runs rough/rolling idle		Engine speed fluctuates between specified idle speed and lower speed and engine shakes excessively.
9	Fast idle/runs on		Engine speed continues at fast idle after warm-up. Engine runs after ignition switch is turned off.
10	Low idle/stalls during deceleration		Engine stops unexpectedly at beginning of deceleration or recovery from deceleration.
11	Engine stalls/quits.	Acceleration/cruise	Engine stops unexpectedly at beginning of acceleration or during acceleration. Engine stops unexpectedly while cruising.
	Engine runs rough.	Acceleration/cruise	Engine speed fluctuates during acceleration or cruising.
	Misses	Acceleration/cruise	Engine misses during acceleration or cruising.
	Buck/jerk	Acceleration/cruise/ deceleration	Vehicle bucks/jerks during acceleration, cruising, or deceleration.
	Hesitation/stumble	Acceleration	Momentary pause at beginning of acceleration or during acceleration
	Surges	Acceleration/cruise	Momentary minor irregularity in engine output
12	Lack/loss of power	Acceleration/cruise	Performance is poor under load. (e.g., power down when climbing hills)
13	Knocking/pinging	Acceleration/cruise	Sound is produced when air/fuel mixture is ignited by something other than spark plug. (e.g., hot spot in combustion chamber)
14	Poor fuel economy		Fuel economy is unsatisfactory.
15	Emission compliance		Fails emissions test.
16	High oil consumption/leakage		Oil consumption is excessive.
17	Cooling system concerns	Overheating	Engine runs at higher than normal temperature/overheats.
18	Cooling system concerns	Runs cold	Engine does not reach normal operating temperature.
19	Exhaust smoke		Blue, black, or white smoke from exhaust system
20	Fuel odor (in engine compartment)		Gasoline fuel smell or visible leakage
21	Engine noise		Engine noise from under hood
22	Vibration concerns (engine)		Vibration from under hood or driveline
23	A/C does not work sufficiently.		A/C compressor magnetic clutch does not engage when A/C is turned on.
24	A/C is always on or A/C compressor runs continuously.		A/C compressor magnetic clutch does not disengage.
25	A/C is not cut off under WOT conditions.		A/C compressor magnetic clutch does not disengage under WOT.
26	Exhaust sulphur smell		Rotten egg smell (sulphur) from exhaust
27	Fuel refill concerns		Fuel tank does not fill smoothly.
28	Fuel filling shut off issues		Fuel does not shut off properly.
29	Constant voltage		Incorrect constant voltage
30	Spark plug condition		Incorrect spark plug condition

QUICK DIAGNOSTIC CHART [L3 WITH TC]

E6U010318881W79

X: Applied

	Troubleshooting item / Possible factor		Starter motor malfunction (Mechanical or electrical)	Starter circuit including ignition switch is open	Starter interlock switch malfunction	Improper engine oil level	Low or dead battery	Charging system malfunction	Improper engine compression	Improper dipstick	Base engine malfunction	Flywheel is seized	Improper tension or damaged drive belts	Improper engine coolant level	Water and anti-freeze mixture is improper	Cooling system malfunction (Radiator, hoses,overflow system, thermostat, etc.)	Cooling fan system malfunction

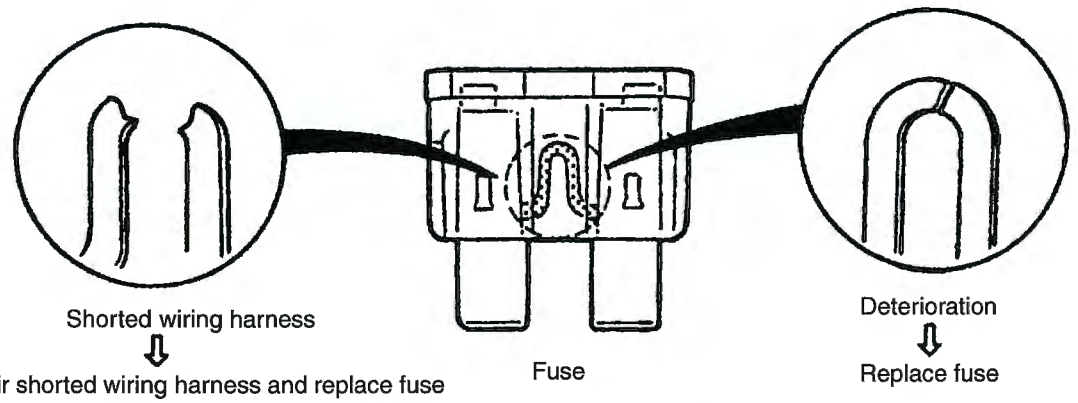
NO.1 MELTING OF MAIN OR OTHER FUSES [L3 WITH TC]

E6U010318881W80

1	MELTING OF MAIN OR OTHER FUSES

[TROUBLESHOOTING HINTS]
Inspect condition of fuse.



Damaged fuse	Related wiring harness
MAIN	**MAIN fuse** • BTN fuse • IG KEY2 fuse • FAN1 fuse • FAN 2 fuse
BTN	**BTN fuse** • ROOM fuse
ROOM	**ROOM fuse** • DLC-2
IG KEY2	**IG KEY fuse** • Ignition switch
FAN 1	**FAN1 fuse** • Cooling fan relay
FAN 2	**FAN2 fuse** • Cooling fan relay
ENG BB	**ENG BB fuse** • Cooling fan relay • Wastegate control solenoid valve
INJ DRIVE	**INJ DRIVE fuse** • Injector relay
INJ	**INJ fuse** • ETC relay • PCM • CKP sensor • CMP sensor
ENG BAR	**ENG BAR fuse** • Front HO2S • EGR valve • Purge solenoid valve • MAF/IAT sensor • Oil control valve • Variable swirl shutter valve switch • Variable swirl solenoid valve • EVAP system leak detection pump
FUEL PUMP	**FUEL PUMP fuse** • Main relay • Fuel pump resistor — Fuel pump relay — Fuel pump control relay
IG KEY1	**IG KEY1 fuse** • Ignition switch — ENGINE fuse

Damaged fuse	Related wiring harness
ENGINE	**ENGINE fuse** • PCM • Injection relay • Ignition coil • Fuel pump relay
ENG +B	**ENG +B fuse** • PCM
ETC fuse	**ETC fuse** • ETC control relay

NO.2 MIL ILLUMINATES [L3 WITH TC]

E6U010318881W81

2	MIL ILLUMINATES
DESCRIPTION	MIL illuminates incorrectly.
POSSIBLE CAUSE	• PCM illuminates for emission-related concern (DTC is stored in PCM) • Instrument cluster malfunction **Note** • If the MIL blinks at a steady rate, a misfire condition could possibly exist.

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect the WDS or equivalent to the DLC. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	**DTC is displayed:** • Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	**No DTC is displayed:** • Inspect for an open or short to circuit between instrument cluster terminal 2W and PCM terminal 2R. • Inspect for an open or short to circuit between instrument cluster terminal 2X and PCM terminal 2U. (See 09–22–5 INSTRUMENT CLUSTER INSPECTION.)
2	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.3 WILL NOT CRANK [L3 WITH TC]

E6U010318881W82

3	WILL NOT CRANK
DESCRIPTION	Starter does not work.
POSSIBLE CAUSE	• Open starter circuit between the ignition switch and the starter • Low or dead battery • Charging system malfunction • Starter interlock switch malfunction • Starter malfunction • Seized/hydro-locked engine, flywheel • Immobilizer system and/or related circuit malfunction • Immobilizer system operates properly (Key is not registered.) • Advanced keyless entry system malfunction

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	**Note** • The following test should be performed on the advanced keyless entry system. If not equipped, go to the next step. Start the engine using the standard ignition key. Does the engine start?	Yes	Inspect the advanced keyless entry system and repair or replace according to the inspection result. (See 09–03G–2 SYMPTOM TROUBLESHOOTING CHART [KEYLESS ENTRY SYSTEM].)
		No	Go to next step.
2	Connect the WDS or equivalent to the DLC-2. Do any of the following conditions appear? • Engine does not complete start. • DTC B1681 is displayed.	Yes	**Both conditions are appear:** Go to Step 6.
		No	**Either or other condition appears:** Go to the next step.
3	Is the coil connector securely connected to the coil?	Yes	Go to the next step.
		No	Connect the connector securely, retest from Step 2.
4	Does the security light illuminate?	Yes	Go to the next step.
		No	Inspect and repair or replace the following: • Wiring harnesses and connectors from PCM terminal 2W and instrument cluster terminal 1G • Instrument cluster (See 09–22–5 INSTRUMENT CLUSTER INSPECTION.)
5	Retrieve DTCs using the WDS or equivalent. Are any of the following DTCs present? **DTC B1213, B1342, B1600, B1601, B1602, B1681, B2103, B2431**	Yes	Go to the appropriate DTC test. (See 09–02F–3 DTC TABLE [IMMOBILIZER SYSTEM].)
		No	Advanced keyless entry system is not equipped: Go to the next step. Advanced keyless entry system is equipped: Go to Step 11.
6	Is there continuity between PCM terminal 4X, 2AB, 2AC and ground?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
7	Turn the ignition switch to the ON position (Engine off.) Measure voltage between PCM terminal 4X, 2AB, 2AC and ground. Is the voltage **below 1.0V?**	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
8	Turn the ignition switch to the ON position. (Engine off) Access the VPWR PID. Is the VPWR PID normal? **VPWR PID** **Battery voltage**	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
9	Disconnect the coil connector. Turn the ignition switch to the ON position. (Engine off) Is there battery voltage at coil connector terminal D?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between coil connector terminal D and the fuse panel.
10	Inspect the following wiring harness and connectors. • Between coil terminal A and PCM terminal 2Q • Between coil terminal B and PCM terminal 2T Is there any malfunction (open or short circuit, terminal corrosion, etc.)?	Yes	Repair or replace malfunctioning part.
11	Is there continuity between the keyless CM harness-side connector terminal 3C and body ground?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
12	Turn the ignition switch to the ON position. Measure the voltage between keyless CM harness-side connector terminal 3C and body ground. Is the voltage **below 1.0V?**	Yes	Go to the next step.
		No	Repair or replace the wiring harness.

STEP	INSPECTION	RESULTS	ACTION
13	Turn the ignition switch to the ON position. (Engine off.) Measure the voltage between keyless CM harness-side connector terminal 3B, 3D, 3I and body ground. Is the voltage **B+**?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
14	Turn the ignition switch off. Disconnect the coil connector. Turn the ignition switch to the ON position. (Engine off.) Measure the voltage between coil harness-side connector terminal D and body ground. Is the voltage **B+**?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
15	Inspect the following wiring harnesses and connectors. • Between keyless CM terminal 3Y and coil A • Between keyless CM terminal 3AA and coil B • Between keyless CM terminal 4A and PCM 2T • Between keyless CM terminal 4C and PCM 2Q Is there any malfunction (open or short circuit, terminal corrosion, etc.)?	Yes	Repair or replace malfunctioning part.
		No	Go to the next step.
16	Is there continuity between PCM terminal 4I and the starter relay with the clutch pedal depressed?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
17	Inspect the following: • Battery connection • Battery condition • Fuses Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
18	Is a clicking sound heard from the starter when the ignition switch is turned to the START position?	Yes	Go to the next step.
		No	Go to Step 24.
19	Inspect the starting system. (See 01–19B–3 STARTER INSPECTION [L3 WITH TC].) Is the starting system normal?	Yes	Inspect for a seized/hydro-locked engine, flywheel. (See 05–10–32 FLYWHEEL INSPECTION [A26MX-R].)
		No	Repair or replace components if necessary required.
20	Do any other electrical accessories work?	Yes	Go to the next step.
		No	Inspect the charging system. (See 01–17B–2 BATTERY INSPECTION [L3 WITH TC].) (See 01–17B–6 GENERATOR INSPECTION [L3 WITH TC].)
21	Perform the self-test function using the WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	**No DTC is displayed:** Inspect the following: • START circuit in the ignition switch • Open circuit between ignition switch and starter • Starter interlock switch
22	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.4 HARD TO START/LONG CRANK/ERRATIC START/ERRATIC CRANK [L3 WITH TC]

E6U010318881W83

4	HARD TO START/LONG CRANK/ERRATIC START/ERRATIC CRANK
DESCRIPTION	• Starter cranks the engine at normal speed but the engine requires excessive cranking time before starting. • Battery is operating normally
POSSIBLE CAUSE	• Vacuum leakage • Poor fuel quality • Starting system malfunction • Erratic signal to ignition coils • Spark plug malfunction • Air leakage from intake-air system • Improper air/fuel mixture ratio control • Incorrect fuel injection timing • Erratic signal from CKP sensor • Erratic signal from CMP sensor • Front and/rear HO2S sensor or related circuit malfunction • ECT sensor or related circuit malfunction • MAF sensor or related circuit malfunction • Intake-air system restriction • Improper operation of electronic throttle control system • PCV valve malfunction • Inadequate fuel pressure (high or low pressure side) • Relief valve malfunction (built-in delivery pipe) • Spill valve control solenoid valve malfunction (built-in high pressure fuel pump) • Fuel filter clogging • Fuel line restriction • Fuel leakage • Fuel pump (low-side) resister or related circuit malfunction • Fuel injector malfunction • Fuel pressure sensor malfunction • High pressure fuel pump malfunction • Exhaust system or three-way catalytic converter restriction • EGR valve malfunction • Purge solenoid valve malfunction • Low engine compression • Improper valve timing • Injector driver module or related circuit malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **• Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **• Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** **• Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Inspect for the following: • Fuel quality (proper octane, contamination, winter/summer blend) • Fuel leakage • Intake-air system leakage or restriction • Vacuum leakage Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
2	Perform the self-test function using the WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	**No DTC is displayed:** Go to the next step.
3	Access the ECT PID using the WDS or equivalent. Verify that the ECT PID is **less than 116°C {241°F}** during driving. Is the ECT PID less than specified?	Yes	Go to the next step.
		No	The cause of this concern could be from the cooling system overheating. Perform the symptom troubleshooting "NO.17 COOLING SYSTEM CONCERNS - OVERHEATING." (See 01–03B–61 NO.17 COOLING SYSTEM CONCERNS-OVERHEATING [L3 WITH TC].)
4	Will the engine run smoothly at part throttle?	Yes	Go to the next step.
		No	Go to Step 6.
5	Perform the TP sweep inspection. (See 01–03B–85 Throttle position (TP) sweep inspection.) Does the electronic throttle control system work properly?	Yes	Visually inspect the throttle body (damage/scratching.) If normal, go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
6	Perform the EGR system operation inspection. (See 01–03B–90 EGR Control System Inspection.) Does the EGR system operate properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
7	Perform the Purge Control System Operation inspection. (See 01–03B–91 Purge Control System Inspection.) Does the purge solenoid valve work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
8	Inspect the CMP and CKP sensor for the following; • Installation condition (See 01–40B–38 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) • Damaged trigger wheel and camshaft • Open or short circuit in the wiring harnesses. Is there any malfunction detected?	Yes	Repair or replace the malfunctioning part according to the inspection results.
		No	Go to the next step.
9	Access and monitor following the PIDs using the data monitor function. • ECT • MAF • O2S11 • O2S12 • LONGFT1 • SHTFT1 Do the PIDs indicate the correct values under trouble condition? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and the related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
10	Remove and shake the PCV valve. Does the PCV valve rattle?	Yes	Go to the next step.
		No	Replace the PCV valve.
11	Inspect for restriction in the exhaust system and the three-way catalytic converter (TWC). Is there any restriction?	Yes	Replace the malfunctioning part.
		No	Go to the next step.

STEP	INSPECTION	RESULTS	ACTION
12	Perform the spark test. (See 01–03B–90 Spark Test.) Is a strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
13	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 38.
		No	Go to the next step.
14	Is the vehicle accelerate performance normally?	Yes	Go to the next step.
		No	Go to Step 16.
15	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to Step 17.
		No	Replace the delivery pipe.
16	Replace the high pressure fuel pump. Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Go to Step 21.
		No	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].)
17	Connect the fuel pressure gauge between the fuel pump and the high pressure fuel pump. Measure the fuel pressure line of the low pressure side. (See 01–14B–5 FUEL LINE PRESSURE INSPECTION [L3 WITH TC].) Is the fuel pressure within the specification?	Yes	Go to the next step.
		No	Inspect for the following: • Fuel line restriction • Fuel filter clogging If normal replace the fuel pump.
18	Inspect the fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Are the fuel injectors normal?	Yes	Go to the next step.
		No	Replace the suspected fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/ INSTALLATION [L3 WITH TC].)
19	Measure the compression pressure for each cylinder. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].) Does the starting system work properly?	Yes	Go to the next step.
		No	Inspect for the following: • Damaged valve seat • Worn valve stem and valve guide • Worn or stuck piston ring • Worn piston, piston ring or cylinder • Improper valve timing Service if necessary.
20	Inspect the starting system. (See 01–19B–3 STARTER INSPECTION [L3 WITH TC].) Does the starting system work properly?	Yes	Replace the injector driver module. If the problem remains, overhaul the engine.
		No	Repair or replace the malfunctioning part.
21	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.5 ENGINE STALLS-AFTER START/AT IDLE [L3 WITH TC]

E6U010318881W84

5	ENGINE STALLS - AFTER START/AT IDLE
DESCRIPTION	• Engine stops unexpectedly.
POSSIBLE CAUSE	• A/C system improper operation • Air leakage from intake-air system • Purge solenoid valve malfunction • Improper operation of electronic throttle control system • EGR valve malfunction • Vacuum leakage • Engine overheating • Low engine compression • Ignition system malfunction • Poor fuel quality • PCV valve malfunction • Intake-air system restriction • Exhaust system and/or three-way catalytic converter (TWC) restriction or clogging • Electrical connector disconnection • Open or short circuit in the fuel pump (low-side) body or related wiring harness • Fuel pump resister or related circuit malfunction • No battery power supply to PCM or poor ground • Inadequate fuel pressure (high or low pressure side) • Fuel pressure sensor or related circuit malfunction • Spill valve control solenoid valve malfunction (built-in high pressure fuel pump) • Relief valve malfunction (built-in delivery pipe) • Fuel pump (low-side) body mechanical malfunction • Fuel leakage • Fuel line restriction • Fuel filter clogging • Incorrect fuel injection timing • High pressure fuel pump malfunction • Fuel injector malfunction • Ignition coil malfunction • Improper air/fuel mixture ratio control • No signal from CKP sensor due to sensor, related wiring harness or wrong installation • Erratic signal from CMP sensor • Front and/or rear HO2S sensor or related circuit malfunction • ECT sensor or related circuit malfunction • Accelerator positions sensor or related circuit malfunction • MAF sensor or related circuit malfunction • Improper valve timing • Improper operation variable valve timing control system • Immobilizer system and/or circuit malfunction • Injector driver module or related circuit malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect the WDS or equivalent to the DLC-2. Do any of the following conditions appear? • Engine does not start completely. • DTC B1681 is displayed.	Yes	**Both conditions are appear:** Go to Step 5.
		No	**Either or other condition appears:** Go to the next step.
2	Does the engine stall after **approx. 2s** from when it is started?	Yes	Go to the next step.
		No	Is the immobilizer system is normal? Go to Step 16.
3	Is the coil connector securely connected to coil?	Yes	Go to the next step.
		No	Connect the connector securely, retest from Step 2.
4	Does the security light illuminate?	Yes	Go to the next step.
		No	Inspect and repair or replace the following: • Wiring harnesses and connectors from PCM terminal 2W and instrument cluster terminal 1G • Instrument cluster (See 09–22–5 INSTRUMENT CLUSTER INSPECTION.)
5	Retrieve the DTC using the WDS or equivalent. Are any of the following DTCs present? **DTC B1213, B1342, B1600, B1601, B1602, B1681, B2103, B2431**	Yes	Go to appropriate DTC test. (See 09–02F–3 DTC TABLE [IMMOBILIZER SYSTEM])
		No	Advanced keyless entry system is not equipped: Go to the next step. Advanced keyless entry system is equipped: Go to Step 11.
6	Is there continuity between PCM terminal 4X, 2AB, 2AC and ground?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
7	Turn the ignition switch to the ON position (Engine off.) Measure the voltage between PCM terminal 4X, 2AB, 2AC and ground. Is the voltage **below 1.0V**?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
8	Turn the ignition switch to the ON position. (Engine off) Access the VPWR PID. Is the VPWR PID normal? **VPWR PID** **Battery voltage**	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
9	Disconnect the coil connector. Turn the ignition switch to the ON position. (Engine off) Is there battery voltage at coil connector terminal D?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between coil connector terminal D and the fuse panel.
10	Inspect the following wiring harness and connectors. • Between coil terminal A and PCM terminal 2Q • Between coil terminal B and PCM terminal 2T Is there any malfunction (open or short circuit, terminal corrosion, etc.)?	Yes	Repair or replace malfunction part.
		No	Go to the next step.
11	Is there continuity between the keyless CM harness-side connector terminal 3C and body ground?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
12	Turn the ignition switch to the ON position. Measure the voltage between keyless CM harness-side connector terminal 3C and body ground. Is the voltage **below 1.0V**?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
13	Turn the ignition switch to the ON position. (Engine off.) Measure the voltage between keyless CM harness-side connector terminal 3B, 3D, 3I and body ground. Is the voltage **B+**?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.

STEP	INSPECTION	RESULTS	ACTION
14	Turn the ignition switch off. Disconnect the coil connector. Turn the ignition switch to the ON position. (Engine off.) Measure the voltage between coil harness-side connector terminal D and body ground. Is the voltage **B+**?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
15	Inspect the following wiring harnesses and connectors. • Between keyless CM terminal 3Y and coil A • Between keyless CM terminal 3AA and coil B • Between keyless CM terminal 4A and PCM 2T • Between keyless CM terminal 4C and PCM 2Q Is there any malfunction (open or short circuit, terminal corrosion, etc.)?	Yes	Repair or replace malfunctioning part.
		No	Go to the next step.
16	Inspect for the following: • Fuel quality (proper octane, contamination, winter/summer blend) • Intake-air system leakage and restriction • Electrical connectors • Poor connection for PCM ground and body ground • Fuel leakage • Vacuum leakage Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 16.
17	Perform the self-test function using WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is the DTC displayed?	Yes	DTC is displayed: Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	No DTC is displayed: Go to the next step.
18	Access the ECT PID using the WDS or equivalent. Verify that the ECT PID is **less than 116 °C {241 °F}** during driving. Is the ECT PID less than specified?	Yes	Go to the next step.
		No	The cause of this concern could from be cooling system overheating. Perform the symptom troubleshooting "NO.17 COOLING SYSTEM CONCERNS - OVERHEATING." (See 01–03B–61 NO.17 COOLING SYSTEM CONCERNS-OVERHEATING [L3 WITH TC].)
19	Access the VPWR PID. Turn the ignition switch to the ON position. (Engine off) Does the VPWR PID indicate **B+**?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between main relay terminal C and PCM terminal 2Y and 1D.
20	Perform the A/C Cut-off Operation Inspection. (See 01–03B–92 A/C Cut-off Control System Inspection.) Does the A/C Cut-off Operation work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts according to the inspection results.
21	Will the engine run smoothly at part throttle?	Yes	Go to the next step.
		No	Go to Step 23.
22	Perform the TP sweep inspection. (See 01–03B–85 Throttle position (TP) sweep inspection.) Does the electronic throttle control system work properly?	Yes	Visually inspect the throttle body (damaged/scratching.) If normal, go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
23	Perform the EGR system operation inspection. (See 01–03B–90 EGR Control System Inspection.) Does EGR system operate properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
24	Perform the Purge Control System Operation inspection. (See 01–03B–91 Purge Control System Inspection.) Does the purge solenoid valve work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.

STEP	INSPECTION	RESULTS	ACTION
25	Perform the Variable Valve Timing Control System Operation Inspection. (See 01–03B–93 Variable Valve Timing Control System Operation Inspection.) Does the variable valve timing control system work properly?	Yes	Inspect the valve timing.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
26	Inspect the CMP and CKP sensor for the following; • Installation condition (See 01–40B–38 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) • Damaged trigger wheel and camshaft • Open or short circuit in the wiring harnesses Is there any malfunction detected?	Yes	Repair or replace the malfunctioning part according inspection results.
		No	Go to the next step.
27	Access and monitor the following PIDs using the data monitor function. • ECT • APP • MAF • O2S11 • O2S12 • LONGFT1 • SHTFT1 Do the PIDs indicate the correct values under the malfunction condition? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting procedure. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
28	Remove and shake the PCV valve. Does the PCV valve rattle?	Yes	Go to the next step.
		No	Replace the PCV valve.
29	Inspect for restriction in the exhaust system and Three-way catalytic converter (TWC). Is there any restriction?	Yes	Replace malfunctioning part.
		No	Go to the next step.
30	Perform the spark test. (See 01–03B–90 Spark Test.) Is a strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
31	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 35.
		No	Go to the next step.
32	Is the vehicle accelerate performance normally?	Yes	Go to the next step.
		No	Go to Step 34.
33	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to Step 35.
		No	Replace the delivery pipe.
34	Replace the high pressure fuel pump. Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Go to Step 38.
		No	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].)
35	Connect the fuel pressure gauge between the fuel pump and the high pressure fuel pump. Measure the fuel pressure line of the low pressure side. (See 01–14B–5 FUEL LINE PRESSURE INSPECTION [L3 WITH TC].) Is the fuel pressure within the specification?	Yes	Go to the next step.
		No	Inspect for the following: • Fuel line restriction • Fuel filter clogging If normal, replace the fuel pump.
36	Inspect the fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Are the fuel injectors normal?	Yes	Go to the next step.
		No	Replace the suspected fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/INSTALLATION [L3 WITH TC].)

STEP	INSPECTION	RESULTS	ACTION
37	Measure the compression pressure for each cylinder. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].) Are the compression pressures within the specification?	Yes	Replace the injector driver module. If the problem remains, overhaul the engine.
		No	Inspect for the following: • Damaged valve seat • Worn valve stem and valve guide • Worn or stuck piston ring • Worn piston, piston ring or cylinder • Improper valve timing Service if necessary.
38	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.6 CRANKS NORMALLY BUT WILL NOT START [L3 WITH TC]

E6U010318881W85

6	CRANKS NORMALLY BUT NOT START
DESCRIPTION	• Starter cranks engine at normal speed but engine will not run. • Refer to symptom troubleshooting "No.5 Engine stalls" if this symptom appears after the engine stalls. • Fuel is in tank. • Battery is in normal condition.
POSSIBLE CAUSE	• Air leakage from intake-air system • Open PCM ground or vehicle body ground • Improper operation of electronic throttle control system • EGR valve malfunction • Low engine compression • Engine overheating • Vacuum leakage • Ignition system malfunction • Poor fuel quality • PCV valve malfunction • Intake-air system restriction • Improper air/fuel mixture ratio control • No signal from CKP sensor due to sensor, related wire or incorrect installation • No signal from CMP sensor due to sensor, related wire or incorrect installation • Front and/or rear HO2S sensor or related circuit malfunction • ECT sensor or related circuit malfunction • Accelerator position sensor or related circuit malfunction • MAF sensor or related circuit malfunction • High pressure fuel pump malfunction • Exhaust system or three-way catalytic converter (TWC) malfunction • Disconnected electrical connector • Open or short in fuel pump (low-side) body and related harness • Inadequate fuel pressure (high or low pressure side) • Fuel pressure sensor or related circuit malfunction • Relief valve malfunction (built-in high pressure fuel pump) • Fuel line clogging or restriction • Incorrect fuel injection timing • Fuel pump resistor or control relay malfunction • Fuel pump (low-side) mechanical malfunction • Fuel leakage • Fuel injector malfunction • Purge solenoid valve malfunction • Spark plug malfunction • Ignition coil malfunction • Improper valve timing • Improper variable valve timing control system operation • Immobilizer system or related circuit malfunction • Injector driver module or related circuit malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect the WDS or equivalent to the DLC-2. Do any of the following conditions appear? • Engine does not completely start. • DTC B1681 is displayed.	Yes	**Both conditions are appear:** Go to Step 5.
		No	**Either or other condition appears:** Go to the next step.
2	Does the engine stall after **approx. 2s** from when it is started?	Yes	Go to the next step.
		No	Is the Is the immobilizer system is normal. Go to Step 20.
3	Is the coil connector securely connected to coil?	Yes	Go to the next step.
		No	Connect the connector securely, retest from Step 1.
4	Does the security light illuminate?	Yes	Go to the next step.
		No	Inspect and repair or replace the following: • Wiring harnesses and connectors from PCM terminal 2W and instrument cluster terminal 1G • Instrument cluster (See 09–22–5 INSTRUMENT CLUSTER INSPECTION.)
5	Retrieve the DTC using the WDS or equivalent. Are any of the following DTCs present? **DTC** **B1213, B1342, B1600, B1601, B1602, B1681, B2103, B2431**	Yes	Go to appropriate DTC test. (See 09–02F–3 DTC TABLE [IMMOBILIZER SYSTEM].)
		No	Advanced keyless entry system is not equipped: Go to the next step. Advanced keyless entry system is equipped: Go to Step 11.
6	Is there continuity between PCM terminal 4X, 2AB, 2AC and ground?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
7	Turn the ignition switch to the ON position (Engine off.) Measure the voltage between PCM terminal 4X, 2AB, 2AC and ground. Is the voltage **below 1.0V?**	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
8	Turn the ignition switch to the ON position. (Engine off) Access the VPWR PID. Is the VPWR PID normal? **VPWR PID** **Battery voltage**	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
9	Disconnect the coil connector. Turn the ignition switch to the ON position. (Engine off) Is there battery voltage at coil connector terminal D?	Yes	Go to the next step.
		No	Repair or replace the wiring harness between coil connector terminal D and the fuse panel.
10	Inspect the following wiring harness and connectors. • Between coil terminal A and PCM terminal 2Q • Between coil terminal B and PCM terminal 2T Is there any malfunction (open or short circuit, terminal corrosion, etc.)?	Yes	Repair or replace malfunctioning part.
		No	Go to the next step.
11	Is there continuity between the keyless CM harness-side connector terminal 3C and body ground?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
12	Turn the ignition switch to the ON position. Measure the voltage between keyless CM harness-side connector terminal 3C and body ground. Is the voltage **below 1.0V?**	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
13	Turn the ignition switch to the ON position. (Engine off.) Measure the voltage between keyless CM harness-side connector terminal 3B, 3D, 3I and body ground. Is the voltage **B+**?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.

STEP	INSPECTION	RESULTS	ACTION
14	Turn the ignition switch off. Disconnect the coil connector. Turn the ignition switch to the ON position. (Engine off.) Measure the voltage between coil harness-side connector terminal D and body ground. Is the voltage **B+**?	Yes	Go to the next step.
		No	Repair or replace the wiring harness.
15	Inspect the following wiring harnesses and connectors. • Between keyless CM terminal 3Y and coil A • Between keyless CM terminal 3AA and coil B • Between keyless CM terminal 4A and PCM 2T • Between keyless CM terminal 4C and PCM 2Q Is there any malfunction (open or short circuit, terminal corrosion, etc.)?	Yes	Repair or replace malfunctioning part.
		No	Go to the next step.
16	Inspect for the following: • Fuel quality (proper octane, contamination, winter/summer blend) • Intake-air system leakage and restriction • Electrical connectors • Fuses • Fuel leakage • Vacuum leakage • Poor connection for PCM ground and body ground Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 16.
17	Perform the self-test function using the WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	DTC is displayed: Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	No DTC is displayed: Go to the next step.
18	Access the ECT PID using the WDS or equivalent. Verify that the ECT PID is **less than 116°C {241°F}** during driving. Is the ECT PID less than specified?	Yes	Go to the next step.
		No	The cause of this concern could be from the cooling system overheating. Perform the symptom troubleshooting "NO.17 COOLING SYSTEM CONCERNS - OVERHEATING." (See 01–03B–61 NO.17 COOLING SYSTEM CONCERNS-OVERHEATING [L3 WITH TC].)
19	Does the engine start with throttle close?	Yes	Go to the next step.
		No	Go to Step 25.
20	Perform the Variable Valve Timing Control System Operation Inspection. (See 01–03B–93 Variable Valve Timing Control System Operation Inspection.) Does the variable valve timing control system work properly?	Yes	Inspect the valve timing.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
21	Will the engine start and run smoothly at part throttle?	Yes	Go to the next step.
		No	Go to Step 23.
22	Perform the TP sweep inspection. (See 01–03B–85 Throttle position (TP) sweep inspection.) Does the electronic throttle control system work properly?	Yes	Visually inspect the throttle body (damaged/ scratching.) If normal, go to the next step.
		No	Inspect or replace the malfunctioning parts, according the to inspection results.
23	Access the RPM PID using the WDS or equivalent. Is the RPM PID indicating engine speed when the cranking engine.	Yes	Go to the next step.
		No	Inspect the CKP sensor for following; • Installation condition (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) • Damaged trigger wheel and camshaft • Open or short circuit in wiring harnesses Is there any malfunction detected?

STEP	INSPECTION	RESULTS	ACTION
24	Inspect CMP sensor for the following; • Installation condition (See 01–40B–38 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) • Damaged trigger wheel and camshaft • Open or short circuit in wiring harnesses Is there any malfunction detected?	Yes	Repair or replace the malfunctioning part according inspection results.
		No	Go to the next step.
25	Perform the EGR system operation inspection. (See 01–03B–90 EGR Control System Inspection.) Does EGR system operate properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
26	Perform the Purge Control System Operation inspection. (See 01–03B–91 Purge Control System Inspection.) Does the purge solenoid valve work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
27	Access and monitor the following PIDs using the data monitor function. • ECT • APP • MAF • O2S11 • O2S12 • LONGFT1 • SHTFT1 Do the PIDs indicate the correct values under the malfunction condition? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and the related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting procedure. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
28	Inspect for restriction in the exhaust system and three-way catalytic converter (TWC). Is there any restriction?	Yes	Replace malfunctioning part.
		No	Go to the next step.
29	Remove and shake the PCV valve. Does the PCV valve rattle?	Yes	Go to the next step.
		No	Replace the PCV valve.
30	Perform the spark test. (See 01–03B–90 Spark Test.) Is a strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
31	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 38.
		No	Go to the next step.
32	Replace the high pressure fuel pump. MOnitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Go to Step 37.
		No	Go to the next step.
33	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to the next step.
		No	Replace the delivery pipe.
34	Connect the fuel pressure gauge between the fuel pump and the high pressure fuel pump. Measure the fuel pressure line of the low pressure side. (See 01–14B–5 FUEL LINE PRESSURE INSPECTION [L3 WITH TC].) Is the fuel pressure within the specification?	Yes	Go to the next step.
		No	Inspect for the following: • Fuel line restriction • Fuel filter clogging If normal, replace the fuel pump.
35	Inspect the fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Are the fuel injectors normal?	Yes	Go to the next step.
		No	Replace the suspected fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/ INSTALLATION [L3 WITH TC].)

STEP	INSPECTION	RESULTS	ACTION
36	Measure the compression pressure for each cylinder. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].) Are the compression pressures within the specification?	Yes	Replace the injector driver module. If the problem remains, overhaul the engine.
		No	Inspect for the following: • Damaged valve seat • Worn valve stem and valve guide • Worn or stuck piston ring • Worn piston, piston ring or cylinder • Improper valve timing Service if necessary.
37	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.7 SLOW RETURN TO IDLE [L3 WITH TC]

E6U010318881W86

7	SLOW RETURN TO IDLE
DESCRIPTION	• Engine takes more time than normal to return to idle speed. • Engine speed continues at fast idle after warm-up
POSSIBLE CAUSE	• ECT sensor or related circuit malfunction • Thermostat is stuck open • Fuel injection timing is incorrect • Erratic signal from CKP sensor • Erratic signal from CMP sensor • Accelerator position sensor or related circuit malfunction • Air suction in intake-air system • MAF sensor or related circuit malfunction • Fuel pressure sensor or related circuit malfunction • Excessive fuel pressure • Relief valve malfunction (built-in delivery pipe) • Fuel injector malfunction • Cooling fan control system malfunction • Improper load signal input • Injector driver module or related circuit malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Inspect air suction in intake-air system components while racing engine to higher speed. Is any air suction?	Yes	Repair or replace as necessary.
		No	Go to the next step.
2	Perform the self-test function using the WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
3	Access the ECT PID. Start and warm-up engine to normal operating temperature. Is the ECT PID reading **below 82°C {180°F}?**	Yes	Go to the next step.
		No	Go to symptom troubleshooting "NO.18 COOLING SYSTEM CONCERNS, RUNS COLD". (See 01–03B–63 NO.18 COOLING SYSTEM CONCERNS-RUNS COLD [L3 WITH TC].)
4	Verify the cooling fan operation. Does the cooling fan operate properly according ECT PID value?	Yes	Go to the next step.
		No	Perform the Cooling Fan Control System Operation Inspection. (See 01–03B–92 Cooling Fan Control System Inspection.)
5	Inspect CMP and CKP sensor for the following; • Installation condition (See 01–40B–38 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) • Damaged trigger wheel and camshaft • Open or short circuit in the wiring harnesses. Is there any malfunction detected?	Yes	Repair or replace the malfunctioning part according inspection results.
		No	Go to the next step.
6	Access and monitor following the PIDs using the data monitor function. • ECT • APP • MAF • CPP (PCM terminal 1H) • PNP (PCM terminal 1W) • PSP (PCM terminal 1Z) Do the PIDs indicate the correct values under trouble condition? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and the related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting procedure. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
7	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 11.
		No	Go to the next step.
8	Is the vehicle accelerate performance normally?	Yes	Go to the next step.
		No	Go to Step 10.
9	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to Step 11.
		No	Replace the delivery pipe.
10	Replace the high pressure fuel pump. Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Go to Step 13.
		No	Go to the next step.
11	Inspect the fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Are fuel injectors normal?	Yes	Go to the next step.
		No	Replace the suspected fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/INSTALLATION [L3 WITH TC].)

STEP	INSPECTION	RESULTS	ACTION
12	Remove the thermostat and inspection operation. (See 01–12B–7 THERMOSTAT REMOVAL/ INSTALLATION [L3 WITH TC].) (See 01–12B–7 THERMOSTAT INSPECTION [L3 WITH TC].) Is the thermostat normal?	Yes	Inspect and repair or replace the throttle body. If throttle body is normal or the problem remains, replace the injector driver module.
		No	Replace thermostat.
13	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.8 ENGINE RUNS ROUGH/ROLLING IDLE [L3 WITH TC]

E6U010318881W87

8	ENGINE RUNS ROUGH/ROLLING IDLE
DESCRIPTION	• Engine speed fluctuates between the specified idle speed and lower speed and, engine shakes excessively. • Idle speed is too slow and the engine shakes excessively.
POSSIBLE CAUSE	• Air leakage from intake-air system • A/C system improper operation • Erratic signal to ignition coil • Spark plug malfunction • Purge solenoid valve malfunction • Improper operation of electronic throttle control system • EGR valve malfunction • Low engine compression or excessive unbalance for each cylinder • Improper valve timing • Improper variable valve timing control system • Poor fuel quality • PCV valve malfunction • Intake-air system restriction • Exhaust system or three-way catalytic converter (TWC) restriction or clogging • Disconnected electrical connectors • Inadequate fuel pressure (high or low pressure side) • Fuel pressure sensor or related circuit malfunction • Spill valve control solenoid valve malfunction (built-in high pressure fuel pump) • Relief valve malfunction (built-in delivery pipe) • Fuel pump (low-side) body mechanical malfunction • Fuel filter restriction or clogging • Fuel leakage • Incorrect fuel injection timing • Unbalanced fuel injection amount for each cylinder • High pressure fuel pump malfunction • Fuel injector malfunction • Erratic signal from CKP sensor • Erratic or no signal from CMP sensor • ECT sensor or related circuit malfunction • Manifold absolute pressure (MAP) sensor or related circuit malfunction • Accelerator position sensor or related circuit malfunction • MAF sensor malfunction • Incorrect or no load signal input • Engine overheating • Vacuum leakage • Injector driver module or related circuit malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Inspect for the following: • Fuel quality (proper octane, contamination, winter/summer blend) • Intake-air system restriction or leakage • Electrical connectors connection • Fuel leakage in fuel system • Vacuum leakage Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
2	Perform the self-test function using the WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	**No DTC is displayed:** Go to the next step.
3	Access the ECT PID. Verify that the ECT PID is **less than 116°C {241°F}** during driving. Is the ECT PID less than specified?	Yes	Go to the next step.
		No	The cause of this concern could be from the cooling system overheating. Perform the symptom troubleshooting "NO.17 COOLING SYSTEM CONCERNS - OVERHEATING." (See 01–03B–61 NO.17 COOLING SYSTEM CONCERNS-OVERHEATING [L3 WITH TC].)
4	Perform the A/C Cut-off Operation Inspection. (See 01–03B–92 A/C Cut-off Control System Inspection.) Does the A/C Cut-off Operation work properly?	Yes	Go to the next step.
		No	Repair or replace the malfunctioning parts according to inspection results.
5	Perform the EGR system operation inspection. (See 01–03B–90 EGR Control System Inspection.) Does the EGR system operate properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
6	Perform the TP sweep inspection. (See 01–03B–85 Throttle position (TP) sweep inspection.) Does the electronic throttle control system work properly?	Yes	Visually inspect the throttle body (damaged/ scratching.) If normal, go to the next step.
		No	Inspect or replace the malfunctioning parts, according the to inspection results.
7	Perform the Purge Control System Operation inspection. (See 01–03B–91 Purge Control System Inspection.) Does the purge solenoid valve work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
8	Perform the Variable Valve Timing Control System Operation Inspection. (See 01–03B–93 Variable Valve Timing Control System Operation Inspection.) Does the variable valve timing control system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
9	Inspect CMP and CKP sensor for the following; • Installation condition (See 01–40B–38 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) • Damaged trigger wheel and camshaft • Open or short circuit in the wiring harnesses. Is there any malfunction detected?	Yes	Repair or replace the malfunctioning part according to the inspection results.
		No	Go to the next step.

STEP	INSPECTION	RESULTS	ACTION
10	Connect the WDS or equivalent to the DLC-2. Access and monitor following PIDs using the data monitor function. • ACSW • APP • ECT • MAF • MAP • CPP (PCM terminal 1H) • PNP (PCM terminal 1W) • PSP (PCM terminal 1Z) Do the PIDs indicate the correct values under trouble condition? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and the related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting procedure. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
11	Inspect for restriction in the exhaust system and three-way catalytic converter (TWC). Is there any restriction?	Yes	Replace the malfunctioning part.
		No	Go to the next step.
12	Remove and shake the PCV valve. Does the PCV valve rattle?	Yes	Go to the next step.
		No	Replace the PCV valve.
13	Perform the spark test. (See 01–03B–90 Spark Test.) Is a strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
14	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 18.
		No	Go to the next step.
15	Is the vehicle accelerate performance normally?	Yes	Go to the next step.
		No	Go to Step 17.
16	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to Step 18.
		No	Replace the delivery pipe.
17	Replace the high pressure fuel pump. Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Go to Step 21.
		No	Go to the next step.
18	Connect the fuel pressure gauge between the fuel pump and the high pressure fuel pump. Measure the fuel pressure line of the low pressure side. (See 01–14B–5 FUEL LINE PRESSURE INSPECTION [L3 WITH TC].) Is the fuel pressure within the specification?	Yes	Go to the next step.
		No	Inspect for the following: • Fuel line restriction • Fuel filter clogging If normal replace the fuel pump.
19	Inspect fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Are the fuel injectors normal?	Yes	Go to the next step.
		No	Replace the suspected fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/ INSTALLATION [L3 WITH TC].)
20	Measure the compression pressure for each cylinder. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].) Are compression pressures within the specification?	Yes	Replace the injector driver module. If the problem remains, overhaul the engine.
		No	Inspect for the following: • Damaged valve seat • Worn valve stem and valve guide • Worn or stuck piston ring • Worn piston, piston ring or cylinder • Improper valve timing Service if necessary.
21	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.9 FAST IDLE/RUNS ON [L3 WITH TC]

E6U010318881W88

9	FAST IDLE/RUNS ON
)ESCRIPTION	• Engine speed continues at fast idle after warm-up. • Engine runs after the ignition switch is turned off.
POSSIBLE CAUSE	• ECT sensor or related circuit malfunction • Suction control valve (built-in high pressure fuel pump) • Fuel injector malfunction • Air leakage from intake-air system • Throttle body malfunction • Accelerator pedal position sensor or related circuit malfunction • Cruise control system operation improperly • Improper load signal input • Improper operation of electric throttle control system • Injector driver module or related circuit malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **• Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **• Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** **• Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect the WDS or equivalent to the DLC. Access the ECT PID. Start and warm-up engine to normal operating temperature. Is ECT PID reading between **82—112 °C {180—234 °F}?**	Yes	Go to the next step.
		No	**ECT PID is higher than 112 °C {234 °F}:** Go to symptom troubleshooting "NO.17 COOLING SYSTEM CONCERNS - OVERHEATING". **ECT PID is less than 82 °C {180 °F}** Go to symptom troubleshooting "NO.18 COOLING SYSTEM CONCERNS - RUNS COLD".
2	Perform the self-test function using the WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	**No DTC is displayed:** Go to the next step.
3	Inspect for leakage in intake-air system. Is there any leakage found?	Yes	Repair or replace for leakage.
		No	Go to the next step.
4	Perform the TP sweep inspection. (See 01–03B–85 Throttle position (TP) sweep inspection.) Does the electronic throttle control system work properly?	Yes	Visually inspect the throttle body (damaged/scratching.) If normal, go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
5	Connect the WDS or equivalent to the DLC-2. Access and monitor the following PIDs using the data monitor function. • ECT • APP • ACSW • CPP (PCM terminal 1H) • PNP (PCM terminal 1W) • PSP (PCM terminal 1Z) Do the PIDs indicate the correct values under trouble condition? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and the related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
6	Inspect the high pressure fuel pump. (See 01–14B–20 HIGH PRESSURE FUEL PUMP INSPECTION [L3 WITH TC].) Is the high pressure fuel pump normal?	Yes	Go to the next step.
		No	Replace the high pressure fuel pump.
7	Inspect the fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Are fuel injectors normal?	Yes	Go to the next step.
		No	Replace the suspected fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/INSTALLATION [L3 WITH TC].)
8	Inspect the operation of cruise control system. Does the cruise control system work properly?	Yes	Inspect and repair or replace the injector driver module or related circuit.
		No	Repair or replace the malfunctioning part according to inspection results.
9	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.10 LOW IDLE/STALLS DURING DECELERATION [L3 WITH TC]

E6U010318881W89

10	LOW IDLE/STALLS DURING DECELERATION
DESCRIPTION	• Engine stops unexpectedly at beginning of deceleration or recovery from deceleration.
POSSIBLE CAUSE	• Poor fuel quality • Vacuum leakage • Improper operation of electronic throttle control system • Air leakage from intake-air system • Intake-air system restriction • EVAP control system malfunction • Improper air/fuel mixture ratio control • Erratic signal from CKP sensor • Erratic signal from CMP sensor • Accelerator position sensor or related circuit malfunction • TP sensor or related circuit malfunction • MAF sensor or related circuit malfunction • Front and/or rear HO2S sensor or related circuit malfunction • Brake switch or related circuit malfunction • Neutral or clutch switch malfunction or related circuit malfunction • Improper A/C magnetic clutch operation • Inadequate fuel pressure (high or low pressure side) • Suction control valve malfunction (built-in high pressure fuel pump) • Relief valve malfunction (built-in delivery pipe) • Fuel leakage • Fuel line restriction • Fuel filter clogging • Incorrect fuel injection timing • High pressure fuel pump malfunction • Fuel injector malfunction • Low engine compression • Improper valve timing • EGR system malfunction • Vacuum leakage • ECT sensor or related circuit malfunction • Fuel pressure sensor or related circuit malfunction • Injector driver module or related circuit malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Does the engine idle rough?	Yes	Go to symptom troubleshooting "NO.8 ENGINE RUNS ROUGH/ROLLING IDLE". (See 01–03B–36 NO.8 ENGINE RUNS ROUGH/ ROLLING IDLE [L3 WITH TC].)
		No	Go to the next step.
2	Verify the following: • Fuel quality (proper octane, contamination, winter/summer blend) • Intake-air system restriction or leakage • Fuel leakage in fuel system • Vacuum leakage Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 2.

STEP	INSPECTION	RESULTS	ACTION
3	Inspect CMP and CKP sensor for the following; • Installation condition (See 01–40B–38 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) • Damaged trigger wheel and camshaft • Open or short circuit in the wiring harnesses Is there any malfunction detected?	Yes	Repair or replace the malfunctioning part according inspection results.
		No	Go to the next step.
4	Perform the self-test function using the WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	**No DTC is displayed:** Go to the next step.
5	Connect the WDS or equivalent to the DLC-2. Access and monitor the following PIDs using the data monitor function. • ACSW • APP • BOO • ECT • MAF • TP • O2S11 • O2S12 • LONGFT1 • SHTFT1 • PSP (PCM terminal 1Z) • CPP (PCM terminal 1H) • PNP (PCM terminal 1W) Do the PIDs indicate the correct values under trouble condition? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and the related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting procedure. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
6	Perform the EGR system operation inspection. (See 01–03B–90 EGR Control System Inspection.) Does the EGR system operate properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
7	Perform the TP sweep inspection. (See 01–03B–85 Throttle position (TP) sweep inspection.) Does the electronic throttle control system work properly?	Yes	Visually inspect the throttle body (damaged/ scratching.) If normal, go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
8	Perform the Purge Control System Operation inspection. (See 01–03B–91 Purge Control System Inspection.) Does the purge solenoid valve work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
9	Perform the A/C Cut-off Operation Inspection. (See 01–03B–92 A/C Cut-off Control System Inspection.) Does the A/C Cut-off Operation work properly?	Yes	Go to the next step.
		No	Repair or replace the malfunctioning parts according to inspection results.
10	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 14.
		No	Go to the next step.
11	Is the vehicle accelerate performance normally?	Yes	Go to the next step.
		No	Go to Step 14.
12	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to Step 14.
		No	Replace the delivery pipe.

STEP	INSPECTION	RESULTS	ACTION
13	Replace the high pressure fuel pump Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Go to the Step 17.
		No	Go to the next step.
14	Connect the fuel pressure gauge between the fuel pump and the high pressure fuel pump. Measure the fuel pressure line of the low pressure side. (See 01–14B–5 FUEL LINE PRESSURE INSPECTION [L3 WITH TC].) Is the fuel pressure within the specification?	Yes	Go to the next step.
		No	Inspect for the following: • Fuel line restriction • Fuel filter clogging If normal replace the fuel pump.
15	Inspect the fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Are fuel injectors normal?	Yes	Go to the next step.
		No	Replace the suspected fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/ INSTALLATION [L3 WITH TC].)
16	Measure the compression pressure for each cylinder. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].) Are compression pressures within the specification?	Yes	Replace the injector driver module. If the problem remains, overhaul the engine.
		No	Inspect for the following: • Damaged valve seat • Worn valve stem and valve guide • Worn or stuck piston ring • Worn piston, piston ring or cylinder • Improper valve timing Service if necessary.
17	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.11 ENGINE STALLS/QUITS, ENGINE RUNS ROUGH, MISSES, BUCK/JERK, HESITATION/STUMBLE, SURGES [L3 WITH TC]

E6U010318881W90

11	**ENGINE STALLS/QUITS - ACCELERATION/CRUISE** **ENGINE RUNS ROUGH - ACCELERATION/CRUISE** **BUCK/JERK - ACCELERATION/CRUISE/DECELERATION** **HESITATION/STUMBLE - ACCELERATION** **SURGES - ACCELERATION/CRUISE**
DESCRIPTION	• Engine stops unexpectedly at beginning of acceleration or during cruise. • Engine stops unexpectedly while cruising. • Engine speed fluctuates during acceleration or cruising. • Engine misses during acceleration or cruising. • Vehicle bucks/jerks during acceleration, during or deceleration. • Momentary pause at beginning of acceleration or during acceleration • Momentary minor irregularity in engine output

11	**ENGINE STALLS/QUITS - ACCELERATION/CRUISE** **ENGINE RUNS ROUGH - ACCELERATION/CRUISE** **BUCK/JERK - ACCELERATION/CRUISE/DECELERATION** **HESITATION/STUMBLE - ACCELERATION** **SURGES - ACCELERATION/CRUISE**
POSSIBLE CAUSE	• A/C system improper operation • Air leakage from intake-air system • Intake-air system restriction • Purge solenoid valve malfunction • Improper operation of electronic throttle control system • EGR system malfunction • Low engine compression • Turbocharger malfunction • Improper operation of wastegate control system • Vacuum leakage • Poor fuel quality • Main relay intermittent malfunction • Throttle body malfunction • Engine overheating • Spark plug malfunction • Variable swirl system malfunction • Air cleaner restriction • PCV valve malfunction • Improper valve timing due to jumping out timing chain • Exhaust system and/or three-way catalytic converter restriction • Intermittent open or short circuit in fuel pump circuit • Incorrect fuel injection timing • Inadequate fuel pressure (high or low pressure side) • Fuel pressure sensor or related circuit malfunction • Suction control valve malfunction (built-in high pressure fuel pump) • Relief valve malfunction (built-in delivery pipe) • High pressure fuel pump malfunction • Fuel injector malfunction • Improper fuel pump speed control operation • Fuel pump mechanical malfunction • Fuel line restriction or clogging • Improper air/fuel mixture ratio control operation • Erratic or no signal from CMP sensor • Erratic signal from CKP sensor • Front and/or rear HO2S sensor or related circuit malfunction • Accelerator position sensor or related circuit malfunction • MAF sensor or related circuit malfunction • Neutral switch or related circuit malfunction • ECT sensor or related circuit malfunction • Manifold absolute pressure (MAP) sensor or related circuit malfunction • IAT sensor No.1 or related circuit malfunction • IAT sensor No.2 or related circuit malfunction • Intermittent open or short circuit MAF sensor, accelerator position sensor, TP sensor and VSS • Clutch slippage • Injector driver module or related circuit malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Inspect for the following: • Fuel quality (proper octane, contamination, winter/summer blend) • Air leakage from intake-air system • Intake-air system restriction • Air cleaner element • Clutch slippage • Fuel leakage from fuel line • Vacuum leakage Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
2	Perform the self-test function using the WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	**No DTC is displayed:** Go to the next step.
3	Access the ECT PID. Verify that the ECT PID is **less than 116°C {241°F}** during driving. Is the ECT PID less than specified?	Yes	Go to the next step.
		No	The cause of this concern could be from the cooling system overheating. Perform the symptom troubleshooting "NO.17 COOLING SYSTEM CONCERNS - OVERHEATING." (See 01–03B–61 NO.17 COOLING SYSTEM CONCERNS-OVERHEATING [L3 WITH TC].)
4	Perform the Main Relay Operation Inspection with wiggle the related harness. (See 01–03B–84 Main Relay Operation Inspection.) Does the main relay operate properly?	Yes	Go to the next step.
		No	Repair or replace for the intermittent fault.
5	Inspect CMP and CKP sensor for the following; • Installation condition (See 01–40B–38 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) • Damaged trigger wheel and camshaft • Open or short circuit in the wiring harnesses Is there any malfunction detected?	Yes	Repair or replace the malfunctioning part according to the inspection results.
		No	Go to the next step.
6	Connect the WDS or equivalent to DLC-2. Access and monitor following PIDs using the data monitor function while wiggle the harness and under trouble condition. • APP • ECT • MAF • IAT • IAT2 • MAP • FP • VSS • O2S11 • O2S12 • LONGFT1 • SHTFT1 • CPP (PCM terminal 1H) • PNP (PCM terminal 1W) Do the PIDs indicate correct values? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the Step 13.
		No	Inspect and repair or replace suspected parts and related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].) If the MAP PID remains without specified, go to the next step.
7	Perform the EGR system operation inspection. (See 01–03B–90 EGR Control System Inspection.) Does EGR system operate properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
8	Perform the A/C Cut-off Operation Inspection. (See 01–03B–92 A/C Cut-off Control System Inspection.) Does the A/C Cut-off Operation work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts, according to inspection results.

STEP	INSPECTION	RESULTS	ACTION
9	Perform the TP sweep inspection. (See 01–03B–85 Throttle position (TP) sweep inspection.) Does the electronic throttle control system work properly?	Yes	Visually inspect the throttle body (damaged/ scratching.) If normal, go to the next step.
		No	Inspect or replace the malfunctioning parts, accordin to the inspection results.
10	Perform the Variable Swirl Control System Operation Inspection. (See 01–03B–86 Variable Swirl System Operation Inspection.) Does the variable swirl system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
11	Perform the Purge Control System Operation Inspection. (See 01–03B–91 Purge Control System Inspection.) Does the purge control system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
12	Perform the Fuel Pump Speed Control Inspection. (See 01–03B–89 Fuel Pump Speed Control Inspection.) Does the fuel pump speed control work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
13	Perform the Wastegate Control System Operation Inspection. (See 01–03B–93 Wastegate Control System Operation Inspection.) Does the wastegate control system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
14	Remove the parts necessary to inspect turbocharger without remove the turbocharger. Inspect if turbocharger compressor wheel is bent, damaged, or interfering with housing on vehicle. (See 01–13B–16 TURBOCHARGER INSPECTION [L3 WITH TC].) Is there any problem?	Yes	Replace the turbocharger.
		No	Go to the next step.
15	Inspect the turbocharger compressor wheel locknut is loose or has fallen down inside turbocharger. Is there any problem?	Yes	Replace the turbocharger.
		No	Go to the next step.
16	Inspect if turbocharger compressor wheel by hand. Does the wheel turn easily and smoothly?	Yes	Go to the next step.
		No	Replace the turbocharger.
17	Inspect the turbocharger turbine wheel is damaged, cracked or interfering with housing on vehicle. **Note** • Inspect all fins on each turbine wheel. Is there any problem?	Yes	Replace the turbocharger.
		No	Go to the next step.
18	Is any engine oil found inside turbocharger turbine housing?	Yes	**Excessive amount of oil is found:** Replace the turbocharger. **Small amount of oil is found:** Wipe oil out of vehicle, then go to the next step.
		No	Go to the next step.
19	Is any engine oil found inside turbocharger compressor housing?	Yes	Wipe oil out vehicle and install all removed parts in Step 14. Then, go to the next step.
		No	Turbocharger is normal. Install all parts removed in Step 14. Then, go to the next step.
20	Inspect for restriction in the exhaust system and three-way catalytic converter (TWC). Is there any restriction?	Yes	Replace the malfunctioning part.
		No	Go to the next step.
21	Remove and shake the PCV valve. Does the PCV valve rattle?	Yes	Go to the next step.
		No	Replace the PCV valve.

STEP	INSPECTION	RESULTS	ACTION
22	Perform the spark test. (See 01–03B–90 Spark Test.) Is a strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
23	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 27.
		No	Go to the next step.
24	Is the vehicle accelerate performance normally?	Yes	Go to the next step.
		No	Go to Step.26.
25	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to the Step 27.
		No	Replace the delivery pipe.
26	Replace the high pressure fuel pump. Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Go to Step 30.
		No	Go to the next step.
27	Connect the fuel pressure gauge between the fuel pump and the high pressure fuel pump. Measure the fuel pressure line of the low pressure side. (See 01–14B–5 FUEL LINE PRESSURE INSPECTION [L3 WITH TC].) Is the fuel pressure with in the specification?	Yes	Go to the next step.
		No	Inspect for the following: • Fuel line restriction • Fuel filter clogging If normal replace the fuel pump.
28	Inspect the fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Are fuel injectors normal?	Yes	Go to the next step.
		No	Replace the suspected fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/ INSTALLATION [L3 WITH TC].)
29	Measure the compression pressure for each cylinder. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].) Are compression pressures within the specification?	Yes	Replace the injector driver module. If the problem remains, overhaul the engine.
		No	Inspect for the following: • Damaged valve seat • Worn valve stem and valve guide • Worn or stuck piston ring • Worn piston, piston ring or cylinder • Improper valve timing Service if necessary.
30	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.12 LACK/LOSS OF POWER-ACCELERATION/CRUISE [L3 WITH TC]

E6U010318881W91

12	LACK/LOSS OF POWER — ACCELERATION/CRUISE
DESCRIPTION	Performance is poor under load (e.g., powers down when climbing hills).
POSSIBLE CAUSE	• Improper A/C system operation • Improper operation of A/C cut-off control • Air leakage or restriction from intake-air system • Loose turbocharger compressor-to-intake manifold duct connecting • Turbocharger rotating assembly binding or dragging • Wastegate valve malfunction (stuck open) • Turbocharger malfunction • Charge air cooler malfunction • Variable swirl system malfunction • Improper operation of electronic throttle control system • Purge solenoid valve malfunction • EGR system malfunction • Brake dragging • Low engine compression • Poor fuel quality • Vacuum leakage • Incorrect signal to ignition coil • Spark plug malfunction • Engine overheating • Throttle body malfunction • Air cleaner restriction or dirty • PCV valve malfunction • Improper valve timing due to jumping out of timing chain • Improper operation of variable valve timing control system • Restriction in exhaust system or three-way catalytic converter (TWC) • Leakage at exhaust manifold or turbocharger mounting flange • Intermittent open or short fuel pump related circuit • Inadequate fuel pressure (high-or low pressure side) • Fuel pressure sensor or related circuit malfunction • Suction control valve or related circuit malfunction (built-in high pressure fuel pump) • Relief valve malfunction (built-in delivery pipe) • High pressure fuel pump malfunction • Improper fuel pump speed control operation • Fuel pump mechanical malfunction • Fuel line restriction or clogging • Fuel injector malfunction • Incorrect fuel injection timing • Erratic signal from CKP sensor • Erratic or no signal from CMP sensor • ECT sensor or related circuit malfunction • Manifold absolute pressure (MAP) sensor or related circuit malfunction • Accelerator position sensor or related circuit malfunction • MAF/IAT sensor or related circuit malfunction • IAT sensor No.2 or related circuit malfunction • Intermittent open or short circuit MAF sensor, accelerator position sensor, TP sensor and VSS • Clutch slippage • Injector driver module or related circuit malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Verify the following: • Fuel quality (proper octane, contamination, winter/summer blend) • Air cleaner restriction or dirty • Intake-air system restriction or leakage • Charge air cooler condition (restriction or damaged) • Turbocharger compressor-to-intake manifold duct loose connection • Leakage at exhaust manifold or turbocharger mounting flange • Vacuum leakage • Clutch slippage • Brake dragging Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
2	Perform the self-test function using the WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	**No DTC is displayed:** Go to the next step.
3	Is the engine overheating?	Yes	Go to symptom troubleshooting "NO.17 COOLING SYSTEM CONCERN-OVERHEATING." (See 01–03B–61 NO.17 COOLING SYSTEM CONCERNS-OVERHEATING [L3 WITH TC].)
		No	Go to the next step.
4	Perform the EGR system operation inspection. (See 01–03B–90 EGR Control System Inspection.) Does the EGR system operate properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
5	Perform the A/C Cut-off Operation Inspection. (See 01–03B–92 A/C Cut-off Control System Inspection.) Does the A/C Cut-off Operation work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts, according to the inspection results.
6	Perform the TP sweep inspection. (See 01–03B–85 Throttle position (TP) sweep inspection.) Does the variable swirl system work properly?	Yes	Visually inspect throttle body (damaged/scratching.) If normal, go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
7	Perform the Variable Swirl Control System Operation Inspection. (See 01–03B–86 Variable Swirl System Operation Inspection.)	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
8	Perform the Variable Valve Timing Control System Operation Inspection. (See 01–03B–93 Variable Valve Timing Control System Operation Inspection.) Does the variable valve timing control system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
9	Perform the Purge Control System Operation Inspection. (See 01–03B–91 Purge Control System Inspection.) Does the purge control system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
10	Perform Fuel Pump Speed Control Inspection. (See 01–03B–89 Fuel Pump Speed Control Inspection.) Does the fuel pump speed control work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
11	Perform the Wastegate Control System Operation Inspection. (See 01–03B–93 Wastegate Control System Operation Inspection.) Does the wastegate control system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.

STEP	INSPECTION	RESULTS	ACTION
12	Connect the WDS or equivalent to DLC-2. Access and monitor following PIDs using the data monitor function. • ECT • MAF • IAT • IAT2 • APP • TP • MAP • FP (Low side pressure line) • VSS Do the PIDs indicate correct values under trouble condition? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting procedure. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
13	Inspect CMP and CKP sensor for following; • Installation condition (See 01–40B–38 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) • Damaged trigger wheel and camshaft • Open or short circuit in wiring harnesses Is there any malfunction detected?	Yes	Repair or replace the malfunctioning part according to the inspection results.
		No	Go to the next step.
14	Remove and shake PCV valve. Does the PCV valve rattle?	Yes	Go to the next step.
		No	Replace the PCV valve.
15	Inspect spark plug condition. Is spark plug wet, covered with carbon or grayish white?	Yes	Spark plug is wet or covered with carbon: Perform the Spark Test and repair or replace malfunctioning part according to inspection result. (See 01–03B–90 Spark Test.) Spark plug is grayish white: Go to Step 23.
		No	Install spark plugs on original cylinders. Go to the next step.
16	Inspect for restriction in exhaust system and three-way catalytic converter (TWC). Is there any restriction?	Yes	Replace malfunctioning part.
		No	Go to the next step.
17	Remove parts necessary to inspect turbocharger without remove the turbocharger. Inspect if turbocharger compressor wheel is bent, damaged, or interfering with housing on vehicle. (See 01–13B–16 TURBOCHARGER INSPECTION [L3 WITH TC].) Is there any problem?	Yes	Replace turbocharger.
		No	Go to the next step.
18	Inspect turbocharger compressor wheel locknut is loose or has fallen down inside turbocharger. Is there any problem?	Yes	Replace turbocharger.
		No	Go to the next step.
19	Inspect if turbocharger compressor wheel by hand. Does wheel turn easily and smoothly?	Yes	Go to the next step.
		No	Replace turbocharger.
20	Inspect turbocharger turbine wheel is damaged, cracked or interfering with housing on vehicle. **Note** • Inspect all fins on each turbine wheel. Is there any problem?	Yes	Replace turbocharger.
		No	Go to the next step.
21	Is any engine oil found inside turbocharger turbine housing?	Yes	Excessive amount of oil is found: Replace turbocharger. Small amount of oil is found: Wipe oil out of vehicle, then Go to the next step.
		No	Go to the next step.

STEP	INSPECTION	RESULTS	ACTION
22	Is any engine oil found inside turbocharger compressor housing?	Yes	Wipe oil out vehicle and install all removed parts in Step 16. Then, Go to the next step.
		No	Turbocharger is normal. Install all parts removed in Step 17. Then, Go to the next step.
23	Inspect for leakage in fuel line. Is there any fuel leakage found?	Yes	Repair or replace suspected part.
		No	Go to the next step.
24	Access and monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 27.
		No	Go to the next step.
25	Replace the high pressure fuel pump. Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Go to Step 30.
		No	Go to the next step.
26	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to the next step.
		No	Replace the delivery pipe.
27	Connect the fuel pressure gauge between fuel pump and high pressure fuel pump. Measure the fuel pressure line of the low pressure side. (See 01–14B–5 FUEL LINE PRESSURE INSPECTION [L3 WITH TC].) Is the fuel pressure within the specification?	Yes	Go to the next step.
		No	Inspect for the following: • Fuel line restriction • Fuel filter clogging If normal replace the fuel pump.
28	Inspect fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Are fuel injectors normal?	Yes	Go to the next step.
		No	Replace suspected fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/ INSTALLATION [L3 WITH TC].)
29	Measure compression pressure for each cylinder. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].) Are compression pressures within the specification?	Yes	Replace the injector driver module. If the problem remains, overhaul the engine.
		No	Inspect for the following: • Damaged valve seat • Worn valve stem and valve guide • Worn or stuck piston ring • Worn piston, piston ring or cylinder • Improper valve timing Service if necessary.
30	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.13 KNOCKING/PINGING [L3 WITH TC]

E6U010318881W92

13	KNOCKING/PINGING
DESCRIPTION	Sound is produced when air/fuel mixture is ignited by something other than a spark plug (e.g., hot spot in the combustion chamber).
POSSIBLE CAUSE	• Poor fuel quality • Engine overheating due to cooling system malfunction • Variable swirl valve stuck closed • Improper operation of electronic throttle system • Air leakage or restriction from intake-air system • ECT sensor or related circuit malfunction • MAF sensor or related circuit malfunction • IAT sensor No.1 or related circuit malfunction • IAT sensor No.2 or related circuit malfunction • Incorrect fuel injection timing or amount • Fuel injector malfunction • Knock sensor or related circuit malfunction • Ignition system malfunction • Erratic signal from CMP sensor • Inadequate engine compression • Inadequate fuel pressure (high-pressure side) • Manifold absolute pressure (MAP) sensor or related malfunction • Wastegate valve malfunction (stuck closed) • Charge air cooler malfunction • Fuel pressure sensor or related circuit malfunction • Accelerator position sensor or related circuit malfunction • Suction control valve malfunction (built-in high pressure fuel pump) • Exhaust system and/or three-way catalytic converter (TWC) restriction • EGR system malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect the WDS or equivalent to the DLC-2. Access the ECT PID. Verify that the ECT PID is less than 116°C {241°F} during driving. Is ECT PID less than specified?	Yes	Go to the next step.
		No	The cause of this concern could be from the cooling system overheating. Perform the symptom troubleshooting "NO.17 COOLING SYSTEM CONCERNS - OVERHEATING." (See 01–03B–61 NO.17 COOLING SYSTEM CONCERNS-OVERHEATING [L3 WITH TC].)
2	Inspect for the following: • Air leakage or restriction from intake-air system • Fuel quality (proper octane, contamination, winter/summer blend) • Exhaust system and/or three-way catalytic converter (TWC) restriction • Charge air cooler condition (restriction or damaged) Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 2.

STEP	INSPECTION	RESULTS	ACTION
3	Perform the self-test function using the WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	**No DTC is displayed:** Go to the next step.
4	Inspect the knock sensor. (See 01–40B–35 KNOCK SENSOR (KS) INSPECTION [L3 WITH TC].) Is the knock sensor normal?	Yes	Go to the next step.
		No	Replace the knock sensor. (See 01–40B–36 KNOCK SENSOR (KS) REMOVAL/INSTALLATION [L3 WITH TC]
5	Perform the EGR system operation inspection. (See 01–03B–90 EGR Control System Inspection.) Does the EGR system operate properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
6	Perform the TP sweep inspection. (See 01–03B–85 Throttle position (TP) sweep inspection.) Does the electronic throttle control system work properly?	Yes	Visually inspect the throttle body (damaged/scratching.) If normal, go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
7	Perform the Variable Swirl Control System Operation Inspection. (See 01–03B–86 Variable Swirl System Operation Inspection.) Does the variable swirl system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
8	Perform the Wastegate Control System Operation Inspection. (See 01–03B–93 Wastegate Control System Operation Inspection.) Does the variable swirl system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
9	Perform the spark test. (See 01–03B–90 Spark Test.) Is a strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
10	Inspect CMP and CKP sensor for the following; • Installation condition (See 01–40B–38 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) • Damaged trigger wheel and camshaft • Open or short circuit in the wiring harnesses Is there any malfunction detected?	Yes	Repair or replace the malfunctioning part according to the inspection results.
		No	Go to the next step.
11	Connect the WDS or equivalent to the DLC-2. Access and monitor the following PIDs using the data monitor function. • ECT • MAF • IAT • IAT2 • APP • TP • MAP Do the PIDs indicate correct values under trouble condition? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and the related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting procedure. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
12	Access and monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 16.
		No	Go to the next step.
13	Is the vehicle accelerate performance normally?	Yes	Go to the next step.
		No	Go to the Step 15.
14	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to Step 16.
		No	Replace the delivery pipe.

STEP	INSPECTION	RESULTS	ACTION
15	Replace the high pressure fuel pump. Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].)	Yes	Troubleshooting is completed. Go to Step 17.
		No	Go to the next step.
16	Measure compression pressure for each cylinder. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].) Are compression pressure within the specified?	Yes	Inspect fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].)
		No	Inspect following: • Damaged valve seat • Worn valve stem and valve guide • Worn or stuck piston ring • Worn piston, piston ring or cylinder • Improper valve timing Service as necessary.
17	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.14 POOR FUEL ECONOMY [L3 WITH TC]

E6U010318881W93

14	POOR FUEL ECONOMY
DESCRIPTION	Fuel economy is unsatisfactory.
POSSIBLE CAUSE	• Contaminated air cleaner element • Engine cooling system malfunction • Weak spark • Spark plug malfunction • Poor fuel quality • Erratic signal from CKP sensor • Erratic or no signal from CMP sensor • Fuel pressure sensor or related circuit malfunction • ECT sensor or related circuit malfunction • Manifold absolute pressure (MAP) sensor or related circuit malfunction • Accelerator position sensor or related circuit malfunction • MAF sensor or related circuit malfunction • Contaminated MAF sensor • IAT sensor No.1 or related circuit malfunction • IAT sensor No.2 or related circuit malfunction • VSS or related circuit malfunction • Variable swirl system malfunction • Improper coolant level • Inadequate fuel pressure (high-pressure side) • Injection timing is incorrect • Fuel injector or related circuit malfunction • High pressure fuel pump malfunction • Fuel leakage • Fuel line restriction • Fuel filter clogging • PCV valve malfunction • Brake dragging • Clutch slippage • A/C system improper operation • Improper valve timing due to jumping out of timing chain • Improper engine compression • Turbocharger malfunction • Charge air cooler malfunction • Exhaust system and/or three-way catalytic converter clogging • EGR system malfunction • Vacuum leakage • Injector driver module or related circuit malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Inspect for the following: • Air cleaner element for contamination • Intake-air system restriction • Fuel quality (proper octane, contamination, winter/summer blend) • Coolant level • Brake dragging • Clutch slippage • Charge air cooler condition (restriction or damaged) • Vacuum leakage • Fuel leakage • MAF sensor contaminated • Exhaust system and/or three-way catalytic converter restriction Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.
2	Perform the self-test function using the WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	DTC is displayed: Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	No DTC is displayed: Go to the next step.
3	Perform the Cooling Fan Control System Operation Inspection. (See 01–03B–92 Cooling Fan Control System Inspection.) Does the EGR system operate properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
4	Perform the EGR system operation inspection. (See 01–03B–90 EGR Control System Inspection.) Does the EGR system operate properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
5	Perform the Variable Swirl Control System Operation Inspection. (See 01–03B–86 Variable Swirl System Operation Inspection.) Does the variable swirl system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
6	Perform the Wastegate Control System Operation Inspection. (See 01–03B–93 Wastegate Control System Operation Inspection.) Does the variable swirl system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
7	Perform the A/C Cut-off Operation Inspection. (See 01–03B–92 A/C Cut-off Control System Inspection.) Does the A/C Cut-off Operation work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts, according to the inspection results.
8	Remove and shake the PCV valve. Does the PCV valve rattle?	Yes	Go to the next step.
		No	Replace the PCV valve.
9	Perform the spark test. (See 01–03B–90 Spark Test.) Is the strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
10	Inspect CMP and CKP sensor for the following; • Installation condition (See 01–40B–38 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) • Damaged trigger wheel and camshaft • Open or short circuit in the wiring harnesses Is there any malfunction detected?	Yes	Repair or replace the malfunctioning part according to the inspection results.
		No	Go to the next step.

STEP	INSPECTION	RESULTS	ACTION
11	Connect the WDS or equivalent to the DLC-2. Access and monitor following PIDs using the data monitor function. • ECT • MAF • IAT • IAT2 • APP • TP • CPP (PCM terminal 1H) • PNP (PCM terminal 1W) • MAP • VSS Do the PIDs indicate the correct values according to the engine operating condition? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and the related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting procedure. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
12	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 16.
		No	Go to the next step.
13	Is the vehicle accelerate performance normally?	Yes	Go to the next step.
		No	Go to Step 15.
14	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to Step 16.
		No	Replace the delivery pipe.
15	Replace the high pressure fuel pump. Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Go to Step 19.
		No	Go to the next step.
16	Inspect the turbocharger. (See 01–13B–16 TURBOCHARGER INSPECTION [L3 WITH TC].) Is there any problem in turbocharger?	Yes	Replace the turbocharger.
		No	Go to the next step.
17	Inspect the fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Are fuel injectors normal?	Yes	Go to the next step.
		No	Replace the suspected fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/INSTALLATION [L3 WITH TC].)
18	Measure the compression pressure for each cylinder. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].) Are compression pressures within the specification?	Yes	Replace the injector driver module. If the problem remains, overhaul the engine.
		No	Inspect for the following: • Damaged valve seat • Worn valve stem and valve guide • Worn or stuck piston ring • Worn piston, piston ring or cylinder • Improper valve timing Service if necessary.
19	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.15 EMISSION COMPLIANCE [L3 WITH TC]

E6U010318881W94

15	EMISSION COMPLIANCE
DESCRIPTION	Fails emissions test.
POSSIBLE CAUSE	• Poor fuel quality • Vacuum lines leakage or blockage • Cooling system malfunction • Engine overheating • Spark plug malfunction • Air leakage from intake-air system • Variable swirl system malfunction • Wastegate control system improper operation • Turbocharger malfunction • Charge air cooler malfunction • Inadequate fuel pressure (high-pressure side) • PCV valve malfunction or incorrect valve installation • EGR system malfunction • Exhaust system and/or three-way catalytic converter restriction • Fuel tank ventilation system malfunction • Charcoal canister damage • Air cleaner element clogging or restriction • Throttle body malfunction • Improper operation of electronic throttle control system • Relief valve malfunction (built-in delivery pipe) • Suction control valve malfunction (built-in high pressure fuel pump) • Improper air/fuel mixture ratio control operation • Erratic or no signal from CMP sensor • Erratic signal from CKP sensor • Front or rear HO2S or related circuit malfunction • ECT or related circuit malfunction • MAF sensor or related circuit malfunction • IAT sensor No.1 or related circuit malfunction • IAT sensor No.2 or related circuit malfunction • Fuel pressure sensor or related circuit malfunction • Accelerator position sensor or related circuit malfunction • TP sensor or related circuit malfunction • Manifold absolute pressure (MAP) sensor or related circuit malfunction • Neutral or clutch switch malfunction • VSS or related circuit malfunction • Fuel line restriction • High pressure fuel pump malfunction • Fuel injector or related circuit malfunction • Incorrect fuel injection timing • Three-way catalytic converter (TWC) malfunction • Engine internal parts malfunction • Excessive carbon is built-up in combustion chamber • Improper engine compression • Improper valve timing • Injector driver module or related circuit malfunction **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick releas connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Is the engine overheating?	Yes	Go to symptom troubleshooting "NO.17 COOLING SYSTEM CONCERNS - OVERHEATING."
		No	Go to the next step.
2	Is the engine runs cold?	Yes	Go to symptom troubleshooting "NO.18 COOLING SYSTEM CONCERNS - RUNS COLD."
		No	Go to the next step.
3	Connect the WDS or equivalent to the DLC. Perform the self-test function using the WDS or equivalent. Turn the ignition switch to the ON position. Retrieve any DTCs. Is a DTC displayed?	Yes	DTC is displayed: Go to appropriate DTC test.
		No	No DTC is displayed: Go to the next step.
4	Inspect for the following. • Fuel quality (proper octane, contamination, winter/summer blend) • Charge air cooler condition (restriction or damaged) • Air cleaner element (clogging or restriction) • Intake-air system leakage • PCV valve installation • Vacuum line leakage or blockage • Fuel leakage at fuel system • Charcoal canister damaged • Exhaust system and/or three-way catalytic converter restriction Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 4.
5	Perform the EGR system operation inspection. (See 01–03B–90 EGR Control System Inspection.) Does the EGR system operate properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
6	Perform the TP sweep inspection. (See 01–03B–85 Throttle position (TP) sweep inspection.) Does the electronic throttle control system work properly?	Yes	Visually inspect the throttle body (damaged/ scratching.) If normal, go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
7	Perform the Variable Swirl Control System Operation Inspection. (See 01–03B–86 Variable Swirl System Operation Inspection.) Does the variable swirl system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
8	Perform the Wastegate Control System Operation Inspection. (See 01–03B–93 Wastegate Control System Operation Inspection.) Does the variable swirl system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
9	Perform the Evaporative Emission (EVAP) System Leak Inspection. (See 01–03B–93 Wastegate Control System Operation Inspection.) Does the variable swirl system work properly?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
10	Remove and shake the PCV valve. Does the PCV valve rattle?	Yes	Go to the next step.
		No	Replace the PCV valve.
11	Perform the spark test. (See 01–03B–90 Spark Test.) Is a strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
12	Inspect CMP and CKP sensor for the following; • Installation condition (See 01–40B–38 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].) • Damaged trigger wheel and camshaft • Open or short circuit in the wiring harnesses Is there any malfunction detected?	Yes	Repair or replace the malfunctioning part according to the inspection results.
		No	Go to the next step.

STEP	INSPECTION	RESULTS	ACTION
13	Connect the WDS or equivalent to the DLC-2. Access and monitor the following PIDs using the data monitor function. • ECT • MAF • IAT • IAT2 • APP • TP • MAP • VSS • O2S11 • O2S12 • LONGFT1 • SHTFT1 • CPP (PCM terminal 1H) • PNP (PCM terminal 1W) Do the PIDs indicate the correct values according to the engine operating condition? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and the related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting procedure. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
14	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 18.
		No	Go to the next step.
15	Is the vehicle accelerate performance normally?	Yes	Go to the next step.
		No	Go to Step 17.
16	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to Step 18.
		No	Replace the delivery pipe.
17	Replace the high pressure fuel pump. Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Go to Step 22.
		No	Go to the next step.
18	Inspect the turbocharger. (See 01–13B–16 TURBOCHARGER INSPECTION [L3 WITH TC].) Is there any problem in turbocharger?	Yes	Replace the turbocharger.
		No	Go to the next step.
19	Inspect the three-way catalytic converter (TWC). Is the TWC normal?	Yes	Go to the next step.
		No	Replace the TWC.
20	Inspect the fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Are fuel injectors normal?	Yes	Go to the next step.
		No	Replace the suspected fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/ INSTALLATION [L3 WITH TC].)
21	Measure the compression pressure for each cylinder. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].) Are compression pressures within the specification?	Yes	Replace the injector driver module. If the problem remains, overhaul the engine.
		No	Inspect for the following: • Damaged valve seat • Worn valve stem and valve guide • Worn or stuck piston ring • Worn piston, piston ring or cylinder • Improper valve timing Service if necessary.
22	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.16 HIGH OIL CONSUMPTION/LEAKAGE [L3 WITH TC]

E6U010318881W95

16	HIGH OIL CONSUMPTION/LEAKAGE
DESCRIPTION	Oil consumption is excessive.
POSSIBLE CAUSE	• PCV valve malfunction • Improper dipstick • Improper engine oil viscosity • Engine internal parts malfunction • Seal leakage at the compressor or turbine end of turbocharger (indicated by oil in housing on wheel) • Oil leakage

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Remove and shake the PCV valve. Does the PCV valve rattle?	Yes	Go to the next step.
		No	Replace the PCV valve.
2	Verify the following: • Proper dipstick • Proper engine viscosity • Engine oil level Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 2.
3	Inspect the oil leakage from outside of the engine. Is there any oil leakage found?	Yes	Repair or replace oil leakage part.
		No	Go to the next step.
4	Remove the parts to necessary to inspect turbocharger without remove the turbocharger. Visually inspect for the oil leakage inside turbocharger compressor and turbine housing. Is any engine oil found inside turbocharger compressor or turbine housing?	Yes	Excessive amount of oil is found: Replace the turbocharger. Small amount of oil is found: Wipe oil out of vehicle, then go to the next step.
		No	Go to the next step.
5	Is any engine oil found around oil pipes attached on turbocharger center housing?	Yes	If oil leaks from damaged pipe, replace oil pipe. Install the removed parts at Step 4.
		No	Inspect internal engine parts such as valves, valve guides, valve stem seals, cylinder head drain passage, and piston rings. Then install the removed parts at Step 4.
6	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.17 COOLING SYSTEM CONCERNS-OVERHEATING [L3 WITH TC]

E6U010318881W96

17	COOLING SYSTEM CONCERNS -OVERHEATING
DESCRIPTION	Engine runs at higher than normal temperature/overheats.
POSSIBLE CAUSE	• Improper coolant level • Blown fuse • Coolant leakage (engine internal, turbocharger, external) • Excessive A/C system pressure • A/C system operation is improper • Improper water/anti-freeze mixture • Fans reverse rotation • Poor radiator condition • Thermostat malfunction • Radiator hose damage • Cooling fan inoperative • Condenser fan inoperative • Improper or damaged radiator cap • Coolant overflow system malfunction • Improper drive belt tension • Drive belt damage

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Inspect for the following: • Engine coolant level • Coolant leakage (around heater unit in passenger compartment, coolant hoses and/or radiator.) • Water and anti-freeze mixture • Radiator condition • Collapsed or restricted radiator hoses • Radiator pressure cap • Coolant overflow system • Fan rotational direction • Fan rotation direction • Fuses Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 1.Service if necessary.
2	Connect the WDS or equivalent to the DLC-2. Turn the ignition switch to the ON position (Engine off). Retrieve any DTCs. Is there any DTCs displayed?	Yes	DTC is displayed: Go to appropriate DTC test.
		No	No DTC is displayed: Go to the next step.
3	Perform the KOEO and KOER self-test function using the WDS or equivalent. (See 01–02B–9 KOEO/KOER SELF TEST [L3 WITH TC].) Is there any DTCs displayed?	Yes	DTC is displayed: Go to appropriate DTC test.
		No	No DTC is displayed: Go to the next step.
4	Start the engine and run it at idle speed. Turn the A/C switch off. Does the A/C compressor disengaged?	Yes	Go to the next step.
		No	Go to symptom troubleshooting "NO.24 A/C ALWAYS ON OR A/C COMPRESSOR RUNS CONTINUOUSLY." (See 01–03B–71 NO.24 A/C IS ALWAYS ON OR A/C COMPRESSOR RUNS CONTINUOUSLY [L3 WITH TC].)
5	Perform the Cooling Fan Control System Operation Inspection. (See 01–03B–92 Cooling Fan Control System Inspection.) Does the cooling fan system operate properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part, according to inspection results.
6	Is the drive belt normal?	Yes	Go to the next step.
		No	Replace the drive belt.
7	Is there any leakage around heater unit in passenger compartment?	Yes	Inspect and service heater unit for leakage.
		No	Go to the next step.
8	Is there any leakage at coolant hoses and/or radiator?	Yes	Replace the malfunctioning part.
		No	Go to the next step.
9	Cool down the engine. Remove the thermostat and inspect operation. (See 01–12B–7 THERMOSTAT REMOVAL/INSTALLATION [L3 WITH TC].) (See 01–12B–7 THERMOSTAT INSPECTION [L3 WITH TC].) Is thermostat normal?	Yes	Thermostat is normal. Inspect the cylinder block for leakage or blockage.
		No	Access the ECT PID using the WDS or equivalent. Inspect for both ECT PID and temperature gauge readings. If the temperature gauge on instrument cluster indicates normal but ECT PID is not same as temperature gauge reading, inspect the ECT sensor. (See 01–40B–30 ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [L3 WITH TC].) If the temperature gauge on instrument cluster indicates overheating but ECT PID is normal, inspect the instrument cluster. (See 09–22–6 Water Temperature Gauge.)
10	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.18 COOLING SYSTEM CONCERNS-RUNS COLD [L3 WITH TC]

E6U010318881W97

18	COOLING SYSTEM CONCERNS - RUNS COLD
DESCRIPTION	Engine takes excessive time to reach normal operating temperature.
POSSIBLE CAUSE	• Thermostat malfunction • Condenser fan system malfunction • Cooling fan system malfunction

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Is customer complaint "Lack of passenger compartment heat" only?	Yes	Inspect the A/C heater system.
		No	Go to the next step.
2	Does the engine speed continue at fast idle?	Yes	Go to symptom troubleshooting "NO.9 FAST IDLE/ RUNS ON." (See 01–03B–39 NO.9 FAST IDLE/RUNS ON [L3 WITH TC].)
		No	Go to the next step.
3	Cool down the engine. Remove the thermostat and inspect operation. (See 01–12B–7 THERMOSTAT REMOVAL/ INSTALLATION [L3 WITH TC].) (See 01–12B–7 THERMOSTAT INSPECTION [L3 WITH TC].) Is thermostat normal?	Yes	Go to the next step.
		No	Replace the thermostat.
4	Perform the Cooling Fan Control System Operation Inspection. (See 01–03B–92 Cooling Fan Control System Inspection.) Does the cooling fan system operate properly?	Yes	Access the ECT PID using the WDS or equivalent. Inspect for both ECT PID and temperature gauge readings. If the temperature gauge on instrument cluster indicates normal but ECT PID is not same as temperature gauge reading, inspect the ECT sensor. (See 01–40B–30 ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [L3 WITH TC].) If the temperature gauge on instrument cluster indicates overheating but ECT PID is normal, inspect the instrument cluster. (See 09–22–6 Water Temperature Gauge.)
		No	Repair or replace malfunctioning part, according to inspection results.
5	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.19 EXCESSIVE BLACK SMOKE [L3 WITH TC]

E6U010318881W98

19	EXHAUST SMOKE
DESCRIPTION	Blue, black, or smoke from the exhaust system
POSSIBLE CAUSE	**Blue smoke (Burning oil):** • PCV valve malfunction • Engine internal oil leakage • Oil leakage at the compressor or turbine end of the turbocharger **White smoke (Water in combustion):** • Cooling system malfunction (coolant loss) • Engine internal coolant leakage • Coolant leakage at the compressor or the turbine end of the turbocharger **Black smoke (Rich fuel mixture):** • Air cleaner restriction • Intake-air system is collapsed or restricted • Leakage at engine intake or exhaust manifold • Wastegate valve malfunction (stuck open) • Excessive fuel pressure • Improper engine compression • Ignition system malfunction • Improper fuel injection timing and amount **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	What color is smoke coming from the exhaust system?	Blue	Burning oil is indicated. Go to the next step.
		White	Water in combustion is indicated. Go to the Step 5.
		Black	Rich fuel mixture is indicating. Go to the Step 6.
2	Remove and shake the PCV valve. Does the PCV valve rattle?	Yes	Go to the next step.
		No	Replace the PCV valve.
3	Remove the parts necessary to inspect turbocharger without remove the turbocharger. Visually inspect for the turbocharger compressor housing. Is any engine oil found inside turbocharger compressor housing?	Yes	Install all parts removed in this step. **Perform the following, according to inspection results. Excessive amount of oil is found:** Replace the turbocharger. **Small amount of oil is found:** Wipe oil out of vehicle, then Go to the next step.
		No	Turbocharger is normal. Install all parts removed in this step. Then, Go to the next step.
4	Inspect for the following engine internal parts. • Damaged valve guide, stems or valve seals • Blocked oil drain passage in cylinder head • Piston ring is not seated, seized or worn • Damage cylinder bore Are there ant problem found?	Yes	Repair or replace suspected parts, according to the inspection results.
		No	Engine internal parts are normal. If other driveability symptoms are present, return to diagnostic index to service additional symptoms.
5	Does cooling system hold the coolant pressure? (See 01–12B–5 ENGINE COOLANT LEAKAGE INSPECTION [L3 WITH TC].)	Yes	Inspect for the following: • Cylinder head gasket leakage • Intake manifold gasket leakage • Cracked or porous engine block If other driveability symptoms are present, return to diagnostic index to service additional symptoms.
		No	Inspect for the cause.
6	Inspect for the following for intake-air system. • Air cleaner restriction • Collapsed or restricted • Leakage Are all items normal?	Yes	Go to the next step.
		No	Repair or replace the suspected part.
7	Connect the WDS or equivalent to the DLC-2. Access following PIDs. • ECT • MAF • IAT • IAT2 • APP • TP • MAP • VSS • O2S11 • O2S12 • LONGFT1 • SHTFT1 • PNP (PCM terminal 1W) • CPP (PCM terminal 1H) Monitor the PIDs under the black smoke appeared engine condition. Do all PID indicate normal according to engine conditions?	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and the the related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting procedure. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
8	Inspect the wastegate. (See 01–13B–14 WASTEGATE CONTROL SOLENOID VALVE INSPECTION [L3 WITH TC].) Does the wastegate stuck open?	Yes	Perform the wastegate control system operation inspection. (See 01–03B–93 Wastegate Control System Operation Inspection.) Repair or replace malfunctioning part according to the inspection results.
		No	Go to the next step.

STEP	INSPECTION	RESULTS	ACTION
9	Connect the WDS or equivalent to DLC-2. Access and monitor following PIDs using the data monitor function. • ECT • MAF • IAT • IAT2 • APP • TP • MAP • VSS • CPP (PCM terminal 1H) • PNP (PCM terminal 1W) • O2S11 • O2S12 • LONGFT1 • SHTFT1 Do the PIDs indicate correct values under trouble condition? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to the next step.
		No	Inspect and repair or replace suspected parts and related harnesses. If the malfunction remains, perform the intermittent concern troubleshooting procedure. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
10	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 14.
		No	Go to the next step.
11	Is vehicle accelerate performance normally?	Yes	Go to the next step.
		No	Go to Step 13.
12	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to Step 14.
		No	Replace the delivery pipe.
13	Replace the high pressure fuel pump. Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Retest Step 16.
		No	Go to the next step.
14	Perform the spark test. (See 01–03B–90 Spark Test.) Is a strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Inspect or replace the malfunctioning parts, according to the inspection results.
15	Measure the compression pressure for each cylinder. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].) Are compression pressures within the specification?	Yes	Inspect the fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC])
		No	Inspect for the following: • Damaged valve seat • Worn valve stem and valve guide • Worn or stuck piston ring • Worn piston, piston ring or cylinder • Improper valve timing Service if necessary.
16	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.20 FUEL ODOR (IN ENGINE COMPARTMENT) [L3 WITH TC]

E6U010318881W99

20	FUEL ODOR (IN ENGINE COMPARTMENT)
DESCRIPTION	Gasoline fuel smell or visible leakage
POSSIBLE CAUSE	• Excessive fuel pressure • Purge solenoid valve malfunction • Fuel system vent system blockage • Evaporative gas leakage • Improper connection of evaporative related vacuum hoses • Charcoal canister malfunction • Fuel leakage from fuel system **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **• Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **• Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** **• Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Visually inspect fuel leakage at fuel line. Is there any fuel leakage?	Yes	Service if necessary.
		No	Go to the next step.
2	Inspect the vacuum hose routine. (See 01–13B–4 VACUUM HOSE ROUTING DIAGRAM [L3 WITH TC].) Are vacuum hoses routines properly?	Yes	Go to the next step.
		No	Reconnect the vacuum hose.
3	Perform the Evaporative Emission (EVAP) System Leak Inspection. (See 01–03B–94 Evaporative Emission (EVAP) System Leak Inspection.) Is there any problem found?	Yes	Repair or replace suspected part according to the inspection results.
		No	Go to the next step.
4	Inspect the airflow of purge solenoid valve. (See 01–16B–10 Airflow Inspection.) Is the purge solenoid airflow properly?	Yes	Go to the next step.
		No	Replace the purge solenoid valve.
5	Connect the WDS or equivalent to the DLC-2. Access the FUEL_PRESPID. Monitor the FUEL_PRES PID while idle and race the engine. Is the FUEL_PRES PID indicate **15 MPa {153 kgf/cm^2, 2175 psi} or less**?	Yes	Inspect the charcoal canister for fuel saturation. If excess amount of liquid fuel is present, replace the charcoal canister.
		No	Inspect the fuel pressure sensor and the high pressure fuel pump. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) (See 01–14B–20 HIGH PRESSURE FUEL PUMP INSPECTION [L3 WITH TC].)
5	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.21 ENGINE NOISE [L3 WITH TC]

E6U010318881WA0

21	ENGINE NOISE
DESCRIPTION	Engine noise under hood
POSSIBLE CAUSE	**Squeal, click or chirp noise:** • Improper engine oil level • Loose installation of solenoid valves • Improper drive belt tension **Rumble or grinding sound noise:** • Loose parts • Fluid revel low or air in power the steering fluid • Improper drive belt tension **Hiss sound noise:** • Vacuum leakage • Loose spark plug • Air leakage from the intake-air system **Rattle noise:** • Loose parts **Rap or roar noise:** • Exhaust system looseness **Excessive noise from turbocharger** • Foreign objects or material in the compressor inlet to the intake manifold ducting or the compressor housing • Carbon built-up in the turbine housing • Turbocharger routing assembly banding or dragging • Loose intake or exhaust ducting systems **Other noise:** • Camshaft friction gear noise or MLA noise • Timing chain noise **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR ROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Is the noise from the turbocharger?	Yes	Go to Step 8.
		No	Go to the next step
2	Is squeal, click or chirp sound present?	Yes	Inspect the engine oil level, solenoid valves installation or drive belt tension.
		No	Go to the next step.
3	Is rumble or grinding sound present?	Yes	Inspect and repair the following; • Drive belt tension • Loose parts in engine compartment • Power steering system fluid level If normal, perform the power steering fluid line air bleed. (See 06–12–3 AIR BLEEDING.)
		No	Go to the next step.
4	Is rattle sound present?	Yes	Inspect the location of rattle for loose parts.
		No	Go to the next step.
5	Is hiss sound present?	Yes	Inspect and repair the following; • Vacuum leakage • Spark plug looseness • Intake-air system leakage
		No	Go to the next step.
6	Is rap or roar sound present?	Yes	Inspect the exhaust system or loose parts.
		No	Go to the next step.
7	Is knocking noise present?	Yes	Go to symptom troubleshooting "NO.13 KNOCKING/PINGING". (See 01–03B–52 NO.13 KNOCKING/PINGING [L3 WITH TC].)
		No	If noise comes from engine internal, inspect for the friction gear, timing chain or MLA noise.
8	Inspect the intake and exhaust housing system for loose installation. Is there any problem found?	Yes	Repair installation or replace suspected part.
		No	Go to the next step.
9	Remove the parts to necessary to inspect turbocharger without remove the turbocharger. Inspect if turbocharger compressor wheel is bent, damaged, or interfering with housing on vehicle. Is there any problem?	Yes	Replace the turbocharger.
		No	Go to the next step.
10	Inspect the turbocharger compressor wheel locknut is loose or has fallen down inside turbocharger. Is there any problem?	Yes	Replace the turbocharger.
		No	Go to the next step.
11	Turn the turbocharger compressor wheel by hand. Does the wheel turn easily and smoothly?	Yes	Go to the next step.
		No	Replace the turbocharger.
12	Visually inspect the turbine housing. Is there any carbon built-up or foreign material on turbine housing?	Yes	Clean built-up carbon or remove foreign materials. If turbine housing damaged, replace the turbocharger.
		No	Install the removal parts at Step 9, and inspect all turbocharger related parts installed correctly.
13	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.22 VIBRATION CONCERNS (ENGINE) [L3 WITH TC]

E6U010318881WA1

22	VIBRATION CONCERNS (ENGINE)
DESCRIPTION	• Vibration from under the hood or driveline
POSSIBLE CAUSE	• Loose attaching bolts or worn parts • Components malfunction such as worn parts

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Inspect the following components for loose attaching bolts or worn parts: • Cooling fan • Condenser fan • Drive belt and pulley • Engine mounts • Exhaust system Are all items normal?	Yes	Inspect the following systems: • Wheels • Transmission and mounts • Driveline • Suspension Service if necessary.
		No	Readjust or retighten suspect parts installation position. Service if necessary for other parts.
2	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.23 A/C DOES NOT WORK SUFFICIENTLY [L3 WITH TC]

E6U010318881WA2

23	A/C DOES NOT WORK SUFFICIENTLY.
DESCRIPTION	A/C compressor magnetic clutch does not engage when A/C switch is turned on.
POSSIBLE CAUSE	• Improper refrigerant charging amount • Open A/C magnetic clutch • Open circuit between the A/C relay and the A/C magnetic clutch • Poor ground of A/C magnetic clutch • Refrigerant pressure switch is stuck open. • A/C relay is stuck open. • Seized A/C compressor • Open circuit between the A/C switch and the PCM through both the refrigerant pressure switch and the A/C amplifier

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect the WDS or equivalent to the DLC-2. Turn the ignition switch to the ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
2	Disconnect the A/C compressor connector. Start the engine and turn the A/C switch on. Is there correct voltage at terminal of A/C compressor magnetic clutch connector? **Specification** **10.5 V or more**	Yes	Inspect for the ground condition of magnetic clutch on A/C compressor. If ground condition is normal, inspect for an open circuit magnetic clutch coil.
		No	Go to the next step.
3	Disconnect the refrigerant pressure switch connector. Connect jumper wire between terminals of A/C high-pressure switch connector. Connect jumper wires between terminals of refrigerant pressure switch connector. Turn the ignition switch to the ON position. Turn A/C switch on and set blower fan to any speed. Does A/C work?	Yes	Inspect the refrigerant pressure switch operation. If switch is normal, go to the next step.
		No	Inspect for the following: • A/C switch is stuck open. • Open circuit between refrigerant pressure switch and PCM terminal 1AC • Open circuit between blower motor fan switch and resistor (if blower motor does not operate) • Evaporator temperature sensor and A/C amplifier

STEP	INSPECTION	RESULTS	ACTION
4	Remove jumper wire from switch connector. Reconnect connector to refrigerant pressure switch. Start engine and turn A/C switch on. Does fan operate?	Yes	Inspect the whether A/C relay is stuck open. Replace if necessary.
		No	Inspect the following and repair or replace if necessary: • Refrigerant charging amount • A/C compressor for seizure
5	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.le. Retest.		

NO.24 A/C IS ALWAYS ON OR A/C COMPRESSOR RUNS CONTINUOUSLY [L3 WITH TC]

E6U010318881WA3

24	A/C IS ALWAYS ON OR A/C COMPRESSOR RUNS CONTINUOUSLY.
DESCRIPTION	A/C compressor magnetic clutch does not disengage.
POSSIBLE CAUSE	• A/C compressor magnetic clutch engagement is stuck. • A/C relay is stuck closed. • Short to ground between A/C switch and PCM • Short to ground circuit between A/C relay and PCM • A/C relay to magnetic clutch circuit shorted to battery power

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Connect the WDS or equivalent to the DLC-2. Turn the ignition switch to the ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
2	Start the engine and idle it. Turn the A/C switch on. Remove the A/C relay. Does the A/C magnetic clutch disengage?	Yes	Inspect for the following: • A/C relay is stuck closed. • Short to ground circuit between A/C relay and PCM terminal 4N. If both items normal, go to the next step.
		No	Inspect if circuit between A/C relay and magnetic clutch shorts to battery power circuit. If circuit is normal, inspect magnetic clutch for stuck engagement or clearance.
3	Disconnect the refrigerant pressure switch connector. Start the engine and turn the A/C switch on. **Note** • A/C should not work when disconnecting connector. If A/C remains working, short to ground circuit may be present. Does A/C remain working?	Yes	Inspect for a short to ground circuit between refrigerant pressure switch and PCM terminal 1AC.
		No	Go to the next step.
4	Reconnect refrigerant pressure switch connector. Turn off A/C switch. **Note** • A/C should not work when turning A/C switch off. If A/C remains working, short to ground circuit may be present. Does A/C remain working?	Yes	Inspect for the following: • Short to ground circuit between A/C switch and A/C amplifier • Short to ground circuit between A/C amplifier and refrigerant pressure switch
		No	Inspect the whether A/C switch is stuck closed.
5	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.le. Retest.		

NO.25 A/C IS NOT CUT OFF UNDER WIDE OPEN THROTTLE CONDITIONS [L3 WITH TC]

E6U010318881WA4

25	A/C IS NOT CUT OFF UNDER WOT CONDITIONS.
DESCRIPTION	A/C compressor magnetic clutch does not disengage under WOT.
POSSIBLE CAUSE	• Accelerator position sensor malfunction • Loosely installed accelerator position sensor.

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Does the A/C compressor disengage when A/C switch is turned off?	Yes	Go to the next step.
		No	Go to symptom troubleshooting "No.24 A/C is always on or A/C compressor runs continuously".
2	Connect the WDS or equivalent to the DLC-2. Turn the ignition switch to the ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to appropriate DTC test.
		No	**No DTC is displayed:** Inspect the accelerator position sensor.
3	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.Ie. Retest.		

NO.26 EXHAUST SULPHUR SMELL [L3 WITH TC]

E6U010318881WA5

26	EXHAUST SULPHUR SMELL
DESCRIPTION	Rotten egg smell (sulphur) from exhaust
POSSIBLE CAUSE	• Electrical connectors are disconnected or connected poorly • Charcoal canister malfunction • Vacuum lines are disconnected or connected improperly. • Improper fuel pressure • Poor fuel quality **Warning** **The following troubleshooting flow chart contains fuel system diagnosis and repair procedures. Read following warnings before servicing fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Are any driveability or exhaust smoke concerns present?	Yes	Go to the appropriate flow chart.
		No	Go to the next step.
2	Inspect for the following: • Electrical connections • Vacuum lines • Fuel quality Are all items normal?	Yes	Go to the next step.
		No	Service if necessary. Repeat Step 2.
3	Connect the WDS or equivalent to the DLC-2. Turn the ignition switch to the ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
4	Access and monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to Step 8.
		No	Go to the next step.
5	Is vehicle accelerate performance normally?	Yes	Go to the next step.
		No	Go to Step 7.
6	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to Step 8.
		No	Go to the next step.
7	Replace the high pressure fuel pump. Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Go to Step 9.
		No	Go to the next step.
8	Inspect the charcoal canister for fuel saturation. Is excess amount of liquid fuel present in canister?	Yes	Replace the charcoal canister.
		No	Inspect the fuel tank vent system. If fuel tank vent system is normal, suggest trying a different brand since sulfur content can vary in different fuels. If fuel tank vent system is not normal, repair or replace the malfunctioning parts.
9	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.Ie. Retest.		

NO.27 FUEL REFILL CONCERNS [L3 WITH TC]

E6U010318881WA6

27	Fuel refill concerns
DESCRIPTION	• Fuel tank does not fill smoothly.
POSSIBLE CAUSE	• Clogged EVAP pipes • Nonreturn valve malfunction • Improper use of fuel nozzle • Inadequate fuel filling speed **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before servicing the fuel system:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	Connect the WDS or equivalent to the DLC-2. Turn the ignition switch to the ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
2	Remove the fuel-filler pipe. Make sure nonreturn valve is installed properly. Inspect the nonreturn valve operation. Is nonreturn valve normal?	Yes	Inspect for the following: • Improper use of fuel nozzle • Inadequate fuel filling speed
		No	**Nonreturn valve is installed improperly:** • Reinstall the nonreturn valve to proper position. **Nonreturn valve does not operate properly:** • Replace the nonreturn valve.
3	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.Ie. Retest.		

NO.28 FUEL FILLING SHUT OFF ISSUES [L3 WITH TC]

E6U010318881WA7

28	Fuel filling shut off issues
DESCRIPTION	• Fuel does not shut off properly.
POSSIBLE CAUSE	• Clogged EVAP pipes • Nonreturn valve malfunction • Fuel shut-off valve malfunction • Fuel nozzle malfunction • Fuel nozzle is not inserted correctly. **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before servicing the fuel system:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	Connect the WDS or equivalent to the DLC-2. Turn the ignition switch to the ON position (Engine off). Retrieve any DTCs. Are there any DTCs displayed?	Yes	**DTC is displayed:** Go to the appropriate DTC test.
		No	**No DTC is displayed:** Go to the next step.
2	Remove the fuel-filler pipe. Make sure nonreturn valve is installed properly. Inspect the nonreturn valve operation. Is nonreturn valve normal?	Yes	Inspect for the following: • Improper use of fuel nozzle • Fuel is not inserted correctly. • Inspect fuel shut-off valve.
		No	**Nonreturn valve is installed improperly:** • Reinstall the nonreturn valve to proper position. **Nonreturn valve does not operate properly:** • Replace the nonreturn valve.
3	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.29 CONSTANT VOLTAGE [L3 WITH TC]

E6U010318881WA8

29	CONSTANT VOLTAGE
DESCRIPTION	Incorrect constant voltage
POSSIBLE CAUSE	• Constant voltage circuit malfunction **Note** • MAP sensor, fuel pressure sensor and accelerator position sensor use constant voltage.

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Disconnect the MAP sensor connector where constant voltage circuit inspection failed. Turn the ignition switch to the ON position. Measure voltage between the following MAP sensor connector terminals: • Constant voltage terminal - ground terminal Is constant voltage **greater than 6.0 V**?	Yes	Go to Step 13.
		No	Go to the next step.
2	Is voltage across battery terminals **greater than 10.5 V**?	Yes	Go to the next step.
		No	Inspect the charging system.
3	Turn the ignition switch off. Leave the MAP sensor connector disconnected. Disconnect the fuel pressure sensor and accelerator position sensor connectors. Measure the voltage between battery positive terminal and ground (between PCM and MAP sensor) circuit at appropriate sensor connector. Is the voltage **greater than 10.5 V** and **within 1.0 V** of battery voltage?	Yes	Go to the next step.
		No	Go to Step 8.
4	**Note** • Purpose of this step is to determine if WDS or equivalent is communicating with PCM. Turn the ignition switch to the ON position. Attempt to access ECT PID. Can ECT PID be accessed?	Yes	Go to Step 7.
		No	Go to the next step.
5	Turn the ignition switch off. Disconnect the manifold pressure sensor and PCM connectors. Turn the ignition switch to the ON position. Measure the voltage between PCM terminals, 2Y and 2AB. Is the voltage **greater than 10.5 V**?	Yes	Go to the next step.
		No	Repair open circuit between PCM terminal 2Y and main relay.
6	Leave the MAP sensor and the PCM connectors disconnected. Measure the resistance between PCM terminals, 2Y and 2AB. Is the resistance **greater than 10,000 ohms**?	Yes	Inspect for the constant voltage at suspect sensor connector again.
		No	Repair the constant voltage circuit short to ground.
7	Turn the ignition switch off. Leave the MAP sensor disconnected. Disconnect the PCM connector. Measure the resistance between PCM terminal, 1J and constant voltage circuit at appropriate sensor connector. Is the resistance **less than 5.0 ohms**?	Yes	Inspect for the constant voltage at suspect sensor connector again.
		No	Repair the open constant voltage circuit.
8	**Note** • Purpose of this step is to determine if WDS or equivalent is communicating with PCM. Reconnect the MAP sensor connector. Turn the ignition switch to the ON position. Access the ECT PID. Can ECT PID be accessed?	Yes	Go to the next step.
		No	Go to Step 11.

STEP	INSPECTION	RESULTS	ACTION
9	Are the DTCs present for two or more sensors connected to PCM terminal, 2H? Sensor connected to PCM terminal, 2H. • IAT sensor (P0112, P0113) • Boost air temperature sensor (P0097, P0098) • FHO2S (P0131, P0132) • RHO2S (P0137, P0138) • MAP sensor (P0107, P0108) • ECT sensor (P0117, P0118) • Accelerator position sensor (P2122, P2123, P2127, P2128)	Yes	Go to the next step.
		No	Repair the open ground circuit to sensor where constant voltage circuit inspection failed.
10	Turn the ignition switch off. Disconnect the WDS or equivalent from the DLC-2. Disconnect the PCM connector. Measure the resistance between ground circuit at appropriate sensor connector and PCM terminal, 2H. Is resistance **less than 5.0 ohms**?	Yes	Reconnect the sensor connector. Go to appropriate DTC test.
		No	Repair open ground circuit.
11	Turn the ignition switch off. Disconnect the PCM connector. Measure the resistance between battery negative terminal and PCM terminals, 4X, 2AB and 2AC. Is each resistance **less than 5.0 ohms**?	Yes	Go to the next step.
		No	Repair open ground circuit.
12	Turn the ignition switch off. Measure the resistance between ground circuit at the following sensor connectors and ground: • IAT sensor (integrated in MAF sensor) • Boost air temperature sensor (integrated in MAP sensor) • FHO2S • RHO2S • MAP sensor • ECT sensor • APP sensor	Yes	Ground circuits are normal. Inspect for the constant voltage at suspect sensor connector again.
		No	Inspect for the open ground circuit.
13	Turn the ignition switch off. Disconnect the MAP sensor and integrated the PCM connectors. Turn the ignition switch to the ON position. Measure the voltage between constant voltage circuit at the MAP sensor connector and battery negative terminal. Is the voltage **less than 0.5 V**?	Yes	Inspect for the constant voltage at suspect sensor connector again.
		No	Repair the constant voltage circuit shorted to power in harness.
14	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

NO.30 SPARK PLUG CONDITION [L3 WITH TC]

E6U010318881WA9

30	SPARK PLUG CONDITION
DESCRIPTION	Incorrect spark plug condition
POSSIBLE CAUSE	**Note** • Inspecting the condition of the spark plugs can determine whether a problem is related to a specific cylinder or possibly all cylinders. **Wet/carbon stuck on specific plug:** • Spark—Weak, not visible • Air/fuel mixture—Excessive fuel injection volume • Compression—No compression, low compression • Malfunctioning spark plug **Grayish white with specific plug:** • Air/fuel mixture—Insufficient fuel injection volume • Malfunctioning spark plug **Wet/carbon is stuck on all plugs:** • Spark—Spark weak • Air/fuel mixture—Too rich • Compression—Low compression • Clogging in intake/exhaust system **Grayish white with all plugs:** • Air/fuel mixture—Too lean **Warning** **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before servicing the fuel system:** • **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** • **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)** **(See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)** **Caution** • **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION	RESULTS	ACTION
1	Remove all the spark plugs. Inspect the spark plug condition. Is the spark plug condition normal?	Yes	Troubleshooting completed.
		No	**Specific plug is wet or covered with carbon:** Go to the next step. **Specific plug looks grayish white:** Go to Step 9. **All plugs are wet or covered with carbon:** Go to Step 11. **All plugs look grayish white:** Go to Step 19.
2	Is the spark plug wet/covered with carbon from engine oil?	Yes	Inspect all areas related to oil.
		No	Go to the next step.
3	Inspect the spark plugs for the following: • Cracked insulator • Heat range • Air gap • Worn electrode Is the spark plug normal?	Yes	Go to the next step.
		No	Replace the spark plug.
4	Inspect the compression pressure at the suspected malfunctioning cylinder. Is the compression pressure correct? (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].)	Yes	Go to the next step.
		No	Repair or replace the malfunctioning parts.

STEP	INSPECTION	RESULTS	ACTION
5	Install all the spark plugs. Perform the spark test at the suspected malfunctioning cylinder. Is a strong blue spark visible? (Compare with normal cylinder.)	Yes	Go to the next step.
		No	Repair or replace the malfunctioning parts.
6	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Inspect the suspected cylinders fuel injector for the following: • Open or short circuit in the fuel injector (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].)
		No	Go to the next step.
7	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to the next step.
		No	Replace the delivery pipe.
8	Inspect the high pressure fuel pump. (See 01–14B–20 HIGH PRESSURE FUEL PUMP INSPECTION [L3 WITH TC].) Is the high pressure fuel pump normal?	Yes	Replace the delivery pipe. Retest Step 6 If the FUEL_PRES PID indication is other that the specification, replace the high pressure fuel pump.
		No	Replace the high pressure fuel pump.
9	Inspect the spark plug for the following. • Heat range • Air gap Is the spark plug normal?	Yes	Go to the next step.
		No	Replace the spark plug.
10	Perform the KOER self-test function using the WDS or equivalent. (See 01–02B–9 KOEO/KOER SELF TEST [L3 WITH TC].) Is the suspected cylinder injector circuit related DTC (P0201, P0202, P0203 or P0204) present?	Yes	Go to appropriate the DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	Inspect the suspect cylinder fuel injector for the following: • Resistance (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].)
11	Is the air cleaner element free of blockage?	Yes	Go to the next step.
		No	Replace the air cleaner element.
12	Perform the spark test. (See 01–03B–80 ENGINE CONTROL SYSTEM OPERATION INSPECTION [L3 WITH TC].) Is a strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Repair or replace the malfunctioning parts.
13	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Go to step 16.
		No	Go to the next step.
14	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to the next step.
		No	Replace the delivery pipe.
15	Inspect the high pressure fuel pump. (See 01–14B–20 HIGH PRESSURE FUEL PUMP INSPECTION [L3 WITH TC].) Is the high pressure fuel pump normal?	Yes	Replace the delivery pipe. Retest Step 13. If the FUEL_PRES PID indication is other that the specification, replace the high pressure fuel pump.
		No	Replace the high pressure fuel pump.
16	Inspect the following PIDs: • ECT • O2S11 (When engine can be started) • MAF (See 01–40B–6 PCM INSPECTION [L3 WITH TC].) Are the PIDs normal?	Yes	Go to the next step.
		No	Repair or replace the malfunctioning parts.
17	Perform the purge control inspection. (When engine can be started) (See 01–03B–91 Purge Control System Inspection.) Is the purge control correct?	Yes	Go to the next step.
		No	Repair or replace the malfunctioning parts.
18	Perform the compression inspection. Is the compression correct?	Yes	Inspect for clogging in the exhaust system.
		No	Repair or replace the malfunctioning parts.

STEP	INSPECTION	RESULTS	ACTION
19	When the engine cannot be started, inspect the intake-air system for air leakage. When the engine can be started, perform the intake manifold vacuum inspection. Is air sucked in from the intake-air system?	Yes	Repair or replace the malfunctioning part.
		No	Go to the next step.
20	Access and monitor the FUEL_PRES PID. Is the FUEL_PRES PID value within the specification? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Inspect for the following PIDs: • ECT • O2S11 • O2S12 • MAF (See 01–40B–6 PCM INSPECTION [L3 WITH TC].) Inspect the PCM ground condition.
		No	Go to the next step.
21	Is vehicle accelerate performance normally?	Yes	Go to the next step.
		No	Go to Step 13.
22	Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].) Is the fuel pressure sensor normal?	Yes	Go to the next step.
		No	Replace the delivery pipe.
23	Replace the high pressure fuel pump. Monitor FUEL_PRES PID. Is the FUEL_PRES PID value within the specified? (See 01–40B–6 Using the WDS or Equivalent.)	Yes	Troubleshooting is completed. Go to Step 16.
		No	Inspect following PIDs. • ECT • O2S11 • O2S12 • MAF (See 01–40B–6 Using the WDS or Equivalent.) Inspect PCM ground condition.
24	Verify test results. • If normal, return to the diagnostic index to service any additional symptoms. • If a malfunction remains, inspect the related Service Bulletins and/or On-line Repair Information and perform the repair or diagnosis. — If the vehicle is repaired, troubleshooting is completed. — If the vehicle is not repaired or additional diagnostic information is not available, reprogram the PCM if a later calibration is available. Retest.		

ENGINE CONTROL SYSTEM OPERATION INSPECTION [L3 WITH TC]

E6U010318881WB0

Input Signal System Investigation Procedure

1. Find an unusual signal. (See 01–03B–80 Finding unusual signals.)
2. Locate the source. (See 01–03B–80 Locating the source of unusual signals.)
3. Repair or replace the defective part.
4. Confirm that the unusual signal has been erased.

Finding unusual signals

While referring to 01–02B–7 ON-BOARD DIAGNOSTIC TEST [L3 WITH TC], use the PID/DATA monitor and record function to inspect the input signal system relating to the problem.

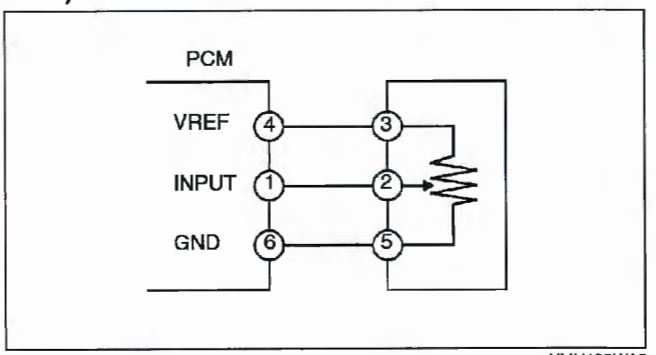
1. Start the engine and idle the vehicle. You can assume that any signals that are out of specification by a wide margin are unusual.
2. When recreating the problem, any sudden change in the monitor input signals that is not consciously created by the driver can be determined as unusual.

Locating the source of unusual signals

Caution

- **Compare the WDS or equivalent monitor voltage with the measurement voltage using the digital measurement system function. If you use another tester, a misreading may occur.**
- **When measuring the voltage, attach the tester ground to the ground of the PCM that is being tested, or to the engine itself. If this is not done, the measured voltage and actual voltage may differ**
- **After connecting the pin to a waterproof coupler, confirm continuity and measure the voltage, and inspect the waterproof connector for cracks. If there are any, use sealant to fix them. Failure to do this may result in deterioration of the wiring harness or terminal from water damage, leading to problems with the vehicle.**

Variable resistance type 1 (TP sensor and EGR boost sensor)



YMU103WA5

Investigate the input signal system for variable resistance type 1

1. When an unusual signal is received, measure the #1 PCM terminal voltage.
   - If the #1 terminal voltage and the WDS or equivalent monitor voltage are the same, proceed to the next step.
   - If there is a difference of **0.5 V or more**, inspect for the following points concerning the PCM connector:
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Wiring harness/pin crimp is loose or disconnected.
2. Measure the #2 sensor terminal voltage.
   - If there is a **0.5 V or more** difference between the sensor and WDS or equivalent voltages, inspect the wiring harness for open or short circuits.
   - If the sensor and WDS or equivalent voltages are the same, inspect for the following points concerning the sensor connector:
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
   - If there are no problems, proceed to next investigation below.

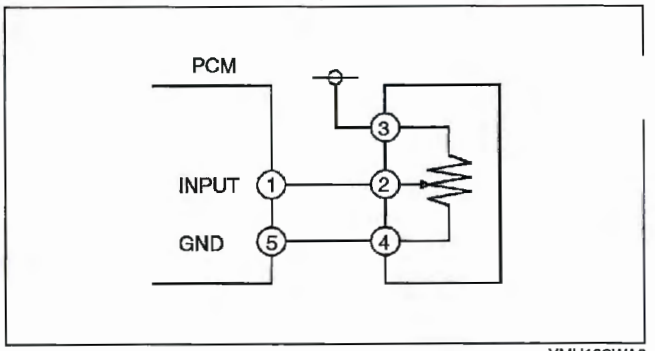
Investigate the standard power supply system for variable resistance type 1

- Confirm that the #3 terminal is at **5 V**.
  — If the measured voltage on the #3 terminal is **5 V**, inspect the following points on the sensor connector.
  — If there is no problem, inspect for the following:
    - Female terminal opening loose
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
  — If the #3 terminal measures other than **5 V**, inspect for the following:
    - Open or short circuit in wiring harness
    - Wiring harness/pin crimp is loose or disconnected.

Investigate the ground system for variable resistance type 1

- Confirm that terminal sensor #5 is at **0 V**.
  — If it is at **0 V**, inspect the sensor.
    - If necessary, replace the sensor.
  — If not, inspect for the following:
    - Open or short circuit in wiring harness
    - Female terminal opening is loose causing an open or short circuit in wiring harness
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
    - Wiring harness/pin crimp is loose or disconnected.

Variable resistance type 2 (fuel tank level sensor and mass air flow (MAF) sensor)



YMU103WA6

Investigate the ground system for variable resistance type 2

- Confirm that terminal sensor #4 is at **0 V**.
  - — If it is at **0 V**, inspect the sensor.
    - If necessary, replace the sensor.
  - — If not at **0 V**, inspect for the following:
    - Open circuit in wiring harness
    - Female terminal opening is loose.
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
    - Wiring harness/pin crimp is loose or disconnected.

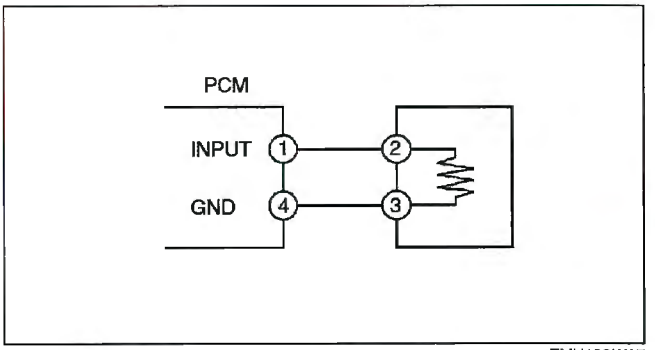
Investigate the input signal system for variable resistance type 2

1. When an unusual signal is received, measure the #1 PCM terminal voltage.
   - If the #1 terminal voltage and the WDS or equivalent monitor voltage are the same, proceed to the next step.
   - If there is a difference of **0.5 V or more**, inspect for the following points concerning the PCM connector:
     - — Female terminal opening is loose.
     - — Coupler (pin holder) damage
     - — Pin discoloration (blackness)
     - — Wiring harness/pin crimp is loose or disconnected.
2. Measure the #2 sensor terminal voltage.
   - If there is a **0.5 V or more** difference between the sensor and WDS or equivalent voltages, inspect the wiring harness for open or short circuits.
   - If the sensor and WDS or equivalent voltages are the same, inspect the following points concerning the sensor connector:
     - — Female terminal opening is loose.
     - — Coupler (pin holder) damage
     - — Pin discoloration (blackness)
     - — Wiring harness/pin crimp is loose or disconnected.
   - If there are no problems, proceed to next investigation below.

Investigate the electrical supply system for variable resistance type 2

- Confirm that the sensor #3 terminal is **B+**.
  - — If the measured voltage on the #3 terminal is **B+**, inspect the following points on the sensor connector.
  - — If there is no problem, inspect for the following:
    - Female terminal opening is loose.
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
  - — If the #3 terminal measures other than **B+**, inspect the following:
    - Open or short circuit in wiring harness
    - Wiring harness/pin crimp is loose or disconnected.

Thermistor type (IAT sensor and ECT sensor)



ZMU103WA7

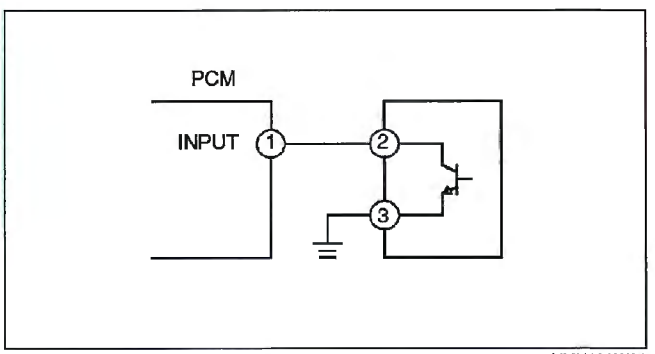
Investigate the input signal system for thermistor type

1. When an unusual signal is received, measure the #1 PCM terminal voltage.
   - If the #1 terminal voltage and the WDS or equivalent monitor voltage are the same, proceed to the next step.
   - If there is a difference of **0.5 V or more**, inspect the following points concerning the PCM connector:
     — Female terminal opening loose
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Wiring harness/pin crimp is loose or disconnected.
2. Measure the #2 sensor terminal voltage.
   - If there is a **0.5 V or more** difference between the sensor and WDS or equivalent voltages, inspect the wiring harness for open or short circuits.
   - If the sensor and WDS or equivalent voltages are the same, inspect the following points concerning the sensor connector:
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Wiring harness/pin crimp is loose or disconnected.
   - If there are no problems, proceed to next investigation below.

Investigate the ground system for thermistor type

- Confirm that terminal sensor #3 is at **0 V**.
  — If it is at **0 V**, inspect the sensor. If necessary, replace the sensor.
  — If not, inspect for the following:
    - Open circuit in wiring harness
    - Female terminal opening is loose.
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
    - Wiring harness/pin crimp is loose or disconnected.

VSS



YMU103WA8

1. Measure the #1 PCM terminal voltage and confirm that it is at **0 V** or **5 V** when the ignition switch to the ON position and the engine is idling.
   - If it is at **0 V** or **5 V**, intermittent concern exists. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
   - If not, inspect the following points concerning the PCM connector.
   - If there is no problem, inspect for the following:
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Wiring harness/pin crimp is loose or disconnected.
2. Measure the #2 sensor terminal voltage and confirm that it is at **0 V** or **5 V** when the ignition switch to the ON position and the engine is idling.
   - If it is at **0 V** or **5 V**, intermittent concern exists. (See 01–03B–6 INTERMITTENT CONCERN TROUBLESHOOTING [L3 WITH TC].)
   - If not, inspect the following points concerning the sensor connector:
   - If there is no problem, inspect for the following.
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Wiring harness/pin crimp is loose or disconnected.
3. Confirm that the #3 terminal switch voltage is at **0 V**.
   - If it is at **0 V**, inspect the sensor. If necessary, replace the sensor.
     — If necessary, replace the sensor.
   - If not, inspect for the following:
     — Open circuit in wiring harness
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Wiring harness/pin crimp is loose or disconnected.

Main Relay Operation Inspection

1. Verify that the main relay clicks when the ignition switch is turned to ON position and then off.
   - If there is no operation sound, inspect the following:
     — Main relay (See 09–21–7 RELAY INSPECTION.)
     — Wiring harness and connector between ignition switch and main relay terminal A.
     — Wiring harness and connector between PCM terminal 2X and main relay terminal E.

Intake Manifold Vacuum Inspection

1. Verify air intake hoses are installed properly.
2. Start the engine and run it is idling.
3. Disconnect the vacuum hose between the intake manifold and purge solenoid valve from the intake manifold side.
4. Connect a vacuum gauge to the intake manifold and measure the intake manifold vacuum.
   - If not as specified, inspect the following:

Specification
More than 60 kPa {450 mmHg, 18 inHg}

Note
- Air suction can be located by the engine speed change when lubricant is sprayed on the area where suction is occurring.
  — Air suction at throttle body, charge air cooler, intake manifold and PCV valve installation points
  — EGR valve (stuck open)
  — Engine compression
  (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].)

Electronic Throttle Control System Inspection

Engine coolant temperature compensation inspection

1. Connect the WDS or equivalent to the DLC-2.
   Select the following PIDs:
   - ECT
   - IAT
   - RPM
3. Verify that the engine is cold, then start the engine.
4. Verify that the engine speed decreases as the engine warms up.
   - If the engine speed does not decrease or decreases slowly, inspect the following:
     — ECT sensor and related wiring harness
     (See 01–40B–30 ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [L3 WITH TC].)
     — Electronic throttle body and related wiring harness
     (See 01–13B–12 THROTTLE ACTUATOR INSPECTION [L3 WITH TC].)

Load compensation inspection

1. Start the engine and run it is idling.
2. Connect the WDS or equivalent to the DLC-2.
3. Verify that DTC P0506 or P0507 is not displayed.
   - If DTC P0506, or P0507 is displayed, perform the DTC inspection.
     (See 01–02B–14 DTC TABLE [L3 WITH TC].)
4. Select the RPM PID.

Note
- Excludes temporary idle speed drop just after the loads are turned on.

5. Verify that the engine speed is within the specification under each load condition.
   - If the load condition is not as specified, inspect the following:
     — A/C switch and related wiring harness
     (See 07–40–39 CLIMATE CONTROL UNIT INSPECTION [L3 WITH TC].)
     — Fan switch and related wiring harness
     (See 07–40–39 CLIMATE CONTROL UNIT INSPECTION [L3 WITH TC].)
     — PSP switch and related wiring harness
     (See 01–40B–24 POWER STEERING PRESSURE (PSP) SWITCH INSPECTION [L3 WITH TC].)

Engine speed

Load condition		Engine speed (rpm)*1
No load		650—750
E/L operating		650—750
P/S operating		650—750
A/C operating*2	Refrigerant pressure low*3	700—800
	Refrigerant pressure high*4	725—825

*1 : Neutral
*2 : A/C switch and fan switch are on.
*3 : Refrigerant pressure switch (middle pressure) is off.
*4 : Refrigerant pressure switch (middle pressure) is on.

Throttle position (TP) sweep inspection

1. Connect the WDS or equivalent to the DLC-2.
2. Reform the KOER self-test function.
   (See 01–02B–9 KOEO/KOER SELF TEST [L3 WITH TC].)
3. Verify that none of the following DTCs are displayed:
   - P0122, P0123, P0222, P0223, P2100, P2101, P2102, P2103, P2107, P2108, P2119, P2122, P2123, P2127, P2128, P2135, P2138
     — If any one DTC is displayed, perform the DTC inspection.
4. Access the TP_REL PID.
5. Verify that the PID reading is within the CTP value. (See 01–40B–6 PCM INSPECTION [L3 WITH TC].)
   - If the PID reading is out of range, perform the following:
     — Remove the air duct from the throttle valve body.
     — Verify that the throttle valve opens when the accelerator pedal is depressed.
       - If the throttle valve opens, inspect the throttle position sensor and the related wiring harness.
       - If the throttle valve does not open, inspect the throttle actuator control motor and the related wiring harness.

6. Gradually depress the throttle pedal and verify that the PID reading increases lineally.
   - If the PID reading drops momentarily, inspect the following:
     — Throttle position sensor
7. Fully depress the throttle pedal and verify that the PID reading is within the WOT value. (See 01–40B–6 PCM INSPECTION [L3 WITH TC].)
   - If the PID reading is out of range, perform the following:
     — Remove the air duct from throttle valve body with connector connected.
     — Verify that the throttle valve opens when throttle pedal is depressed.
       - If the throttle valve opens, inspect the throttle position sensor and the related wiring harness.
       - If the throttle valve does not open, inspect the throttle actuator control motor and the related wiring harness.

Variable Swirl System Operation Inspection

1. Connect the WDS or equivalent to the DLC-2.
2. Access the ECT PID.
3. Verify that the ECT PID is **below 60°C {140°F}**.
4. Start the engine.
5. Inspect the rod operation under the following conditions:

Rod operation

Engine speed	3,750 rpm	
	Below	Above
Shutter valve actuator	Operate	Not operate

If the rod operation is not specified, inspect as follows:

1. Perform the KOER self-test using the WDS or equivalent and verify that DTCs No. P2004, P2006, P2009 or P2010 are not displayed.
   - If DTC No. P2004, P2006, P2009 or P2010 are displayed, perform DTC inspection. (See 01–02B–14 DTC TABLE [L3 WITH TC].)

If simulation function of WDS or equivalent is used:

1. Turn the ignition switch to the ON position. (Engine off)
2. Turn the variable swirl solenoid valve from off to on using the IMRC PID and verify that the operation sound of the solenoid valve is heard.
   - If the operation sound is not heard, replace the variable swirl solenoid valve. (See 01–13B–13 VARIABLE SWIRL SOLENOID VALVE INSPECTION [L3 WITH TC].)
   - If the operation sound is not heard, inspect the following:
     — Vacuum hose and vacuum chamber for looseness or damage
     — Shutter valve actuator (See 01–13B–13 VARIABLE SWIRL SHUTTER VALVE ACTUATOR INSPECTION [L3 WITH TC].)
     — Check valve is stuck open or closed
     — Shutter valve cannot move smoothly

If simulation function of WDS or equivalent is not used:

1. Inspect variable swirl solenoid valve. (See 01–13B–13 VARIABLE SWIRL SOLENOID VALVE INSPECTION [L3 WITH TC].)
   - If the variable swirl solenoid valve is not normal, replace the variable swirl solenoid valve.
   - If the variable swirl solenoid valve is normal, inspect the following:
     — Vacuum hose and vacuum chamber for looseness or damage
     — Shutter valve actuator (See 01–13B–13 VARIABLE SWIRL SHUTTER VALVE ACTUATOR INSPECTION [L3 WITH TC].)
     — Check valve is stuck open or closed
     — Shutter valve cannot move smoothly

Fuel Injector Operation Inspection
If simulation function of WDS or equivalent is used:

STEP	INSPECTION		ACTION
1	Start the engine and warm it up until normal operating temperature. Connect the WDS or equivalent to DLC-2. Select the INJ#1, INJ#2, INJ#3, and INJ#4 PIDs. Turn the fuel injector from on to off using the PIDs for each cylinder. Does the engine speed drop?	Yes	Fuel injector work properly
		No	**Engine speed does not drop an any cylinder:** Go to the next steps. **Engine speed drops on some cylinders:** Go to step 3.
2	Perform the Main Relay Operation Inspection. (See 01–03B–84 Main Relay Operation Inspection.) Does the main relay work properly?	Yes	Go to the next step.
		No	Repair or replace the malfunctioning parts.
3	Inspect the fuel injector of the suspected cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Is the fuel injector normal?	Yes	Inspect the following for the suspected cylinder. • Fuel injector power and/or ground systems related wiring harness and connectors. If all items normal replace the injector driver module. (See 01–40B–21 INJECTOR DRIVER MODULE REMOVAL/INSTALLATION [L3 WITH TC].)
		No	Replace the fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/ INSTALLATION [L3 WITH TC].)
4	Perform KOER self-test function using the WDS or equivalent. (See 01–02B–9 KOEO/KOER SELF TEST [L3 WITH TC].) Are DTCs P0201, P0202, P0203 and/or P0204 present?	Yes	Go to the appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	Go to the next step.
5	Inspect the fuel injector of the suspected cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Is the fuel injector normal?	Yes	Inspect the following for the suspected cylinder: • PCM terminals (pulled-out pins, corrosion) • Injector driver module terminals (pulled-out pins, corrosion) • Fuel injector terminals (pulled-out pins, corrosion) If all items are normal replace the injector driver module. (See 01–40B–21 INJECTOR DRIVER MODULE REMOVAL/INSTALLATION [L3 WITH TC].)
		No	Replace the fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/ INSTALLATION [L3 WITH TC].)

If simulation function of WDS or equivalent is not used:

STEP	INSPECTION		ACTION
1	Perform the KOER self-test function using the WDS or equivalent. (See (0102) KOEO/KOER SELF-TEST.) Are DTCs P0201, P0202, P0203 and/or P0204 present?	Yes	Go to appropriate DTC test. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
		No	Go to the next step.
2	Inspect the fuel injector for each cylinder. (See 01–14B–29 FUEL INJECTOR INSPECTION [L3 WITH TC].) Is the fuel injector normal?	Yes	Go to the next step.
		No	Replace the fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/ INSTALLATION [L3 WITH TC].)
3	Inspect the following for the suspected cylinder: • Fuel injector power and/or ground system related wiring harnesses and connectors. • PCM terminals (pulled-out pins, corrosion) • Injector driver module terminals (pulled-out pins, corrosion) • Fuel injector terminals (pulled-out pins, corrosion) Are all items normal?	Yes	Replace the injector driver module. (See 01–40B–21 INJECTOR DRIVER MODULE REMOVAL/INSTALLATION [L3 WITH TC].)
		No	Repair or replace malfunctioning parts.

Fuel Cut Control System Inspection

Note
- This inspection has to be performed after the Fuel Injector Operation Inspection.

If simulation function of WDS or equivalent is used:
1. Warm up the engine and idle it.
2. Connect the WDS or equivalent to the DLC-2.
3. Select the RPM and the FUELPW1 PIDs.
4. Monitor both PIDs while performing the following steps.
   1. Depress the accelerator pedal and increase the RPM PID to **4,000 rpm.**
   2. Quickly release the accelerator pedal (brake pedal is not depressed) and verify that the FUELPW1 PID is **0 msec.**, and **2—5 msec.** when the RPM PID drops **below 1,200 rpm**.
   - If not as specified, inspect the following.
     — ECT sensor and related wiring harness
     (See 01–40B–30 ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [L3 WITH TC].)
     — Neutral switch and related wiring harness
     (See 01–40B–23 NEUTRAL SWITCH INSPECTION [L3 WITH TC].)
     — Clutch switch and related wiring harness
     (See 01–40B–22 CLUTCH PEDAL POSITION (CPP) SWITCH INSPECTION [L3 WITH TC].)

If simulation function of WDS or equivalent is not used:
1. Warm up the engine and idle it.
2. Measure the fuel injector control signal wave profile using the oscilloscope while performing the following steps.
   1. Depress the accelerator pedal and increase the engine speed to **4,000 rpm**.
   2. Quickly release the accelerator pedal (brake pedal is not depressed) and verify that the wave profile constant **B+**, and the wave appears when the engine speed drops **below 1,200 rpm**.
   (See 01–40B–6 PCM INSPECTION [L3 WITH TC].)
   - If not as specified, inspect the following.
     — ECT sensor and related wiring harness
     (See 01–40B–30 ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [L3 WITH TC].)
     — Neutral switch and related wiring harness
     (See 01–40B–23 NEUTRAL SWITCH INSPECTION [L3 WITH TC].)
     — Clutch switch and related wiring harness
     (See 01–40B–22 CLUTCH PEDAL POSITION (CPP) SWITCH INSPECTION [L3 WITH TC].)

Fuel Pump Operation Inspection
If simulation function of WDS or equivalent is not used:
1. Connect the WDS or equivalent to the DLC-2.
2. Remove the fuel-filler cap.
3. Turn the ignition switch to the ON position.
4. Turn the fuel pump relay from off to on using the FP PID and inspect if the operation sound of the fuel pump is heard.
   - If no operation sound is heard, proceed to the next step.
5. Measure the voltage at the wiring harness side fuel pump connector terminal B with the FIP PID turned on.
   - If the voltage is as specified, inspect the following:
     — Fuel pump continuity
     — Fuel pump ground
     — Wiring harness between the fuel pump relay and PCMM terminal 4Q
   - If not as specified, inspect the following:
     — Fuel pump relay
     — Fuel pump speed control relay
     — Wiring harness connector (Main relay-fuel pump relay-fuel pump resister-fuel pump.)

Specification
8.0—11.5 V (Ignition switch at ON)

If simulation function of WDS or equivalent is not used:

Caution
- **Connecting the wrong check connector terminal may possibly cause a malfunction. Carefully connect the specified terminal only.**

1. Short the check connector terminal F/P to body ground using a jumper wire.
2. Remove the fuel-filler cap.

3. Turn the ignition switch to the ON position.
4. Verify that the fuel pump operation sound is heard.
   - If no operation sound is heard, proceed to the next step.

Measure the voltage at wiring harness side fuel pump connector terminal B.

- If the voltage is as specified, inspect the following:
  - — Fuel pump continuity
  - — Fuel pump ground
  - — Wiring harness between the fuel pump relay and PCM terminal, 4Q
- If not as specified, inspect the following:
  - — Fuel pump relay
  - — Fuel pump speed control relay
  - — Wiring harness connector (Main relay – fuel pump relay – fuel pump resister – fuel pump.)

Specification
8.0—11.5 V (Ignition switch at on)

Fuel Pump Control System Inspection
If simulation function of WDS or equivalent is used:

1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to the ON position.
3. Select the FP PID.
4. Turn the fuel pump relay from off to on and inspect if the operation sound of the fuel pump relay is heard.
   - If no operation sound is heard, inspect the fuel pump relay.
   - If the fuel pump relay is normal, inspect the following:
     - — Wiring harness and connectors (Main relay – fuel pump relay – PCM terminal 4Q)

If simulation function of WDS or equivalent is not used:

1. Crank the engine and verify that the fuel pump relay operation sound is heard.
2. If the operation sound is not heard, inspect the following:
   - Fuel pump relay
   - Wiring harness and connectors (Main relay – fuel pump relay – PCM terminal 4Q)

el Pump Speed Control Inspection
imulation function of WDS or equivalent is used:

1. Perform the Fuel Pump Operation Inspection.
2. Connect the WDS or equivalent to the DLC-2.
3. Turn the ignition switch to the ON position.
4. Turn the fuel pump speed control relay from off to on using the FPRR PID and verify that the fuel pump speed control relay operation sound is heard.
   - If the operation sound is not heard, inspect the following:
     - — Fuel pump speed control relay
     - — Wiring harness and connectors (Main relay - fuel pump speed control relay - PCM terminal 4P)
5. Start the engine and run it is idling.
6. Remove the fuel-filler cap.
7. Turn the fuel pump speed control relay from off to on using the FPRR PID and inspect if the operation sound frequency of the fuel pump is higher than when the FPRR PID is off.
   - If it cannot be verified, inspect the following:
     - — Fuel pump resister
     - — Wiring harness and connectors (open circuit at fuel pump speed control relay terminal C - fuel pump relay terminal D)

If simulation function of WDS or equivalent is not used:

8. Perform the fuel pump operation inspection.
9. Verify that fuel pump relay operation sound is heard, while cranking the engine.
   - If the operation sound is not heard, inspect the following:
     - — Fuel pump relay
     - — Wiring harnesses and connectors (Main relay—fuel pump relay—PCM terminal 4Q)
10. Remove the fuel-filler cap.
11. Verify that the fuel pump unit operation sound frequency at cranking is higher than during idle.
    - If it cannot verified, inspect for the following:
      - — Fuel pump resister
      - — Fuel pump relay
      - — Wiring harnesses and connectors (open circuit at fuel pump relay terminal C—fuel pump terminal B)

Spark Test

1. Disconnect the fuel pump relay.
2. Disconnect the injector driver module connector.
3. Verify that each ignition coil and connector is connected properly.
4. Inspect the ignition system in the following procedure.
5. Clear the DTC from PCM memory using the WDS or equivalent, after perform the spark test procedures and reconnect the injector driver module connector. (See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)

Warning

- **High voltage in the ignition system can cause strong electrical shock which can result in serious injury. Avoid direct contact to the vehicle body during the following spark test.**

STEP	INSPECTION		ACTION
1	• Disconnect the ignition coil from the spark plugs. • Remove the spark plugs. • Reconnect the spark plugs to the ignition coil. • Ground the spark plugs to the engine. • Is a strong blue spark visible at each cylinder while cranking?	Yes	Ignition system is normal.
		No	**Some cylinders do not spark:** • Go to the next step. **All cylinders do not spark:** • Go to Step 4.
2	• Inspect the spark plugs for damage, wear, carbon deposits and proper plug gap. • Are the spark plugs normal?	Yes	Go to the next step.
		No	Replace spark plugs, then go to Step 1.
3	• Inspect the following wiring harnesses for an open or short circuit: — Ignition coil No.1 terminal C—PCM terminal 3W — Ignition coil No.2 terminal C—PCM terminal 3X — Ignition coil No.3 terminal C—PCM terminal 3Z — Ignition coil No.4 terminal C—PCM terminal 3AA • Are the wiring harnesses normal?	Yes	Inspect and replace the ignition coil. (See 01–18B–2 IGNITION COIL INSPECTION [L3 WITH TC].)
		No	Repair or replace the malfunctioning part, then go to Step 1.
4	• Measure the voltage at terminal A in each ignition coils. • Is the voltage **B+**?	Yes	Go to the next step.
		No	Inspect the power supply circuit of ignition coils.
5	• Does the PCM connector or ignition coil connectors have poor connection?	Yes	Repair or replace the connector, then go to Step 1.
		No	Go to the next step.
6	• Are the following parts normal? — CKP sensor and crankshaft pulley	Yes	Inspect for an open or short circuit in the wiring harness and connector of the CKP sensor.
		No	Repair or replace the malfunctioning part, then go to Step 1.

EGR Control System Inspection

If simulation function of WDS or equivalent is used:

1. Crank the engine and verify that the EGR valve operation (initial operation) sound is heard.
   - If the operation sound is not heard, connect the WDS or equivalent to the DLC-2 and verify that the DTC P0403 is shown. Perform the DTC inspection. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
2. Start the engine run it is idling.
3. Increase the step value of the EGR valve from **0 to 40** using the SEGR PID of the simulation function.
4. Operate the EGR valve and inspect if the engine speed becomes unstable or the engine stalls.
   - If the engine speed does not change, proceed to the following.
     1. Stop the engine.
     2. Remove the EGR valve.
     3. Connect the EGR valve connector.
     4. Turn the ignition switch to the ON position.
     5. Increase the step value of EGR valve from **0 to 40** using SEGRP PID.
     6. Verify that the EGR valve operates according to the SEGRP PID.
        - If the EGR valve is operated, clean the EGR valve and the EGR gas passage.
        - If the EGR valve does not operate, replace the EGR valve.
5. Start the engine and warm it up completely.
6. Access the following PIDs.
   - ECT, RPM, SEGRP, APP1, APP2, TP_REL, VSS
7. Idle the vehicle and verify that the SEGRP value is **0**.

8. Put the vehicle in drive.
9. Depress the accelerator pedal and verify that the SEGRP value increases.
   - If the SEGRP value does not increase, inspect the VSS, TP and ECT PIDs. (See 01–40B–6 PCM INSPECTION [L3 WITH TC].)
. Stop the vehicle and verify that the SEGRP value is returns to **0**.

If simulation function of WDS or equivalent is not used:

11. Verify that EGR valve operation (initial operation) sound is heard when the ignition switch is turned to the ON position.
    - If the operation sound is not heard, connect the WDS or equivalent to the DLC-2 and verify that the DTC P0403 is shown. Perform the DTC inspection. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
12. Start the engine and idle it.
13. Warm up the engine to normal operating temperature.
14. Select the following PIDs:
    - ECT, RPM, SEGRP, APP1, APP2, TP_REL, VSS
15. Let the vehicle idle and verify that the SEGRP value is **0**.
16. Put the vehicle in drive.
17. Depress the accelerator pedal and verify that the SEGRP value is increased.
    - If the EGR valve increases, inspect the following:
      — EGR valve (stuck open or closed)
      — Wiring harness and connectors (Main relay – EGR valve – PCM)
    - If the SEGRP value does not increase, inspect the VSS, APP1, APP2, TP_REL and ECT PIDs. (See 01–40B–6 PCM INSPECTION [L3 WITH TC].)
18. Stop the vehicle and verify that the SEGRP value returns to **0**.

Purge Control System Inspection

If simulation function of WDS or equivalent is used:

1. Start the engine.
2. Disconnect the vacuum hose between the purge solenoid valve and the charcoal canister.
3. Put a finger to the purge solenoid valve and verify that there is no vacuum applied when the engine is cold.
   - If there is a vacuum, inspect the following:
     — Wiring harness and connectors (Purge solenoid valve - PCM terminal 4U)
     — Purge solenoid valve (stuck open)
. Connect the WDS or equivalent to the DLC-2 and verify that the DTC P0403 is displayed. Perform the DTC inspection.
   (See 01–02B–136 DTC P0403 [L3 WITH TC].)
5. Select the EVAPCP PID.
6. Increase the duty value of the purge solenoid valve to **50%** and inspect if the operation sound of the valve is heard.
   - If the operation sound is heard, inspect for loose or damaged vacuum hoses. (Intake manifold - purge solenoid valve - charcoal canister)
   - If the operation sound is not heard, perform the purge solenoid valve inspection. (See 01–16B–10 PURGE SOLENOID VALVE INSPECTION [L3 WITH TC].)
7. Warm up the engine to normal operating temperature.
8. Monitor the EVAPCP PID using the WDS or equivalent, and drive the vehicle **approx. 2000 rpm** for **30 s** or more.
   - If the EVAPCP PID is **0%**, inspect the following.
     — MAF, APP1, APP2, TP_REL and LOAD PIDs.

If simulation function of WDS or equivalent is not used:

9. Start the engine.
10. Disconnect the vacuum hose between the purge solenoid valve and the charcoal canister.
11. Put a finger to the purge solenoid valve and verify that there is no vacuum applied when the engine is cold.
    - If there is vacuum, inspect the following:
      — Wiring harness and connectors (Purge solenoid valve-PCM terminal, 4U)
      — Purge solenoid valve
12. Warm up the engine to the normal operating temperature.
13. Stop the engine.
14. Connect the WDS or equivalent to the DLC-2 and verify that the DTC P0443 is shown. Perform DTC inspection. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
15. Turn the ignition switch to the ON position.
    Select the ECT PID.
. Verify that the engine coolant temperature is above **60°C {140°F}**.
    - If the WDS or equivalent indicates that the temperature is below **60°C {140°F}**, perform the ECT sensor inspection.

18. Set the vehicle on the dynamometer or chassis roller.

Warning

- **When the dynamometer or chassis roller is operating, there is a possibility that the operator may come into contact with or be caught up in the rotating parts, leading to serious injuries or death When performing work while the dynamometer or chassis roller is operating, be careful not to contact or be caught up in any of the rotating parts.**

19. Drive vehicle at an engine speed to **approx. 2000 rpm** for **30 s or more.**
20. Put a finger to the purge solenoid valve and verify that there is no vacuum applied during Step 2.
    - If there is no vacuum, inspect the following:
      — Wiring harness and connector (Main relay – purge solenoid valve – PCM terminal 4T)
      — Purge solenoid valve
      — MAF, APP1, APP2, TP_REL and LOAD PIDs
    - If there is vacuum, inspect the following:
      — Vacuum hose (Purge solenoid valve – charcoal canister)

A/C Cut-off Control System Inspection

1. Start the engine.
2. Turn the A/C switch and fan switch on.
3. Verify that the A/C compressor magnetic clutch actuates.
   - If it does not actuate, go to symptom troubleshooting "No.23 A/C does not work sufficiently".
4. Fully open the throttle valve and verify that the A/C compressor magnetic clutch does not actuate for **2—5 s**.
   - If it actuates, inspect as follows:
     — A/C relay
     — Open or short to ground circuit in the wiring harness and connectors (Ignition switch-A/C relay-PCM terminal 4N)
     — A/C related parts
     — APP1, APP2 PIDs

Cooling Fan Control System Inspection

1. Connect the WDS or equivalent to the DLC-2.
2. Start the engine and warm it up to normal operating temperature.
3. Perform the KOER self-test.
   (See 01–02B–9 KOEO/KOER SELF TEST [L3 WITH TC].)
4. Verify that the DTC P0480 is not shown and the cooling fan operates during the KOER self-test.
   - If DTC P0480 is shown, perform the DTC troubleshooting procedure.
     (See 01–02B–155 DTC P0480 [L3 WITH TC].)
   - If the cooling fans do not operate, proceed to the following:
   1. Verify the clicking sound of the cooling fan relay when the ignition switch is turned from the off to the ON position.
   2. If there is no the clicking sound, inspect the cooling fan relay for an open circuit between the ignition switch and the cooling fan relay.
      - If there is a clicking sound, go to the next step.
      - Inspect the following parts in the indicated order in accordance with fan operation conditions.

Cooling fans do not operate

— Open circuit between the fan control module and the cooling fan relay
— Open circuit between fan control module and ground
— Poor connection of the fan control module connector
— Fan control module
(See 01–12B–10 FAN CONTROL MODULE INSPECTION [L3 WITH TC].)

Cooling fan motor No.1 does not operate

— Open or short to ground circuit between the fan control module and cooling fan motor No.1
— Poor connection of the fan control module connector or cooling fan motor No.1 connector
— Cooling fan motor No.1
(See 01–12B–10 COOLING FAN MOTOR INSPECTION [L3 WITH TC].)
— Fan control module
(See 01–12B–10 FAN CONTROL MODULE INSPECTION [L3 WITH TC].)

Cooling fan motor No.2 does not operate

— Open or short to ground circuit between the fan control module and the cooling fan motor No.2
— Poor connection of the fan control module connector or the cooling fan motor No.1 connector
— Cooling fan motor No.2
(See 01–12B–10 COOLING FAN MOTOR INSPECTION [L3 WITH TC].)
— Fan control module
(See 01–12B–10 FAN CONTROL MODULE INSPECTION [L3 WITH TC].)

Wastegate Control System Operation Inspection
If simulation function of WDS or equivalent is used:

1. Start the engine and run it is idling.
2. Disconnect the hose between the wastegate control solenoid valve and the intake pipe.
   Put a finger to the wastegate control solenoid valve and verify that there is no pressure applied.
   - If there is pressure, inspect the following:
     — Wiring harness and connectors (Wastegate control solenoid valve—PCM terminal 4H)
     — Wastegate control solenoid valve (Stuck open)
4. Warm up the engine to normal operating temperature.
5. Connect the WDS or equivalent to the DLC-2 and verify that DTC P0245 or P0246 are shown. Perform the DTC inspection.
   (See 01–02B–115 DTC P0245 [L3 WITH TC].)
   (See 01–02B–116 DTC P0246 [L3 WITH TC].)
6. Select the VGT PID.
7. Increase the duty value of the wastegate control solenoid valve and inspect if the operation sound of the solenoid valve is heard.
   - If the operation sound is heard, inspect for loose or damaged vacuum hoses. (Wastegate actuator - wastegate control solenoid valve - intake hose)
   - If the operation sound is not heard, perform the wastegate control solenoid valve inspection.
     (See 01–13B–14 WASTEGATE CONTROL SOLENOID VALVE INSPECTION [L3 WITH TC].)
8. Warm up the engine to normal operating temperature.
9. Monitor the VGT and APP PIDs using the WDS or equivalent.
10. Run the engine with the APP PID **above 30%** and verify that the VGT PID value increases from **0%**.
    - If the VGT PID is **0%**, inspect the APP PID.

If simulation function of WDS or equivalent is not used:

11. Start the engine and run it is idling.
12. Disconnect the hose between the wastegate control solenoid valve and the intake pipe.
13. Put a finger to the wastegate control solenoid valve and verify that there is no pressure applied.
    - If there is pressure, inspect the following:
      — Wiring harness and connectors (Wastegate control solenoid valve - PCM terminal 4H)
      — Wastegate control solenoid valve (Stuck open)
14. Warm up the engine to normal operating temperature.
15. Connect the WDS or equivalent to the DLC-2 and verify that the DTC P0245 or P0246 are shown. Perform the DTC inspection.
    (See 01–02B–115 DTC P0245 [L3 WITH TC].)
    (See 01–02B–116 DTC P0246 [L3 WITH TC].)
16. Warm up the engine to normal operating temperature.
17. Monitor the VGT and APP PIDs using the WDS or equivalent.
18. The hose between the wastegate control solenoid valve and intake pipe is disconnected.
19. Run the engine with the APP PID **above 30%** and verify that the VGT PID value increases from **0%** and there is pressure applied.
    - If the VGT PID is **0%**, inspect the TP_REL PID.
    - If there is no pressure applied, inspect for the following:
      — Wastegate control solenoid valve (Stuck closed)
      — Hose connection (Intake hose (turbocharger compressor downstream side) - wastegate actuator - intake hose (turbocharger compressor upstream side))

Variable Valve Timing Control System Operation Inspection
When idling cannot be continued

1. Remove the oil control valve (OCV) and verify that the spool valve is at maximum retard position.
2. Connect the oil control valve (OCV).
3. Turn the ignition switch to the ON position.
4. Verify that the spool valve is at the maximum retard position.
   - If the spool valve is stuck in the advance direction, inspect for the following:
     — Short circuit in wiring harnesses or connectors between the oil control valve (OCV) and the PCM.
5. Inspect the variable timing actuator.

When idling can be continued
If simulation function of WDS or equivalent is used:

1. Warm up the engine to normal operating temperature.
2. Connect the WDS or equivalent to the DLC-2.
   Start the engine and run it is idling.
4. Select the VT DUTY1 PID.
5. Increase the oil control valve (OCV) duty value and verify that the engine idles roughly or stalls.
   - If as specified, inspect the timing belt component (valve timing deviation).
   - If not as specified, go to the next step.

6. Remove the oil control valve (OCV) while the connector is connected.
7. Turn the ignition switch to the ON position.
8. Select VT DUTY1 PID.
9. Increase the oil control valve (OCV) duty value and verify that the spool valve operates in the advance directic
   - If as specified, inspect the following hydraulic passage for clogging and/or leakage.
     — Oil pressure switch - oil control valve (OCV)
     — Oil control valve (OCV) - camshaft
     — Camshaft internal passage
   - If not as specified, inspect the following:
     — Oil control valve (OCV) operation
     — Harness and connectors for open or short circuit (Oil control valve (OCV) - PCM terminal 4S)
10. If they are normal, replace the intake camshaft pulley (with a built-in variable valve timing actuator).

If simulation function of WDS or equivalent is not used:

11. Disconnect the oil control valve (OCV) connector.
12. Warm up the engine and idle it.
13. Apply battery voltage to the oil control valve (OCV) and verify that the engine idles roughly or stalls.
    - If the engine idles roughly or stalls, inspect the timing belt component (valve timing deviation).
    - If the engine does not idle roughly or stalls, go to the next step.
14. Remove the oil control valve (OCV) and perform the spool valve operation inspection.
    (See 01–10B–38 OIL CONTROL VALVE (OCV) INSPECTION [L3 WITH TC].)
    - If not as specified, inspect the following:
      — Oil control valve (OCV)
      — Harnesses and connectors between oil control valve (OCV) and PCM have an open or short circuit.
    - If as specified, inspect the following hydraulic passages for clogging or leakage or both:
      — Oil pressure switch – oil control valve (OCV)
      — Oil control valve (OCV) – camshaft
      — Camshaft internal passage
15. If they are normal, replace the camshaft pulley (with built-in variable valve timing actuator).

Evaporative Emission (EVAP) System Leak Inspection

- To verify that the problem has been fixed properly after repairs, the run-drive cycle or EVAP system leak inspection must be performed.

EVAP system leak inspection using the WDS or equivalent

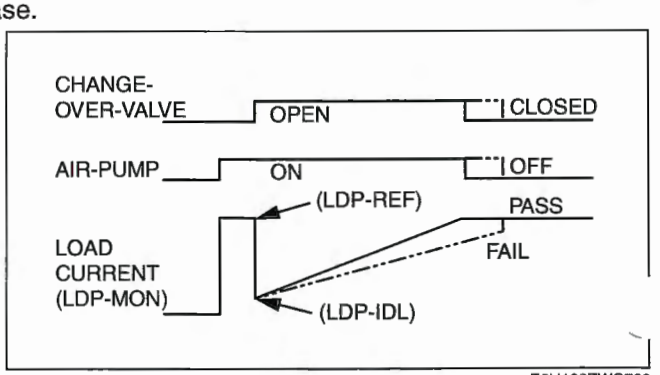
Note

EVAP system test outline

- The EVAP system test, which can substituted for the run-drive cycle as an EVAP control system repair confirmation method, can be done while operating the WDS in the KOEO (Key On Engine Off) condition instead of actually driving the vehicle.

EVAP system test description

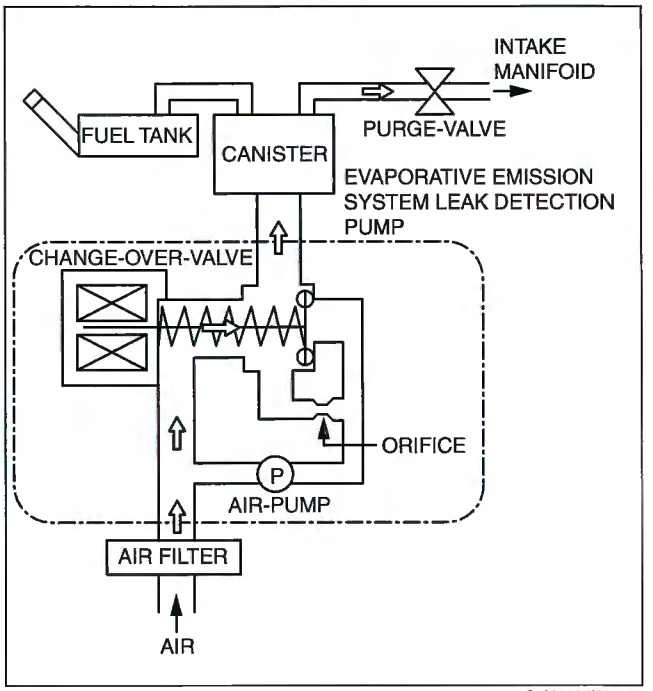
- The EVAP system test finds gas leaks in the system using the PCM to monitor changes in the air pump load current of the EVAP system leak detection pump. This test starts after sending an on-demand test signal from the WDS to the PCM. The PCM controls the air pump and change-over-valve operation and also stores the load current of the air pump as follows:
  i. The PCM turns the air pump on and retrieves the air pump load current value (LDP_MON PID) as a reference current (LDP_REF PID).
  ii. After retrieving the reference current value, the PCM commands the change-over-valve to open, then captures the air pump load current value (LDP_MON PID) as the idle current (LDP_IDL PID). The EVAP system will be pressurized from this phase.
  iii. The PCM continues to monitor the air pump load current value (LDP_MON PID) until the end of the test.
- You can confirm whether any EVAP gas leak has occurred or not by reading the test results.



E6U103ZWC700

EVAP system malfunction judgment

- The PCM calculates the stored air pump load current value and sends the results to the WDS as DTCs:



C5U116AW7002

DTC No.	Condition
P0442	EVAP control system leak detected (small leak)
P0446	Change over valve (COV) (EVAP system leak detection pump) stuck closed
P0455	EVAP control system leak detected (gross leak)
P0456	EVAP control system leak detected (very small leak)
P2401	EVAP system leak detection pump motor circuit low
P2402	EVAP system leak detection pump motor circuit high
P2404	EVAP system leak detection pump sensor circuit malfunction
P2405	EVAP system leak detection pump sensor circuit low input
P2407	EVAP system leak detection pump sensor circuit intermittent

Evaporative system test procedure

1. Select the EVAP system test from the Toolbox on the WDS display and follow the instructions.
2. Verify that all of the following PIDs are within the specifications at the pre-test confirmation screen.

Note

- To successfully perform this procedure, all PIDs must be within the following specifications before proceeding to the next step.
- The PCM will cancel the EVAP system test if the B+ PID value falls lower than **11.0 V** during the test.

Specification

PID	PID Range
BARO	72.2 kPa {543 mmHg, 21.3 inHg} or more
FLI	15—85%
IAT	5—45 °C {41—113 °F}
B+	11.0 V or more

3. Start the engine.
4. Drive the vehicle or let the engine idle more than **20 min**.
5. Turn the ignition switch off, then turn it to the ON position again (Key On Engine Off).
6. Press the tick icon to start the test.
   Verify that no DTCs are present after the completion of the test.

- If any test result is indicated with red, diagnose the problem using the following DTC troubleshooting procedure or component inspection procedure.
- If any DTCs are detected, diagnose the problem using the appropriate DTC troubleshooting procedure.

EVAP system leak inspection using leak tester

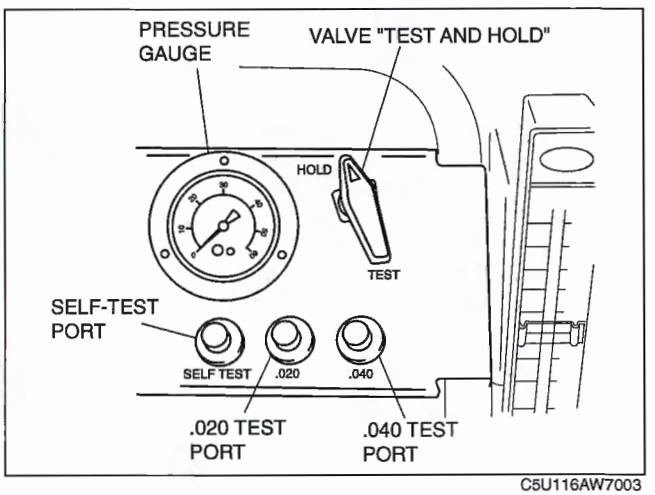
1. Perform the following **SST** (EVAP System Tester 134-01049) self-test:

Note

- If the tester does not work correctly during the self-test, refer to the tester operators manual for a more detailed self-test procedure.

(1) Verify that the control valve on the panel is in the HOLD position, then open the nitrogen bottle valve.
(2) Connect the vehicle interface hose (part of the **SST**) to the SELF TEST port located on the control panel. Hand tighten the fitting. (Do not overtighten.)
(3) Turn the control valve to the TEST position.
(4) The gauge should read **331—381 mm {13—15 in}** of water.
- If the gauge is not reading in this range, adjust the pressure by turning the black knob on the low pressure regulator at the nitrogen bottle.

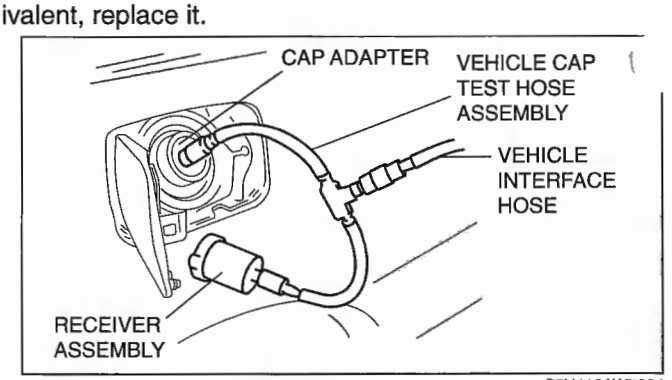
(5) Turn the control valve to the HOLD position.
(6) Verify that the gauge holds pressure and that the flow meter reads no flow.
- If there is no drop in pressure and no flow, the tester passes the self-test.
- If the gauge leaks down, refer to the operators manual.



C5U116AW7003

2. Connect the **SST** to the vehicle.
(1) Verify that the control valve on the panel is in the HOLD position then open the nitrogen bottle valve.
(2) Remove the fuel-filler cap from the vehicle.
- If the fuel-filler cap is not a MAZDA part or equivalent, replace it.

(3) Connect the receiver assembly (**SST**: 134-01059) to the vehicle cap test hose assembly (part of **SST**) and the fuel-filler cap from the vehicle.
(4) Connect the cap adaptor (**SST**: 134-01058) to the vehicle cap test hose assembly (part of the **SST**) and to the fuel-filler neck.
(5) Connect the vehicle interface hose (part of the **SST**) to the center fitting of the vehicle cap test hose assembly (part of the **SST**).



C5U116AW7004

3. Connect the WDS or equivalent to the DLC-2.
4. Turn the ignition switch to the ON position (Engine off).
5. Request the PCM on-board device control (Mode 08) using the WDS or equivalent to close the change-over valve (COV) in the EVAP system leak detection pump.

Note

- The COV is closed for **10 min** unless any of the following actions are performed:
  — The engine is started.
  — The ignition switch is turned off.

6. Make sure the control valve on the 134-01049 is in the HOLD position and that the valve on the cylinder of nitrogen gas is open.
7. Turn the control valve to the open position and let the system fill. You should note a drop in the gauge pressure along with the flow meter being pegged at maximum flow for several minutes depending on how full or empty the fuel tank is, and how long it takes to completely fill and pressurize the evaporative emissions system hoses.
8. If the gauge and the flow meter do not settle to a measurable level after **2—3 min**, then refer to the Mazda Workshop Manual to verify that the cut or vent valve is properly closed.

9. Verify the pressure gauge and flow meter reading to determine if there is an evaporative emissions leak:
   NO EVAPORATIVE LEAK:
   - The flow meter registers "zero flow" and the pressure gauge returns to the pre-set pressure of **356 mm {14 in}** of water (H2O).

   EVAPORATIVE LEAK:
   - The pressure does not return to the preset level of **356 mm {14 in}** of water (H2O) when measuring the flow. See "SETTING LEAK STANDARD FOR TESTING" (.020 to. 040 inch H2O) of the Evaporative Emissions Tester operators manual (134-01067).

   Note
   - Turn the control valve to the HOLD position then disconnect the **SST**.

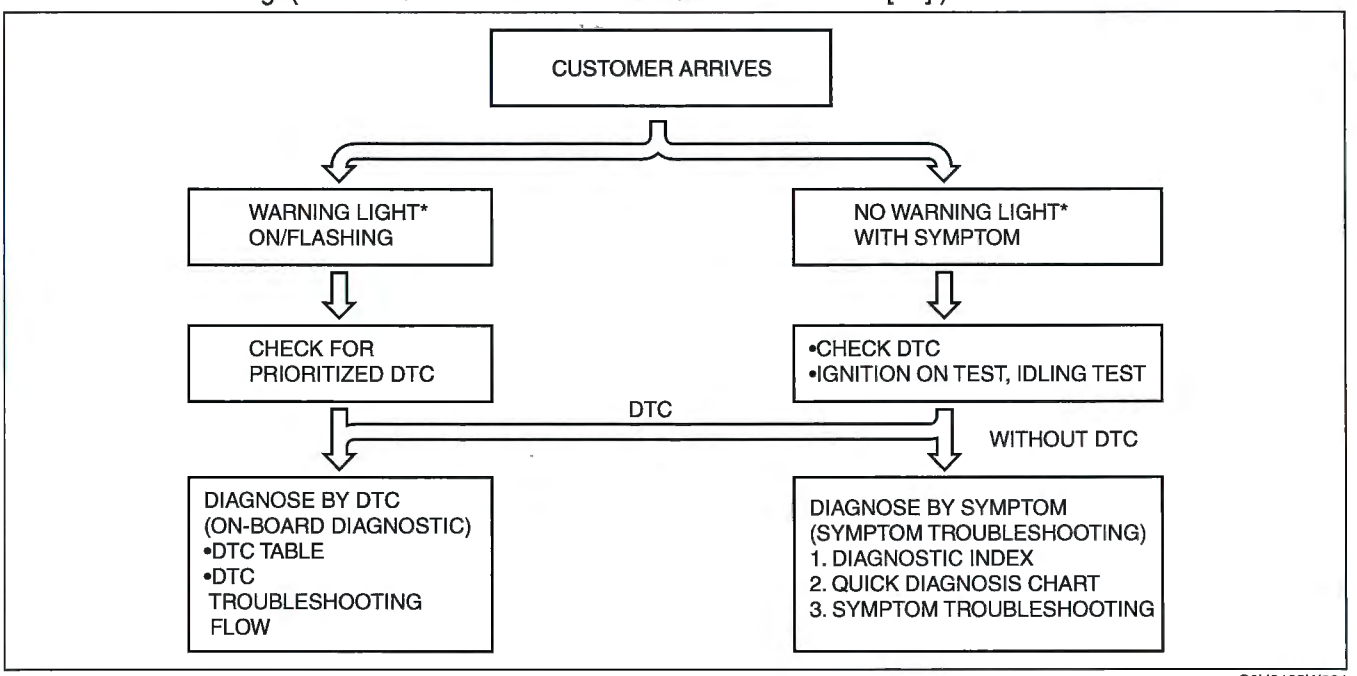
FOREWORD [AJ]

E6U010318881W38

- When the customer reports a vehicle malfunction, check the malfunction indicator lamp (MIL) indication and diagnostic trouble code (DTC), then diagnose the malfunction according to the following flowchart:
  - — If a DTC exists, diagnose the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
  - — If no DTC exists and the MIL does not illuminate or flash, diagnose the applicable symptom troubleshooting. (See 01–03C–8 SYMPTOM DIAGNOSTIC INDEX [AJ].)



C6U0103W501

*: Malfunction Indicator Lamp (MIL), Generator Warning Light, Security Light

INTERMITTENT CONCERN TROUBLESHOOTING [AJ]

E6U010318881W39

Vibration Method

- If malfunction occurs or becomes worse while driving on a rough road or when engine is vibrating, perform the steps below.

Note

- There are several reasons vehicle or engine vibration could cause an electrical malfunction. Some of the things to check for are:
  - — Connectors not fully seated.
  - — Wire harnesses not having full play.
  - — Wires laying across brackets or moving parts.
  - — Wires routed too close to hot parts.
- An improperly routed, improperly clamped, or loose harness can cause wiring to become pinched between parts.
- The connector joints, points of vibration, and places such as where wire harnesses pass through the firewall, body panels are the major areas to be checked.

Inspection Method for Switch Connectors or Wires

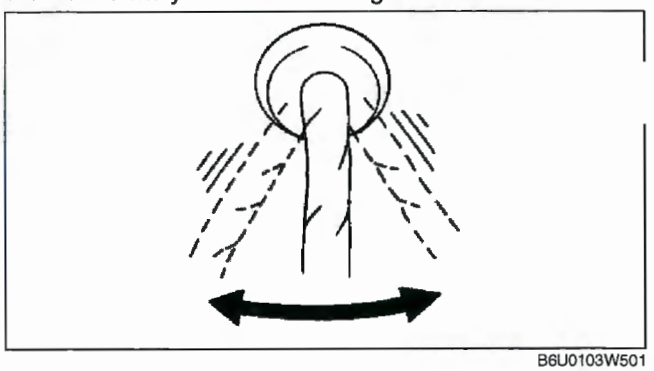
1. Connect the WDS or equivalent to the DLC-2.
2. Turn ignition switch to ON position (Engine OFF).

Note

- If the engine starts and runs, perform the following steps at idle.

3. Access PIDs for the switch you are inspecting.
4. Turn switch on manually.

5. Shake each connector or wire harness a little vertically and horizontally while monitoring the PID.
   - If PID value is unstable, check for poor connection.



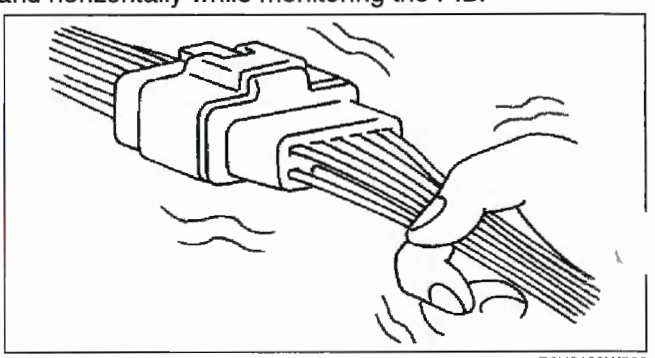
B6U0103W501

Inspection Method for Sensor Connectors or Wires

1. Connect the WDS or equivalent to the DLC-2.
2. Turn ignition switch to ON position (Engine OFF).

Note
- If engine starts and runs, perform the following steps at idle.

3. Access PIDs for the switch you are inspecting.
4. Shake each connector or wire harness a little vertically and horizontally while monitoring the PID.
   - If PID value is unstable, check for poor connection.



B6U0103W502

Inspection Method for Sensors

1. Connect the WDS or equivalent to the DLC-2.
2. Turn ignition switch to ON position (Engine OFF).

Note
- If engine starts and runs, perform the following steps at idle.

3. Access PIDs for the switch you are inspecting.
4. Vibrate the sensor slightly with your finger.
   - If PID value is unstable or malfunction occurs, check for poor connection or poorly mounted sensor, or both.

Inspection Method for Actuators or Relays

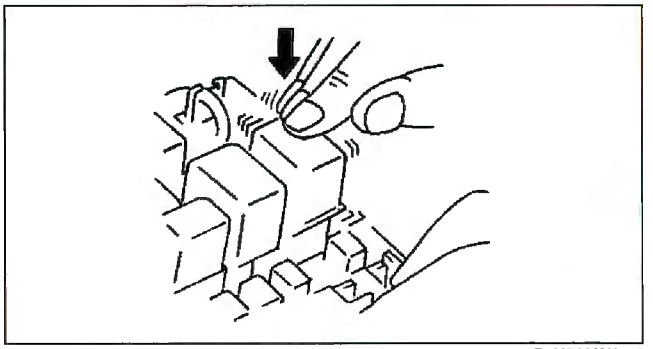
1. Connect the WDS or equivalent to the DLC-2.
2. Turn ignition switch to ON position (Engine OFF).

Note
- If engine starts and runs, perform the following steps at idle.

3. Prepare the output device control function for actuators or relays that you are inspecting.

4. Vibrate the actuator or relay with your finger for **3 s** after output device control function is activated.
   - If a variable click sound is heard, check for poor connection or poorly mounted actuator/ relay, or both.

Note
- Vibrating relays too strongly may result in open relays.



B6U0103W503

Water Sprinkling Method

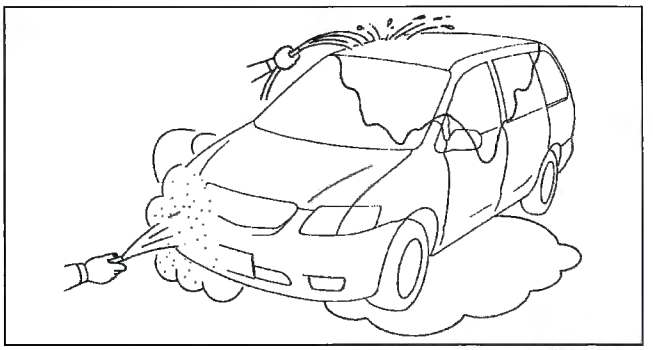
If malfunction occurs only during high humidity or rainy/snowy weather, perform the following steps.

Caution
- **Indirectly change the temperature and humidity by spraying water onto the front of the radiator.**
- **If a vehicle is subject to water leakage, the leakage may damage the control module. When testing a vehicle with a water leakage problem, special caution must be used.**

1. Connect the WDS or equivalent to the DLC-2 if you are inspecting sensors or switches.
2. Turn ignition switch to ON position (Engine OFF).

Note
- If engine starts and runs, perform the following steps at idle.

3. Access PIDs for sensor or switch if you are inspecting sensors or switches.
4. If you are inspecting the switch, turn it on manually.
   Spray water onto the vehicle or run it through a car wash.
   - If the PID value is unstable or malfunction occurs, repair or replace part as necessary.



B6U0103W504

SYMPTOM DIAGNOSTIC INDEX [AJ]

E6U010318881W40

No.	TROUBLESHOOTING ITEM		DESCRIPTION	PAGE
1	Melting of main or other fuses		—	(See 01–03C–14 NO.1 MELTING OF MAIN OR OTHER FUSES [AJ].)
2	MIL illuminates		MIL is illuminated incorrectly.	(See 01–03C–15 NO.2 MIL ILLUMINATES [AJ].)
3	Will not crank		Starter does not work.	(See 01–03C–16 NO.3 WILL NOT CRANK [AJ].)
4	Hard start/long crank/erratic start/erratic crank		Starter cranks engine at normal speed but engine requires excessive cranking time before starting.	(See 01–03C–18 NO.4 HARD START/LONG CRANK/ERRATIC START/ ERRATIC CRANK [AJ].)
5	Engine stalls	After start/at idle	Engine stops unexpectedly at idle and/or after start.	(See 01–03C–20 NO.5 ENGINE STALLS-AFTER START/AT IDLE [AJ].)
6	Cranks normally but will not start		Starter cranks engine at normal speed but engine will not run.	(See 01–03C–24 NO.6 CRANKS NORMALLY BUT WILL NOT START [AJ].)
7	Slow return to idle		Engine takes more time than normal to return to idle speed.	(See 01–03C–28 NO.7 SLOW RETURN TO IDLE [AJ].)
8	Engine runs rough/rolling idle		Engine speed fluctuates between specified idle speed and lower speed and engine shakes excessively.	(See 01–03C–29 NO.8 ENGINE RUNS ROUGH/ ROLLING IDLE [AJ].)
9	Fast idle/runs on		Engine speed continues at fast idle after warm-up. Engine runs after ignition switch is turned to off.	(See 01–03C–32 NO.9 FAST IDLE/RUNS ON [AJ].)
10	Low idle/stalls during deceleration		Engine stops unexpectedly at beginning of deceleration or recovery from deceleration.	(See 01–03C–33 NO.10 LOW IDLE/STALLS DURING DECELERATIC [AJ].)
11	Engine stalls/quits	Acceleration/cruise	Engine stops unexpectedly at beginning of acceleration or during acceleration. Engine stops unexpectedly while cruising.	(See 01–03C–34 NO.11 ENGINE STALLS/QUITS, ENGINE RUNS ROUGH, MISSES, BUCK/JERK, HESITATION/STUMBLE, SURGES [AJ].)
	Engine runs rough	Acceleration/cruise	Engine speed fluctuates during acceleration or cruising.	
	Misses	Acceleration/cruise	Engine misses during acceleration or cruising.	
	Buck/jerk	Acceleration/cruise/ deceleration	Vehicle bucks/jerks during acceleration, cruising, or deceleration.	
	Hesitation/stumble	Acceleration	Momentary pause at beginning of acceleration, or during acceleration	
	Surges	Acceleration/cruise	Momentary minor irregularity in engine output	
12	Lack/loss of power	Acceleration/cruise	Performance poor under load (e.g. power down when climbing hills).	(See 01–03C–38 NO.12 LACK/LOSS OF POWER-ACCELERATION /CRUISE [AJ].)
13	Knocking/pinging	Acceleration/cruise	Sound is produced when air/fuel mixture is ignited by something other than spark plug (e.g. hot spot in combustion chamber).	(See 01–03C–41 NO.13 KNOCKING/ PINGING-ACCELERATIO N/CRUISE [AJ].)
14	Poor fuel economy		Fuel economy is unsatisfactory.	(See 01–03C–42 NO.14 POOR FUEL ECONOMY [AJ].)
15	Emissions compliance		Fails emissions test	(See 01–03C–44 NO.15 EMISSION COMPLIANCE [AJ].)
16	High oil consumption/leakage		Oil consumption is excessive.	(See 01–03C–46 NO.16 HIGH OIL CONSUMPTION/ LEAKAGE [AJ].)

No.	TROUBLESHOOTING ITEM		DESCRIPTION	PAGE
17	Cooling system concerns	Overheating	Engine runs at higher than normal temperature/overheats.	(See 01–03C–46 NO.17 COOLING SYSTEM CONCERNS-OVERHEATING [AJ].)
18	Cooling system concerns	Runs cold	Engine does not reach normal operating temperature.	(See 01–03C–48 NO.18 COOLING SYSTEM CONCERNS-RUNS COLD [AJ].)
19	Exhaust smoke		Blue, black, or white smoke from exhaust system	(See 01–03C–49 NO.19 EXHAUST SMOKE [AJ].)
20	Fuel odor (in engine compartment)		Gasoline fuel smell or visible leakage	(See 01–03C–51 NO.20 FUEL ODOR (IN ENGINE COMPARTMENT) [AJ].)
21	Engine noise		Engine noise from under hood	(See 01–03C–52 NO.21 ENGINE NOISE [AJ].)
22	Vibration concerns (engine)		Vibration from under hood or driveline	(See 01–03C–52 NO.22 VIBRATION CONCERNS (ENGINE) [AJ].
23	A/C does not work sufficiently		A/C compressor magnetic clutch does not engage when A/C is turned on.	(See 01–03C–53 NO.23 A/C DOES NOT WORK SUFFICIENTLY [AJ].)
24	A/C always on or A/C compressor runs continuously.		A/C compressor magnetic clutch does not disengage.	(See 01–03C–54 NO.24 A/C ALWAYS ON/A/C COMPRESSOR RUNS CONTINUOUSLY [AJ].)
25	A/C does not cut off under wide open throttle conditions.		A/C compressor magnetic clutch does not disengage under wide open throttle.	(See 01–03C–55 NO.25 A/C DOES NOT CUT OFF UNDER WIDE OPEN THROTTLE CONDITIONS [AJ].)
26	Exhaust sulphur smell		Rotten egg smell (sulphur) from exhaust	(See 01–03C–56 NO.26 EXHAUST SULPHUR SMELL [AJ].)
27	Fuel refill concerns		Fuel tank does not fill smoothly.	(See 01–03C–57 NO.27 FUEL REFILL CONCERNS [AJ].)
28	Fuel filling shut off issues		Fuel does not shut off properly.	(See 01–03C–58 NO.28 FUEL FILLING SHUT OFF ISSUES [AJ].)
29	Spark plug condition		Incorrect spark plug condition	(See 01–03C–59 NO.29 SPARK PLUG CONDITION [AJ].)
30	ATX concerns	Upshift/downshift/ engagement	ATX concerns not related to engine performance	(See 05–03B–4 SYMPTOM TROUBLESHOOTING ITEM TABLE [AW6A-EL].)

SYMPTOM QUICK DIAGNOSIS CHART [AJ]

E6U010318881W41

X: Applicable

	Troubleshooting item / Possible factor		Starter motor malfunction (Mechanical or electrical)	Starter circuit including ignition switch is open	Improper engine oil level	Low or dead battery	Charging system malfunction	Improper engine compression	Improper valve timing	Hydrolocked engine	Improper engine oil viscosity	Improper dipstick	Base engine malfunction	Flywheel or drive plate is seized.	Improper tension or damaged drive belts	Improper engine coolant level	Water and anti-freeze mixture are improper.	Cooling fan system malfunction	Engine or transaxle mounts improperly installed.	Cooling fan seat improper.	Accelerator position sensor play misadjustment
1	Melting of main or other fuses																				
2	MIL illuminates																				
3	Will not crank		x	x		x	x			x				x							
4	Hard to start/long crank/erratic start/erratic crank																				
5	Engine stalls.	After start/at idle						x	x												
6	Cranks normally but will not start							x	x												
7	Slow return to idle																	x			
8	Engine runs rough/rolling idle							x	x												
9	Fast idle/runs on																				x
10	Low idle/stalls during deceleration																				x
11	Engine stalls/quits	Acceleration/cruise						x	x												x

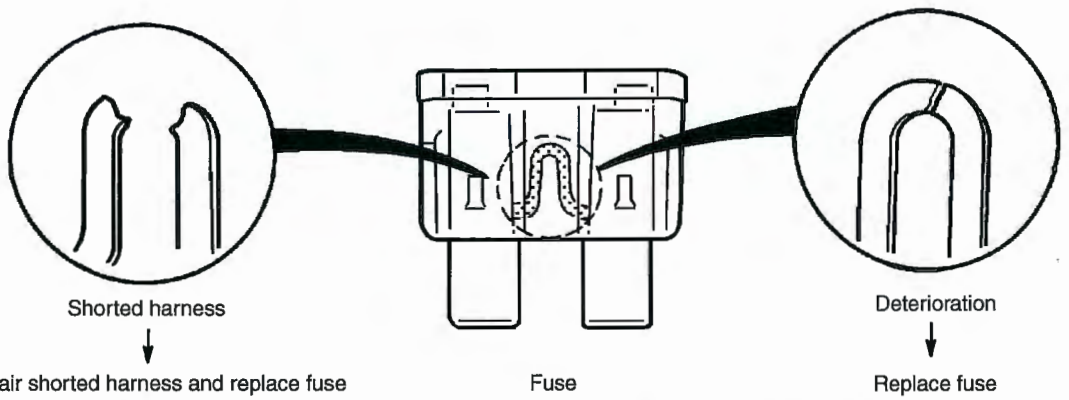
E6U103BW5L05

NO.1 MELTING OF MAIN OR OTHER FUSES [AJ]

E6U010318881W42

1	Melting of main or other fuses

[TROUBLESHOOTING HINTS]
Inspect condition of fuse.



Damaged fuse	Related wiring harness
MAIN	**MAIN fuse** • BTN fuse • IG KEY2 fuse • IG1 fuse • FAN1 fuse • FAN2 fuse • Generator
BTN	**BTN fuse** • ROOM fuse
ROOM	**ROOM fuse** • DLC-2
IG KEY2	**IG KEY2 fuse** • Ignition switch • Starter relay
IG KEY1	**IG KEY1 fuse** • Ignition switch — ENGINE fuse — Starter relay
ENGINE	ENGINE fuse • Fuel pump relay • Ignition coils • Capacitor
FUEL PUMP	**FUEL PUMP fuse** • Fuel pump relay • Main relay
IG1	**IG1 fuse** • IG1 fuse
FAN1	**FAN1 fuse** • Cooling fan relay
FAN2	**FAN2 fuse** • Cooling fan relay
ETC	**ETC fuse** • Drive-by-wire relay
INJ	**INJ fuse** • Drive-by-wire relay • PCM • Fuel injectors

ENG BAR	**ENG BAR fuse** • Purge solenoid valve • VAD control solenoid valve • EGR boost sensor solenoid valve • MAF/IAT sensor • EGR valve • OCV (RH) • OCV (LH) • EVAP system leak detection pump
ENG BB	**ENG BB fuse** • Cooling fan relay
If malfunction remains, refer to related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.	

NO.2 MIL ILLUMINATES [AJ]

E6U010318881W43

2	**MIL illuminates**
DESCRIPTION	• MIL illuminates.
POSSIBLE CAUSE	• PCM illuminates MIL for emission-related concern (DTCs are stored in PCM) • Short to GND circuit between MIL (located on instrument cluster) and PCM **Note** • If MIL blinks at steady rate, misfire condition could possibly exist.

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Connect WDS or equivalent to DLC-2. • Turn ignition switch to ON position. • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Inspect for short to GND circuit between instrument cluster and PCM terminal 2AE. • Inspect instrument cluster operation (See 09–22–5 INSTRUMENT CLUSTER INSPECTION.)
2	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.3 WILL NOT CRANK [AJ]

E6U010318881W44

3	Will not crank
DESCRIPTION	• Starter does not work.
POSSIBLE CAUSE	• Open starter circuit between ignition switch and starter • TR switch malfunction (ATX) • TR switch misadjustment (ATX) • Low or dead battery • Charging system malfunction • Starter interlock switch malfunction (MTX) • Starter malfunction • Seized/hydro locked engine, flywheel or drive plate • Immobilizer system (PATS) and / or circuit malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Connect WDS or equivalent to DLC-2. • Do following conditions appear? — Engine is not completely started. — DTC B1681 is displayed.	Yes	**Both conditions appear:** Go to Step 4.
		No	**Either or other condition appears:** Go to the next step.
2	• Is coil connector securely connected to coil?	Yes	Go to the next step.
		No	Connect coil connector securely. Return to step 1.
3	• Does security light illuminate?	Yes	Go to the next step.
		No	Inspect instrument cluster and wiring harness. (See 09–22–5 INSTRUMENT CLUSTER INSPECTION.)
4	• Connect WDS or equivalent to DLC-2 and retrieve DTC. **DTC** **B1213, B1342, B1600, B1601, B1602, B1681, B2103, B2431**	Yes	Go to appropriate DTC test.
		No	Go to the next step.
5	• Is there continuity between PCM GND terminals 2H, 2L, 2D, 2BH, 2AZ and GND?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
6	• Measure voltage between PCM GND terminals 2H, 2L, 2D, 2BH, 2AZ and coil terminals C • Is voltage **below 1.0 V**?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
7	• Turn ignition switch to ON position. • Measure voltage PCM terminal 2AP and 1A. • Is voltage **B+**?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
8	• Disconnect coil connector. • Turn ignition switch to ON position. • Is there battery voltage at coil connector terminal D?	Yes	Go to the next step.
		No	Repair or replace wiring harness between coil connector terminal D and fuse panel.
9	• Inspect for following wiring harnesses and connectors: — Between coil terminal A and PCM terminal 1J — Between coil terminal B and PCM terminal 1I • Is there any malfunction?	Yes	Repair or replace wiring harness.
		No	Go to the next step.
10	• Is there continuity between PCM terminal 1AD and starter relay with clutch pedal depressed (MTX), P or N position (ATX)?	Yes	Go to the next step.
		No	Repair or replace wiring harness. For ATX inspect starter cut relay and related wiring harness
11	• Verify the following: — Battery connection — Battery condition — Transaxle is in Park or Neutral. (ATX) — Clutch is fully depressed. (MTX) — Fuses • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 11.
12	• Is clicking sound heard from starter when ignition switch is turned to START position?	Yes	Go to the next step.
		No	Go to Step 14.

STEP	INSPECTION		ACTION
13	• Inspect starting system. (See 01–19A–4 STARTER INSPECTION [L3, AJ].) (See 01–19A–9 STARTER INTERLOCK SWITCH INSPECTION (MTX).) • Is starting system normal?	Yes	Inspect for seized/hydrologic engine, flywheel or drive plate.
		No	Repair or replace components as required.
14	• Do any other electrical accessories work?	Yes	Go to the next step.
		No	Inspect charging system. (See 01–17A–2 BATTERY INSPECTION [L3, AJ].) (See 01–17A–5 GENERATOR INSPECTION [L3, AJ].)
15	**Note** • The following test should be performed on ATX only. For MTX, go to the next step. • Inspect adjustment of TR switch. (See 05–17B–13 TRANSAXLE RANGE (TR) SWITCH INSPECTION [AW6A-EL].) • Is TR switch adjusted properly?	Yes	Go to the next step.
		No	Perform N position learning. (See 05–17B–28 Neutral Position Learning.) If problem remains replace TR switch. (See 05–17B–25 TCM REMOVAL/ INSTALLATION [AW6A-EL].)
16	• Connect WDS or equivalent to DLC-2. • Turn ignition switch to ON position. • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriated DTC test. **Communication error message is displayed:** • Inspect for following — Open circuit between main relay terminal C and PCM terminal 2AP or 1A — Open main relay GND circuit — Main relay is stuck open. — Open or poor GND circuit (PCM terminal 2H, 2L, 2D, 2BH, 2AZ) — Poor connection of vehicle body GND
		No	**No DTC displayed:** • Inspect START circuit in ignition switch. (See 09–21–5 IGNITION SWITCH INSPECTION [WITH ADVANCED KEYLESS SYSTEM].) (See 09–21–3 IGNITION SWITCH INSPECTION [WITHOUT ADVANCED KEYLESS SYSTEM].) • Inspect for open circuit between ignition switch and starter.
17	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM later calibration is available. Retest.		

NO.4 HARD START/LONG CRANK/ERRATIC START/ERRATIC CRANK [AJ]

E6U010318881W45

4	Hard start/long crank/erratic start/erratic crank
DESCRIPTION	• Starter cranks engine at normal speed but engine requires excessive cranking time before start. • Battery is in normal condition.
POSSIBLE CAUSE	• Erratic signal to ignition coil • Vacuum leakage • Poor fuel quality • Starting system malfunction • Spark plug malfunction • Air leakage from intake-air system • Erratic signal from CKP sensor • Erratic signal from CMP sensor • Improper air/fuel mixture ratio control • Air cleaner restriction • Improper operation of electronic throttle control system • PCV valve malfunction • Inadequate fuel pressure • Purge solenoid valve malfunction • MAF sensor contamination • Restriction in exhaust system • EGR valve malfunction • Pressure regulator malfunction **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Inspect for the following: — Vacuum leakage — Proper fuel quality (e.g. proper octane, contamination, winter/summer blend) — Loose bands on intake-air system — Cracks on intake-air system parts — Air cleaner restriction • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 1.
2	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position. • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
3	• Is engine overheating?	Yes	Go to flowchart "No.17 Cooling system concerns—Overheating".
		No	Go to the next step.
4	• Inspect ignition coil related harnesses condition (intermittent open or short circuit) for all cylinders. • Are all harnesses condition normal?	Yes	Go to the next step.
		No	Repair suspected wiring harness.

STEP	INSPECTION		ACTION
5	• Inspect spark plug conditions. • Is spark plug wet, covered with carbon or grayish white?	Yes	**Spark plug is wet or covered with carbon:** • Inspect for fuel leakage from fuel injector. **Spark plug is grayish white:** • Inspect for clogged fuel injector.
		No	Install spark plugs on original cylinders. Go to the next step.
6	• Visually inspect CKP sensor and teeth of crankshaft pulley. • Are CKP sensor and teeth of crankshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning part.
7	• Remove and shake PCV valve. • Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
8	• Install fuel pressure gauge between pulsation damper and fuel distributor. • Short check connector terminal F/P to body GND using a jumper wire. (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].) • Turn ignition switch to ON position (Engine OFF). • Inspect fuel line pressure. (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) • Is fuel line pressure correct?	Yes	Go to the next step.
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump related circuit. • Inspect for clogged fuel line. — If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
9	• Attempt to start engine at part throttle. • Does engine run smoothly at part throttle?	Yes	Inspect electronic throttle control system operation.
		No	Go to the next step.
10	• Is fuel line pressure held after ignition switch is turned to OFF position?	Yes	Go to the next step.
		No	Inspect fuel injector. (See 01–14A–32 FUEL INJECTOR INSPECTION [AJ].) • If fuel injector is normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
11	• Disconnect vacuum hose from purge solenoid valve and plug opening end of vacuum hose. • Attempt to start engine. • Is starting condition improved?	Yes	Inspect if purge solenoid valve sticks open. (See 01–16A–13 PURGE SOLENOID VALVE INSPECTION [L3, AJ].)
		No	Go to the next step.
12	• Inspect MAF sensor for contamination. (See 01–40C–32 MASS AIR FLOW (MAF) SENSOR INSPECTION [AJ].) • Is there any contamination?	Yes	Replace MAF/IAT sensor.
		No	Go to the next step.
13	• Inspect for restriction in the exhaust system. • Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.
14	• Inspect engine condition while tapping EGR valve housing. • Does engine condition improve?	Yes	Replace EGR valve. (See 01–16A–17 EGR VALVE REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
15	• Inspect starting system. (See 01–19A–4 STARTER INSPECTION [L3, AJ].) (See 01–19A–9 STARTER INTERLOCK SWITCH INSPECTION (MTX).) • Is starting system normal?	Yes	Inspect for loose connectors or poor terminal contact. • If normal, remove EGR valve and visually inspect for mechanically stuck EGR valve. (See 01–16A–18 EGR VALVE INSPECTION [AJ].)
		No	Repair or replace components as required.
16	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.5 ENGINE STALLS-AFTER START/AT IDLE [AJ]

E6U010318881W46

5	Engine stalls—after start/at idle
DESCRIPTION	• Engine stops unexpectedly.
POSSIBLE CAUSE	• A/C system operation is improper • Air leakage from intake-air system parts • Purge solenoid valve malfunction • Improper operation of electronic throttle control system • EGR valve malfunction • No signal from CKP sensor due to sensor or related wire • Vacuum leakage • Low engine compression • Erratic signal to ignition coil • Poor fuel quality • PCV valve malfunction • Air cleaner restriction • Restriction in exhaust system • Electrical connector disconnection • Open or short circuit in fuel pump body and related harness • No battery power supply to PCM or poor GND • Inadequate fuel pressure • Fuel pump body mechanical malfunction • Fuel leakage from fuel injector • Fuel injector clogging • Immobilizer system (PATS) and/or circuit malfunction • Ignition coil malfunction • Improper air/fuel ratio control • Improper valve timing • Improper operation of variable valve timing control system. • Pressure regulator malfunction **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** — **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** — **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Connect WDS or equivalent to DLC–2. • Do the following conditions appear? — Engine is not completely started. — DTC B1681 is displayed.	Yes	**Both conditions appear:** • Go to Step 3.
		No	**Either or other condition appear:** • Go to the next step.
2	• Does engine stall **after approx. 2 s** from when engine is started?	Yes	Go to the next step.
		No	Immobilizer system is normal. Go to Step 10.
3	• Is coil connector securely connected to coil?	Yes	Go to the next step.
		No	Connect coil connector securely. Return to Step 2.
4	• Does security light illuminate?	Yes	Go to the next step.
		No	Inspect instrument cluster and wiring harness.
5	• Connect WDS or equivalent to DLC–2 and retrieve DTC. • Are the following DTCs displayed? **DTC** **B1213, B1342, B1600, B1601, B1602, B1681, B2103, B2431**	Yes	Go to appropriate DTC test.
		No	Go to the next step.
6	• Is there continuity between PCM GND terminals 2H, 2L, 2D, 2BH, 2AZ and GND?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
7	• Measure voltage between PCM GND terminals 2H, 2L, 2D, 2BH, 2AZ and coil terminal C. • Is voltage **below 1.0 V**?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
8	• Turn ignition switch to ON position. • Measure voltage PCM terminal 1B and 1A. • Is voltage **B+**?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
9	• Disconnect coil connector. • Turn ignition switch to ON position (Engine OFF). • Is there battery voltage at coil connector terminal D?	Yes	Inspect for following: • Open or short circuit between coil terminal A and PCM terminal 1J • Open or short circuit between coil terminal B and PCM terminal 1I
		No	Repair or replace wiring harness between coil connector terminal D and fuse panel.
10	• Verify following: — Vacuum connection — Air cleaner element — No air leakage from intake-air system — No restriction of intake-air system — Proper sealing of intake manifold and components attached to intake manifold: EGR valve — Ignition wiring — Fuel quality: proper octane, contamination, winter/summer blend — Electrical connections — Smooth operation of throttle valve • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 10.
11	• Turn ignition switch to ON position (Engine OFF). • Disconnect throttle body connector. • Measure voltage at throttle body VREF terminal with ignition switch at ON position. • Is voltage **4.5—5.5 V**?	Yes	Go to the next step.
		No	Inspect and repair open or short circuit between PCM terminal 1BD and throttle body VREF terminal.
12	• Turn ignition switch to OFF position. • Disconnect APP sensor connector. • Measure voltage at APP sensor VREF terminal with ignition switch at ON position. • Is voltage **4.5—5.5 V**?	Yes	Go to the next step.
		No	Repair or replace open or short circuit for the following: • PCM terminal 1AR and APP sensor terminal D • PCM terminal 1AV and APP sensor terminal A

STEP	INSPECTION		ACTION
13	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test. **Communication error message is displayed:** • Inspect for following: — Open circuit between main relay terminal C and PCM terminal 1B or 1A — Open main relay GND circuit — Main relay is stuck open. — Open or poor GND circuit (PCM terminal 2H, 2L, 2D, 2BH, 2AZ) — Poor connection of vehicle body GND
		No	**No DTC is displayed:** • Go to the next step.
14	• Attempt to start engine at part throttle. • Does engine run smoothly at part throttle?	Yes	Inspect electronic throttle control system operation.
		No	Go to the next step.
15	• Connect WDS or equivalent to DLC–2. • Access RPM PID. • Is RPM PID indicating engine speed during engine cranking?	Yes	Go to the next step.
		No	Inspect for the following: • Open or short circuit in CKP sensor • Open or short circuit between CKP sensor and PCM terminal 2Z or 2Y • Open or short circuit in CKP sensor harnesses — If CKP sensor and harness are normal, go to the next step.
16	• Visually inspect CKP sensor and teeth of crankshaft pulley. • Are CKP sensor and teeth of crankshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning part.
17	• Inspect ignition coil related harness condition (intermittent open or short) for all cylinders. • Are all harnesses condition normal?	Yes	Go to the next step.
		No	Repair suspected wiring harness.
18	• Perform spark test. (See 01–03C–68 Spark Test.) • Is strong blue spark visible at each cylinder?	Yes	Go to the next step. • If symptom occurs with A/C on, go to Step 24.
		No	Repair or replace malfunctioning part according to spark test results.
19	• Inspect spark plug conditions. • Is spark plug wet, covered with carbon or grayish white?	Yes	**Spark plug is wet or covered with carbon:** • Inspect for fuel leakage from injector. **Spark plug is grayish white:** • Inspect for clogged fuel injector.
		No	Install spark plugs on original cylinders. Go to the next step.
20	• Remove and shake PCV valve. • Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
21	• Inspect for restriction in the exhaust system. • Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.
22	• Install fuel pressure gauge between fuel filter and fuel distributor. • Short the check connector terminal F/P to body GND using a jumper wire. (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].) • Turn ignition switch to ON position (Engine OFF). • Inspect fuel line pressure. (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) • Is fuel line pressure correct?	Yes	Go to the next step.
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump related circuit. • Inspect for clogged fuel line. — If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
23	• Visually inspect for fuel leakage at fuel injector O-ring and fuel line. • Service if necessary. • Turn OFF fuel pump using FP PID in output state control of data logger function. • Does fuel line pressure hold after ignition switch is turned to OFF position?	Yes	Go to the next step.
		No	Inspect fuel injector. (See 01–14A–32 FUEL INJECTOR INSPECTION [AJ].) • If fuel injector is normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)

STEP	INSPECTION		ACTION
24	**Note** • The following test is for stall concerns with A/C on. If other symptoms exist, go to the next step: • Connect pressure gauges to A/C low and high pressure side lines. • Turn A/C on and measure low side and high side pressure. • Are pressures within specifications? (See 07–10–4 REFRIGERANT PRESSURE CHECK [L3, AJ].)	Yes	Go to the next step.
		No	If A/C is always on, go to symptom troubleshooting "No.24 A/C always on/A/C compressor runs continuously". For other symptoms, inspect following: • Refrigerant charging amount • Condenser fan operation
25	• Disconnect vacuum hose between purge solenoid valve and intake manifold from purge solenoid side. • Plug opening end of vacuum hose. • Start engine. • Is engine stall now eliminated?	Yes	Inspect if purge solenoid valve is stuck open. Inspect EVAP control system.
		No	Go to the next step.
26	• Is air leakage felt or heard at intake-air system components while racing engine to higher speed?	Yes	Repair or replace.
		No	Go to the next step.
27	• Inspect engine condition while tapping EGR valve housing. • Does engine condition improve?	Yes	Replace EGR valve. (See 01–16A–17 EGR VALVE REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
28	• Perform variable valve timing control system operation inspection. (See 01–03C–74 Variable Valve Timing Control System Operation Inspection.) • Does variable valve timing control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to variable valve timing system operation inspection results.
29	• Is engine compression correct? (See 01–10C–6 COMPRESSION INSPECTION [AJ].)	Yes	Inspect valve timing.
		No	Inspect for cause.
30	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.6 CRANKS NORMALLY BUT WILL NOT START [AJ]

E6U010318881W47

6	Cranks normally but will not start
DESCRIPTION	• Starter cranks engine at normal speed but engine will not run. • Refer to symptom troubleshooting "No.5 Engine stalls" if this symptom appears after engine stall. • Fuel in tank. • Battery is in normal condition.
POSSIBLE CAUSE	• No battery power supply to PCM • Air leakage from intake-air system • Open PCM GND or vehicle body GND • Improper operation of electronic throttle control system • EGR valve malfunction • No signal from CKP sensor due to sensor or related wire • No signal from CMP sensor due to sensor or related wire • Low engine compression • Vacuum leakage • Poor fuel quality • PCV valve malfunction • Air cleaner restriction • Restriction in exhaust system • Disconnected electrical connector • Open or short circuit in fuel pump and related harness • Inadequate fuel pressure • Fuel pump mechanical malfunction • Fuel leakage from injector • Fuel injector clogging • Purge solenoid valve malfunction • Ignition coil malfunction • Improper air/fuel ratio control • Improper valve timing • Improper operation of variable valve timing control system • Immobilizer system (PATS) and/or circuit malfunction • Pressure regulator malfunction **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**Note** • The following test should be performed on vehicles with immobilizer system. Go to Step 12 for vehicles without immobilizer system. • Connect WDS or equivalent to DLC–2. — Do the following conditions appear? — Engine is not completely started. — DTC B1681 is displayed.	Yes	**Both conditions appear:** • Go to Step 3.
		No	**Either or other condition appear:** • Go to the next step.
2	• Does engine stall after **approx. 2 s** from when engine is started?	Yes	Go to the next step.
		No	Immobilizer system is normal. Go to Step 10.
3	• Is coil connector securely connected to coil?	Yes	Go to the next step.
		No	Connect coil connector securely. Return to Step 2.
4	• Does security light illuminate?	Yes	Go to the next step.
		No	Inspect instrument cluster and wiring harness.
5	• Connect WDS or equivalent to DLC-2 and retrieve DTC. • Are the following DTCs displayed? **DTC** **B1602, B1603, B1604, B1621, B1622, B1624**	Yes	Go to appropriate DTC test.
		No	Go to the next step.
6	• Is there continuity between PCM GND terminals 2H, 2L, 2D, 2BH, 2AZ and GND?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
7	• Measure voltage between PCM GND terminals 2H, 2L, 2D, 2BH, 2AZ and coil terminal C. • Is voltage **below 1.0 V**?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
8	• Turn ignition switch to ON position. • Measure voltage PCM terminal 1B and 1A. • Is voltage **B+**?	Yes	Go to the next step.
		No	Repair or replace wiring harness.
9	• Disconnect coil connector. • Turn ignition switch to ON position (Engine OFF). • Is there battery voltage at coil connector terminal D?	Yes	Inspect for following: • Open or short circuit between coil terminal A and PCM terminal 1J • Open or short circuit between coil terminal B and PCM terminal 1I
		No	Repair or replace wiring harness between coil connector terminal D and fuse panel.
10	• Verify following: — Vacuum connection — External fuel shut off or accessory (kill switch, alarm etc.) — Fuel quality: proper octane, contamination, winter/summer blend — No air leakage from intake-air system — Proper sealing of intake manifold and components attached to intake manifold: EGR valve — Ignition wiring — Electrical connections — Fuses — Smooth operation of throttle valve • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 10.

STEP	INSPECTION		ACTION
11	• Connect WDS or equivalent to DLC–2. • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test. **Communication error message is displayed:** • Inspect for the following: — Open circuit between main relay terminal C and PCM terminal 1B or 1A — Open main relay GND circuit — Main relay is stuck open. — Open or poor GND circuit (PCM terminal 2H, 2L, 2D, 2BH, 2AZ) — Poor connection of vehicle body GND
		No	**No DTC is displayed:** • Go to the next step.
12	• Turn ignition switch to ON position (Engine OFF). • Disconnect throttle body connector. • Measure voltage at throttle body VREF terminal with ignition switch at ON position. • Is voltage **4.5—5.5 V**?	Yes	Go to the next step.
		No	Inspect and repair open or short circuit between PCM terminal 2AR and throttle body VREF terminal.
13	• Turn ignition switch to OFF position. • Disconnect APP sensor connector. • Measure voltage at APP sensor VREF terminal with ignition switch at ON position. • Is voltage **4.5—5.5 V**?	Yes	Go to the next step.
		No	Repair or replace open or short circuit for the following: • PCM terminal 1AR and APP sensor terminal D • PCM terminal 1AV and APP sensor terminal A
14	• Will engine start and run smoothly at part throttle?	Yes	Inspect electronic throttle control system operation (See 01–03C–66 Electronic Throttle Control Inspection.)
		No	Go to the next step.
15	• Connect WDS or equivalent to DLC–2. • Access RPM PID. • Is RPM PID indicating engine speed when cranking engine?	Yes	Go to the next step.
		No	Inspect for the following: • Open or short circuit in CKP sensor • Open or short circuit between CKP sensor and PCM terminal 2Z or 2Y • Open or short circuit in CKP sensor harnesses — If CKP sensor and harness are normal, go to the next step.
16	• Visually inspect CKP sensor and teeth of crankshaft pulley. • Are CKP sensor and teeth of crankshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning part.
17	• Inspect ignition coil related harnesses condition (intermittent open or short) for all cylinders. • Are all harnesses condition normal?	Yes	Go to the next step.
		No	Repair suspected wiring harness.
18	• Perform spark test. (See 01–03C–68 Spark Test.) • Is strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to malfunction results.
19	• Inspect spark plug conditions. • Is spark plug wet, covered with carbon or grayish white?	Yes	**Spark plug is wet or covered with carbon:** • Inspect for fuel leakage from injector. **Spark plug is grayish white:** • Inspect for clogged fuel injector.
		No	Install spark plugs on original cylinders. Go to the next step.
20	• Remove and shake PCV valve. • Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
21	• Inspect for restriction in the exhaust system. • Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.

STEP	INSPECTION		ACTION
22	• Install fuel pressure gauge between pulsation damper and fuel distributor. • Short check connector terminal F/P to body GND using a jumper wire. (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].) • Turn ignition switch to ON (Engine OFF). • Is fuel line pressure correct when ignition switch is cycled ON/OFF five times? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump circuit. • Inspect for clogged fuel line. — If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
23	• Visually inspect for fuel leakage at fuel injector O-ring and fuel line. • Service as necessary. • Is fuel line pressure held after ignition switch is turned to OFF position?	Yes	Go to the next step.
		No	Inspect fuel injector. (See 01–14A–32 FUEL INJECTOR INSPECTION [AJ].) • If fuel injector is normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
24	• Disconnect vacuum hose between purge solenoid valve and intake manifold from purge solenoid valve side. • Plug opening end of vacuum hose. • Attempt to start engine. • Is starting condition improved?	Yes	Inspect if purge solenoid valve is stuck open mechanically. Inspect EVAP control system.
		No	Go to the next step.
25	• Is air leakage felt or heard at intake-air system components while racing engine to higher speed?	Yes	Repair or replace.
		No	Go to the next step.
26	• Inspect engine condition while tapping EGR valve housing. • Does engine condition improve?	Yes	Replace EGR valve. (See 01–16A–17 EGR VALVE REMOVAL/INSTALLATION [AJ].)
		No	Go to the next step.
27	• Perform variable valve timing control system operation inspection. (See 01–03C–74 Variable Valve Timing Control System Operation Inspection.) • Does variable valve timing control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to variable valve timing control system operation inspection results.
28	• Is engine compression correct? (See 01–10C–6 COMPRESSION INSPECTION [AJ].)	Yes	Inspect valve timing.
		No	Inspect for causes.
29	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.7 SLOW RETURN TO IDLE [AJ]

E6U010318881W48

7	Slow return to idle
DESCRIPTION	• Engine takes more time than normal to return to idle speed.
POSSIBLE CAUSE	• ECT sensor malfunction • Thermostat is stuck open. • Throttle body malfunction • Air leakage from intake-air system

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
2	• Remove thermostat and inspect operation. (See 01–12A–9 THERMOSTAT REMOVAL/ INSTALLATION [L3, AJ].) (See 01–12A–10 THERMOSTAT INSPECTION [L3, AJ].) • Is thermostat normal?	Yes	ECT and thermostat are normal. Go to the next step.
		No	Access ECT PID. Inspect for both ECT PID and temperature gauge on instrument cluster readings. • If temperature gauge on instrument cluster indicates normal range but ECT PID is not same as temperature gauge reading, inspect ECT sensor. • If temperature gauge on instrument cluster indicates cold range but ECT PID is normal, inspect temperature gauge and heat gauge unit.
3	• Is throttle body free of contaminations?	Yes	Inspect for air leakage from intake-air system components while racing engine to higher speed.
		No	Clean or replace throttle body.
4	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repa or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.8 ENGINE RUNS ROUGH/ROLLING IDLE [AJ]

E6U010318881W49

8	Engine runs rough/rolling idle
DESCRIPTION	• Engine speed fluctuates between specified idle speed and lower speed and engine shakes excessively. • Idle speed is too slow and engine shakes excessively.
POSSIBLE CAUSE	• Air leakage from intake-air system parts • A/C system improper operation • Spark plug malfunction • Erratic signal to ignition coil • Purge solenoid valve malfunction • Improper operation of electronic throttle control system • EGR valve malfunction • Erratic or no signal from CMP sensor • Low engine compression • Improper valve timing • Improper operation of valve timing control system • Erratic signal from CKP sensor • Poor fuel quality • PCV valve malfunction • Air cleaner restriction • Restriction in exhaust system • Disconnected electrical connectors • Inadequate fuel pressure • Fuel pump mechanical malfunction • Improper load signal input • Fuel line restriction or clogging • Improper operation or fuel injection control • Fuel leakage from fuel injector • Fuel injector clogging • Engine overheating • Vacuum leakage • Pressure regulator malfunction **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Verify the following: — External fuel shut off or accessory (kill switch, alarm etc.) — Fuel quality: proper octane, contamination, winter/summer blend — No air leakage from intake-air system — Proper sealing of intake manifold and components attached to intake manifold: EGR valve — Ignition wiring — Electrical connections — Fuses — Smooth operation of throttle valve • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 1.
2	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
3	• Is engine overheating?	Yes	Go to symptom troubleshooting "No.17 Cooling system concerns — Overheating".
		No	Go to the next step.
4	**Note** • The following test is for engine running at rough idle with A/C on. If other symptoms exist, go to the next step. • Connect pressure gauge to A/C low and high pressure side lines. • Start engine and run it at idle. • Turn A/C switch on. • Measure low side and high side pressures. • Are reading pressures within specifications? (See 07–10–4 REFRIGERANT PRESSURE CHECK [L3, AJ].)	Yes	Go to the next step.
		No	If A/C is always on, go to symptom troubleshooting "No.24 A/C always on/A/C compressor runs continuously". For other symptoms, inspect the following: • Refrigerant charging amount • Condenser fan operation
5	**Note** • The following test is for engine running rough with P/S on. If other symptoms exist, go to the next step. • Start engine and run it at idle • Measure voltage at PSP switch terminal A. • Is voltage normal?	Yes	Go to the next step.
		No	Inspect PSP switch operation and wiring harness between PSP switch terminal A and PCM terminal 2T.
6	• Visually inspect CKP sensor and teeth of crankshaft pulley. • Are CKP sensor and teeth of crankshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning part.
7	• Inspect ignition coil related harnesses condition (intermittent open or short circuit) for all cylinders. • Are all harnesses condition normal?	Yes	Go to the next step.
		No	Repair suspected wiring harness.
8	• Inspect spark plug conditions. • Is spark plug wet, covered with carbon or grayish white?	Yes	**Spark plug is wet or covered with carbon:** • Inspect for fuel leakage from injector. **Spark plug is grayish white:** • Inspect for clogged fuel injector.
		No	Install spark plugs on original cylinders. Go to the next step.
9	• Perform electronic throttle control system operation inspection. (See 01–03C–66 Electronic Throttle Control Inspection.) • Does electronic throttle control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to electronic throttle control system operation inspection results.

STEP	INSPECTION		ACTION
10	• Install fuel pressure gauge between pulsation damper and fuel distributor. • Start engine and run it at idle. • Measure fuel line pressure at idle. (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) • Is fuel line pressure correct at idle?	Yes	Go to the next step.
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump circuit. • Inspect for clogged fuel line. • If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/INSTALLATION [L3, AJ].)
11	• Visually inspect for fuel leakage at fuel injector, O-ring, and fuel line. • Service if necessary. • Does fuel line pressure hold after ignition switch is turned to OFF position?	Yes	Go to the next step.
		No	Inspect fuel injector. (See 01–14A–32 FUEL INJECTOR INSPECTION [AJ].) • If fuel injector is normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/INSTALLATION [L3, AJ].)
12	• Connect WDS or equivalent to DLC–2. • Start the engine and run it at idle. • Access LONGFT1 and LONGFT2 PID. • Measure LONGFT1 and LONGFT2 PID at idle. • Is PID value **within -15% — +15%**?	Yes	Go to the next step.
		No	LONGFT1 and LONGFT2 PID is out of specification. **Less than specification (too rich):** • Inspect EVAP control system. — If system is normal, go to Step 14. **Greater than specification (too lean):** • Inspect for air leakage at intake-air system components. — If system normal, go to the next step.
13	• Disconnect vacuum hose between purge solenoid valve and intake manifold from purge solenoid valve side. • Plug opening end of vacuum hose. • Start engine. • Does engine condition improve?	Yes	Inspect if purge solenoid valve sticks open mechanically. Inspect EVAP control system.
		No	Go to the next step.
14	• Remove and shake PCV valve. • Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve. (See 01–16A–17 EGR VALVE REMOVAL/INSTALLATION [AJ].)
15	• Inspect for restriction in the exhaust system. • Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.
16	• Visually inspect CMP sensor and tooth of camshaft pulley. • Are CMP sensor and tooth of camshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning part.
17	• Inspect engine condition while tapping EGR valve housing. • Does engine condition improve?	Yes	Replace EGR valve.
		No	Go to the next step.
18	• Perform variable valve timing control system inspection. (See 01–03C–74 Variable Valve Timing Control System Operation Inspection.) • Does variable valve timing control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to variable valve timing control system inspection results.
19	• Is engine compression correct? (See 01–10C–6 COMPRESSION INSPECTION [AJ].)	Yes	Inspect valve timing.
		No	Inspect for causes.
20	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.9 FAST IDLE/RUNS ON [AJ]

E6U010318881W50

9	Fast idle/runs on
DESCRIPTION	• Engine speed continues at fast idle after warm-up. • Engine runs after ignition switch is turned to OFF position.
POSSIBLE CAUSE	• ECT sensor malfunction • Air leakage from intake-air system • Throttle body malfunction • APP sensor misadjustment • Cruise control system operation improperly • Improper operation of electronic throttle control system

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Connect WDS or equivalent to DLC–2. • Access ECT PID. • Start and warm-up engine to normal operating temperature. • Is ECT PID reading between **82—112 °C {180—234 °F}**?	Yes	Go to the next step.
		No	**ECT PID is higher than 112 °C {234 °F}:** • Go to symptom troubleshooting "No.17 Cooling system concerns—Overheating". **ECT PID is less than 82 °C {180 °F}:** • Go to symptom troubleshooting "No.18 Cooling system concerns—Runs cold".
2	• Connect WDS or equivalent to DLC–2. • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
3	• Measure voltage at PCM terminal 1AN, 1AH, 1AB (MTX), 2X (MTX) and 2T. • Are voltage normal?	Yes	Go to Step 5.(MTX) Go to the next step.(ATX)
		No	**If PCM terminal 1AN voltage is not as specified:** • Inspect A/C switch, refrigerant pressure switch and fan switch. **If PCM terminal 1AH voltage is not as specified:** • Inspect refrigerant pressure switch (middle pressure). **If PCM terminal 1AB voltage is not as specified:** • Inspect clutch switch. **If PCM terminal 2X voltage is not as specified:** • Inspect neutral switch. **If PCM terminal 2T voltage is not as specified:** • Inspect PSP switch.
4	• Inspect indication of selector lever position at instrument cluster. • Does indicator lamp indicate properly selector lever position?	Yes	Go to the next step.
		No	Perform N position learning. (See 05–17B–28 Neutral Position Learning.) If problem remains replace TR switch. (See 05–17B–25 TCM REMOVAL/INSTALLATION [AW6A-EL].)
5	• Is there air leakage felt or heard at intake-air system components while racing engine to higher speed?	Yes	Repair or replace parts as necessary.
		No	Inspect following: • Electronic throttle control system operation • Accelerator position sensor adjustment
6	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.10 LOW IDLE/STALLS DURING DECELERATION [AJ]

E6U010318881W51

10	Low idle/stalls during deceleration
DESCRIPTION	• Engine stops unexpectedly at beginning of deceleration or recovery from deceleration.
POSSIBLE CAUSE	• Vacuum leakage • Improper operation of electronic throttle control system • Air leakage from intake-air system • Improper air/fuel ratio mixture control • EVAP control system malfunction • APP sensor or related circuit malfunction • APP sensor misadjustment • Neutral/clutch switch or related circuit malfunction (MTX) • TR switch or related circuit malfunction (ATX) • TP sensor or related circuit malfunction • MAF sensor or related circuit malfunction • Brake switch or related circuit malfunction • Improper operation of A/C magnetic clutch

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Does engine idle rough?	Yes	Go to symptom troubleshooting "No.8 Engine runs rough/ rolling idle".
		No	Go to the next step.
2	• Turn off A/C switch and fan switch. • Does A/C magnetic clutch engage?	Yes	Go to symptom troubleshooting "No.24 A/C always on or A/C compressor runs continuously"?
		No	Go to the next step.
3	• Verify following: — Proper routing and no damage to vacuum lines — No air leakage from intake-air system • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 3.
4	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTC. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
5	• Perform electronic throttle control system operation inspection. (See 01–03C–66 Electronic Throttle Control Inspection.) • Does electronic controlled throttle work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to electronic throttle control system operation inspection results.
6	• Disconnect vacuum hose between purge solenoid valve and intake manifold from purge solenoid valve side. • Plug opening end of vacuum hose. • Drive vehicle. • Does engine condition improve?	Yes	Inspect EVAP control system.
		No	Go to the next step.
7	• Connect WDS or equivalent to DLC–2. • Access APP1, APP2, TP_REL, MAF and VSS PIDs. • Monitor each PID while driving vehicle. (See 01–40C–6 PCM INSPECTION [AJ].) • Are PIDs normal?	Yes	Intermittent concern exists. (See 01–03C–5 INTERMITTENT CONCERN TROUBLESHOOTING [AJ].)
		No	**APP1 or APP2 PIDs:** • Inspect APP sensor. (See 01–40C–26 ACCELERATOR PEDAL POSITION (APP) SENSOR INSPECTION [AJ].) **TP_REL PID:** • Inspect TP sensor. (See 01–40C–28 THROTTLE POSITION (TP) SENSOR INSPECTION [AJ].) **MAF PID:** • Inspect MAF sensor. (See 01–40C–32 MASS AIR FLOW (MAF) SENSOR INSPECTION [AJ].) **VSS PID:** • Inspect VSS. (See 05–15B–5 VEHICLE SPEED SENSOR INSPECTION (WITHOUT ABS) [A65M-R].)

STEP	INSPECTION	ACTION
8	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.	

NO.11 ENGINE STALLS/QUITS, ENGINE RUNS ROUGH, MISSES, BUCK/JERK, HESITATION/STUMBLE, SURGES [AJ]

E6U010318881W52

11	**Engine stalls/quits—acceleration/cruise** **Engine runs rough—acceleration/cruise** **Misses—acceleration/cruise** **Buck/jerk—acceleration/cruise/deceleration** **Hesitation/stumble—acceleration** **Surges—acceleration/cruise**
DESCRIPTION	• Engine stops unexpectedly at beginning of acceleration or during acceleration. • Engine stops unexpectedly while cruising. • Engine speed fluctuates during acceleration or cruising. • Engine misses during acceleration or cruising. • Vehicle bucks/jerks during acceleration, cruising or deceleration. • Momentary pause at beginning of acceleration or during acceleration • Momentary minor irregularity in engine output

POSSIBLE CAUSE	• A/C system improper operation • Erratic signal or no signal from CMP sensor • Air leakage from intake-air system parts • Purge solenoid valve malfunction • Improper operation of electronic throttle control system • EGR valve malfunction • Erratic signal from CKP sensor • Low engine compression • Vacuum leakage • Poor fuel quality • Main relay intermittent malfunction • Throttle body malfunction • Engine overheating • Spark plug malfunction • Improper air/fuel mixture control operation • Erratic signal to ignition coil • Air cleaner restriction • PCV valve malfunction • Improper valve timing due to jumping out of timing belt • Restriction in exhaust system • Intermittent open or short in fuel pump circuit • Inadequate fuel pressure • Fuel line and/or fuel filter restriction or clogging • Pressure regulator malfunction • APP sensor misadjustment • TP sensor misadjustment • Fuel pump mechanical malfunction • Fuel leakage from fuel injector • Fuel injector clogging • Intermittent open or short of MAF sensor, APP sensor, TP sensor and VSS • ATX malfunction (ATX) • Clutch slippage (MTX) **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Verify following: — Vacuum connection — Air cleaner element — No air leakage from intake-air system — No restriction of intake-air system — Proper sealing of intake manifold and components attached to intake manifold: EGR valve — Ignition wiring — Fuel quality: proper octane, contamination, winter/summer blend — Electrical connections — Smooth operation of throttle valve • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 1.
2	• Connect WDS or equivalent DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
3	• Is engine overheating?	Yes	Go to symptom troubleshooting "No.17 Cooling system concerns—Overheating".
		No	Go to the next step.
4	• Connect WDS or equivalent to DLC–2. • Access APP1, APP2, RPM, MAF, TP_REL and VSS PIDs. • Drive vehicle while monitoring PIDs. • Are PIDs within specification? (See 01–40C–6 PCM INSPECTION [AJ].)	Yes	Go to the next step.
		No	**APP1, APP2, PIDs:** • Inspect if output signal APP sensor changes smoothly. (See 01–40C–26 ACCELERATOR PEDAL POSITION (APP) SENSOR INSPECTION [AJ].) **RPM PID:** • Inspect CKP sensor and related harness for vibration or intermittent open/short circuit, or both. (See 01–40C–41 CRANKSHAFT POSITION (CKP) SENSOR INSPECTION [AJ].) **MAF PID:** • Inspect for intermittent open circuit between MAF sensor and related wire harness. (See 01–40C–32 MASS AIR FLOW (MAF) SENSOR INSPECTION [AJ].) **TP_REL PID:** • Inspect if output signal from TP sensor changes smoothly. (See 01–40C–28 THROTTLE POSITION (TP) SENSOR INSPECTION [AJ].) **VSS PID:** • Inspect for intermittent open circuit between VSS and related wire harness. (See 05–15B–5 VEHICLE SPEED SENSOR INSPECTION (WITHOUT ABS) [A65M-R].)
5	• Visually inspect CKP sensor and teeth of crankshaft pulley. • Are CKP sensor and teeth of crankshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning part.
6	• Inspect spark plug conditions. • Is spark plug wet, covered with carbon or grayish white?	Yes	**Spark plug is wet or covered with carbon:** • Inspect for fuel leakage from fuel injector. **Spark plug is grayish white:** • Inspect for clogged fuel injector.
		No	Install spark plugs on original cylinders. Go to the next step.
7	• Remove and shake PCV valve. • Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.

STEP	INSPECTION		ACTION
8	• Perform electronic throttle control system operation inspection. (See 01–03C–66 Electronic Throttle Control Inspection.) • Does electronic controlled throttle work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to electronic throttle control system operation inspection results.
9	• Inspect for restriction in the exhaust system. • Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.
10	• Install fuel pressure gauge between pulsation damper and fuel distributor. • Short the check connector terminal F/P to body GND using a jumper wire. (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].) • Turn ignition switch to ON position (Engine OFF). • Inspect fuel line pressure. (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) • Is fuel line pressure correct with ignition switch at ON position?	Yes	Go to the next step.
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump. • Inspect for clogged fuel line. — If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
11	• Visually inspect for fuel leakage at fuel injector O-ring and fuel line. • Service if necessary. • Does fuel line pressure hold after ignition switch is turned to OFF position? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	Inspect fuel injector. (See 01–14A–32 FUEL INJECTOR INSPECTION [AJ].) • If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
12	**Note** • The following test is for engine stall with A/C on. If other symptom exists, go to the next step. • Connect a pressure gauge to A/C low and high pressure side lines. • Turn A/C on and measure low side and high side pressures. • Are pressures within specifications? (See 07–10–4 REFRIGERANT PRESSURE CHECK [L3, AJ].)	Yes	Go to the next step.
		No	If A/C is always on, go to symptom troubleshooting "No.24 A/C always on/A/C compressor runs continuously". For other symptoms, inspect following: • Refrigerant charging amount • Condenser fan operation
13	**Note** • Following test is performed for symptom with cruise control on. If other symptom exists, go to the next step. • Inspect cruise control system. • Is cruise control system normal?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part.
14	• Disconnect vacuum hose between purge solenoid valve and intake manifold from purge solenoid valve side. • Plug opening end of vacuum hose. • Drive vehicle. • Does engine condition improve?	Yes	Inspect if purge solenoid valve is stuck open mechanically. Inspect EVAP control system.
		No	Go to the next step.
15	• Visually inspect CMP sensor and projections of camshaft pulley. • Are CMP sensor and projections of camshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts.
16	• Inspect EGR system. • Is EGR system normal?	Yes	Go to the next step.
		No	Replace malfunctioning parts.
17	• Is engine compression correct? (See 01–10C–6 COMPRESSION INSPECTION [AJ].)	Yes	Inspect following: • Valve timing • Internal transaxle part
		No	Inspect for cause.

STEP	INSPECTION	ACTION
18	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.	

NO.12 LACK/LOSS OF POWER-ACCELERATION/CRUISE [AJ]

E6U010318881W53

12	Lack/loss of power—acceleration/cruise
DESCRIPTION	• Performance is poor under load (e.g. power down when climbing hills).
POSSIBLE CAUSE	• Improper A/C system operation • Erratic signal or no signal from CMP sensor • Air leakage from intake-air system parts • Improper operation of electronic throttle control system • Purge control solenoid malfunction • EGR valve malfunction • Brake dragging • Erratic signal from CKP sensor • Low engine compression • Vacuum leakage • Poor fuel quality • Erratic signal ignition coil • Engine overheating • Throttle body malfunction • Spark plug malfunction • Air cleaner restriction • PCV valve malfunction • Improper valve timing due to jumping out of timing belt • Improper operation of variable valve timing control system • Restriction in exhaust system • Intermittent open or short in fuel pump circuit • Inadequate fuel pressure • Fuel pump mechanical malfunction • Fuel line restriction or clogging • Fuel leakage from fuel injector • Fuel injector clogging • Intermittent open or short of MAF sensor, APP sensor, TP sensor and VSS • ATX malfunction (ATX) • Clutch slippage (MTX) **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Verify the following: — Vacuum connection — Air cleaner element — No air leakage from intake-air system — No restriction of intake-air system — Proper sealing of intake manifold and components attached to intake manifold: EGR valve — Fuel quality: proper octane, contamination, winter/summer blend • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 1.
2	• Connect WDS or equivalent to DLC–2. • Tun ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?.	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
3	Is engine overheating?	Yes	Go to symptom troubleshooting "No.17 Cooling system concerns—Overheating".
		No	Go to the next step.
4	• Connect WDS or equivalent to DLC–2. • Access APP1, APP2, RPM, MAF,TP_REL and VSS PIDs. • Drive vehicle with monitoring PIDs. • Are PIDs within specification? (See 01–40C–6 PCM INSPECTION [AJ].)	Yes	Go to the next step.
		No	**APP1, APP2, PIDs:** • Inspect if output signal from APP sensor changes smoothly. (See 01–40C–26 ACCELERATOR PEDAL POSITION (APP) SENSOR INSPECTION [AJ].) **RPM PID:** • Inspect CKP sensor and related harness for vibration or intermittent open/short circuit, or both. (See 01–40C–41 CRANKSHAFT POSITION (CKP) SENSOR INSPECTION [AJ].) **MAF PID:** • Inspect for intermittent open circuit between MAF sensor and related wire harness. (See 01–40C–32 MASS AIR FLOW (MAF) SENSOR INSPECTION [AJ].) **TP_REL PID:** • Inspect if output signal from TP sensor changes smoothly. (See 01–40C–28 THROTTLE POSITION (TP) SENSOR INSPECTION [AJ].) **VSS PID:** • Inspect for intermittent open circuit between VSS and related wire harness. (See 05–15B–5 VEHICLE SPEED SENSOR INSPECTION (WITHOUT ABS) [A65M-R].)
5	• Visually inspect CKP sensor and teeth of crankshaft pulley. • Are CKP sensor and teeth of crankshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning part.
6	• Inspect spark plug conditions. • Is spark plug wet, covered with carbon or grayish white?	Yes	**Spark plug is wet or covered with carbon:** • Inspect for fuel leakage from fuel injector. • Inspect ignition system for suspect cylinder. **Spark plug is grayish white:** • Inspect for clogged fuel injector.
		No	Install spark plugs on original cylinders. Go to the next step.
7	• Remove and shake PCV valve. • Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
8	• Perform electronic throttle control system operation inspection. (See 01–03C–66 Electronic Throttle Control Inspection.) • Does electronic controlled throttle work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to electronic throttle control system operation inspection results.

STEP	INSPECTION		ACTION
9	• Inspect for restriction in the exhaust system. • Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.
10	• Install fuel pressure gauge between pulsation damper and fuel distributor. • Short the check connector terminal F/P to body GND using a jumper wire. (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].) • Turn ignition switch to ON position (Engine OFF). • Inspect fuel line pressure. (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) • Is fuel line pressure correct with ignition switch at ON position?	Yes	Go to the next step.
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump circuit. • Inspect for clogged fuel line. — Inspect normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
11	**Note** • The following test is for engine stall with A/C on. If other symptom exists, go to the next step. • Connect pressure gauge to A/C low and high side pressure lines. • Turn A/C on and measure low side and high side pressures. • Are pressures within specifications? (See 07–10–4 REFRIGERANT PRESSURE CHECK [L3, AJ].)	Yes	Go to the next step.
		No	If A/C is always on, go to symptom troubleshooting "No.24 A/C always on/A/C compressor runs continuously". For other symptoms, inspect following: • Refrigerant charging amount • Condenser fan operation
12	• Inspect A/C cut-off operation. • Does A/C cut-off work properly?	Yes	Go to the next step.
		No	Inspect A/C cut-off system components.
13	• Disconnect vacuum hose between purge solenoid valve and intake manifold from purge solenoid valve side. • Plug opened end of vacuum hose. • Drive vehicle. • Does engine condition improve?	Yes	Inspect if purge solenoid valve is stuck open mechanically. Inspect EVAP control system.
		No	Go to the next step.
14	• Visually inspect CMP sensor and projections of camshaft pulley. • Are CMP sensor and projections of camshaft pulley normal?	Yes	Go to the next step.
		No	Replace malfunctioning part.
15	• Inspect EGR system. • Is EGR system normal?	Yes	Go to the next step.
		No	Replace malfunctioning part.
16	• Perform Variable Valve Timing Control System Inspection. (See 01–03C–74 Variable Valve Timing Control System Operation Inspection.) • Does variable valve timing control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to Variable Valve Timing Control System Inspection results.
17	• Is engine compression correct? (See 01–10C–6 COMPRESSION INSPECTION [AJ].)	Yes	Inspect following: • Valve timing • Internal transaxle components (ATX) • Clutch (MTX) • Brake system for dragging
		No	Inspect for cause.
18	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.13 KNOCKING/PINGING-ACCELERATION/CRUISE [AJ]

E6U010318881W54

13	Knocking/pinging—acceleration/cruise
ESCRIPTION	• Sound is produced when air/fuel mixture is ignited by something other than spark plug (e.g. hot spot in combustion chamber).
POSSIBLE CAUSE	• Engine overheating due to cooling system malfunction • ECT sensor malfunction • IAT sensor malfunction • MAF sensor malfunction • Erratic signal from CMP sensor • Inadequate engine compression • Inadequate fuel pressure • KS and related circuit malfunction **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Connect WDS or equivalent to DLC–2. • Access ECT PID. • Verify ECT PID is **less than 116 °C {241 °F}** during driving. • Is ECT PID less than specification?	Yes	Go to the next step.
		No	Inspect cooling system for cause of overheating.
2	• Access IAT, MAF PIDs. • Monitor each PID. • Are PIDs normal?	Yes	Go to the next step.
		No	**IAT PID:** • Inspect IAT sensor. (See 01–40C–31 INTAKE AIR TEMPERATURE (IAT) SENSOR INSPECTION [AJ].) **MAF PID:** • Inspect MAF sensor. (See 01–40C–32 MASS AIR FLOW (MAF) SENSOR INSPECTION [AJ].)
3	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
4	• Is engine compression correct? (See 01–10C–6 COMPRESSION INSPECTION [AJ].)	Yes	Go to the next step.
		No	Inspect for cause.
5	• Install fuel pressure gauge between pulsation damper and fuel distributor. • Start engine and run it at idle. • Measure fuel line pressure at idle. (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) • Is fuel line pressure correct at idle?	Yes	Go to the next step.
		No	**Zero or low:** • Inspect fuel pump relay fuel pump circuit. • Inspect for clogged fuel line. — If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/INSTALLATION [L3, AJ].)

STEP	INSPECTION		ACTION
6	• Inspect KS. (See 01–40C–38 KNOCK SENSOR (KS) INSPECTION [AJ].) • Is KS normal?	Yes	Inspect ignition timing. (See 01–10C–39 ENGINE TUNE-UP [AJ].)
		No	Replace KS. (See 01–40C–38 KNOCK SENSOR (KS) REMOVAL/ INSTALLATION [AJ].)
7	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.14 POOR FUEL ECONOMY [AJ]

E6U010318881W55

14	Poor fuel economy
DESCRIPTION	• Fuel economy is unsatisfactory.
POSSIBLE CAUSE	• Contaminated air cleaner element • Engine cooling system malfunction • Improper ATF level (ATX) • Weak spark • Poor fuel quality • Erratic or no signal from CMP sensor • Clutch slippage (MTX) • Improper operation of variable valve timing control system • Improper coolant level • Inadequate fuel pressure • Spark plug malfunction • PCV valve malfunction • Brake dragging • Improper valve timing due to jumping out of timing belt • Contaminated MAF sensor • Improper engine compression • Exhaust system clogging **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Inspect following: — Air cleaner element for contamination — ATF level (ATX) — Fuel quality — Coolant level — Clutch slippage (MTX) • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 1.
2	• Connect WDS or equivalent to DLC–2. • Tun ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
3	• Access ECT PID. • Drive vehicle while monitoring PID. (See 01–40C–6 PCM INSPECTION [AJ].) • Is PID within specification?	Yes	Go to the next step.
		No	Inspect for coolant leakage. Inspect cooling fan operations or thermostat operations.
4	• Perform spark test. (See 01–03C–68 Spark Test.) • Is strong blue spark visible at each cylinder?	Yes	Inspect for following: • Spark plugs malfunction • CMP sensor is installed improperly. • Trigger wheel damage on camshaft • Open or short circuit on CMP sensor • Open or short circuit between CMP sensor and PCM terminal 2AA, 2AB, 2AD or 2AE. Repair or replace malfunctioning part. • If normal, go to the next step.
		No	Repair or replace malfunctioning part according to spark test results.
5	• Install fuel pressure gauge between fuel filter and fuel distributor. • Start engine and run it at idle. • Measure fuel line pressure at idle. (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) • Is fuel line pressure correct at idle?	Yes	Go to the next step.
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump circuit. • Inspect for clogged fuel line. — If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
6	• Remove and shake PCV valve. • Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
7	• Inspect for restriction in the exhaust system. • Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.
8	• Is brake system functioning properly?	Yes	Go to the next step.
		No	Inspect for cause.
9	• Inspect MAF sensor for contamination. (See 01–40C–32 MASS AIR FLOW (MAF) SENSOR INSPECTION [AJ].) • Is there any contamination?	Yes	Replace MAF/IAT sensor.
		No	Go to the next step.
10	• Perform variable valve timing control system inspection. (See 01–03C–74 Variable Valve Timing Control System Operation Inspection.) • Does variable valve timing control system work properly?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part according to variable valve timing control system inspection results.
11	• Is engine compression correct? (See 01–10C–6 COMPRESSION INSPECTION [AJ].)	Yes	Inspect valve timing.
		No	Inspect for cause.
12	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.15 EMISSION COMPLIANCE [AJ]

E6U010318881W56

15	Emission compliance
DESCRIPTION	• Emission compliance test failed.
POSSIBLE CAUSE	• Vacuum lines leakage or blockage • Cooling system malfunction • Spark plug malfunction • Air leakage from intake manifold • Erratic or no signal from CMP sensor • Inadequate fuel pressure • PCV valve malfunction or incorrect valve installation • EGR valve malfunction • Exhaust system clogging • Fuel tank ventilation system malfunction • Charcoal canister damage • Air cleaner element clogging or restriction • Throttle body malfunction • Ignition coil or related circuit malfunction. • Improper air/fuel mixture ratio control operation • Excessive carbon built up in combustion chamber • Improper engine compression • Improper valve timing • Catalyst converter malfunction • Engine internal parts malfunction **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Inspect the following: — Vacuum lines for leakage or blockage — Electrical connections — Proper maintenance schedule followed — Intake-air system and air cleaner element concerns: obstructions, leakage or dirtiness • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 1.
2	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
3	• Is any other driveability concern present?	Yes	Go to appropriate symptom troubleshooting.
		No	Go to the next step.
4	• Connect WDS or equivalent to DLC–2. • Access ECT PID. • Warm up engine and run it at idle. • Verify ECT PID is correct. (See 01–40C–6 PCM INSPECTION [AJ].) • Is ECT PID correct?	Yes	Go to the next step.
		No	Inspect for coolant leakage. Inspect cooling fan and operation or thermostat operation.
5	• Perform spark test. (See 01–03C–68 Spark Test.) • Is strong blue spark visible at each cylinder?	Yes	Inspect for the following: • Spark plugs malfunction • CMP sensor is installed improperly. • Damage of trigger wheel on camshaft • Open or short circuit on CMP sensor • Open or short circuit between CMP sensor and PCM terminal 2AE, 2AD, 2AB or 2AA. Repair or replace malfunctioning part. • If normal, go to the next step.
		No	Repair or replace malfunctioning part according to spark test results.
6	• Install fuel pressure gauge between plastic fuel hose and fuel distributor. • Start engine and run it at idle. • Measure fuel line pressure at idle. (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) • Is fuel line pressure correct at idle?	Yes	Go to the next step.
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump circuit. • Inspect for clogged fuel line. — If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
7	• Remove and shake PCV valve. • Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
8	• Inspect for fuel saturation inside charcoal canister. • Is excess amount of liquid fuel present in canister?	Yes	Replace charcoal canister.
		No	Inspect fuel tank vent system. Then, go to the next step.
9	• Inspect WU–TWC. • Is WU–TWC normal?	Yes	Inspect EGR system.
		No	Replace WU–TWC.
10	• Inspect for restriction in the exhaust system. • Is there any restriction?	Yes	Inspect exhaust system.
		No	Go to the next step.
11	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.16 HIGH OIL CONSUMPTION/LEAKAGE [AJ]

E6U010318881W57

16	High oil consumption/leakage
DESCRIPTION	• Oil consumption is excessive.
POSSIBLE CAUSE	• PCV valve malfunction • Improper dipstick • Improper engine oil viscosity • Engine internal part malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Remove and shake PCV valve. • Does PCV valve rattle?	Yes	Go to the next step.
		No	Replace PCV valve.
2	• Verify following: — No external leakage — Proper dipstick — Proper engine oil viscosity • Are all items normal?	Yes	Inspect internal engine parts such as valves, valve guides, valve stem seals, cylinder head drain passage, and piston rings.
		No	Service as necessary. Repeat Step 2.
3	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.17 COOLING SYSTEM CONCERNS-OVERHEATING [AJ]

E6U010318881W58

17	Cooling system concerns—overheating
DESCRIPTION	• Engine runs at higher than normal temperature/overheats.
POSSIBLE CAUSE	• Improper coolant level • Blown fuses • Coolant leakage • Excessive A/C system pressure • A/C system operation is improper. • Improper water/anti-freeze mixture • Fans reverse rotation • Poor radiator condition • Thermostat malfunction • Radiator hoses damage • Condenser fan is inoperative. • Improper or damaged radiator cap • Cooling fan is inoperative. • Coolant overflow system malfunction • Improper tension of drive belt • Drive belt damage • Fan control module malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Inspect the following: — Engine coolant level — Coolant leakage — Water and anti-freeze mixture — Radiator condition — Collapsed or restricted radiator hoses — Radiator pressure cap — Overflow system — Fan rotational direction — Fuses • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 1.
2	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.

STEP	INSPECTION		ACTION
3	• Start engine and run it at idle speed. • Turn A/C switch on. • Does A/C compressor engage?	Yes	Go to step 5.
		No	Inspect the following and repair or replace as necessary: • Refrigerant charging amount • Open circuit between A/C relay and PCM terminal 1AW • Seized A/C magnetic clutch • A/C magnetic clutch malfunction — If all items are normal, Inspect the following: • Refrigerant pressure switch operation • Evaporator temperature sensor and A/C amplifier • A/C switch is stuck open. • Open or short circuit between refrigerant pressure switch and PCM terminal 1AN • Open circuit of blower motor fan switch and resistor (if blower motor does not operate)
4	• Start engine and run it at idle speed. • Turn A/C switch on and set blower fan any speed. • Do cooling fan and condenser fan operate?	Yes	Go to the next step.
		No	**Cooling fan motor does not operate:** • Inspect for following: — Cooling fan motor malfunction — Cooling fan motor GND open circuit — Open circuit between cooling fan motor and fan control module **Condenser fan motor does not operate:** • Inspect for the following: — Condenser fan motor malfunction — Condenser fan motor GND open circuit — Open circuit between condenser fan motor and fan control module **Both cooling fan and condenser fan do not operate:** • Inspect for the following: — Fan control module malfunction — Fan control module GND open circuit — Open circuit between fan control module and cooling fan relay
5	• Is drive belt normal?	Yes	Go to the next step.
		No	Replace drive belt.
6	• Is there any leakage around heater unit in passenger compartment?	Yes	Inspect and service heater for leakage.
		No	Go to the next step.
7	• Is there any leakage at coolant hoses and/or radiator?	Yes	Replace malfunctioning part.
		No	Go to the next step.
8	• Cool down engine. • Remove thermostat and inspect operation. (See 01–12A–9 THERMOSTAT REMOVAL/ INSTALLATION [L3, AJ].) (See 01–12A–10 THERMOSTAT INSPECTION [L3, AJ].) • Is thermostat normal?	Yes	Engine coolant temperature and thermostat are normal. Inspect engine block for leakage or blockage.
		No	Access ECT PID on WDS or equivalent. Inspect both ECT PID and temperature gauge readings. • If temperature gauge on instrument cluster indicates normal range but ECT PID is not same as temperature gauge reading, inspect ECT sensor. • If temperature gauge on instrument cluster indicates overheating but ECT PID is normal, inspect temperature gauge and heat gauge unit.
9	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.18 COOLING SYSTEM CONCERNS-RUNS COLD [AJ]

E6U010318881W59

18	Cooling system concerns—runs cold
DESCRIPTION	• Engine takes excessive time to reach normal operating temperature.
POSSIBLE CAUSE	• Thermostat malfunction • Condenser fan system malfunction • Cooling fan system malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Is customer complaint "Lack of passenger compartment heat" only?	Yes	Inspect A/C and heater systems.
		No	Go to the next step.
2	• Does engine speed continue at fast idle?	Yes	Go to symptom troubleshooting "No.9 Fast idle/runs on".
		No	Go to the next step.
3	• Remove thermostat and inspect operation. (See 01–12A–9 THERMOSTAT REMOVAL/INSTALLATION [L3, AJ].) (See 01–12A–10 THERMOSTAT INSPECTION [L3, AJ].) • Is thermostat normal?	Yes	Go to the next step.
		No	Replace thermostat. (See 01–12A–9 THERMOSTAT REMOVAL/INSTALLATION [L3, AJ].)
4	• Inspect fan control system operation. • Does fan control system work properly?	Yes	Access ECT PID using WDS or equivalent. Inspect for both ECT PID and temperature gauge on instrument cluster readings. • If temperature gauge on instrument cluster indicates normal range but ECT PID is not same as temperature gauge reading, inspect ECT sensor. • If temperature gauge on instrument cluster indicates cold range but ECT PID is normal, inspect instrument cluster and related harnesses.
		No	Repair or replace malfunctioning part.
5	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.19 EXHAUST SMOKE [AJ]

E6U010318881W60

19	Exhaust smoke
DESCRIPTION	• Blue, black, or white smoke from exhaust system
POSSIBLE CAUSE	**Blue smoke (Burning oil):** • PCV valve malfunction • Engine internal oil leakage **White smoke (Water in combustion):** • Cooling system malfunction (coolant loss) • Engine internal coolant leakage **Black smoke (Rich fuel mixture):** • Air cleaner is restricted. • Intake-air system collapsed or restricted. • Fuel return line is restricted. • Excessive fuel pressure • Improper engine compression • Injector fuel leakage • Ignition system malfunction **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** — **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** — **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• What color is smoke coming from exhaust system?	Blue	Burning oil is indicated. Go to the next step.
		White	Water in combustion is indicated. Go to Step 3.
		Black	Rich fuel mixture is indicated. Go to Step 4.
2	• Remove and shake PCV valve. • Does PCV valve rattle?	Yes	Inspect for the following: • Damaged valve guide, stems or valve seals • Blocked oil drain passage in cylinder head • Piston rings are not seated, seized or worn. • Damaged cylinder bore — If other driveability symptoms are present, return to diagnostic index to service any additional symptoms.
		No	Replace PCV valve.
3	• Does cooling system hold pressure?	Yes	Inspect for the following: • Cylinder head gasket leakage • Intake manifold gasket leakage • Engine block cracks or porosity — If other driveability symptoms are present, return to diagnostic index to service any additional symptoms.
		No	Inspect for cause.
4	• Inspect for the following: — Air cleaner restriction — Collapsed or restricted intake-air system — Restricted fuel return line • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 4.
5	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position. • Retrieve any DTC. • Are there any DTCs displayed?	Yes	**DTC displayed:** • Go to appropriate DTC test.
		No	**No DTC displayed:** • Go to the next step.
6	• Install fuel pressure gauge between fuel filter and fuel distributor. • Start engine and run it at idle. • Measure fuel line pressure at idle. (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) • Is fuel line pressure correct at idle?	Yes	Go to the next step.
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump circuit. • Inspect for clogged fuel line. — If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
7	• Perform spark test. (See 01–03C–68 Spark Test.) • Is strong blue spark visible at each cylinder?	Yes	Inspect spark plugs and CMP sensor. (See 01–40C–39 CAMSHAFT POSITION (CMP) SENSOR INSPECTION [AJ].)
		No	Repair or replace malfunctioning part according to results of spark test.
8	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.20 FUEL ODOR (IN ENGINE COMPARTMENT) [AJ]

E6U010318881W61

20	Fuel odor (in engine compartment)
DESCRIPTION	• Gasoline fuel smell or visible leakage
POSSIBLE CAUSE	• Excessive fuel pressure • Purge solenoid valve malfunction • Fuel tank vent system blockage • Charcoal canister malfunction • Fuel leakage from fuel system **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Visually inspect for fuel leakage at fuel injector O-ring, and fuel line. • Service if necessary. • Is fuel line pressure held after ignition switch is turned to OFF position?	Yes	Go to the next step.
		No	Inspect fuel injector. (See 01–14A–32 FUEL INJECTOR INSPECTION [AJ].) • If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
2	• Inspect for blockage/restriction or open circuit between engine vacuum port and charcoal canister. • Inspect for blockage in fuel tank vent system. • Is fault indicated?	Yes	Replace vacuum hose.
		No	Go to the next step.
3	• Inspect purge solenoid valve. (See 01–16A–13 PURGE SOLENOID VALVE INSPECTION [L3, AJ].) • Is solenoid operating properly?	Yes	Go to the next step.
		No	Replace purge solenoid valve.
4	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Inspect charcoal canister for fuel saturation. — If excess amount of liquid fuel present, replace charcoal canister.
5	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.21 ENGINE NOISE [AJ]

E6U010318881W62

21	Engine noise
DESCRIPTION	• Engine noise from under hood
POSSIBLE CAUSE	**Squeal, click or chirp noise:** • Improper engine oil level • Improper drive belt tension **Rattle sound noise:** • Loose parts **Hiss sound noise:** • Vacuum leakage • Loose spark plug • Air leakage from intake-air system • Improper VAD control system operation **Rumble or grind noise:** • Improper drive belt tension **Rap or roar sound noise:** • Exhaust system looseness **Other noise:** • Camshaft friction gear noise or HLA noise • Timing chain noise

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Is squeal, click or chirp sound present?	Yes	Inspect engine oil level or drive belts.
		No	Go to the next step.
2	• Is rumble or grind sound present?	Yes	Inspect drive belt.
		No	Go to the next step.
3	• Is rattle sound present?	Yes	Inspect location of rattle for loose parts.
		No	Go to the next step.
4	• Is hiss sound present?	Yes	Inspect for the following: • Vacuum leakage • Spark plug loose • Intake-air system leakage • VAD control system operation
		No	Go to the next step.
5	• Is rap or roar sound present?	Yes	Inspect exhaust system for loose parts.
		No	Go to the next step.
6	• Is knock sound present?	Yes	Go to symptom troubleshooting "No.13 Knocking/ pinging".
		No	If noise comes from engine internal, inspect for friction gear, timing chain or HLA noise.
7	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.22 VIBRATION CONCERNS (ENGINE) [AJ]

E6U010318881W63

22	Vibration concerns (engine)
DESCRIPTION	• Vibration from under hood or driveline
POSSIBLE CAUSE	• Loose attaching bolts or worn parts • Components malfunction such as worn parts

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Inspect the following components for loose attaching bolts or worn parts: — Cooling fan — Condenser fan — Drive belt and pulleys — Engine mounts • All items normal?	Yes	Inspect the following systems: • Wheels • ATX • Driveline • Suspension
		No	Readjust or retighten engine mount installation position. Service if necessary for other parts.
2	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.23 A/C DOES NOT WORK SUFFICIENTLY [AJ]

E6U010318881W64

23	A/C does not work sufficiently.
DESCRIPTION	• A/C compressor magnetic clutch does not engage when A/C switch is turned on.
POSSIBLE CAUSE	• Improper refrigerant charging amount • Open A/C magnetic clutch • Open circuit between A/C relay and A/C magnetic clutch • Poor GND of A/C magnetic clutch • Refrigerant pressure switch is stuck open. • A/C relay is stuck open. • Seized A/C compressor • Open circuit between A/C switch and PCM through both refrigerant pressure switch and A/C amplifier

Diagnostic procedure

TEP	INSPECTION		ACTION
1	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
2	• Disconnect A/C compressor connector. • Start engine and turn A/C switch on. • Is there correct voltage at terminal of A/C magnetic clutch connector? **Specification** **More than 10.5 V**	Yes	Inspect for GND condition of magnetic clutch on A/C compressor. • If GND condition is normal, inspect for open circuit of magnetic clutch coil.
		No	Go to the next step.
3	• Disconnect refrigerant pressure switch connector. • Connect jumper wire between terminals B and C (high and low pressure side) of refrigerant pressure switch connector. • Start engine and run it at idle. • Turn A/C switch on and set blower fan at any speed. • Does A/C work?	Yes	Inspect refrigerant pressure switch operation. • If switch is normal, go to the next step.
		No	Inspect for the following: • A/C switch is stuck open • Open circuit between refrigerant pressure switch and PCM terminal 1AN • Open circuit of blower motor fan switch and resistor (if blower motor does not operate) • Inspect evaporator temperature sensor and A/C amplifier
4	• Remove jumper wire from switch connector. • Reconnect connector to refrigerant pressure switch. • Start engine and turn A/C switch on. • Does fan operate?	Yes	Inspect for the following: • A/C relay is stuck open. • Open circuit between A/C relay and PCM terminal 1AW
		No	Inspect for the following and repair or replace if necessary: • Refrigerant charging amount • A/C compressor for being seized
5	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.24 A/C ALWAYS ON/A/C COMPRESSOR RUNS CONTINUOUSLY [AJ]

E6U010318881W65

24	A/C always ON or A/C compressor runs continuously
DESCRIPTION	• A/C compressor magnetic clutch does not disengage.
POSSIBLE CAUSE	• Stuck engagement A/C compressor magnetic clutch • A/C relay is stuck closed. • Short to GND between A/C switch and PCM • Short to GND circuit between A/C relay and PCM • A/C relay to magnetic clutch circuit shorts to battery power.

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
2	• Start engine and run it at idle. • Turn A/C switch on. • Remove A/C relay. • Does A/C magnetic clutch disengage?	Yes	Inspect for the following: • A/C relay is stuck closed. • Short to GND circuit between A/C relay and PCM terminal 1U — If both items are normal, go to the next step.
		No	Inspect if circuit between A/C relay and magnetic clutch shorts to battery power circuit. • If circuit is normal, inspect magnetic clutch stuck engagement or clearance.
3	• Disconnect refrigerant pressure switch connector. • Start the engine and A/C switch on. **Note** • A/C should not work when the connector disconnected. If A/C remains working, short to GND circuit may be present. • Does A/C remain working?	Yes	Inspect for short to GND circuit between refrigerant pressure switch and PCM terminal 1AN.
		No	Go to the next step.
4	• Reconnect refrigerant pressure switch connector. • Turn off A/C switch. **Note** • A/C should not work when the A/C switch is turned off. If A/C remains on, short to GND circuit may be present. • Does ACSW PID reading remain on?	Yes	Inspect for the following: • Short to GND circuit between A/C switch and A/C amplifier • Short to GND circuit between A/C amplifier and refrigerant pressure switch
		No	Inspect for stuck closed A/C switch.
5	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.25 A/C DOES NOT CUT OFF UNDER WIDE OPEN THROTTLE CONDITIONS [AJ]

E6U010318881W66

25	A/C does not cut off under wide open throttle conditions.
DESCRIPTION	• A/C compressor magnetic clutch does not disengage under wide open throttle.
POSSIBLE CAUSE	• Accelerator position sensor malfunction • Accelerator position sensor misadjustment • Loosely installed accelerator position sensor

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Does A/C compressor disengage when A/C switch is turned off?	Yes	Go to the next step.
		No	Go to symptom troubleshooting "No.24 A/C always on/ A/C compressor runs continuously".
2	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Inspect accelerator position sensor for proper adjustment.
3	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.26 EXHAUST SULPHUR SMELL [AJ]

E6U010318881W67

26	Exhaust sulphur smell
DESCRIPTION	• Rotten egg smell (sulphur) from exhaust
POSSIBLE CAUSE	• Electrical connectors are disconnected or connected poorly. • Charcoal canister malfunction • Vacuum lines are disconnected or connected improperly. • Improper fuel pressure • Poor fuel quality **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Are any driveability or exhaust smoke concerns present?	Yes	Go to appropriate flow chart.
		No	Go to the next step.
2	• Inspect the following: — Electrical connections — Vacuum lines — Fuel quality • Are all items normal?	Yes	Go to the next step.
		No	Service as necessary. Repeat Step 2.
3	• Connect WDS or equivalent to DLC–2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTC. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
4	• Install fuel pressure gauge between plastic fuel hose and fuel distributor. • Start engine and run it at idle. • Inspect fuel line pressure. (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) • Is fuel line pressure correct at idle?	Yes	Go to the next step.
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump circuit. • Inspect for clogged fuel line. — If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
5	• Inspect charcoal canister for fuel saturation. • Is excess amount of liquid fuel present in canister?	Yes	Replace charcoal canister.
		No	Inspect fuel tank vent system. • If fuel tank vent system is normal, since sulfur content can vary in different fuels, try a different brand. • If fuel tank vent system is not normal, repair or replace malfunctioning part.
6	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.27 FUEL REFILL CONCERNS [AJ]

E6U010318881W68

27	Fuel refill concerns
DESCRIPTION	• Fuel tank does not fill smoothly.
POSSIBLE CAUSE	• Clogged EVAP pipes • Nonreturn valve malfunction • Improper use of fuel nozzle • Inadequate fuel filling speed **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Connect WDS or equivalent to DLC-2 • Turn ignition switch to ON position (Engine OFF). • Retrieve DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC is displayed:** • Go to the next step.
2	• Remove fuel-filler pipe. • Make sure nonreturn valve is installed properly. • Inspect nonreturn valve operation. • Is nonreturn valve normal?	Yes	Inspect for the following: • Improper use of fuel nozzle • Inadequate fuel filling speed
		No	**Nonreturn valve is installed improperly:** • Reinstall nonreturn valve to proper position. **Nonreturn valve does not operate properly:** • Replace nonreturn valve.
3	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.28 FUEL FILLING SHUT OFF ISSUES [AJ]

E6U010318881W69

28	Fuel filling shut off issues
DESCRIPTION	• Fuel does not shut off properly.
POSSIBLE CAUSE	• Clogged EVAP pipes • Nonreturn valve malfunction • Fuel shut-off valve malfunction • Fuel nozzle malfunction • Fuel nozzle is not inserted correctly. **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Connect WDS or equivalent to DLC-2. • Turn ignition switch to ON position (Engine OFF). • Retrieve any DTCs. • Are there any DTCs displayed?	Yes	**DTC is displayed:** • Go to appropriate DTC test.
		No	**No DTC displayed:** • Go to the next step.
2	• Remove fuel-filler pipe. • Make sure nonreturn valve is installed properly. • Inspect nonreturn valve operation. • Is nonreturn valve normal?	Yes	Inspect for the following: • Improper use of fuel nozzle • Fuel-filler pipe is not inserted correctly. • Inspect fuel shut-off valve.
		No	**Nonreturn valve is installed improperly:** • Reinstall nonreturn valve to proper position. **Nonreturn valve does not operate properly:** • Replace nonreturn valve.
3	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

NO.29 SPARK PLUG CONDITION [AJ]

E6U010318881W70

29	Spark plug condition
DESCRIPTION	• Incorrect spark plug condition
POSSIBLE CAUSE	**Note** • Inspecting spark plugs condition can determine whether problem is related to a specific cylinder or to all cylinders. **Wet/carbon is stuck on specific plug:** • Spark—Weak, not visible • Air/fuel mixture—Excessive fuel injection volume • Compression—No compression, low compression • Faulty spark plug **Grayish white with specific plug:** • Air/fuel mixture—Insufficient fuel injection volume • Faulty spark plug **Wet/carbon stuck on all plugs:** • Spark—Weak • Air/fuel mixture—Too rich • Compression—Low compression • Clogging in intake/exhaust system **Grayish white with all plugs:** • Air/fuel mixture—Too lean **Warning** • **The following troubleshooting flow chart contains the fuel system diagnosis and repair procedures. Read the following warnings before performing the fuel system services:** **— Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.** **— Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete "BEFORE REPAIR PROCEDURE" and "AFTER REPAIR PROCEDURE" described in this manual.** **(See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)** **(See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)** **Caution** • **Disconnecting/connecting quick release connector without cleaning it may possibly cause damage to fuel pipe and quick release connector. Always clean quick release connector joint area before disconnecting/connecting, and make sure that it is free of foreign material.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	• Remove all spark plugs. • Inspect spark plug condition. • Is spark plug condition normal?	Yes	Troubleshooting completed.
		No	**Specific plug is wet or covered with carbon:** • Go to the next step. **Specific plug looks grayish white:** • Go to Step 7. **All plugs are wet or covered with carbon:** • Go to Step 9. **All plugs look grayish white:** • Go to Step 15.
2	• Is spark plug wet/covered with carbon by engine oil?	Yes	Working up and down inspect all areas related to oil.
		No	Go to the next step.
3	• Inspect spark plug for the following: — Cracked insulator — Heat range — Air gap — Worn electrode • Is spark plug normal?	Yes	Go to the next step.
		No	Replace spark plug.
4	• Inspect compression pressure at suspected faulty cylinder. • Is engine compression correct? (See 01–10C–6 COMPRESSION INSPECTION [AJ].)	Yes	Go to the next step.
		No	Repair or replace malfunctioning part.

STEP	INSPECTION		ACTION
5	• Install all spark plugs. • Perform spark test at suspected faulty cylinder. • Is strong blue spark visible? (Compare with normal cylinder.)	Yes	Go to the next step.
		No	Repair or replace malfunctioning parts.
6	• Install fuel pressure gauge between fuel filter and fuel distributor. • Short check connector terminal F/P to body GND using a jumper wire. (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].) • Turn ignition switch to ON position (Engine OFF). • Inspect fuel line pressure. (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].) • Is fuel line pressure correct with ignition switch at ON position?	Yes	Inspect fuel injector for the following: • Open or short in injector • Leakage • Injection volume
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump circuit. • Inspect for clogged fuel line. — If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
7	• Inspect spark plug for the following: — Heat range — Air gap • Is spark plug normal?	Yes	Go to the next step.
		No	Replace spark plug. (See 01–18A–5 SPARK PLUG INSPECTION [L3, AJ].)
8	• Remove suspected fuel injector. • Inspect for the following: — Resistance (See 01–14A–32 FUEL INJECTOR INSPECTION [AJ].) — Fuel injection volume (See 01–14A–32 FUEL INJECTOR INSPECTION [AJ].) • Are all above items normal?	Yes	Inspect for open circuit between suspected fuel injector terminals and PCM at the following terminals: • **For #1 cylinder:** 2I • **For #2 cylinder:** 2J • **For #3 cylinder:** 2K • **For #4 cylinder:** 2E • **For #5 cylinder:** 2F • **For #6 cylinder:** 2G
		No	Replace fuel injector. (See 01–14A–27 FUEL INJECTOR REMOVAL/ INSTALLATION [AJ].)
9	• Is air cleaner element free of restriction?	Yes	Go to the next step.
		No	Replace air cleaner element.
10	• Perform spark test. • Is strong blue spark visible at each cylinder?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part.
11	• Install fuel pressure gauge between fuel filter and fuel distributor. • Short check connector terminal F/P to body GND using a jumper wire. (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].) • Turn ignition switch to ON position (Engine OFF). • Is fuel line pressure correct with ignition switch at ON position. (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Go to the next step.
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump circuit. • Inspect for clogged fuel line. — If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
12	• Inspect the following PIDs: — ECT — O2S11 — O2S21 — MAF — O2S12 — O2S22 (See 01–40C–6 PCM INSPECTION [AJ].) • Are PIDs normal?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part.
13	• Perform purge control inspection (when engine can be started). • Is purge control correct?	Yes	Go to the next step.
		No	Repair or replace malfunctioning part.

STEP	INSPECTION		ACTION
14	• Perform compression inspection. (See 01–10C–6 COMPRESSION INSPECTION [AJ].) • Is compression correct?	Yes	Inspect for clogging in exhaust system.
		No	Repair or replace malfunctioning part.
15	• When engine cannot be started, inspect intake-air system for air leakage. • When engine can be started, perform intake manifold vacuum inspection. • Is air sucked in from intake-air system?	Yes	Repair or replace malfunctioning part.
		No	Go to the next step.
16	• Install fuel pressure gauge between fuel filter and fuel distributor. • Short check connector terminal F/P to body GND using a jumper wire. (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].) • Turn ignition switch to ON position (Engine OFF). • Is fuel line pressure correct with ignition switch at ON position? (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)	Yes	Inspect the following PIDs: • ECT • O2S11 • O2S21 • MAF • O2S12 • O2S22 (See 01–40C–6 PCM INSPECTION [AJ].) Inspect PCM GND condition.
		No	**Zero or low:** • Inspect fuel pump relay and fuel pump related circuit. • Inspect for clogged fuel line. — If normal, replace fuel pump unit. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].) **High:** • Replace fuel pump unit (See 01–14A–13 FUEL PUMP UNIT REMOVAL/ INSTALLATION [L3, AJ].)
17	• Verify test results. — If normal, return to diagnostic index to service any additional symptoms. — If malfunction remains, inspect related Service Bulletins and/or On-line Repair Information and perform repair or diagnosis. • If vehicle is repaired, troubleshooting completed. • If vehicle is not repaired or additional diagnostic information is not available, reprogram PCM if later calibration is available. Retest.		

ENGINE CONTROL SYSTEM OPERATION INSPECTION [AJ]

E6U010318881WB2

Input Signal System Investigation Procedure

1. Find an unusual signal. (See 01–03C–61 Finding unusual signals.)
2. Locate its source. (See 01–03C–61 Locating the source of unusual signals.)
3. Repair or replace the defective part.
4. Confirm that the unusual signal has been erased.

Finding unusual signals

While referring to 01–02C–6 ON-BOARD DIAGNOSTIC TEST [AJ], use the PID/DATA monitor and record function to inspect the input signal system relating to the problem.

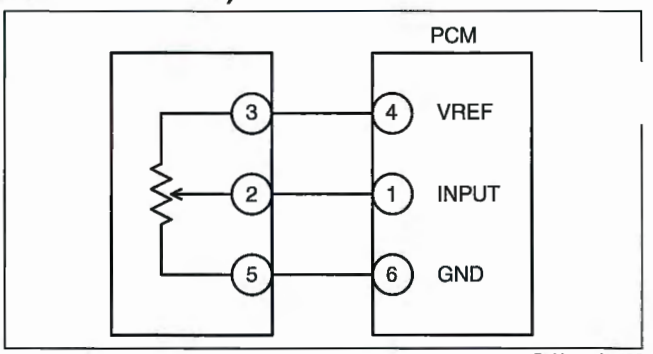
1. Start the engine and idle the vehicle. You can assume that any signals that are out of specification by a wide margin are unusual.
2. When recreating the problem, any sudden change in monitor input signals that is not consciously created by the driver can be judged as unusual.

Locating the source of unusual signals

Caution

- **Compare the WDS or equivalent monitor voltage with the measurement voltage using the digital measurement system function. If you use another tester, misreading may occur.**
- **When measuring voltage, attach the tester GND to the GND of the PCM that is being tested, or to the engine itself. If this is not done, the measured voltage and actual voltage may differ.**
- **After connecting the pin to a waterproof coupler, confirming continuity and measuring the voltage, inspect the waterproof connector for cracks. If there are any, use sealant to fix them. Failure to do this may result in deterioration of the harness or terminal from water damage, leading to problems with the vehicle.**

Variable resistance type 1 (APP sensor, TP sensor and EGR boost sensor)



B6U0103W506

Investigate the input signal system for variable resistance type 1

1. When you get an unusual signal, measure the #1 PCM terminal voltage.
   - If the #1 terminal voltage and the WDS or equivalent monitor voltage are the same, proceed to the next step.
   - If there is a difference of **0.5 V or more**, inspect for the following points concerning the PCM connector.
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Harness/pin crimp is loose or disconnected.
2. Measure the #2 sensor terminal voltage.
   - If there is a **0.5 V or more** difference between the sensor and WDS or equivalent voltages, inspect the harness for open or short circuits.
   - If the sensor and WDS or equivalent voltages are the same, inspect for the following points concerning the sensor connector.
   - If there are no problems, proceed to next investigation below.
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)

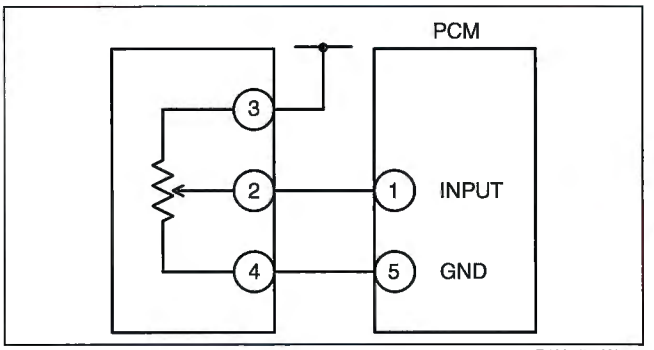
Investigate the standard power supply system for variable resistance type 1

- Confirm that the #3 terminal is at **5 V**.
  — If the measured voltage on the #3 terminal is **5 V**, inspect the following points on the sensor connector.
  — If there is no problem, inspect for the following:
    - Female terminal opening loose
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
  — If the #3 terminal measures other than **5 V**, inspect for the following:
    - Open or short circuit in harness
    - Harness/pin crimp is loose or disconnected.

Investigate the GND system for variable resistance type 1

- Confirm that terminal sensor #5 is at **0 V**.
  — If it is at **0 V**, inspect the sensor.
    - If necessary, replace the sensor.
  — If not, inspect for the following:
    - Open or short circuit in harness
    - Female terminal opening is loose open or short circuit in harness
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
    - Harness/pin crimp is loose or disconnected.

Variable resistance type 2 (MAF sensor)



B6U0103W507

Investigate the GND system for variable resistance type 2

- Confirm that terminal sensor #4 is at **0 V**.
  - — If it is at **0 V**, inspect the sensor.
    - If necessary, replace the sensor.
  - — If not at **0 V**, inspect for the following:
    - Open circuit in harness
    - Female terminal opening is loose.
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
    - Harness/pin crimp is loose or disconnected.

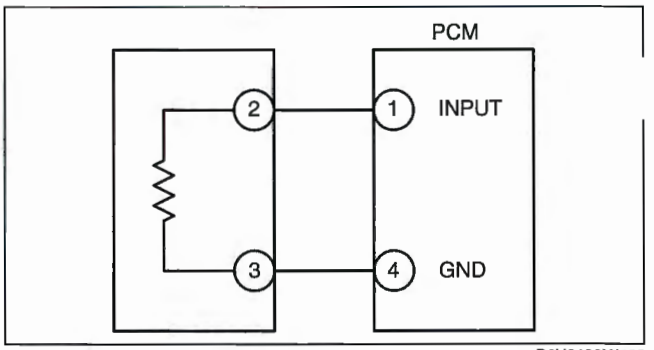
Investigate the input signal system for variable resistance type 2

1. When you get an unusual signal, measure the #1 PCM terminal voltage.
   - If the #1 terminal voltage and the WDS or equivalent monitor voltage are the same, proceed to the next step.
   - If there is a difference of **0.5 V or more**, inspect for the following points concerning the PCM connector.
     - — Female terminal opening is loose.
     - — Coupler (pin holder) damage
     - — Pin discoloration (blackness)
     - — Harness/pin crimp is loose or disconnected.
2. Measure the #2 sensor terminal voltage.
   - If there is a **0.5 V or more** difference between the sensor and WDS or equivalent voltages, inspect the harness for open or short circuits.
   - If the sensor and WDS or equivalent voltages are the same, inspect the following points concerning the sensor connector.
     - — Female terminal opening is loose.
     - — Coupler (pin holder) damage
     - — Pin discoloration (blackness)
     - — Harness/pin crimp is loose or disconnected.
   - If there are no problems, proceed to next investigation below.

Investigate the electrical supply system for variable resistance type 2

- Confirm that the sensor #3 terminal is **B+**.
  - — If the measured voltage on the #3 terminal is **B+**, inspect the following points on the sensor connector.
  - — If there is no problem, inspect for the following:
    - Female terminal opening is loose.
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
  - — If the #3 terminal measures other than **B+**, inspect the following:
    - Open or short circuit in harness
    - Harness/pin crimp is loose or disconnected.

Thermistor type (IAT sensor and ECT sensor)



B6U0103W508

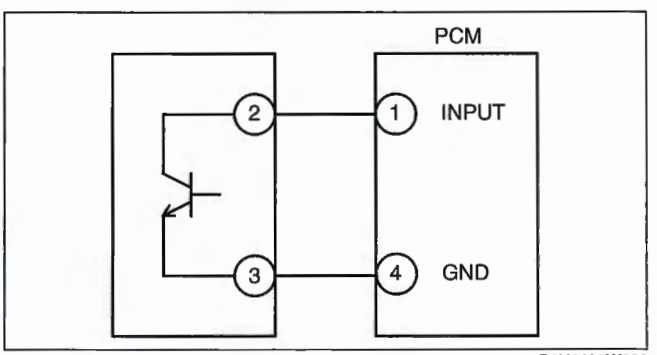
Investigate the input signal system for thermistor type

1. When you get an unusual signal, measure the #1 PCM terminal voltage.
   - If the #1 terminal voltage and the WDS or equivalent monitor voltage are the same, proceed to the next step.
   - If there is a difference of **0.5 V or more**, inspect the following points concerning the PCM connector.
     — Female terminal opening loose
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Harness/pin crimp is loose or disconnected.
2. Measure the #2 sensor terminal voltage.
   - If there is a **0.5 V or more** difference between the sensor and WDS or equivalent voltages, inspect the harness for open or short circuits.
   - If the sensor and WDS or equivalent voltages are the same, inspect the following points concerning the sensor connector.
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Harness/pin crimp is loose or disconnected.
   - If there are no problems, proceed to next investigation below.

Investigate the GND system for thermistor type

- Confirm that terminal sensor #3 is at **0 V**.
  — If it is at **0 V**, inspect the sensor. If necessary, replace the sensor.
  — If not, inspect for the following:
    - Open circuit in harness
    - Female terminal opening is loose.
    - Coupler (pin holder) damage
    - Pin discoloration (blackness)
    - Harness/pin crimp is loose or disconnected.

VSS



B6U0103W509

1. Measure the #1 PCM terminal voltage and confirm that it is at **0 V** or **5 V** when the ignition switch at ON position and the engine at idle.
   - If it is at **0 V** or **5 V**, intermittent concern exists. (See 01–03C–5 INTERMITTENT CONCERN TROUBLESHOOTING [AJ].)
   - If not, inspect the following points concerning the PCM connector.
   - If there is no problem, inspect for the following:
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Harness/pin crimp is loose or disconnected.
2. Measure the #2 sensor terminal voltage and confirm that it is at **0 V** or **5 V** when the ignition switch at ON and the engine at idle.
   - If it is at **0 V** or **5 V**, intermittent concern exists. (See 01–03C–5 INTERMITTENT CONCERN TROUBLESHOOTING [AJ].)
   - If not, inspect the following points concerning the sensor connector.
   - If there is no problem, inspect for the following:
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Harness/pin crimp is loose or disconnected.
3. Confirm that the #3 terminal switch voltage is at **0 V**.
   - If it is at **0 V**, inspect the sensor. If necessary, replace the sensor.
     — If necessary, replace the sensor.
   - If not, inspect for the following:
     — Open circuit in harness
     — Female terminal opening is loose.
     — Coupler (pin holder) damage
     — Pin discoloration (blackness)
     — Harness/pin crimp is loose or disconnected.

Main Relay Operation Inspection

Verify that the main relay clicks when the ignition switch is turned to ON position and off.

- If there is no operation sound, inspect the following:
  — Main relay (See09–21–7 RELAY INSPECTION.)
  — Harness and connector between ignition switch and main relay terminal A.
  — Harness and connector between PCM terminal 1Z and main relay terminal E.

Intake Manifold Vacuum Inspection

1. Verify air intake hoses are installed properly.
2. Start the engine and run it at idle.
3. Measure the manifold vacuum using a vacuum gauge.
   - If not as specified, inspect following:
     — Air suction at throttle body, intake manifold and PCV valve installation points
     — EGR valve (struck open)
     — Fuel injector insulator
     — Engine compression (See 01–10C–6 COMPRESSION INSPECTION [AJ].)

Specification
More than 60 kPa {450 mmHg, 18 inHg}

Note
- Air suction can be located by engine speed change when lubricant is sprayed on the area where suction occurs.

Electronic Throttle Control Inspection

Engine coolant temperature compensation inspection

1. Connect the WDS or equivalent to the DLC-2.
2. Select the PID/DATA MONITOR AND RECORD function on the WDS or equivalent display.
3. Select the following PIDs.
   - ECT
   - IAT
   - RPM
4. Verify that the engine is in cold condition, then start the engine.
5. Verify that the engine speed decreases as the engine warm-up.
   - If the engine speed does not decrease or decreases slowly, inspect the following:
     — ECT sensor and related harness (See 01–40C–29 ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [AJ].)
     — Throttle body and related harness (See 01–13C–6 THROTTLE ACTUATOR INSPECTION [AJ].) (See 01–40C–28 THROTTLE POSITION (TP) SENSOR INSPECTION [AJ].)

Load compensation inspection

1. Start the engine and run is at idle.
2. Connect the WDS or equivalent to the DLC-2.
3. Verify that P0506, P0507 or P0511 are not displayed.
   - If P0506, P0507 or P0511 are displayed, perform DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
4. Select the RPM PID.

   Note
   - Excludes temporary idle speed drop just after the loads are turned on.

5. Verify that the engine speed is within the specification under each load condition.
   - If not as specified at specific load condition, inspect the following:
     — A/C switch and related harness (See 07–40–33 CLIMATE CONTROL UNIT INSPECTION [L3, AJ].)
     — Fan switch and related harness (See 07–40–33 CLIMATE CONTROL UNIT INSPECTION [L3, AJ].)
     — PSP switch and related harness (See 01–40C–25 POWER STEERING PRESSURE (PSP) SWITCH INSPECTION [AJ].)

Idle speed

Condition	Engine speed (rpm)*1
No load	700—800
Electrical loads*2 ON	700—800
P/S ON	700—800
A/C ON	700—800

*1 : Excludes temporary idle speed drop just after the electrical loads are turned on.

*2 : Blower motor is operating at high speed. Headlight switch is turned on. Rear window defroster switch is turned on. Cooling fans are operating.

Throttle position (TP) sweep inspection

1. Connect the WDS or equivalent to the DLC-2.
2. Turn ignition switch to ON position.
3. Verify that following DTCs are not displayed:
   - P0121, P0122, P0123, P0221, P0222, P0223, P2100, P2101, P2102, P2103, P2107, P2108, P2119, P2122, P2123, P2127, P2128, P2135, P2136
     — If any DTC is displayed, perform DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
4. Access TP_REL PID.
5. Verify that the PID reading is within the CTP value. (See 01–40C–6 PCM INSPECTION [AJ].)
   - If the PID reading is out of range, perform the following:
     — Remove air duct from throttle body.
     — Verify that throttle valve moves when the accelerator pedal is depressed.
       - If the throttle valve moves, inspect the following:
     — TP sensor and related harness
       - If the throttle valve does not move, inspect the following:
     — Throttle actuator control motor and related harness
6. Gradually move the throttle valve and verify that the PID reading increases linearly.
   - If the PID reading drops momentarily, inspect the following:
     — TP sensor

7. Fully depress the accelerator pedal and verify that the PID reading is within the WOT value. (See 01–40C–6 PCM INSPECTION [AJ].)
   - If the PID reading is out of range, perform the following:
     — Remove air duct from throttle valve body.
     — Verify that the throttle valve moves when the accelerator pedal is depressed.
       - If the throttle valve moves, inspect the TP sensor and related harness.
       - If the throttle valve does not move, inspect the throttle actuator control motor and related harness.

Fuel Injector Operation Inspection

STEP	INSPECTION	RESULTS	ACTION
1	While cranking engine, inspect for fuel injector operation sound at each cylinder using a soundscope. Is operation sound heard?	Yes	Fuel injector operation is normal.
		No	**Not heard in any cylinders:** Go to the next step. **Heard in some cylinders:** Go to Step 3.
2	Perform main relay operation inspection. Is main relay operation normal?	Yes	Inspect the following: • Fuel injector power system related wiring harness and connectors • PCM connectors • Fuel injector GND and related wiring harness and connectors
		No	Repair or replace malfunctioning parts.
3	Change fuel injector connector of not operating fuel injector and operating fuel injector. Is operation sound heard?	Yes	Go to the next step.
		No	Replace fuel injector.
4	Are wiring harness and connectors of not operation fuel injector normal? (Open or short circuit)	Yes	Inspect PCM terminal voltage of fuel injector signal.
		No	Repair or replace malfunctioning parts.

Fuel Cut Control System Inspection

1. Warm-up engine and let it idle.
   Turn off the electrical loads and A/C switch.
3. Connect the WDS or equivalent to the DLC-2.
4. Select RPM PID.
5. Listen for the fuel injector operation sound at all cylinders using the soundscope and monitor PID while performing the following steps:
   (1) Depress the accelerator pedal and increase the engine speed to **4,000 rpm**.
   (2) Quickly release the accelerator pedal (brake pedal is not depressed) and verify that the fuel injector operation sound stops when the accelerator pedal is released and starts again when the engine speed drops **below 1,200 rpm**.
   - If not as specified, inspect the following:
     — ECT sensor and related harness (See 01–40C–29 ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [AJ].)
     — Neutral/clutch switch and related harness (MTX) (See 01–40C–23 CLUTCH PEDAL POSITION (CPP) SWITCH INSPECTION [AJ].)
     — TR switch and related harness (ATX) (See 05–17B–13 TRANSAXLE RANGE (TR) SWITCH INSPECTION [AW6A-EL].)

Fuel Pump Operation Inspection

Caution
- **Connecting the wrong check connector terminal may possibly cause malfunction. Carefully connect the specified terminal only.**

1. Short the check connector terminal F/P to body GND using a jumper wire. (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)
2. Remove the fuel-filler cap.
3. Turn ignition switch to ON position.
4. Verify that the fuel pump operation sound is heard.
   - If no operation sound is heard, proceed to next step.

5. Measure the voltage at harness side fuel pump connector terminal B.

Specification
B+ (Ignition switch at ON)

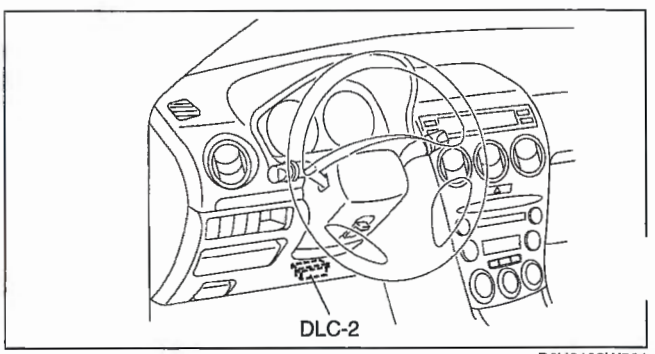
- If the voltage is as specified, inspect the following:
  — Fuel pump continuity
  — Fuel pump GND
  — Wiring harness between fuel pump relay and PCM terminal 1V
- If not as specified, inspect the following:
  — Fuel pump relay
  — Wiring harness connector (Main relay—fuel pump relay—fuel pump)

Fuel Pump Control System Inspection

1. Crank the engine and verify that fuel pump relay operation sound is heard.
   - If operation sound is not heard, inspect the following:
     — Fuel pump relay
     — Wiring harness and connectors (Main relay—fuel pump relay—PCM terminal 1V)
2. If operation sound is not heard, inspect the following:

Ignition Timing Control Inspection

1. Start the engine and run it at idle.
2. Warm up the engine to normal operating temperature.
3. Connect the WDS or equivalent to the DLC–2.
4. Select the PID/DATA MONITOR AND RECORD function on the WDS or equivalent display.
5. Select the SPARKADV PID.
6. Verify that SPARKADV PID is within the specification.



B6U0102W501

Specification
Approx. BTDC 10°

7. Increase the engine speed and verify that the SPARKADV PID value is advanced.
   - If it is not advanced, inspect the following:
     — CKP sensor and related harness (See 01–40C–41 CRANKSHAFT POSITION (CKP) SENSOR INSPECTION [AJ].)
     — MAF sensor and related harness (See 01–40C–32 MASS AIR FLOW (MAF) SENSOR INSPECTION [AJ].)
     — CMP sensors (left and right bank) and related harness (See 01–40C–39 CAMSHAFT POSITION (CMP) SENSOR INSPECTION [AJ]

Spark Test

1. Disconnect the fuel pump relay.
2. Verify that each ignition connector is connected properly.
3. Inspect the ignition system in the following procedure:

Warning

- **High voltage in the ignition system can cause strong electrical shock which can result in serious injury. Avoid direct contact to the vehicle body during the following spark test.**

STEP	INSPECTION		ACTION
1	• Disconnect ignition coil from spark plugs. • Remove spark plugs. • Reconnect spark plugs to ignition coil. • Ground spark plugs to engine. • Is strong blue spark visible at each cylinder while cranking?	Yes	Ignition system is normal.
		No	**Some cylinders do not spark:** • Go to the next step. **All cylinders do not spark:** • Go to Step 4.
2	• Inspect spark plugs for damage, wear, carbon deposits and proper plug gap. • Are spark plugs normal?	Yes	Go to the next step.
		No	Replace spark plugs, then go to Step.1.

STEP	INSPECTION		ACTION
3	• Inspect the following wiring harnesses for open or short circuit: — Ignition coil No.1 terminal B—PCM terminal 2BE — Ignition coil No.2 terminal B—PCM terminal 2BF — Ignition coil No.3 terminal B—PCM terminal 2BG — Ignition coil No.4 terminal B—PCM terminal 2BB — Ignition coil No.5 terminal B—PCM terminal 2BC — Ignition coil No.6 terminal B—PCM terminal 2BD • Are wiring harnesses normal?	Yes	Inspect and replace ignition coil. (See 01–18A–3 IGNITION COIL INSPECTION [L3, AJ].)
		No	Repair or replace malfunctioning part, then go to Step.1.
4	• Measure voltage at terminal A in each ignition coil. • Is voltage **B+**?	Yes	Go to the next step.
		No	Inspect power supply circuit of ignition coils.
5	• Do PCM connector or ignition coil connectors have poor connection?	Yes	Repair or replace connector, then go to Step.1.
		No	Go to the next step.
6	• Are the following parts normal? — CKP sensor and crankshaft pulley — PCM terminal 2Z or 2Y voltage **Specification** **Approx. 1.5 V**	Yes	Inspect for open or short in wiring harness and connector of CKP sensor.
		No	Repair or replace malfunctioning part, then go to Step.1.

EGR Control System Inspection

1. Verify that EGR valve operation (initial operation) sound is heard when the ignition switch is turned to ON position.
   - If the operation sound is not heard, connect WDS or equivalent to the DLC-2 and verify that the DTC P0403 is shown. Perform DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)

   Start the engine and run it at idle.
3. Warm-up the engine to normal operating temperature.
4. Select the following PIDs:
   - ECT
   - RPM
   - SEGRP
   - APP1
   - APP2
   - TP_REL
   - VSS
5. Let the vehicle idle and verify that the SEGRP value is **0**.
6. Put the vehicle in drive.
7. Depress the accelerator pedal and verify that the SEGRP value increases.
   - If the SEGRP value does not increase, inspect the VSS, APP1, APP2, TP_REL and ECT PIDs. (See 01–40C–6 PCM INSPECTION [AJ].)
   - If the SEGRP value does increases, inspect the following:
     — EGR valve (Stuck open or close)
     — Wiring harness and connectors (Main relay—EGR valve—PCM)
8. Stop the vehicle and verify that the SEGRP value returns to **0**.

Purge Control System Inspection

1. Start the engine.
2. Disconnect the vacuum hose between the purge solenoid valve and the charcoal canister.
3. Put a finger to the purge solenoid valve and verify that there is no vacuum applied when the engine is cold.
   - If there is a vacuum, inspect the following:
     — Wiring harness and connectors (Purge solenoid valve - PCM terminal 1BF)
     — Purge solenoid valve
4. Warm-up the engine to the normal operating temperature.
   Stop the engine.
5. Connect the WDS or equivalent to the DLC-2 and verify that the DTC P0443 is displayed. Perform DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
7. Turn ignition switch to ON position.
8. Select ECT PID.

9. Verify that the engine coolant temperature is **60°C {140 °F} or above**.
   - If WDS or equivalent indicates **less than 60°C {140 °F}**, perform the ECT sensor inspection. (See 01–40C–29 ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [AJ].)
10. Set the vehicle on the dynamometer or chassis roller.

Warning

- **When the dynamometer or chassis roller is operating, there is a possibility that the operator may come into contact with or be caught up in the rotating parts, leading to serious injuries or death. When performing work while the dynamometer or chassis roller is operating, be careful not to come into contact with or be caught up in any of the rotating parts.**

11. Drive vehicle with engine speed at **approx. 2,000 rpm** for **more than 30 s**.
12. Put a finger to the purge solenoid valve and verify that there is no vacuum applied.
    - If there is no vacuum, inspect the following:
      — Wiring harness and connector (Main relay— purge solenoid valve—PCM terminal 1BF)
      — Purge solenoid valve
      — MAF, APP1, APP2, TP_REL and LOAD PIDs
    - If there is vacuum, inspect the following:
      — Vacuum hose (Purge Solenoid valve - charcoal canister)

A/C Cut-off Control System Inspection

1. Start the engine.
2. Turn the A/C switch and fan switch on.
3. Verify that the A/C compressor magnetic clutch actuates.
   - If it does not actuate, go to symptom troubleshooting "No.23 A/C does not work sufficiently".
4. Fully open the throttle valve and verify that the A/C compressor magnetic clutch does not actuate for **2—5 s**.
   - If it actuates, inspect the following:
     — A/C relay
     — Open or short to GND circuit in wiring harness and connectors (Ignition switch— A/C relay—PCM terminal 1AW)
     — A/C related parts
     — APP1, APP2 PIDs

Variable Air Duct (VAD) Control System Operation Inspection

1. Connect the WDS or equivalent to DLC-2.
2. Access ECT, TP_REL and RPM PIDs.
3. Start the engine.
4. Verify ECT PID is **70°C {158°F} or over**.
5. Inspect shutter valve operation under the following conditions:

VAD shutter valve operation

Engine speed	Above 6,000 rpm with TP_REL PID less than 60%	
	Below	Above
Shutter valve	Close	Open

- If the shutter valve operation is not as specified, inspect the following:

(1) Verify that DTC P2676 or P2677 is not displayed.
   - If DTC P2676 or P2677 is displayed, perform DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)

(2) Inspect VAD control solenoid valve. (See 01–13C–5 VARIABLE AIR DUCT (VAD) CONTROL SOLENOID VALVE INSPECTION [AJ].)
   - If the VAD control solenoid valve is not normal, replace VAD control solenoid valve.
   - If the VAD control solenoid valve is normal, inspect the following:
     — Vacuum hose looseness or damage
     — Vacuum chamber crack or damage
     — Shutter valve actuator. (See 01–13C–4 VARIABLE AIR DUCT (VAD) SHUTTER VALVE INSPECTION [AJ].)
     — Shutter valve stuck open or close

Evaporative Emission (EVAP) System Leak Inspection

- To verify that the problem has been fixed properly after repairs, the run drive cycle or EVAP system leak inspection must be performed.

EVAP system leak inspection using WDS or equivalent

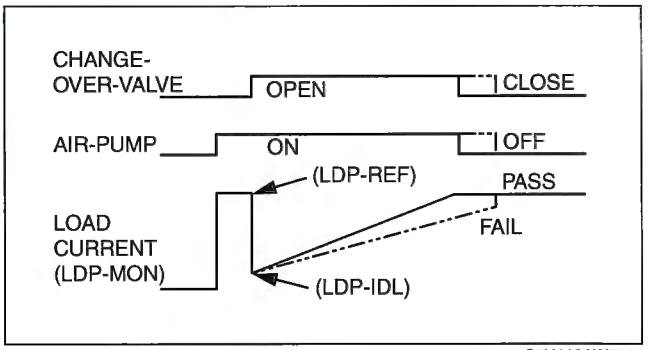
Note

EVAP system test outline

- The EVAP system test, which can substituted for the run drive cycle as an EVAP control system repair confirmation method, can be done while operating the WDS in the KOEO (Key On Engine Off) condition instead of actually driving the vehicle.

EVAP system test description

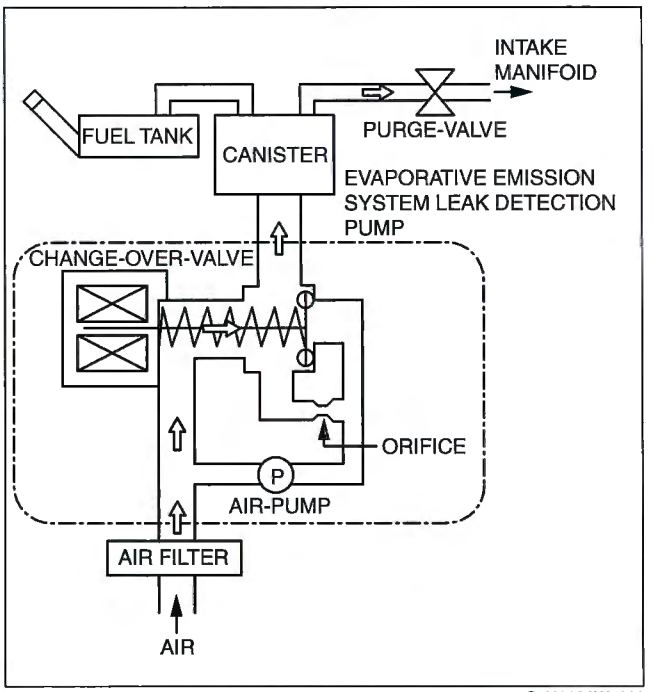
- The EVAP system test finds gas leaks in the system using the PCM to monitor changes in the air pump load current of the EVAP system leak detection pump. This test starts after sending an on-demand test signal from the WDS to the PCM. The PCM controls the air pump and change-over-valve operation and also stores the load current of the air pump as follows:
  i. The PCM commands turn the air pump on and retrieve the air pump load current value (LDP_MON PID) as a reference current (LDP_REF PID).
  ii. After retrieving a reference current value, the PCM commands the change-over-valve to open, then captures the air pump load current value (LDP_MON PID) as idle current (LDP_IDL PID). The EVAP system will be pressurized from this phase.
  iii. The PCM continues to monitor the air pump load current value (LDP_MON PID) until the end of the test.
- You can confirm whether any EVAP gas leak occurred or not by reading the test results.



C5U116AW7001

EVAP system malfunction judgment

- The PCM calculates the stored air pump load current value and send the results to the WDS as DTCs:



C5U116AW7002

DTC No.	Condition
P0442	EVAP control system leak detected (small leak)
P0446	Change-over valve (EVAP system leak detection pump) stuck close
P0455	EVAP control system leak detected (large leak)
P0456	EVAP control system leak detected (very small leak)
P2401	EVAP system leak detection pump control circuit low
P2402	EVAP system leak detection pump control circuit high
P2404	EVAP system leak detection pump sense circuit malfunction
P2405	EVAP system leak detection pump sense circuit low input
P2407	EVAP system leak detection pump sense circuit intermittent

Evaporative system test procedure

1. Select the EVAP system test from the Toolbox on the WDS display and follow the instructions.
2. Verify that all of the following PIDs are within the specifications at the pre-test confirmation screen.

Note

- To successfully perform this procedure, all PIDs must be within the following specifications before proceeding to the next step.
- The PCM will cancel the EVAP system test if the VPWR PID value falls lower than **11.0 V** during the test.

Specification

PID	PID Range
BARO	72.2 kPa {543 mmHg, 21.3 inHg} or more
FLI	15—85%
IAT	5—45 °C {41—113 °F}
VPWR	11.0 V or more

3. Start the engine.
4. Drive the vehicle or let the engine idle more than **20 min.**
5. Turn ignition switch off, then turn it to the ON position again (Key On Engine Off).
6. Press the tick icon to start the test.
7. Verify that no DTCs present after the completion of the test.

- If any test result is indicated with red, diagnose the problem using the following DTC troubleshooting procedure or component inspection procedure.
- If any DTCs are detected, diagnose the problem using the appropriate DTC troubleshooting procedure.

EVAP system leak inspection using leak tester

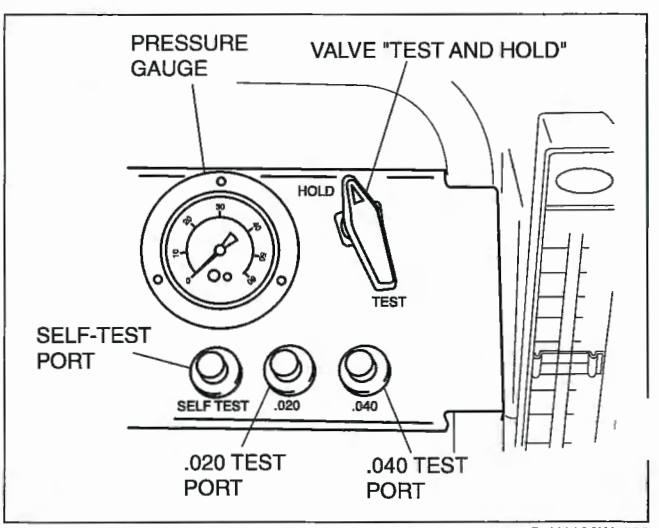
1. Perform the following **SST** (EVAP System Tester 134-01049) self-test:

Note

- If the tester does not work correctly during the self-test, refer to the tester operators manual for a more detailed self-test procedure.

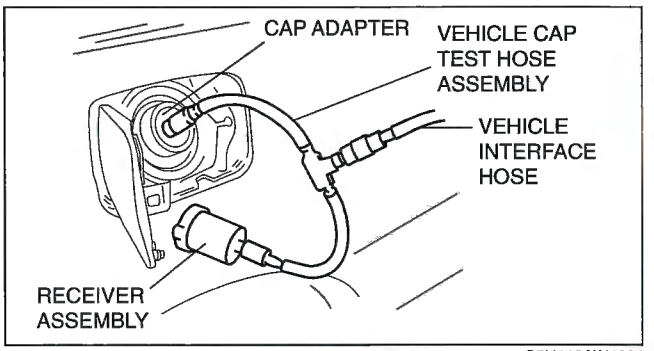
(1) Verify that the control valve on the panel is in the HOLD position and open the nitrogen bottle valve.
(2) Connect the vehicle interface hose (part of the **SST**) to the SELF-TEST port located on the control panel.Hand tighten the fitting. (Do not overtighten.)
(3) Turn the control valve to the TEST position.
(4) The gauge should read **331—381 mm {13—15 in}** of water.
- If the gauge is not reading in this range, adjust the pressure by turning the black knob on the low pressure regulator at the nitrogen bottle.

(5) Turn the control valve to the HOLD position.
(6) Verify that the gauge holds pressure and that the flow meter reads no flow.
- If there is no drop in pressure and no flow, the tester passes the self-test.
- If the gauge leaks down, refer to the operators manual.



C5U116AW7003

2. Connect the **SST** to the vehicle.
   (1) Verify that the control valve on the panel is in the HOLD position and open the nitrogen bottle valve.
   (2) Remove the fuel-filler cap from the vehicle.
      • If the fuel-filler cap is not a genuine part, replace it.
   (3) Connect the receiver assembly (**SST**: 134-01059) to the vehicle cap test hose assembly (part of **SST**) and the fuel-filler cap from the vehicle.
   (4) Connect the cap adaptor (**SST**: 134-01058) to the vehicle cap test hose assembly (part of the **SST**) and to the fuel-filler neck.
   (5) Connect the vehicle interface hose (part of the **SST**) to the center fitting of the vehicle cap test hose assembly (part of the **SST**).



C5U116AW7004

3. Connect the WDS or equivalent to the DLC-2.
4. Turn the ignition switch to the ON position (Engine off).
5. Request the PCM on-board device control (Mode 08) using the WDS or equivalent to close the change-over valve (COV) in the EVAP system leak detection pump.

Note
- The COV is closed for **10 min** unless the following any actions are done:
  — The engine is started.
  — The ignition switch is turned off position.

6. Make sure the control valve on the 134-01049 is in the HOLD position and that the valve on the cylinder of nitrogen gas is open.
7. Turn the control valve to the open position and let the system fill. You should note a drop in the gauge pressure along with the flow meter being pegged at maximum flow for several minutes depending on how full or empty the fuel tank is, and how long it takes to completely fill and pressurize the evaporative emissions system hoses. If the gauge and the flow meter do not settle to a measurable level after **2—3 min**, then refer to the Mazda Workshop Manual to verify that the cut or vent valve is properly closed.
9. Verify the pressure gauge and flow meter reading to determine if there is an evaporative emissions leak:
   NO EVAPORATIVE LEAK:
   - The flow meter registers "zero flow" and the pressure gauge returns to the pre-set pressure of **356 mm {14 in}** of water (H2O).

   EVAPORATIVE LEAK:
   - The pressure does not return to the preset level of **356 mm {14 in}** of water (H2O) when measuring the flow. See "SETTING LEAK STANDARD FOR TESTING" (.020 to.040 inch H2O) of the Evaporative Emissions Tester operators manual (134-01067).

Note
- Turn the control valve to the HOLD position then disconnect the **SST**.

Main Fan/Additional Fan Motor Operation Inspection
1. Connect WDS or equivalent to DLC-2.
2. Warm-up the engine.
3. Access ECT PID.
4. Measure voltage fan control module connector terminal B at 2-pin connector with monitoring ECT PID.

Specification

Engine condition	A/C operation	ECT PID (°C {°F}	Voltage (V)
Ignition switch at ON or idle	Not operating	Below 95 {203}	0
Idle	Operating*		6.9—12.1
	Not operating	Above 100 {212}	0.6—14.6

* : A/C pressure switch (middle pressure) is on.

- If not as specified, inspect the following:
  — CKP sensor
  — ECT sensor
  — APP sensor
  — TP sensor
  — A/C pressure switch (middle pressure)

5. If all items are normal, replace fan control module.

Variable Valve Timing Control System Operation Inspection
When idling cannot be continued

Note
- Inspect for each bank

1. Remove the OCV and verify that the spool valve is at maximum retard position.
   - If the spool valve is stuck in advance direction, replace the OCV. (See 01–10C–41 OIL CONTROL VALVE (OCV) REMOVAL/INSTALLATION [AJ].)
2. Connect the OCV.
3. Turn the ignition switch to ON position.
4. Verify that the spool valve is at max. retard position.
   - If the spool valve is stuck in advance direction, inspect the following:
     — Short circuit in harnesses or connectors between the OCV and the PCM.
5. Inspect the variable valve timing actuator.

When idling can be continued
For right bank
1. Disconnect OCV (RH) connector.
2. Warm up the engine and it at idle.
3. Apply the battery voltage to the OCV and verify that the engine idles roughly or stalls.
   - If the engine idles roughly or stalls, inspect the timing belt component (valve timing deviation).
   - If the engine does not idle roughly or stall, go to the next step.
4. Remove the OCV (RH) and perform spool valve operation inspection. (See 01–10C–42 OIL CONTROL VALVE (OCV) INSPECTION [AJ].)
   - If not as specified, inspect the following:
     — OCV (RH)
     — Harnesses and connectors between OCV (RH) and PCM have an open or short circuit.
   - If as specified, inspect the following right bank hydraulic passages for clogging or leakage, or both.
     — Oil pressure switch - OCV
     — OCV - camshaft
     — Camshaft internal passage
5. If they are normal, replace the right bank camshaft pulley (with built-in variable valve timing actuator).

When idling can be continued
For left bank
1. Disconnect OCV (LH) connector.
2. Warm up the engine to idle.
3. Apply the battery voltage to the OCV and verify that the engine idles roughly or stalls.
   - If the engine idles roughly or stalls, inspect the timing belt component (valve timing deviation).
   - If the engine does not idle roughly or stall, go to the next step.
4. Remove the OCV (LH) and perform spool valve operation inspection. (See 01–10C–42 OIL CONTROL VALVE (OCV) INSPECTION [AJ].)
   - If not as specified, inspect the following:
     — OCV (LH)
     — Harnesses and connectors between OCV (LH) and PCM have an open or short circuit.
   - If as specified, inspect the following left bank hydraulic passages for clogging or leakage or both.
     — Oil pressure switch - OCV
     — OCV - camshaft
     — Camshaft internal passage
5. If they are normal, replace the left bank camshaft pulley (with built-in variable valve timing actuator).

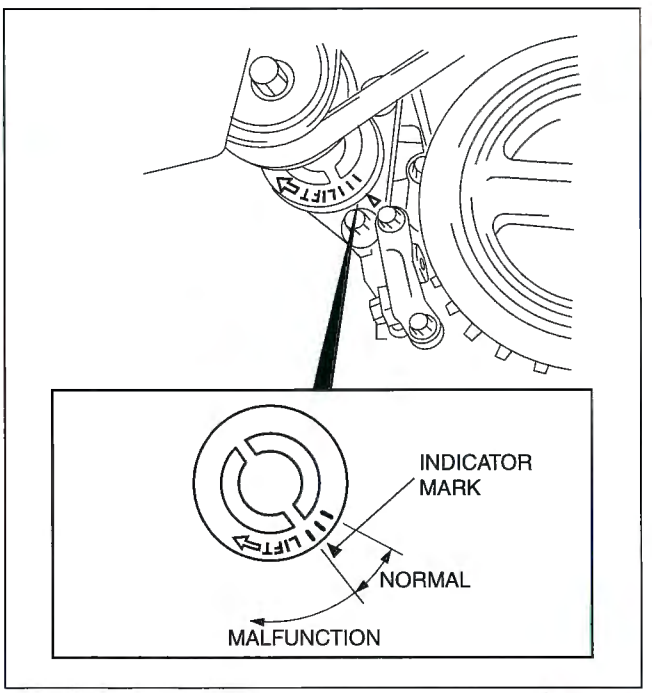
DRIVE BELT INSPECTION [L3]

E6U011015800W03

Note
- Drive belt deflection/tension inspection is not necessary because of the use of the front drive belt auto tensioner.

1. Verify that the drive belt auto tensioner indicator mark does not exceed the limit.
   - If it exceeds the limit, replace the drive belt. (See 01–10A–3 DRIVE BELT REPLACEMENT [L3].)

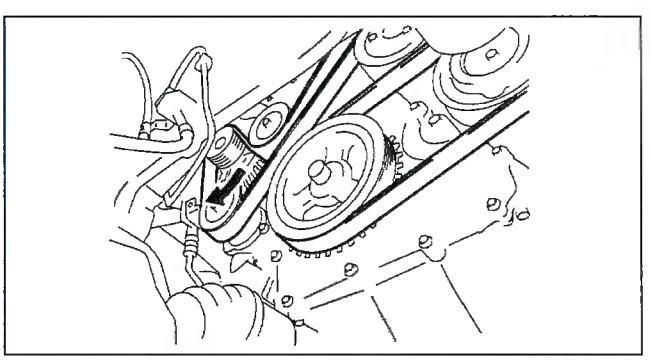


D6E110AW3006

DRIVE BELT REPLACEMENT [L3]

E6U011015800W04

1. Remove the splash shield (RH).
2. Turn the center of the tensioner pulley clockwise to release tension to the drive belt.
3. Remove the drive belt.
4. Reinstall the drive belt or install a new drive belt.
5. Verify that the drive belt auto tensioner indicator mark does not exceed the limit. (See 01–10A–3 DRIVE BELT INSPECTION [L3].)
   - If it exceeds the limit, replace the drive belt.
6. Install the splash shield (RH).

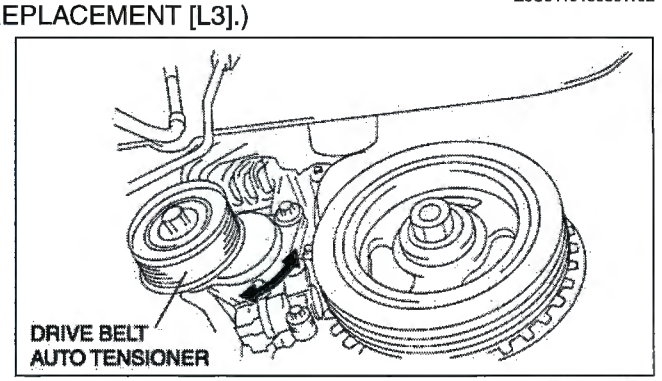


AME2210W002

DRIVE BELT AUTO TENSIONER INSPECTION [L3]

E6U011015980W02

1. Remove the drive belt. (See 01–10A–3 DRIVE BELT REPLACEMENT [L3].)
2. Verify that the drive belt auto tensioner moves smoothly in the operational direction.
   - Replace the drive belt auto tensioner if necessary.
3. Turn the drive belt auto tensioner pulley by hand and verify that it rotates smoothly.
   - Replace the drive belt auto tensioner if necessary.
4. Install the drive belt. (See 01–10A–3 DRIVE BELT REPLACEMENT [L3].)



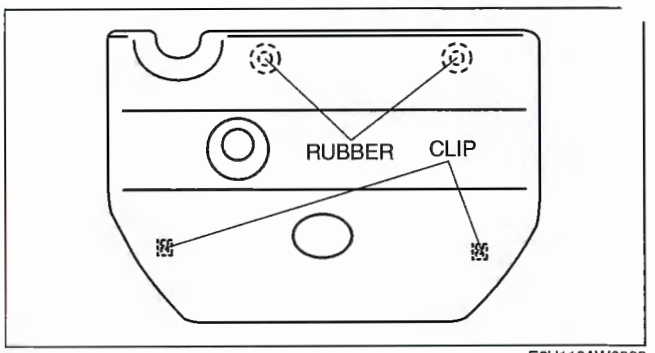
AME2210W003

PLUG HOLE PLATE REMOVAL/INSTALLATION [L3]

E6U011010291W01

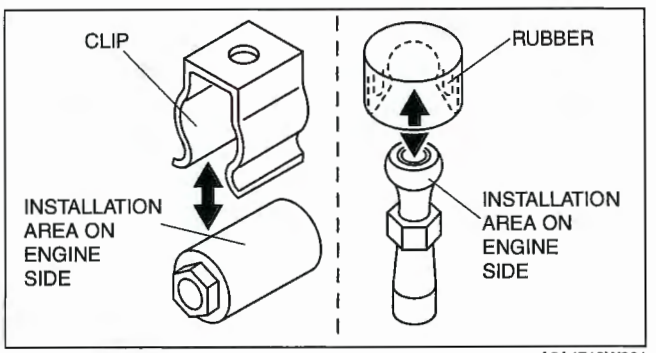
1. Remove the plug hole plate.

Note
- Lift off and remove the plug hole plate from the installation areas (rubber and clips) as shown in the figure.



E6U110AW6002

2. Install the plug hole plate.



A6A4712W301

COMPRESSION INSPECTION [L3]

E6U011002000W07

Warning
- **Hot engines and oil can cause severe burns. Be careful not to burn yourself during removal/ installation of each component.**

1. Verify that the battery is fully charged.
   - Recharge it if necessary. (See 01–17A–2 BATTERY INSPECTION [L3, AJ].)
2. Warm up the engine to the normal operating temperature.
3. Stop the engine and allow it to cool down for **about 10 min.**
4. Perform "Fuel Line Safety Procedures". Leave the fuel pump relay removed. (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)

Warning
- **Fuel vapor is hazardous. It can very easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure". (See 01–14A–6 Fuel Line Safety Procedure.)**

5. Remove the plug hole plate.
   (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
6. Disconnect the ignition coil connector.
7. Remove the spark plugs. (See 01–18A–4 SPARK PLUG REMOVAL/INSTALLATION [L3, AJ].)
8. Connect a compression gauge into the spark plug hole.
9. Fully depress the accelerator pedal and crank the engine.
10. Note down the maximum gauge reading.

11. Inspect each cylinder as above.
    - If the measured value is less than the limited value, or there is a cylinder whose compression value varies from that of other cylinders by **196.1 kPa {2.0 kgf/cm^2, 28.5 psi} or more**, add a small amount of engine oil through the spark plug hole. Then measure the compression pressure and perform the respective operations for the following cases.
      — If the compression increases, the piston, the piston rings, or cylinder wall may be worn and overhaul is required.
      — If the compression stays low, a valve may be stuck or improperly seated and overhaul is required.
      — If the compression in adjacent cylinders stays low, the cylinder head gasket may be damaged or the cylinder head distorted and overhaul is required.

Compression

kPa {kgf/cm^2, psi} [rpm]

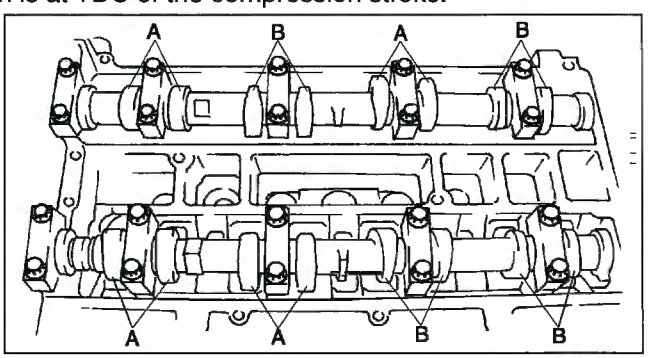
Item	Specification
Standard	1,372 {14.0, 199.08} [285]
Minimum	960 {9.79, 139.21} [285]
Maximum difference between cylinders	196.1 {2.0, 28.5}

12. Disconnect the compression gauge.
13. Install the spark plugs. (See 01–18A–4 SPARK PLUG REMOVAL/INSTALLATION [L3, AJ].)
14. Connect the ignition coil connector.
15. Install the plug hole plate.
    (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
16. Install the fuel pump relay. (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)

VALVE CLEARANCE INSPECTION [L3]

E6U011002000W08

1. Disconnect the negative battery cable.
2. Remove the tire (RH).
3. Remove the splash shield (RH).
4. Remove the plug hole plate.
   (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
   Remove the spark plugs. (See 01–18A–4 SPARK PLUG REMOVAL/INSTALLATION [L3, AJ].)
6. Remove the oil control valve (OCV) connector.
7. Remove the ventilation hose.
8. Remove the cylinder head cover.
9. Verify that the engine is in cold condition.
10. Measure the valve clearance.
    (1) Turn the crankshaft clockwise so that the No.1 piston is at TDC of the compression stroke.
    (2) Measure the valve clearance at A in the figure.
        - If the valve clearance is out of the standard value, adjust it. (See 01–10A–6 VALVE CLEARANCE ADJUSTMENT [L3].)



C6U110AW7001

Note
- Make sure to note down the measured values for choosing the suitable replacement tappets.

Standard [Engine cold]
IN: 0.22—0.28 mm {0.0087—0.0110 in}
EX: 0.27—0.33 mm {0.0107—0.0129 in}

(3) Rotate the crankshaft **360°** clockwise so that the No.4 piston is at TDC of the compression stroke.
(4) Measure the valve clearance at B in the figure.
- If the valve clearance is out of the standard value, adjust it. (See 01–10A–6 VALVE CLEARANCE ADJUSTMENT [L3].)

Note
- Make sure to note down the measured values for choosing the suitable replacement tappets.

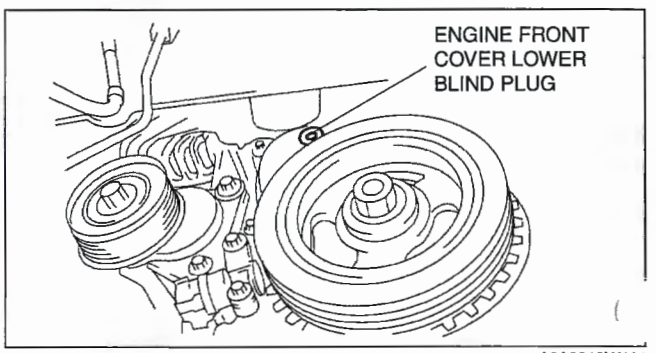
Standard [Engine cold]
IN: 0.22—0.28 mm {0.0087—0.0110 in}
EX: 0.27—0.33 mm {0.0107—0.0129 in}

11. Install the cylinder head cover. (See 01–10A–18 Cylinder Head Cover Installation Note.)
12. Install the ventilation hose.
13. Install the oil control valve (OCV) connector.
14. Install the spark plugs. (See 01–18A–4 SPARK PLUG REMOVAL/INSTALLATION [L3, AJ].)
15. Install the plug hole plate.
    (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
16. Install the splash shield (RH).
17. Install the tire (RH).

VALVE CLEARANCE ADJUSTMENT [L3]

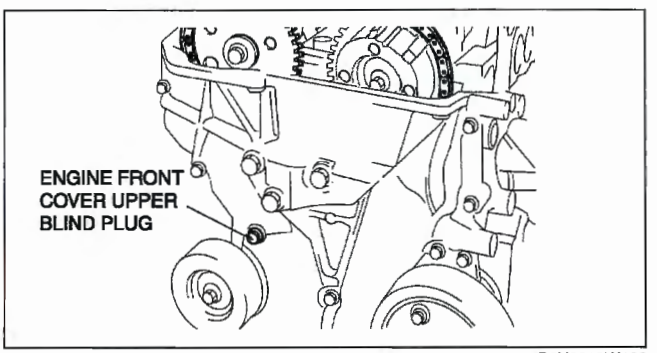
E6U011002000W09

1. Disconnect the negative battery cable.
2. Remove the tire (RH).
3. Remove the splash shield (RH).
4. Remove the plug hole plate.
   (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
5. Remove the spark plugs. (See 01–18A–4 SPARK PLUG REMOVAL/INSTALLATION [L3, AJ].)
6. Remove the oil control valve (OCV) connector.
7. Remove the ventilation hose.
8. Remove the cylinder head cover.
9. Remove the drive belt. (See 01–10A–3 DRIVE BELT REPLACEMENT [L3].)
10. Remove the front drive shaft (RH) from the joint shaft. (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/ INSTALLATION [L3, L3 WITH TC].)
11. Remove the engine front cover lower blind plug.



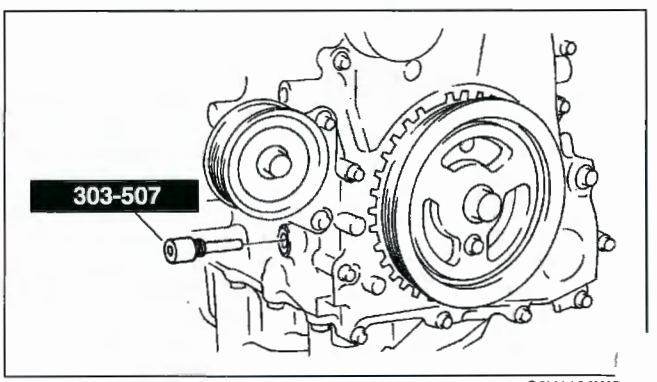
A6A2212W101

12. Remove the engine front cover upper blind plug.
13. Remove the cylinder block lower blind plug.



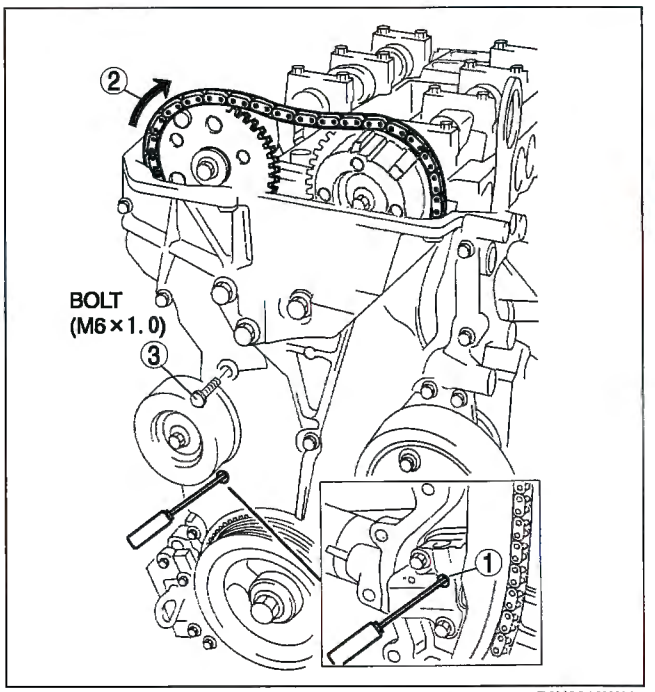
B6U2212W102

14. Install the **SST** as shown in the figure.
15. Rotate the crankshaft clockwise until the crankshaft is in the No.1 cylinder TDC position (until the balance weight is contacting the **SST**).



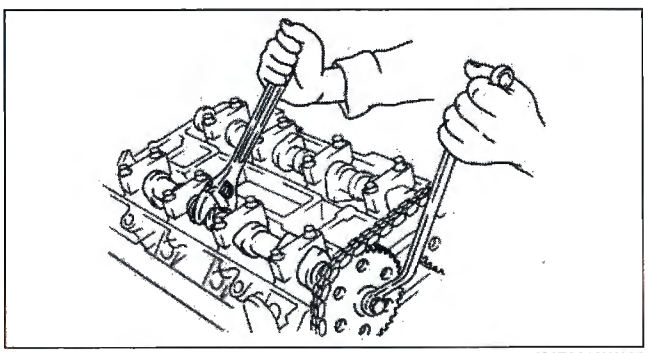
C6U110AWC

16. Loosen the timing chain.
    (1) Unlock the chain tensioner ratchet using a suitable screwdriver or equivalent tool.
    (2) Rotate the exhaust camshaft clockwise using a suitable wrench on the cast hexagon and loosen a timing chain.
    (3) Placing the suitable bolt **(M6 X 1.0 length 25—35 mm {0.99—1.37 in})** at the engine front cover upper blind plug, secure the chain guide at the position where the tension is released.



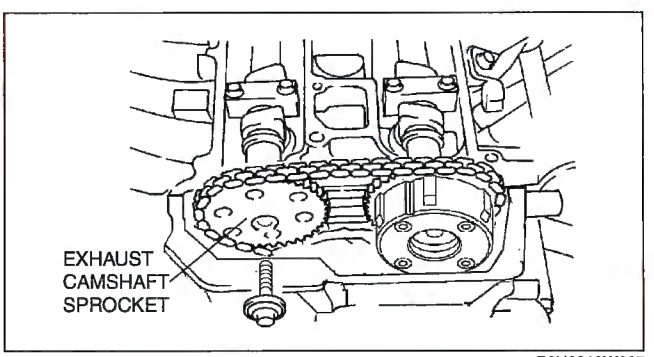
B6U2212W005

17. Hold the exhaust camshaft using a suitable wrench on the cast hexagon as shown in the figure.



AME2212W006

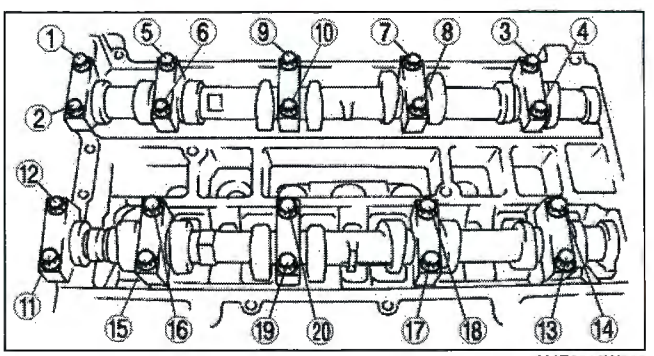
18. Remove the exhaust camshaft sprocket.



B6U2212W007

19. Loosen the camshaft cap bolts in two or three steps in the order shown in the figure.

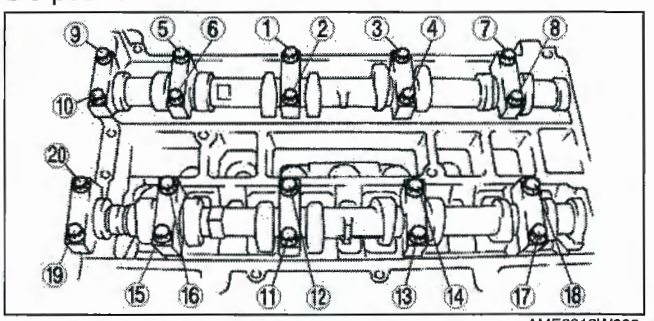
Note
- The cylinder head and the camshaft caps are numbered to be reassembled in their original position correctly. When removed, keep the caps with the cylinder head from where they were removed. Do not mix the caps.



AME2212W008

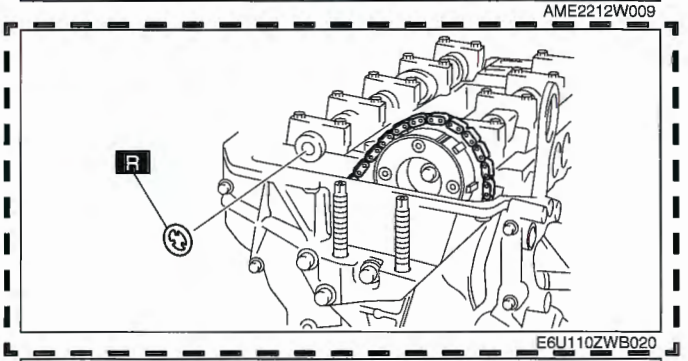
20. Remove the camshaft.
21. Remove the tappet.

22. Select proper adjustment shim.
    New adjustment shim
    = Removed shim thickness + Measured valve clearance - Standard valve clearance (IN: 0.25 mm {0.0098 in}, EX: 0.30 mm {0.0118 in})
    Standard [Engine cold]
    IN: 0.22—0.28 mm {0.0087—0.0110 in}
    EX: 0.27—0.33 mm {0.0107—0.0129 in}
23. Install the camshaft and No.1 cylinder aligned with the TDC position.
24. Tighten the camshaft cap bolt in the following two steps.
    (1) Tighten to **5.0—9.0 N·m {51.0—91.7 kgf·cm, 44.3—79.6 in·lbf}**.
    (2) Tighten to **14.0—17.0 N·m {1.5—1.7 kgf·m, 10.4—12.5 ft·lbf}**.



AME2212W009

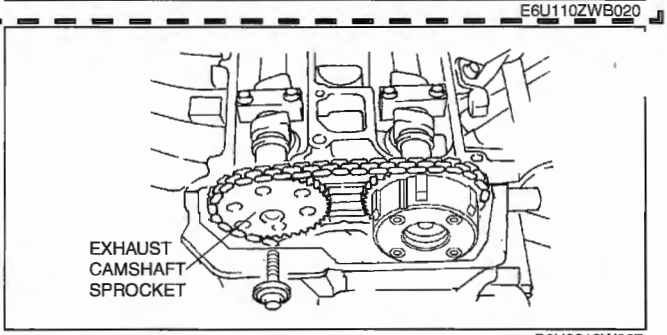
25. Install a new washer.



E6U110ZWB020

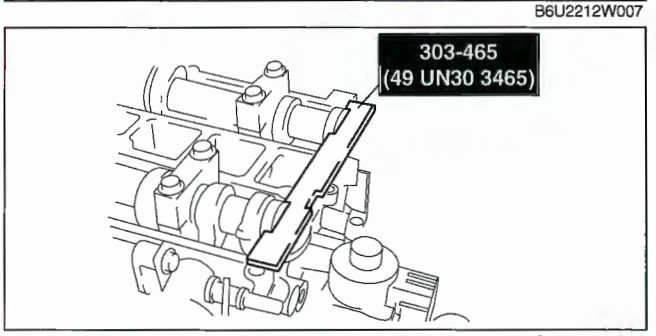
26. Install the exhaust camshaft sprocket.

    Note
    - Do not tighten the bolt for the camshaft sprocket during this step. First confirm the valve timing, then tighten the bolt.



B6U2212W007

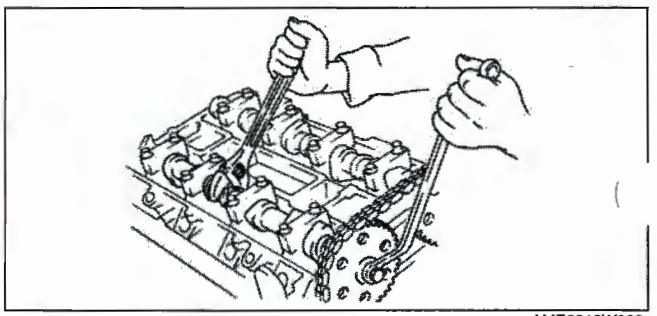
27. Install the **SST** to the camshaft as shown in the figure.
28. Remove the **(M6 X 1.0 length 25mm—35mm {0.99—1.37in})** bolt from the engine front cover to apply tension to the timing chain.
29. Turn the crankshaft clockwise until the crankshaft is in the No.1 cylinder TDC position (until the balance weight is contacting to the **SST**).



C3U0110W066

30. Hold the exhaust camshaft using a suitable wrench on the cast hexagon as shown in the figure.
31. Tighten the exhaust camshaft sprocket lock bolt.

    Tightening torque
    69—75 N·m {7.1—7.6 kgf·m, 50.9—55.3 ft·lbf}



AME2212W006

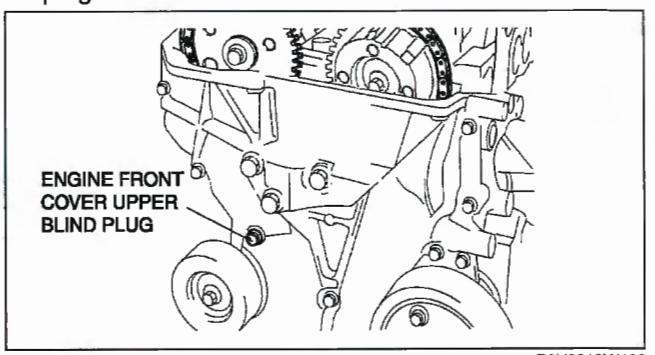
32. Remove the **SST** from the camshaft.
33. Remove the **SST** from the block lower blind plug.

33. Rotate the crankshaft two times clockwise until the crankshaft is in the TDC position, reinstall the **SSTs** to the camshaft and cylinder block, and inspect the valve timing.
    - If not aligned, loosen the crankshaft pulley lock bolt and repeat from Step 16.

Apply silicone sealant to the engine front cover upper blind plug.

. Install the engine front cover upper blind plug.

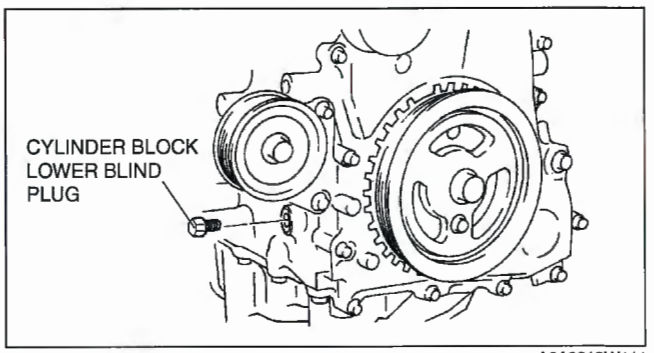
Tightening torque
8.0—11.5 N·m {81.6—117.2 kgf·cm, 70.9—101.7 in·lbf}



B6U2212W102

36. Install the cylinder block lower blind plug.

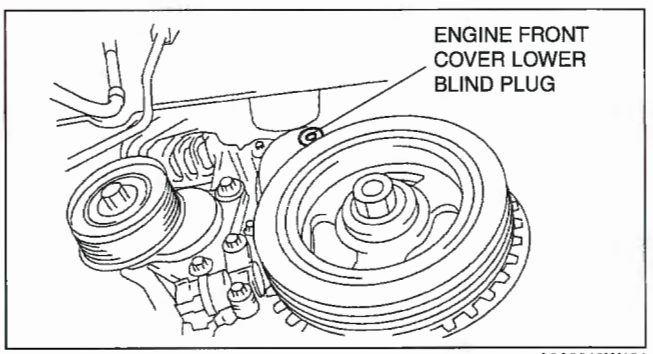
Tightening torque
18—22 N·m {1.9—2.2 kgf·m, 13.3—16.2 ft·lbf}



A6A2212W111

37. Install the new engine front cover lower blind plug.

Tightening torque
10.0—14.0 N·m {102.0—142.7 kgf·cm, 73.8—103.2 in·lbf}



A6A2212W101

38. Connect the front drive shaft (RH) and the joint shaft. (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC].)
39. Install the drive belt. (See 01–10A–3 DRIVE BELT REPLACEMENT [L3].)
40. Install the cylinder head cover. (See 01–10A–18 Cylinder Head Cover Installation Note.)
41. Install the ventilation hose.
42. Install the oil control valve (OCV) connector.
43. Install the spark plugs. (See 01–18A–4 SPARK PLUG REMOVAL/INSTALLATION [L3, AJ].)
44. Install the plug hole plate. (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
45. Install the splash shield (RH).
46. Install the tire (RH).

TIMING CHAIN REMOVAL/INSTALLATION [L3]

E6U011012201W02

Warning
- **Fuel vapor is hazardous. It can very easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure". (See 01–14A–6 Fuel Line Safety Procedure.)**

1. Disconnect the negative battery cable.
2. Remove the plug hole plate. (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
3. Remove the dipstick.
4. Remove the spark plugs. (See 01–18A–4 SPARK PLUG REMOVAL/INSTALLATION [L3, AJ].)

5. Remove the tire (RH).
6. Remove the under cover.
7. Loosen the water pump pulley bolt and removal the drive belt. (See 01–10A–3 DRIVE BELT REPLACEMENT [L3].)
8. Remove the crankshaft position (CKP) sensor. (See 01–40A–45 CRANKSHAFT POSITION (CKP) SENSOF. REMOVAL/INSTALLATION [L3].)
9. Drain the engine oil. (See 01–11A–3 ENGINE OIL REPLACEMENT [L3, AJ].)
10. Remove the P/S oil pump with the oil hose still connected and position the P/S oil pump so that it is out of the way. (See 06–12–27 POWER STEERING OIL PUMP REMOVAL/INSTALLATION [L3, L3 WITH TC].)
11. Remove the front drive shaft (RH) from the joint shaft. (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/ INSTALLATION [L3, L3 WITH TC].)
12. Remove in the order indicated in the table.
13. Install in the reverse order of removal.
14. Start the engine and:
    - Inspect for the engine oil, engine coolant, transaxle oil and fuel leakage.
    - Verify the ignition timing, idle speed and idle mixture. (See 01–10A–29 Ignition Timing Inspection.) (See 01–10A–30 Idle Speed Inspection.) (See 01–10A–30 Idle Mixture Inspection.)
15. Perform a road test.

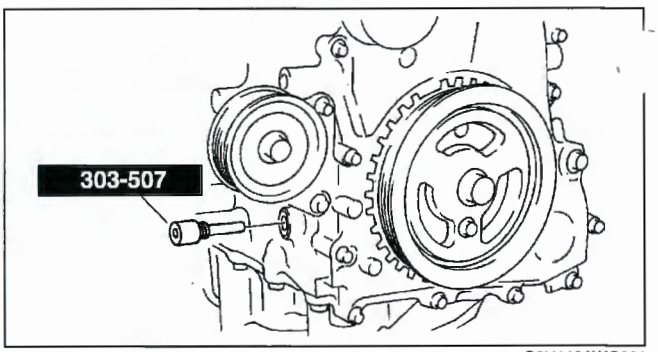
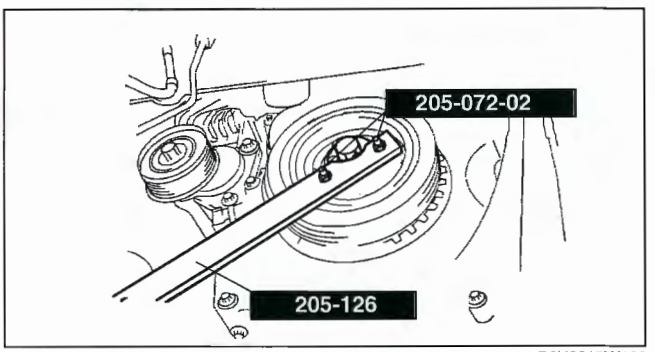
Crankshaft Pulley Lock Bolt Removal Note

1. Remove the cylinder block lower blind plug.
2. Install the **SST**.
3. Rotate the crankshaft clockwise until the crankshaft is in the No.1 cylinder TDC position (until the balance weight is contacting to the **SST**).



C6U110AWC001

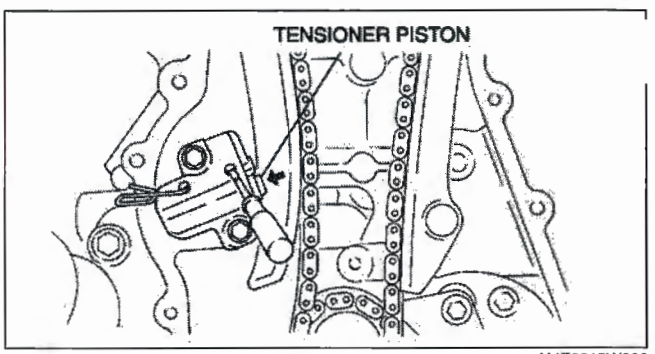
4. Hold the crankshaft pulley using the **SSTs**.



B6U2215W100

Chain Tensioner Removal Note

1. Hold the chain tensioner ratchet lock mechanism away from the ratchet stem using a thin screwdriver.
2. Slowly compress the tensioner piston.
3. Hold the tensioner piston using a **1.5 mm {0.059 in}** wire or paper clip.



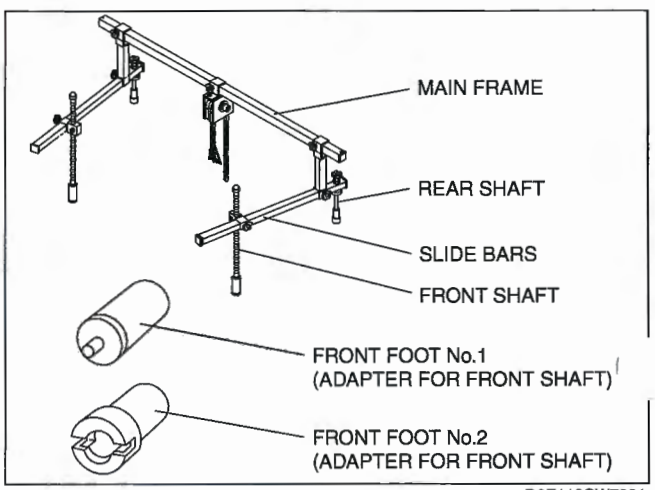
AME2215W003

No.3 Engine Mount Rubber and No.3 Engine Joint Bracket Removal Note

1. Install the **SST** using the following procedure.

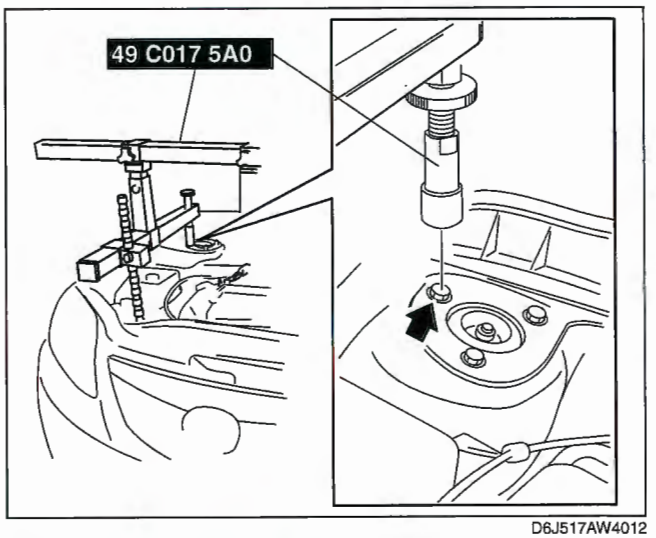
Caution

- **Refer to the SST instruction manual for the basic handing procedure.**



D6E110CW7001

(1) Install the right rear shaft of the **SST** to the bolt of the right shock absorber as shown in the figure.
(2) Install the left rear shaft of the **SST** to the bolt of the left shock absorber. (Identical position to the right side)

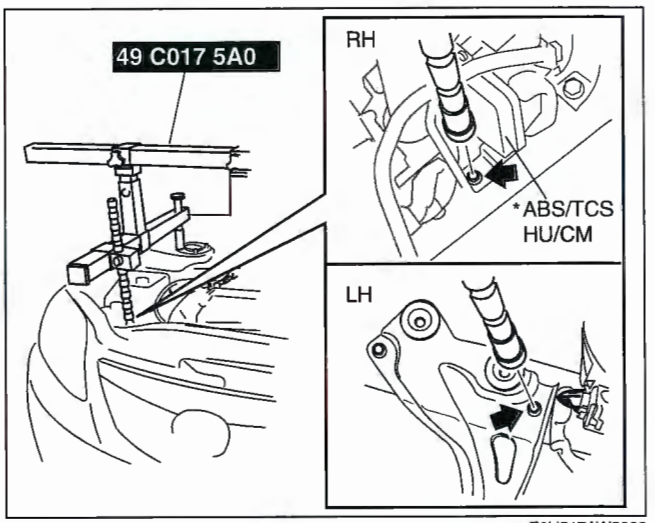


D6J517AW4012

(3) Install the left/right front shaft of the **SST** with front foot No.2 to the bolt as shown in the figure.

* : If equipped.

(4) Adjust the positions of the **SST** side bars so that they are the same height (left and right) and horizontal.
(5) Make sure each joint is securely tightened.

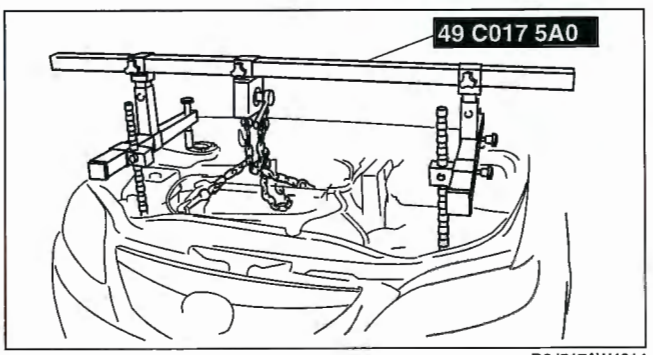


E6U517AW5003

2. Support the engine using the **SST**.

Note
- The SST (49 E017 5A0) can be used in place of the SST (49 C017 5A0).

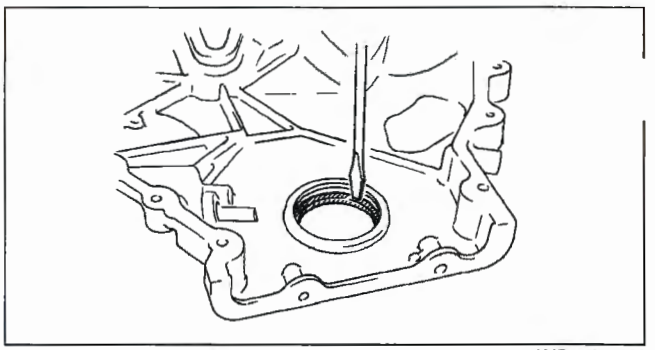
3. Remove the No.3 engine mount.



D6J517AW4014

Engine Front Cover Removal Note

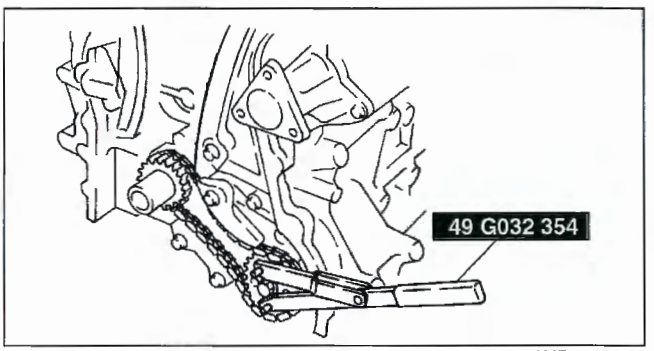
1. Remove the oil seal using a screwdriver as shown in the figure.



AME2215W006

Oil Pump Sprocket Removal Note

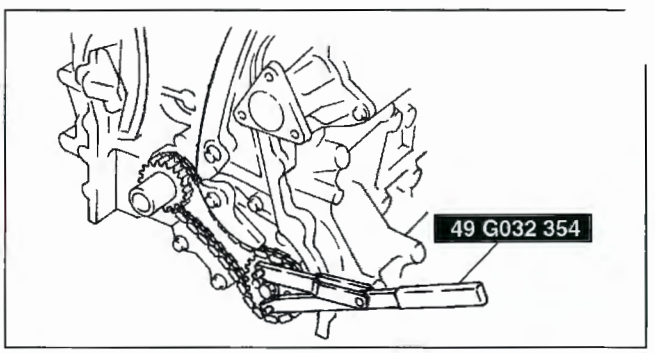
1. Hold the oil pump sprocket using the **SST**.



AME2215W005

Oil Pump Sprocket Installation Note

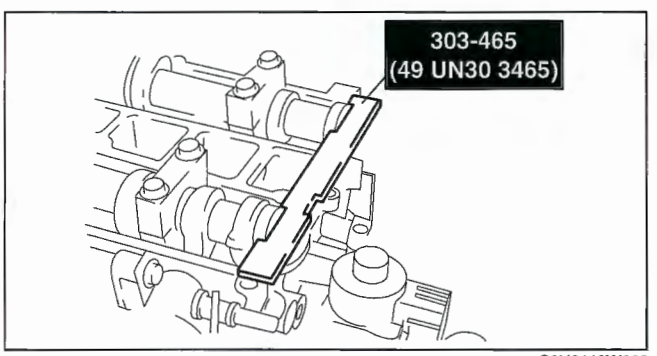
1. Hold the oil pump sprocket using the **SST**.



AME2215W005

Timing Chain Installation Note

1. Install the **SST** to the camshaft as shown in the figure.
2. Install the timing chain.
3. Remove the retaining wire or paper clip from the auto tensioner to apply tension to the timing chain.



C3U0110W066

Engine Front Cover Installation Note

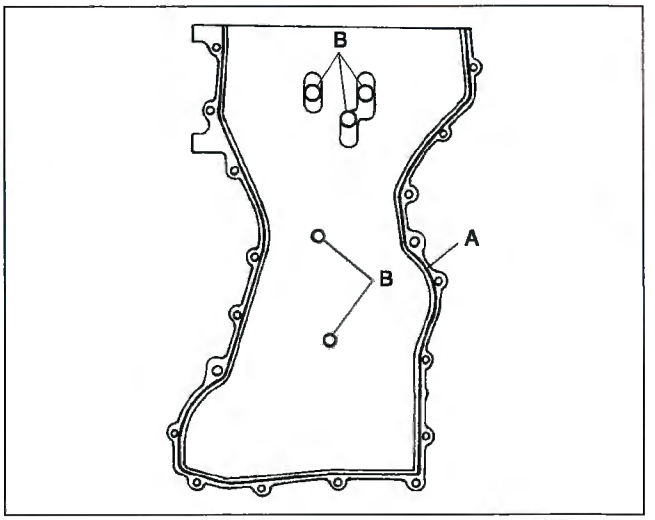
1. Apply silicone sealant to the engine front cover as shown in the figure.

Caution

- **Install the engine front cover within 10 min of applying the silicone sealant.**
- **Silicone sealant is not needed in the area indicated by C as shown in the figure as it is a seal.**

Thickness

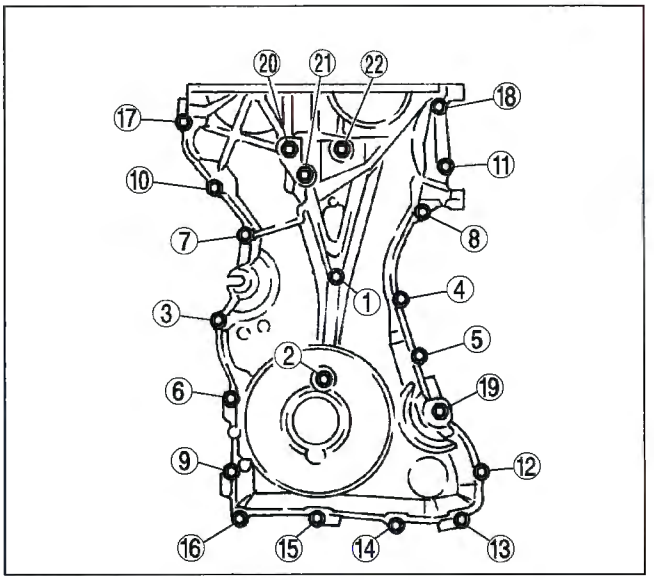
A: 2.0—3.0 mm {0.079—0.118 in}
B: 1.5—2.5 mm {0.059—0.098 in}



AME2215W007

2. Install the engine front cover bolts in the order as shown in the figure.

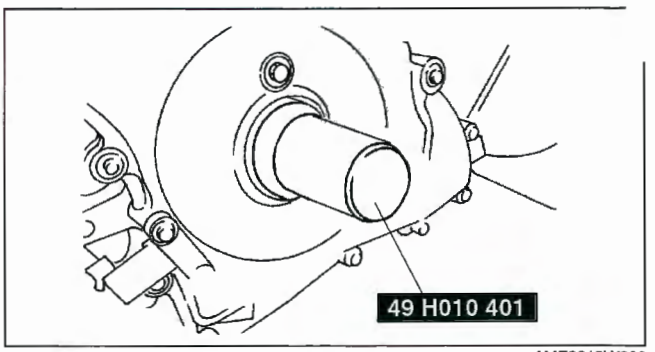
Bolt No.	Tightening torque
1—18	8.0—11.5 N·m {81.6—117.2 kgf·cm, 70.9—101.7 in·lbf}
19—22	40—55 N·m {4.1—5.6 kgf·m, 29.7—40.5 ft·lbf}



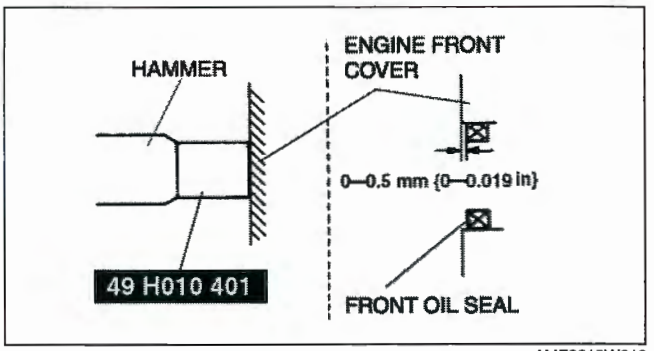
AME2215W008

Front Oil Seal Installation Note

1. Apply clean engine oil to the oil seal.
2. Push the oil seal slightly in by hand.
3. Compress the oil seal using the **SST** and a hammer.



AME2215W009



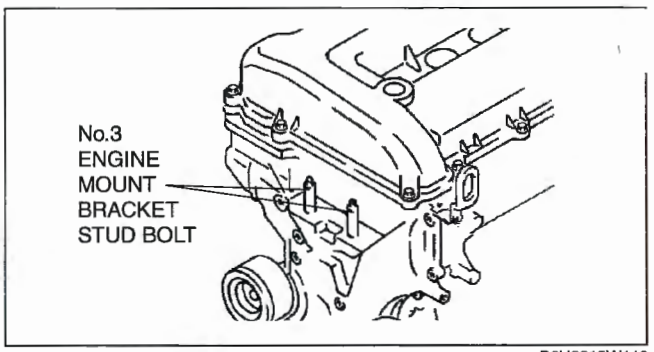
AME2215W010

No.3 Engine Mount Rubber and No.3 Engine Joint Bracket Installation Note

1. Tighten the stud bolt of the No.3 engine mount bracket.

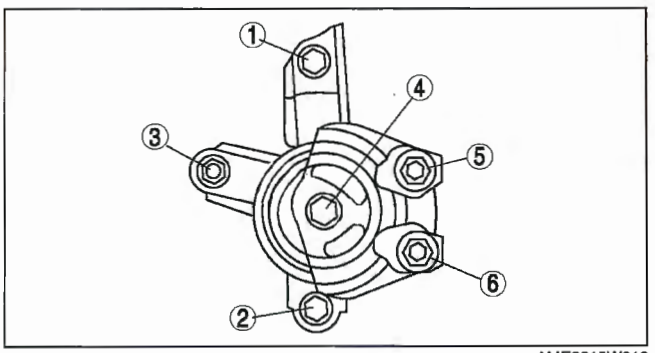
   Tightening torque
   7.0—13 N·m {71.4—132.5 kgf·cm, 62.0—115.0 in·lbf}

2. Hand-tighten the No.3 engine mount rubber and No.3 engine joint bracket.



B6U2215W110

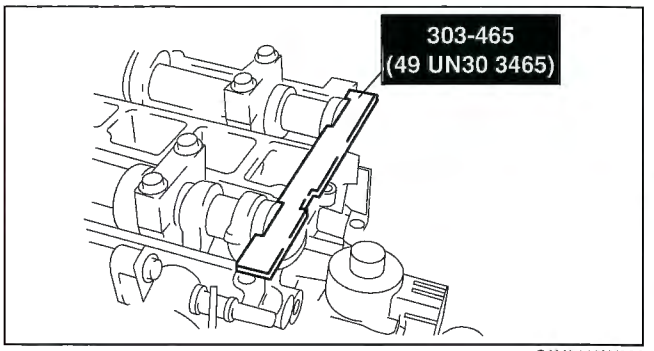
3. Tighten the bolts and nuts in the order shown in the figure.



AME2215W012

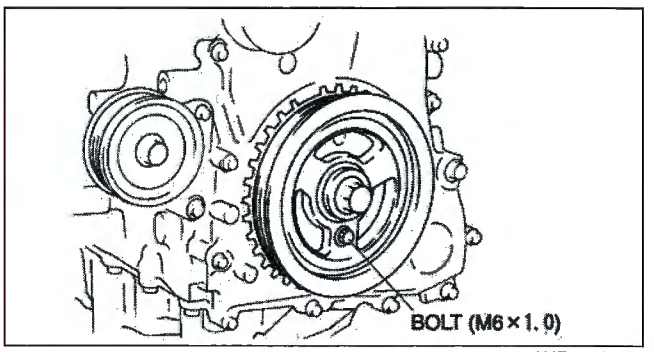
Crankshaft Pulley Lock Bolt Installation Note

1. Install the **SST** to the camshaft as shown in the figure.



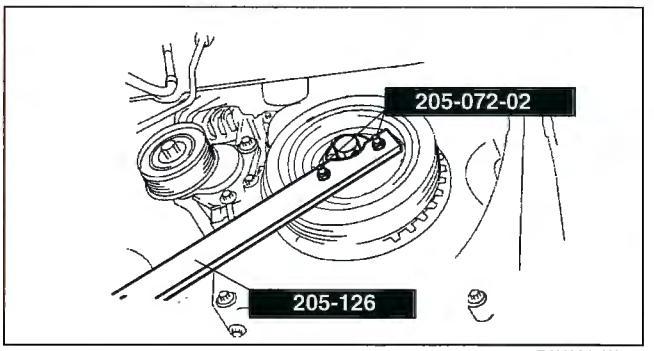
C3U0110W066

2. Install the **M6 x 1.0** bolt in by hand.
3. Rotate the crankshaft clockwise until the crankshaft is in the No.1 cylinder TDC position (until the balance weight is contacting to the **SST**).



AME2215W013

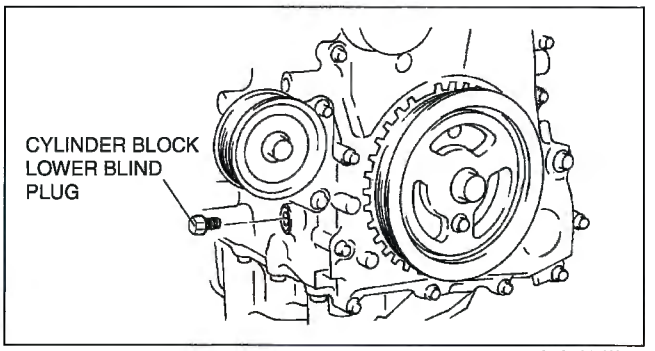
4. Hold the crankshaft pulley using the **SST**.
5. Tighten the crankshaft pulley lock bolt in the following two steps using the **SST (49 D032 316)**.
   (1) Tighten to **96—104 N·m {9.8—10.6 kgf·m, 70.9—76.7 ft·lbf}**
   (2) Tighten **87°—93°**
6. Remove the **M6 x 1.0** bolt.
7. Remove the **SST** from the camshaft.
8. Remove the **SST** from the cylinder block lower blind plug.
9. Rotate the crankshaft two times clockwise until the crankshaft is in the TDC position, reinstall the **SSTs** to the camshaft and cylinder block, and inspect the valve timing.
   - If not aligned, loosen the crankshaft pulley lock bolt and repeat from Step 1.



B6U2215W100

10. Install the cylinder block lower blind plug.

Tightening torque
18—22 N·m {1.9—2.2 kgf·m, 13.3—16.2 ft·lbf}



A6A2212W111

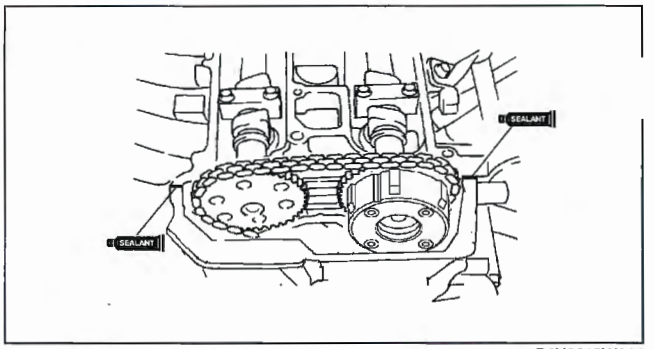
Cylinder Head Cover Installation Note

1. Apply silicone sealant to the mating faces as shown in the figure.

   Caution
   - **Install the cylinder head cover within 10 min of applying the silicone sealant.**

   Thickness
   4.0—6.0 mm {0.16—0.23 in}

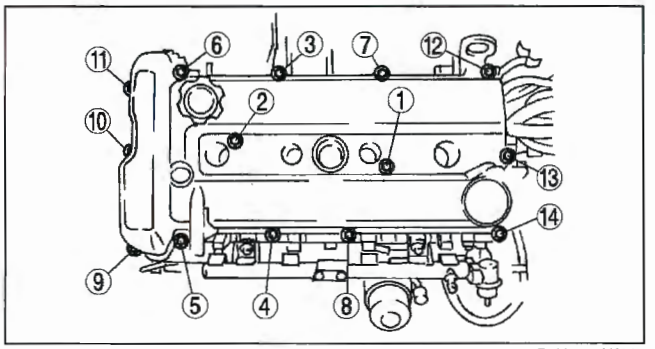
2. Install the cylinder head cover with a new gasket.



B6U2215W014

3. Tighten the bolts in the order shown in the figure.

   Tightening torque
   8.0—10.5 N·m {81.6—107.1 kgf·cm, 70.9—92.9 in·lbf}



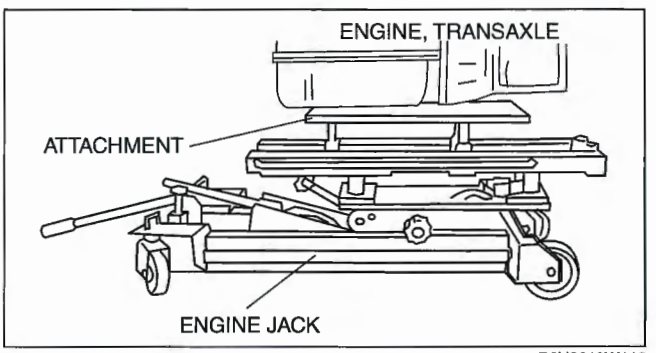
B6U2215W015

CYLINDER HEAD GASKET REPLACEMENT [L3]

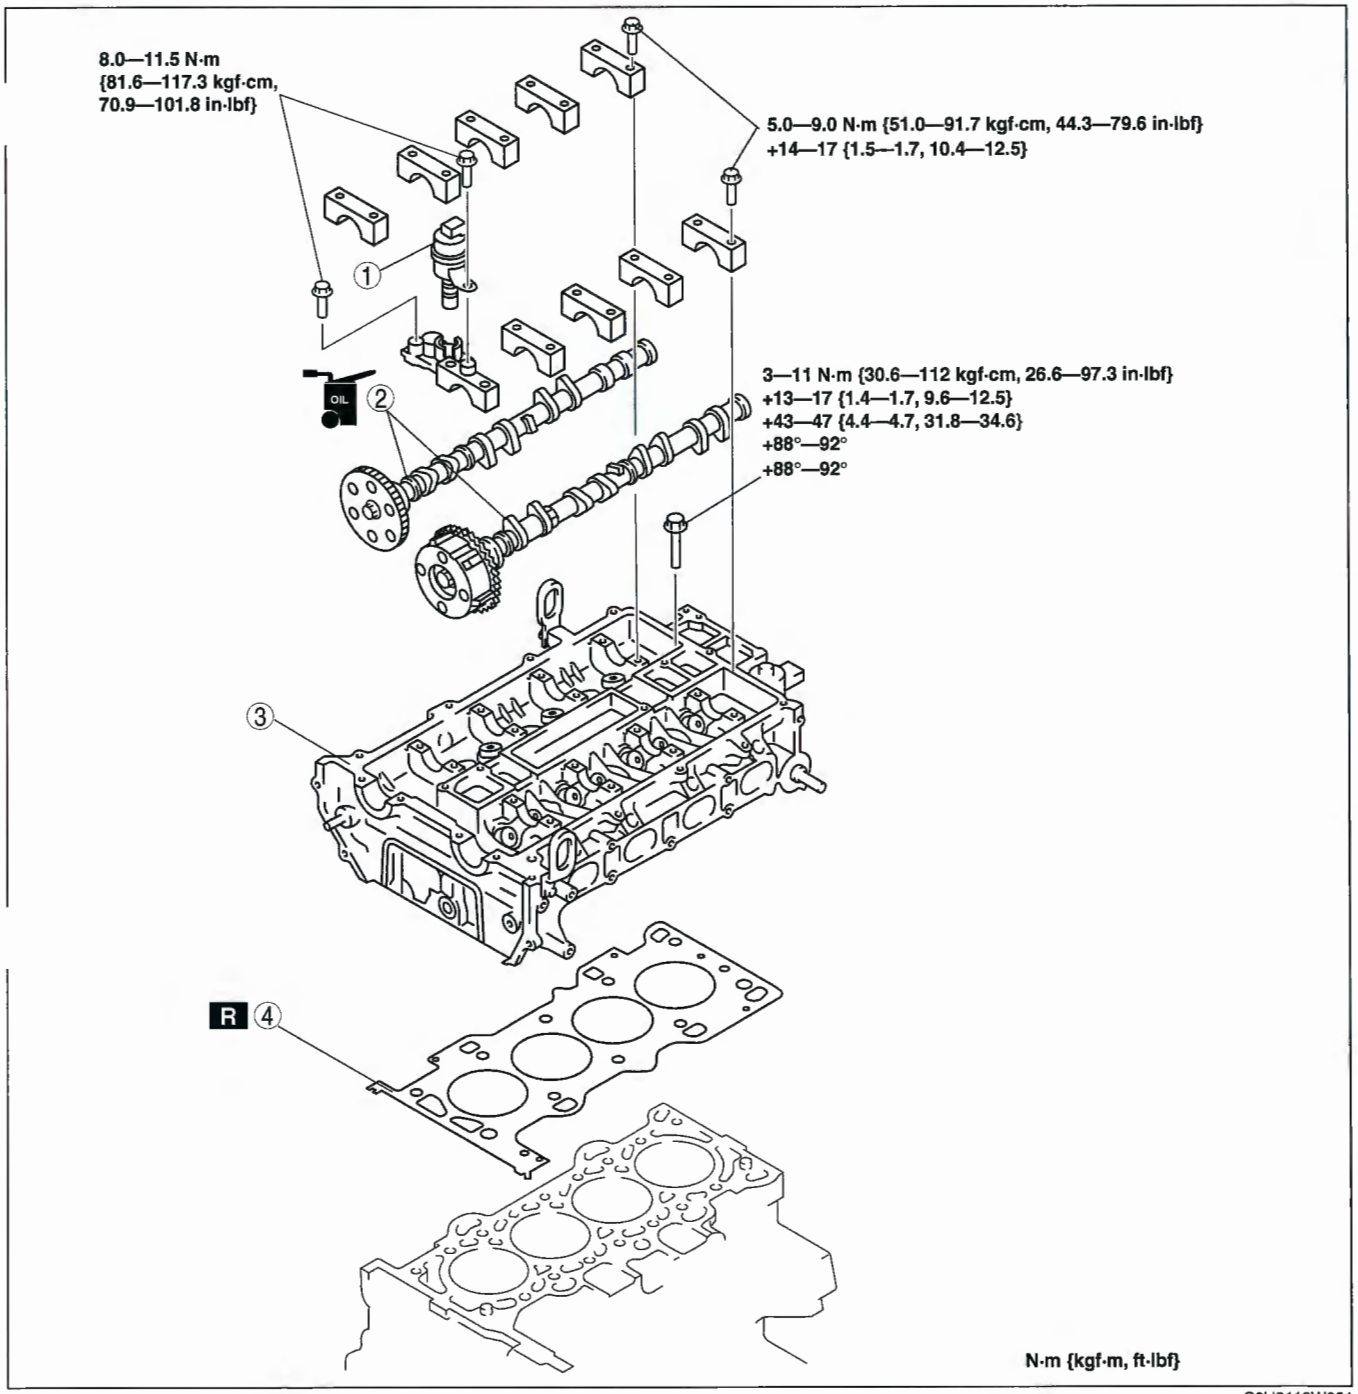
E6U011010271W02

Warning
- **Fuel vapor is hazardous. It can very easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death a damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure". (See 01–14A–6 Fuel Line Safety Procedure.)**

1. Remove the timing chain. (See 01–10A–9 TIMING CHAIN REMOVAL/INSTALLATION [L3].)
2. Disconnect the generator, but do not remove it from the vehicle. Fix the generator using a rope to prevent it from falling. (See 01–17A–4 GENERATOR REMOVAL/INSTALLATION [L3, AJ].)
3. Remove the front pipe. (See 01–15A–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3].)
4. Remove the intake manifold. (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].)
5. Disconnect the heater hose, bypass hose, and radiator hose.
6. To firmly support the engine, first set the engine jack and attachment to the oil pan.
7. Remove in the order indicated in the table.
8. Install in the reverse order of removal.
9. Inspect the compression. (See 01–10A–4 COMPRESSION INSPECTION [L3].)



B6U2218W110



C6U0110W051

1	Oil control valve (OCV)
2	Camshaft (See 01–10A–20 Camshaft Removal Note) (See 01–10A–21 Camshaft Installation Note)

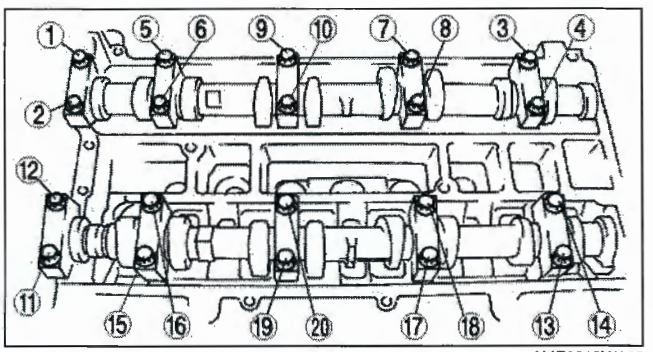
4	Cylinder head gasket

Camshaft Removal Note

Note
- The cylinder head and the camshaft caps are numbered to be reassembled in their original position correctly. When removed, keep the caps with the cylinder head they were removed from. Do not mix the caps.

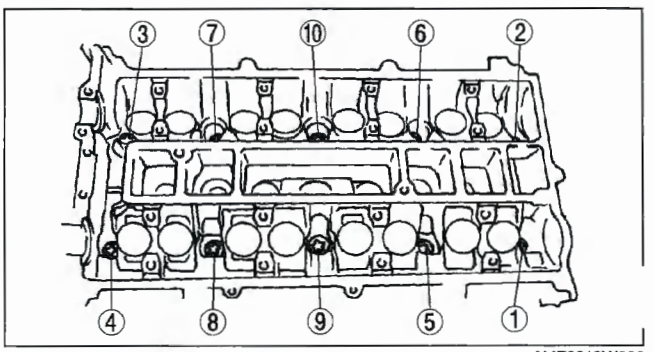
1. Loosen the camshaft cap bolts in two or three steps in the order shown in the figure.



AME2212W008

Cylinder Head Removal Note

1. Loosen the cylinder head bolts in two or three steps in the order shown in the figure.



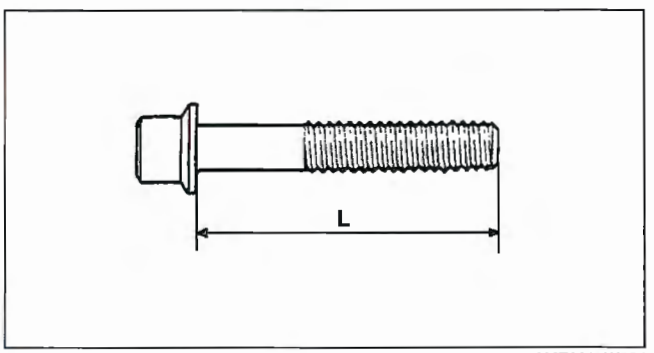
AME2218W003

Cylinder Head Installation Note

1. Measure the length of each cylinder head bolt.
   - Replace any that exceeds maximum length.

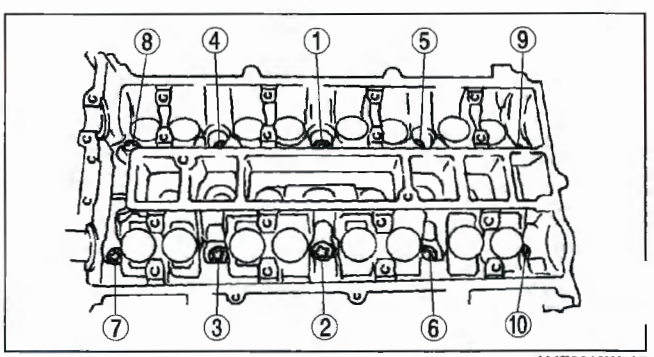
   Length L
   145.2—145.8 mm {5.717—5.740 in}

   Maximum
   146.5 mm {5.767 in}



AME2218W004

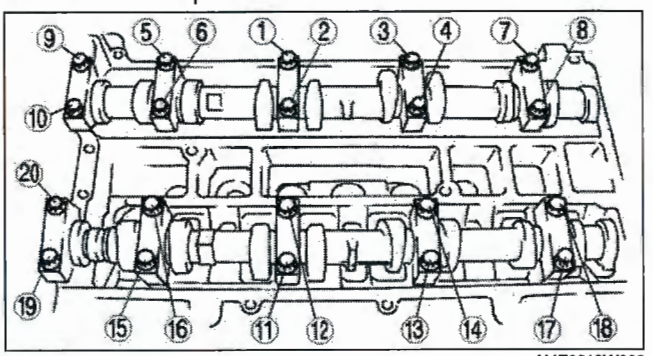
2. Tighten the cylinder head bolts in the order shown following 5 steps.
   (1) Tighten to **3—11 N·m {30.6—112 kgf·cm, 26.6—97.3 in·lbf}**
   (2) Tighten **13—17 N·m {1.4—1.7 kgf·m, 9.6—12.5 ft·lbf}**
   (3) Tighten **43—47 N·m {4.4—4.7 kgf·m, 31.8—34.6 ft·lbf}**
   (4) Tighten **88°—92°**
   (5) Tighten **88°—92°**



AME2218W005

Camshaft Installation Note

1. Set the cam position of No.1 cylinder at the top dead center (TDC) and install the camshaft.
2. Temporarily tighten the camshaft bearing caps evenly in two or three steps.
   Tighten the camshaft cap bolts in the order shown with the following two steps.
   (1) Tighten to **5.0—9.0 N·m {51.0—91.7 kgf·cm, 44.3—79.6 in·lbf}**
   (2) Tighten to **14—17 N·m {1.5—1.7 kgf·m, 10.4—12.5 ft·lbf}**

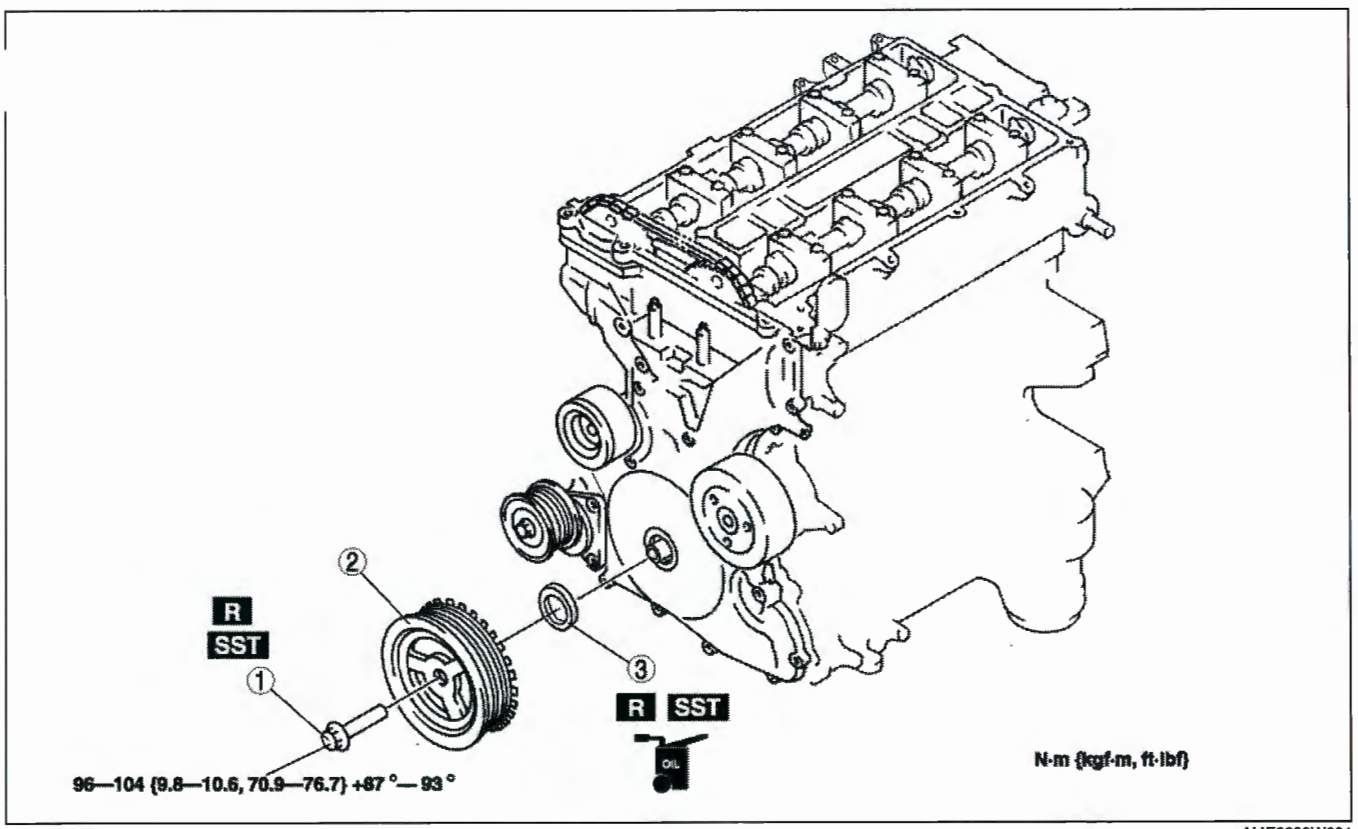


AME2212W009

FRONT OIL SEAL REPLACEMENT [L3]

E6U011010602W02

1. Disconnect the negative battery cable.
2. Remove the plug hole plate. (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
3. Remove the dipstick.
4. Remove the spark plugs. (See 01–18A–4 SPARK PLUG REMOVAL/INSTALLATION [L3, AJ].)
5. Remove the cylinder head cover. (See 01–10A–18 Cylinder Head Cover Installation Note.)
6. Remove the drive belt. (See 01–10A–3 DRIVE BELT REPLACEMENT [L3].)
7. Remove the front drive shaft (RH) from the joint shaft. (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC].)
8. Remove the crankshaft position (CKP) sensor.
   (See 01–40A–45 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3].)
9. Remove in the order indicated in the table.
10. Install in the reverse order of removal.



AME2220W001

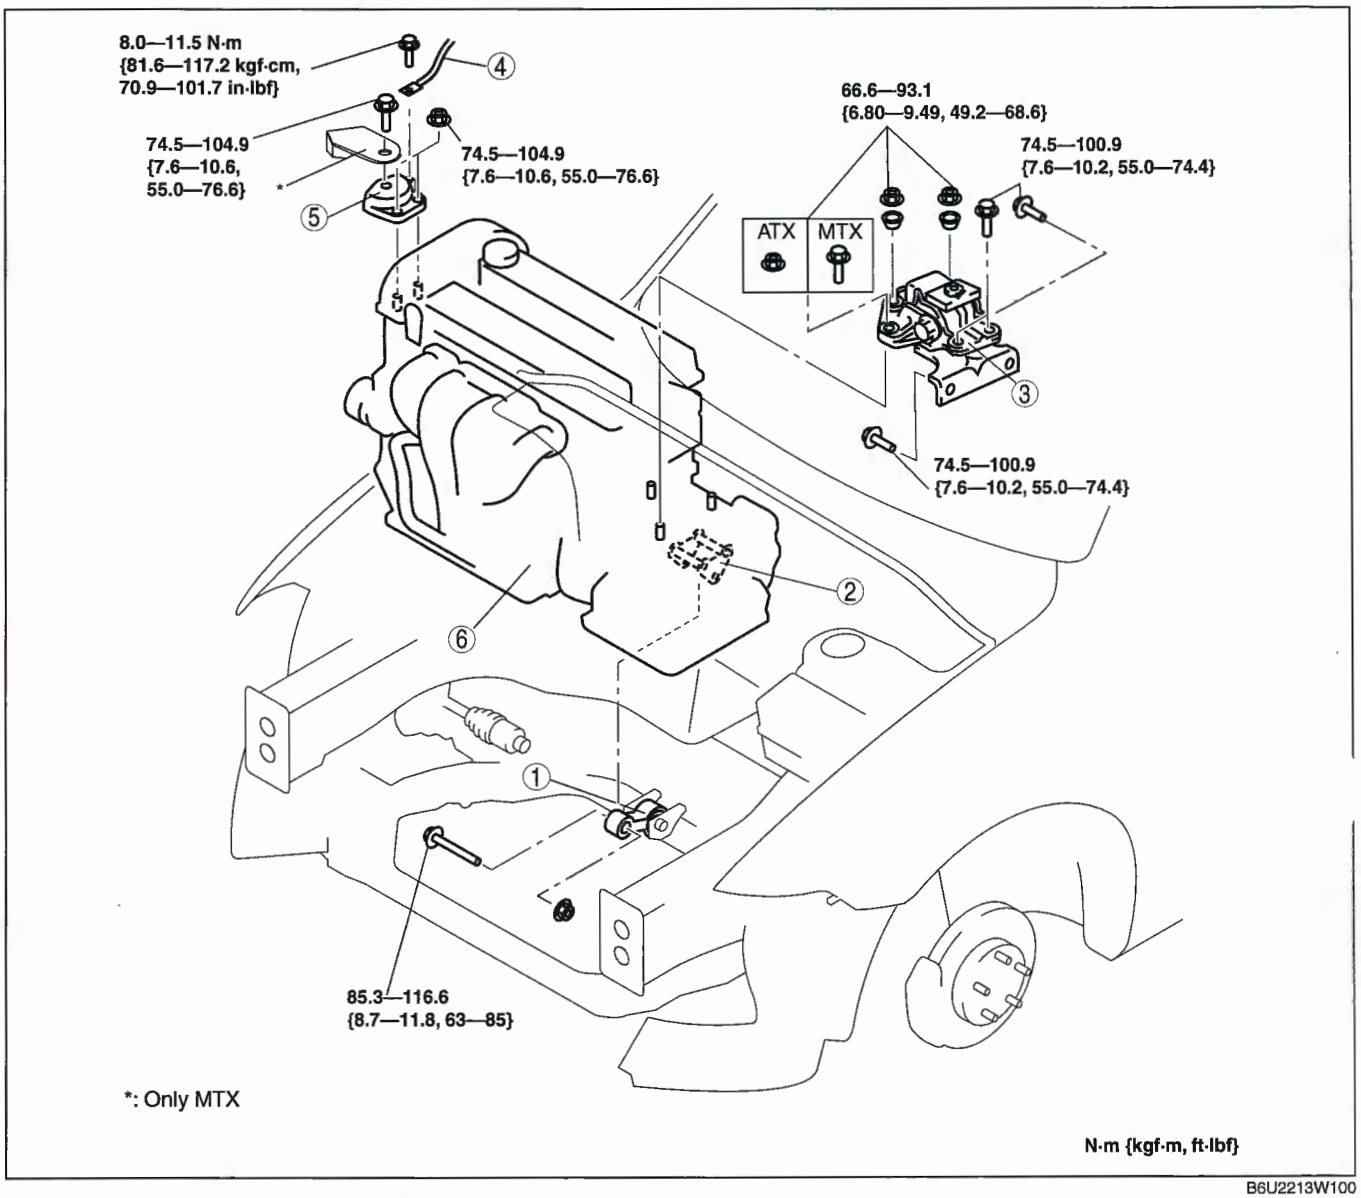
Warning
- **Fuel vapor is hazardous. It can very easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure". (See 01–14A–6 Fuel Line Safety Procedure.)**

1. Remove the battery. (See 01–17A–1 BATTERY REMOVAL/INSTALLATION [L3, AJ].)
2. Remove the battery tray. (See 01–17A–1 BATTERY REMOVAL/INSTALLATION [L3, AJ].)
3. Remove the shroud panel. (See 09–10–17 SHROUD PANEL REMOVAL/INSTALLATION.)
4. Remove the radiator. (See 01–12A–8 RADIATOR REMOVAL/INSTALLATION [L3, AJ].)
5. Drain the transaxle oil.
6. Remove the plug hole plate.
   (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
7. Remove the P/S oil pump with the oil hose still connected and position the P/S oil pump so that it is out of the way. (See 06–12–27 POWER STEERING OIL PUMP REMOVAL/INSTALLATION [L3, L3 WITH TC])
8. Remove the A/C compressor with the pipes still connected. Position the A/C compressor so that it is out of the way. Use wire or rope to secure.
9. Remove the joint shaft. (See 03–13–3 JOINT SHAFT REMOVAL/INSTALLATION [L3].)
10. Remove the front drive shaft (LH) from the transaxle. (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC].)
11. Remove the air cleaner, intake air duct and bracket, and vacuum hose. (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].)
12. Remove the ATF hose and selector cable. (ATX) (See 05–17A–39 AUTOMATIC TRANSAXLE REMOVAL/INSTALLATION [FS5A-EL].)
13. Remove the vacuum hose and heater hose.
14. Remove the release cylinder and control cable. (MTX) (See 05–15A–4 MANUAL TRANSAXLE REMOVAL/INSTALLATION [G35M-R].)
15. Remove the fuel hose. (See 01–14A–16 Plastic Fuel Hose Removal Note.) (See 01–14A–20 Plastic Fuel Hose Installation Note.)
16. Disconnect the wiring harness from the engine side.
    Remove the front pipe. (See 01–15A–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3].)
17. Remove in the order indicated in the table.
19. Install in the reverse order of removal.

20. Start the engine and:
    - Inspect for the engine oil, engine coolant, transaxle oil and fuel leakage.
    - Verify the ignition timing, idle speed and idle mixture. (See 01–10A–29 Ignition Timing Inspection.) (See 01–10A–30 Idle Speed Inspection.) (See 01–10A–30 Idle Mixture Inspection.)
21. Perform a road test.



B6U2213W100

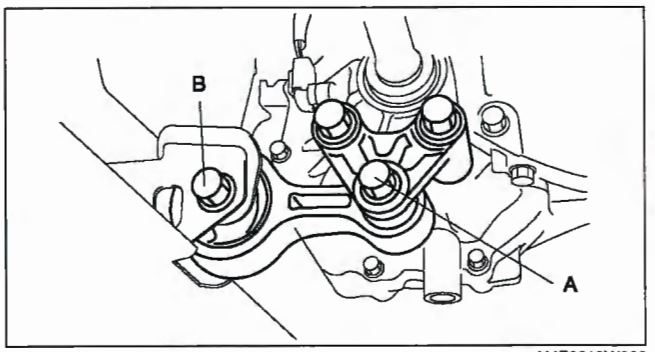
1	No.1 Engine mount rubber (See 01–10A–27 No.1 Engine Mount Rubber Removal Note) (See 01–10A–29 No.1 Engine Mount Rubber Installation Note)
2	No.1 Engine mount bracket (See 01–10A–28 No.1 Engine Mount Bracket Installation Note)
3	No.4 Engine mount bracket and No.4 Engine mount rubber (See 01–10A–27 No.4 Engine Mount Bracket and No.4 Engine Mount Rubber Removal Note) (See 01–10A–28 No.4 Engine Mount Bracket and No.4 Engine Mount Rubber Installation Note)
4	Engine ground
5	No.3 Engine joint bracket (See 01–10A–28 No.3 Engine Joint Bracket Installation Note)
6	Engine, transaxle

No.1 Engine Mount Rubber Removal Note

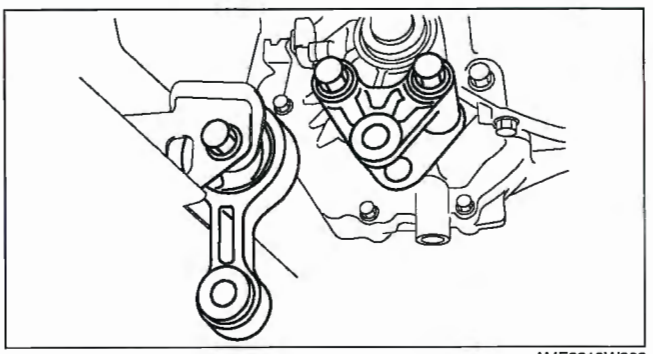
1. Remove through bolt A on the No.1 engine mount bracket side.
2. Loosen through bolt B on the crossmember side until approximately three pitches are showing.

Note

- Do not remove the No.1 engine mount rubber from the vehicle.



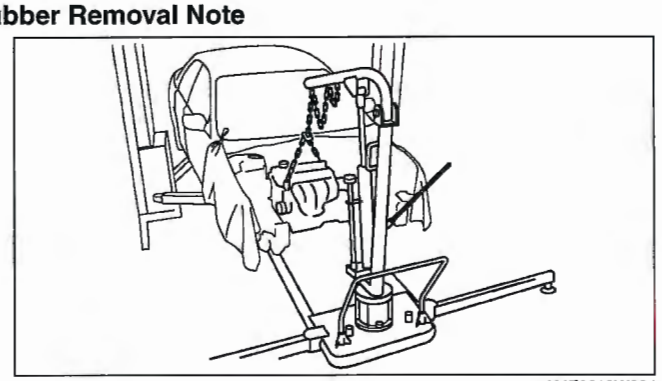
AME2213W002



AME2213W003

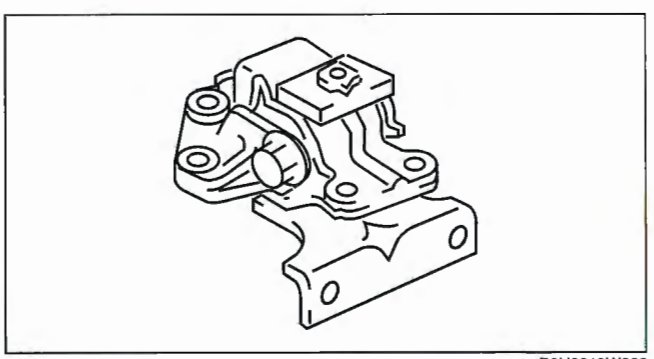
No.4 Engine Mount Bracket and No.4 Engine Mount Rubber Removal Note

1. Secure the engine and the transaxle using a hoist.



AME2213W004

2. Remove the No.4 engine mount bracket and engine mount rubber together as a unit.

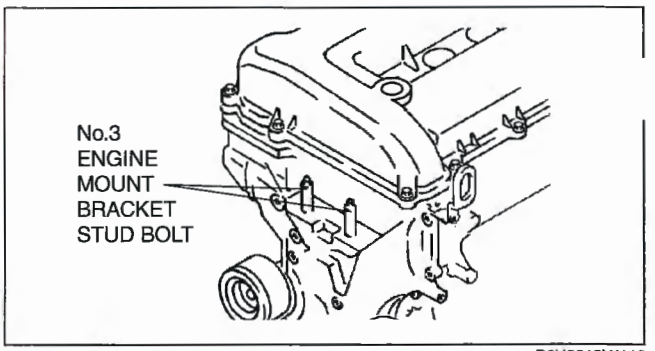


B6U2213W003

No.3 Engine Joint Bracket Installation Note

1. Tighten the No.3 engine mount bracket stud bolt.

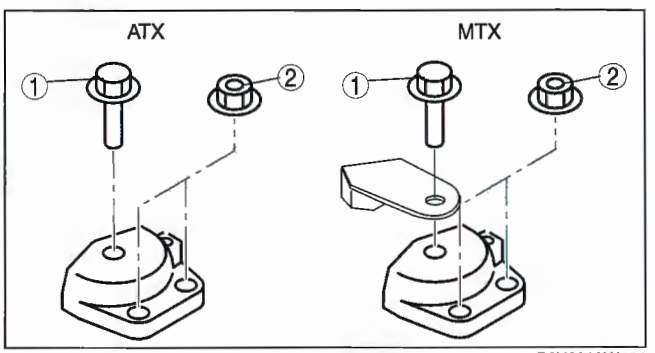
Tightening torque
7.0—13 N·m {71.4—132.5 kgf·cm, 62.0—115.0 in·lbf}



B6U2215W110

2. Tighten the No.3 engine joint bracket bolt and nut in the order as shown.

Tightening torque
74.5—104.9 N·m {7.6—10.6 kgf·m, 55.0—76.6 ft·lbf}

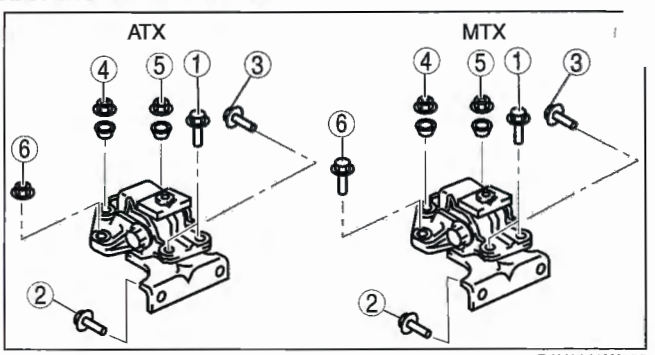


B6U2213W001

No.4 Engine Mount Bracket and No.4 Engine Mount Rubber Installation Note

1. Tighten the No.4 engine mount bracket and No.4 engine mount rubber bolt and nut in the order as shown.

Bolt and nut No.	Tightening torque (N·m {kgf·m, ft·lbf})
1, 2, 3	74.5—100.9 {7.6—10.2, 55.0—74.4}
4, 5, 6	66.6—93.1 {6.80—9.49, 49.2—68.6}



B6U2213W002

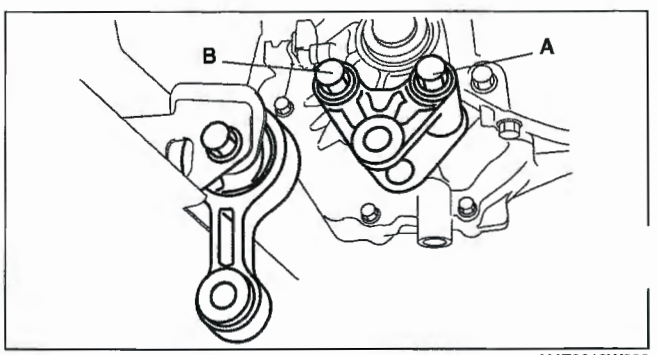
No.1 Engine Mount Bracket Installation Note

1. Tighten No.1 engine mount bracket bolt A.

Tightening torque
93.1—116.6 N·m {9.5—11.8 kgf·m, 68.7—85.9 ft·lbf}

2. Tighten No.1 engine mount bracket bolt B.

Tightening torque
93.1—116.6 N·m {9.5—11.8 kgf·m, 68.7—85.9 ft·lbf}



AME2213W008

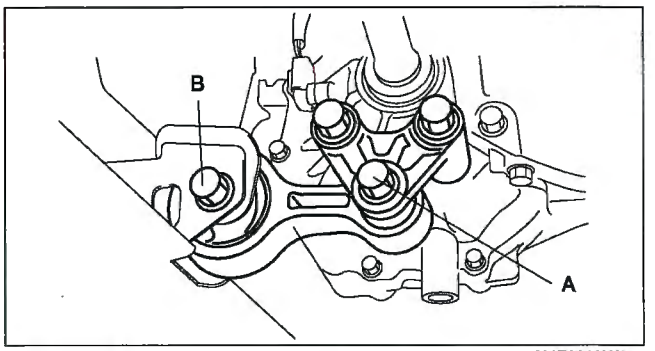
No.1 Engine Mount Rubber Installation Note

1. Tighten through bolt A on the No.1 engine mount bracket.

   Tightening torque
   85.3—116.6 N·m {8.7—11.8 kgf·m, 63—85 ft·lbf}

2. Tighten through bolt B on the crossmember side.

   Tightening torque
   93.1—116.6 N·m {9.5—11.8 kgf·m, 68.7—85.9 ft·lbf}



AME2213W009

ENGINE DISASSEMBLY/ASSEMBLY [L3]

E6U011002000W11

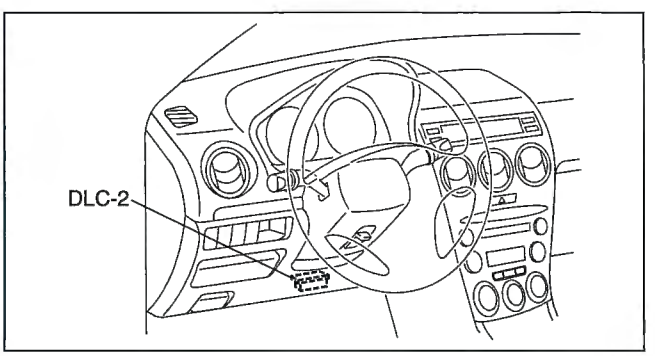
1. Disconnect the engine and automatic transaxle. (ATX) (See 05–17B–30 AUTOMATIC TRANSAXLE REMOVAL/INSTALLATION [AW6A-EL].)
2. Disconnect the engine and manual transaxle. (MTX) (See 05–15A–4 MANUAL TRANSAXLE REMOVAL/INSTALLATION [G35M-R].)
3. Remove the intake-air system. (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].)
4. Remove the exhaust system. (See 01–15A–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3].)
5. Remove the generator. (See 01–17A–4 GENERATOR REMOVAL/INSTALLATION [L3, AJ].)
6. Remove the ignition coils. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)
7. Remove the crankshaft position (CKP) sensor. (See 01–40A–45 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3].)
8. Assemble in the reverse order of disassembly.

ENGINE TUNE-UP [L3]

E6U011002000W12

Engine Tune-up Preparation

1. Turn off the electrical loads.
2. Warm up the engine as follows.
   (1) Start the engine.
   (2) Maintain the engine speed **2,500—3,000 rpm** until the cooling fans start to operate.
   (3) Release the accelerator pedal.
   (4) Wait until the cooling fans stop.
3. Connect the **SST** (WDS or equivalent) to the DLC-2.



A6E3970W002

Ignition Timing Inspection

Note
- Ignition timing is not adjustable.
- Ignition timing verification requires WDS or equivalent.

Verify that the ignition timing (WDS: SPARKADV PID) is within the specification using WDS or equivalent.

Ignition timing
Approx. BTDC 8°

2. Verify that ignition timing advances when the engine speed increases gradually.

Idle Speed Inspection

Note
- Idle speed is not adjustable.
- Idle speed verification requires WDS or equivalent.

1. Verify that the idle speed (WDS: RPM PID) is within the specification using WDS or equivalent.

Standard

Condition	Engine speed (rpm)*1 N, D position (ATX), Neutral position (MTX)		
	ATX		MTX
	N range	D range	
No load	650—750	600—700	650—750
Electrical loads*2 ON	650—750	650—750	650—750
P/S ON	650—750	650—750	650—750
A/C ON and refrigerant pressure switch (middle) OFF	700—800	700—800	700—800
A/C ON and refrigerant pressure switch (middle) ON	700—800	700—800	700—800

*1 : Excludes temporary idle speed drop just after the electrical loads are turned on.
*2 : Blower motor is operating at high speed. Headlight switch is turned on. Rear window defroster switch is turned on. Cooling fans are operating.

Idle Mixture Inspection

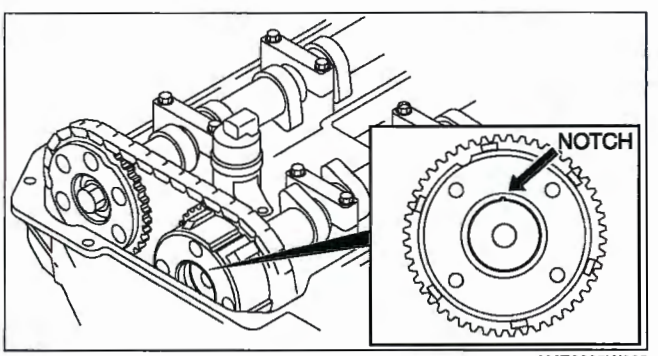
1. Verify that the idle speed and ignition timing are within the specification. (See 01–10A–30 Idle Speed Inspection.) (See 01–10A–29 Ignition Timing Inspection.)
2. Insert an exhaust gas analyzer to the tailpipe.
3. Verify that the CO and HC concentrations are within the regulation.

VARIABLE VALVE TIMING ACTUATOR INSPECTION [L3]

E6U011012490W03

Caution
- **The variable valve timing actuator cannot be disassembled because it is a precision unit.**

1. Disconnect the negative battery cable.
2. Remove the plug hole plate. (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
3. Remove the dipstick.
4. Remove the oil control valve (OCV) connector.
5. Remove the ventilation hose.
6. Remove the cylinder head cover.
7. Confirm that the groove on the rotor and the notch on the cover of the variable valve timing actuator are aligned and fitted.
   - If the groove and the notch are not aligned, turn the crankshaft clockwise two rotations. Verify that the groove and the notch are aligned.
   - If the groove and notch are still not aligned, replace the variable valve timing actuator.
   - If, when turning the crankshaft, there is a hitting noise from the variable valve timing actuator each time the cam passes the fully lifted position, it means that the actuator is not secured. Replace the actuator.



AME2225W002

8. Install the cylinder head cover. (See 01–10A–18 Cylinder Head Cover Installation Note.)
9. Install the ventilation hose.
10. Install the oil control valve (OCV) connector.
11. Install the plug hole plate. (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)

VARIABLE VALVE TIMING ACTUATOR REMOVAL/INSTALLATION [L3]

E6U011012490W04

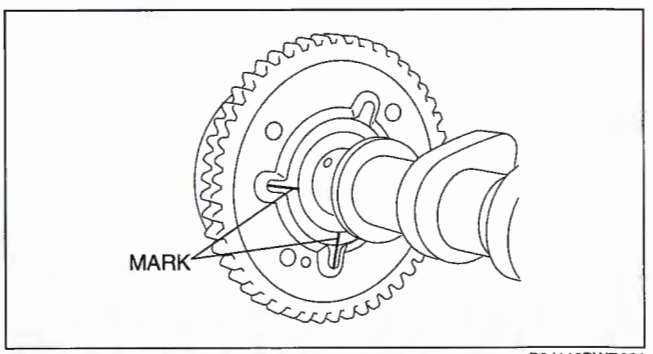
Caution
- **The variable valve timing actuator cannot be disassembled because it is a precision unit.**

Note
- Intake camshaft sprocket is integrated with the variable valve timing actuator and cannot be disassembled.

1. Follow the valve clearance adjustment procedure from 1 to 20 and remove the intake camshaft and variable valve timing actuator as a single unit. (See 01–10A–6 VALVE CLEARANCE ADJUSTMENT [L3].)
2. Remove the variable valve timing actuator.
   (1) Mark the camshaft and variable valve timing actuator as shown in the figure to make sure they are installed in their original position.

   Note
   - Do not add scratch marks to the camshaft thrust area.

   (2) Secure the camshaft in a vise.
   (3) Loosen the variable valve timing actuator tightening bolt.



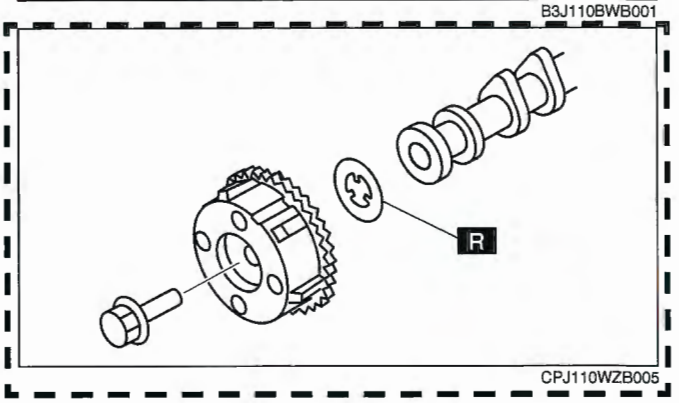
B3J110BWB001

3. Install a new washer.
4. Install the variable valve timing actuator.
   (1) Secure the camshaft in a vise.
   (2) Align the marks of the camshaft and variable valve timing actuator.

   Caution
   - **When the variable valve timing actuator is replaced with a new one, mark it in the same location as the old one.**

   (3) Tighten the variable valve timing actuator tightening bolt.

   Tightening torque
   69—75N·m {7.1—7.6 kgf·m, 50.9—55.3 ft·lbf}



CPJ110WZB005

5. Follow the valve clearance adjustment procedure from 24 to 48 and install the intake camshaft and variable valve timing actuator. (See 01–10A–6 VALVE CLEARANCE ADJUSTMENT [L3].)

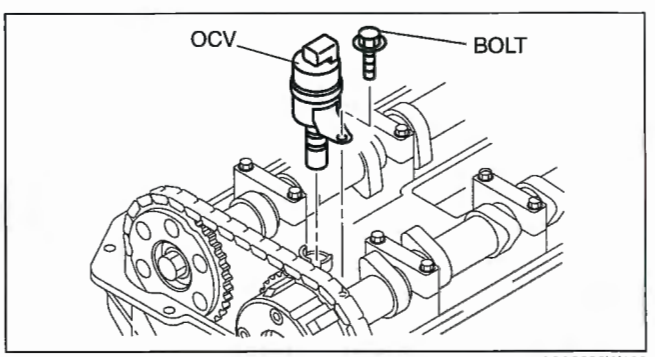
OIL CONTROL VALVE (OCV) REMOVAL/INSTALLATION [L3]

E6U011014420W03

1. Disconnect the negative battery cable.
2. Remove the plug hole plate. (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
3. Remove the dipstick.
4. Remove the OCV connector.
5. Remove the ventilation hose.
6. Remove the cylinder head cover.
7. Remove the OCV.
8. Install the OCV.

   Tightening torque
   8.0—11.5 N·m {81.6—117.2 kgf·cm, 70.9—101.7 in·lbf}

9. Install the cylinder head cover. (See 01–10A–18 Cylinder Head Cover Installation Note.)
10. Install the ventilation hose.
11. Install the OCV connector.
12. Install the plug hole plate. (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)



A6A2226W100

OIL CONTROL VALVE (OCV) INSPECTION [L3]

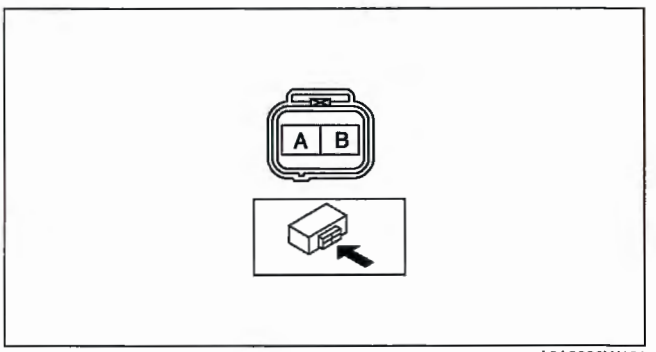
E6U011014420W04

Coil Resistance Inspection

1. Disconnect the negative battery cable.
2. Remove the plug hole plate. (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
3. Remove the dipstick.
4. Disconnect the OCV connector.
5. Measure the resistance between terminals A and B using an ohmmeter.
   - If not as specified, replace the OCV.

   Specification
   6.9—7.9 ohms

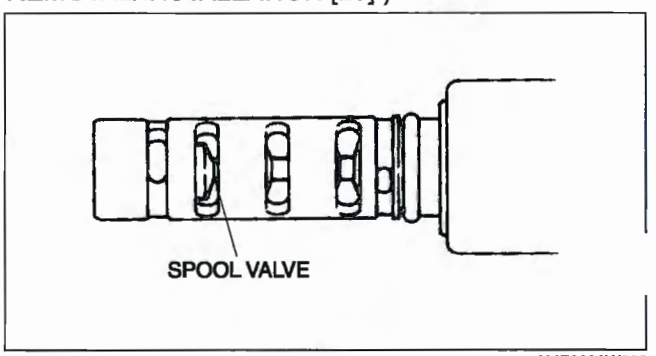
6. Connect the OCV connector.
7. Install the plug hole plate. (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)



A6A2226W101

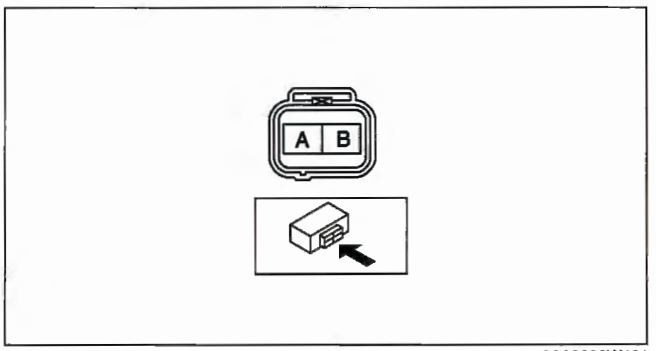
Spool Valve Operation Inspection

1. Disconnect the negative battery cable.
2. Remove the plug hole plate. (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
3. Remove the OCV. (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)
4. Verify that the spool valve in the OCV is in the maximum valve timing retard position as indicated in the figure.
   - If not as specified, replace the OCV.
5. Verify that the battery is fully charged.
   - If not as specified, recharge the battery.



AME2226W003

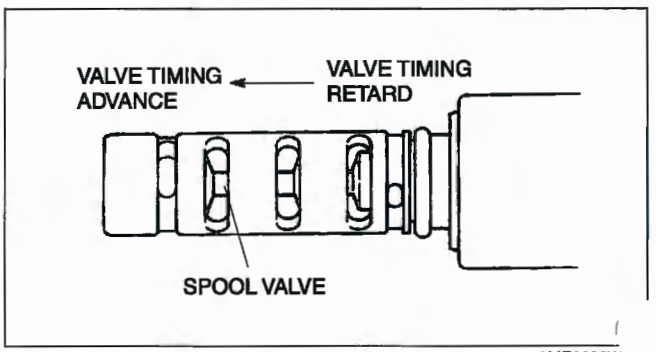
6. Apply battery positive voltage between the OCV terminals and verify that the spool valve operates and moves to the maximum valve timing advance position.



A6A2226W101

   - If not as specified, replace the OCV.

   Note
   - When applying battery positive voltage between the OCV terminals, the connection can be either of the following:
     — Positive battery cable to terminal A, negative battery cable to terminal B
     — Positive battery cable to terminal B, negative battery cable to terminal A



AME2226W

7. Stop applying battery positive voltage and verify that the spool valve returns to the maximum valve timing retard position.
   - If not as specified, replace the OCV.
8. Install the OCV. (See 01–10A–31 OIL CONTROL VALVE (OCV) REMOVAL/INSTALLATION [L3].)
9. Install the plug hole plate. (See 01–10A–4 PLUG HOLE PLATE REMOVAL/INSTALLATION [L3].)

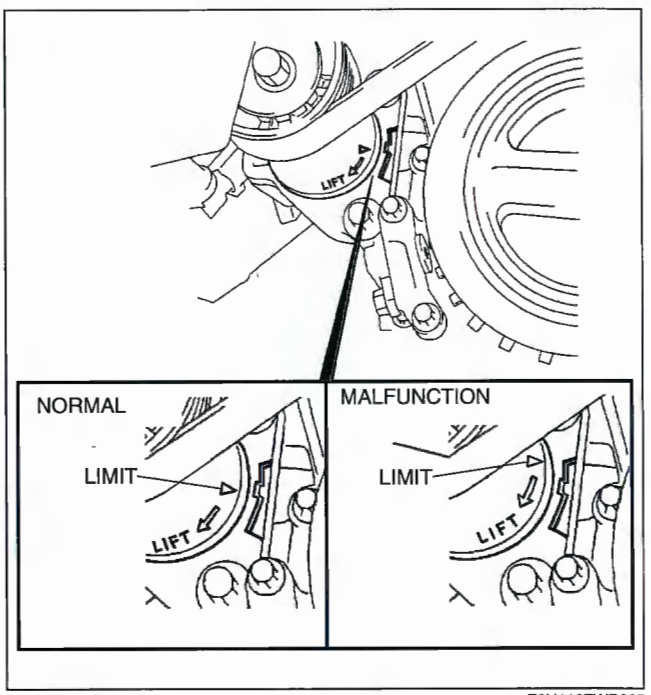
DRIVE BELT INSPECTION [L3 WITH TC]

E6U011015800W05

Note
- Drive belt deflection/tension inspection is not necessary because of the use of the drive belt auto tensioner.

1. Verify that the drive belt auto tensioner indicator mark does not exceed the limit.
   - If it exceeds the limit, replace the drive belt. (See 01–10B–3 DRIVE BELT REPLACEMENT [L3 WITH TC].)

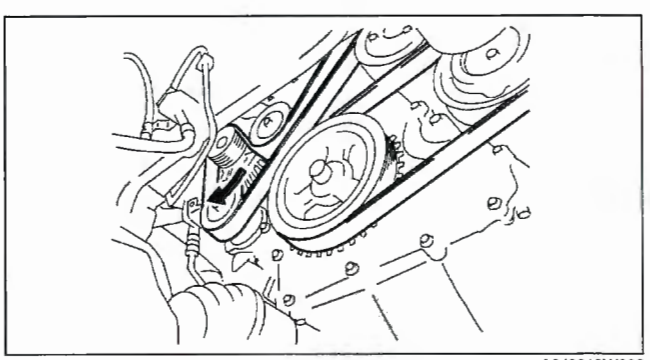


E6U110ZWB035

IVE BELT REPLACEMENT [L3 WITH TC]

E6U011015800W06

1. Remove the splash shield (RH).
2. Rotate the drive belt auto tensioner in the direction shown in the figure and remove the drive belt.
3. Install a new drive belt.
4. Verify that the drive belt auto tensioner indicator mark does not exceed the limit. (See 01–10B–3 DRIVE BELT INSPECTION [L3 WITH TC].)
5. Install the splash shield (RH).

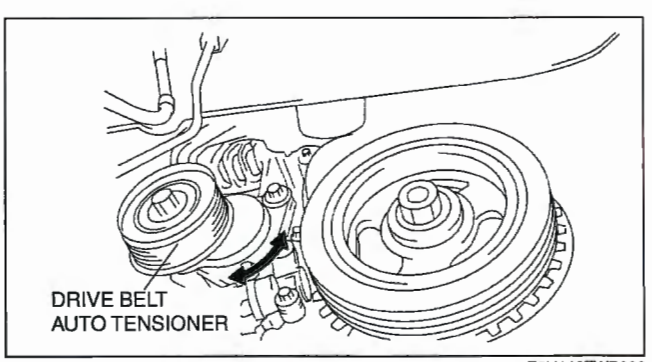


A6J2210W002

DRIVE BELT AUTO TENSIONER INSPECTION [L3 WITH TC]

E6U011015980W03

1. Remove the drive belt. (See 01–10B–3 DRIVE BELT REPLACEMENT [L3 WITH TC].)
2. Verify that the drive belt auto tensioner moves smoothly in the operational direction.
   - Replace the drive belt auto tensioner if necessary.
3. Rotate the drive belt auto tensioner pulley by hand and verify that it rotates smoothly.
   - Replace the drive belt auto tensioner if necessary.
4. Install the drive belt. (See 01–10B–3 DRIVE BELT REPLACEMENT [L3 WITH TC].)



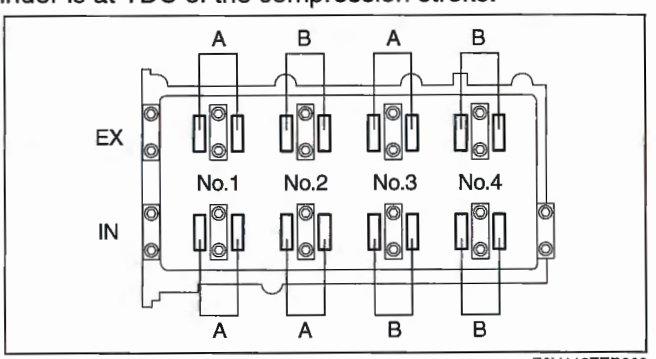
E6U110ZWB036

VALVE CLEARANCE INSPECTION/ADJUSTMENT [L3 WITH TC]

E6U011002000W14

VALVE CLEARANCE INSPECTION

1. Disconnect the negative battery cable.
2. Remove the front tire (RH).
3. Remove the under cover.
4. Remove the splash shield (RH).
5. Remove the charge air cooler. (See01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
6. Remove the high pressure fuel pump. (See 01–14B–18 HIGH PRESSURE FUEL PUMP REMOVAL/ INSTALLATION [L3 WITH TC].)
7. Remove the ignition coils. (See 01–18B–2 IGNITION COIL REMOVAL/INSTALLATION [L3 WITH TC].)
8. Disconnect the OCV connector.
9. Disconnect the CMP sensor connector.
10. Disconnect the P/S oil pump connector.
11. Remove the ventilation hose.
12. Remove the cylinder head cover. (See 01–10B–12 Cylinder Head Cover Removal Note.)
13. Measure the valve clearance.
    (1) Rotate the crankshaft clockwise so that the No.1 cylinder is at TDC of the compression stroke.
    (2) Measure the valve clearance of location A shown in the figure.



E6U110ZEB002

Standard valve clearance [Engine cold]
IN: 0.22—0.28 mm {0.0087—0.0110 in}
EX: 0.27—0.33 mm {0.0107—0.0129 in}

    (3) If it is not within the specification, replace the tappet and adjust the valve clearance to the median value of the standard (See 01–10B–5 VALVE CLEARANCE ADJUSTMENT)

Note
- Make sure to note down the measured values for choosing the suitable replacement tappets.

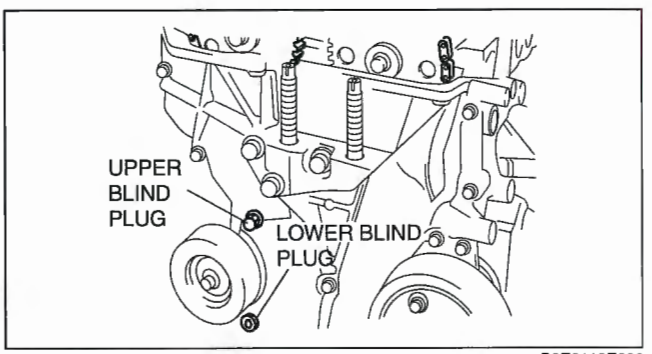
    (4) Rotate the crankshaft clockwise **360°** so that the No.4 cylinder is at TDC of the compression stroke.
    (5) Measure the valve clearance of location B shown in the figure.

Standard valve clearance [Engine cold]
IN: 0.22—0.28 mm {0.0087—0.0110 in}
EX: 0.27—0.33 mm {0.0107—0.0129 in}

    (6) If not within the specification, replace the tappet and adjust the valve clearance to the median value of the standard (See 01–10B–5 VALVE CLEARANCE ADJUSTMENT)
14. Install the cylinder head cover. (See 01–10B–12 Cylinder Head Cover Removal Note.)
15. Install the ventilation hose.
16. Connect the P/S oil pump connector.
17. Connect the CMP sensor connector.
18. Connect the OCV connector.
19. Install the ignition coils. (See 01–18B–2 IGNITION COIL REMOVAL/INSTALLATION [L3 WITH TC].)
20. Install the high pressure fuel pump. (See 01–14B–18 HIGH PRESSURE FUEL PUMP REMOVAL/ INSTALLATION [L3 WITH TC].)
21. Install the charge air cooler. (See01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
22. Install the splash shield (RH).
23. Install the under cover.
24. Install the front tire (RH).
25. Connect the negative battery cable.
26. Bleed the air from the cooling system. (See01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)

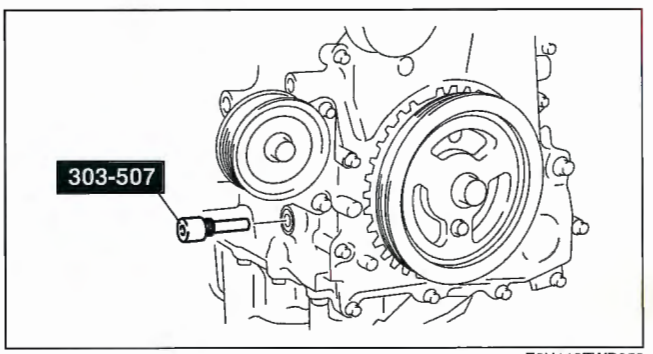
VALVE CLEARANCE ADJUSTMENT

1. Disconnect the negative battery cable.
2. Remove the front tire (RH).
3. Remove the under cover.
   Remove the splash shield (RH).
4. Remove the charge air cooler. (See01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
5. Remove the high pressure fuel pump. (See 01–14B–18 HIGH PRESSURE FUEL PUMP REMOVAL/INSTALLATION [L3 WITH TC].)
6. Remove the ignition coils. (See 01–18B–2 IGNITION COIL REMOVAL/INSTALLATION [L3 WITH TC].)
7. Disconnect the OCV connector.
8. Disconnect the CMP sensor connector.
9. Disconnect the P/S oil pump connector.
10. Remove the ventilation hose.
11. Remove the cylinder head cover. (See 01–10B–12 Cylinder Head Cover Removal Note.)
12. Remove the drive belt. (See 01–10B–3 DRIVE BELT REPLACEMENT [L3 WITH TC].)
13. Disconnect the front drive shaft (RH) from the joint shaft. (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC].)
14. Remove the engine front cover lower blind plug.
15. Remove the engine front cover upper blind plug.



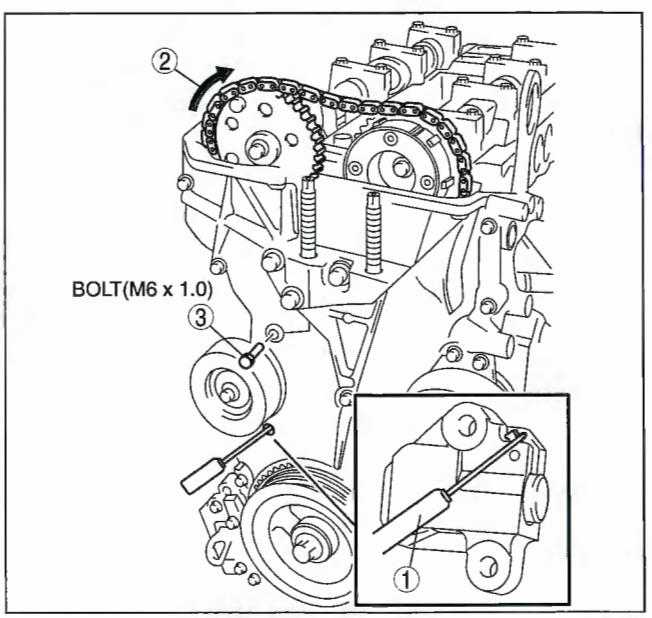
B3E0110E093

16. Remove the cylinder block lower blind plug, and install the **SST**.
    Rotate the crankshaft clockwise so that the No.1 cylinder is at TDC of the compression stroke.
    (The position crank weight contacts the **SST**.)



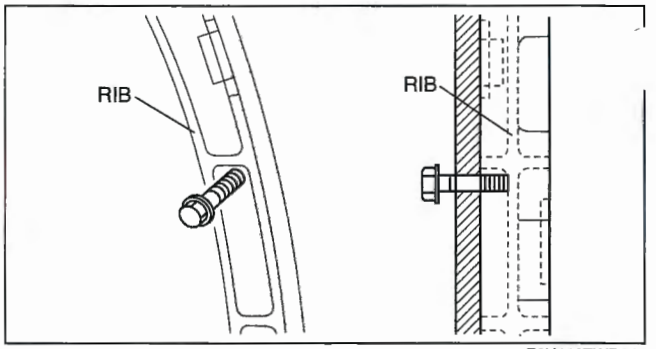
E6U110ZWB050

17. Release the tension on the timing chain.
    (1) Using a suitable screwdriver or equivalent tool, unlock the chain tensioner ratchet.



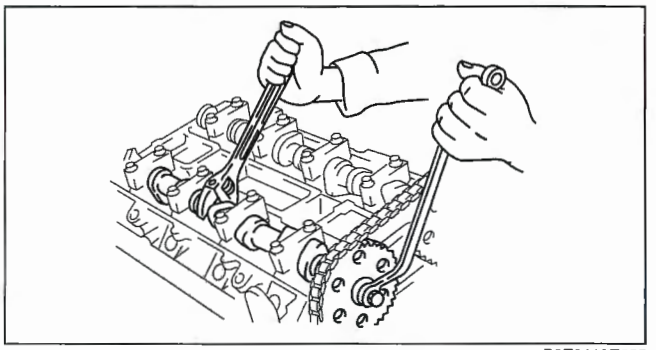
E6U110ZWB052

(2) Rotate the exhaust camshaft clockwise using a suitable wrench on the cast hexagon and loosen the tension on the timing chain.
(3) Using a suitable bolt **(M6 X 1.0 length 25mm—35mm {0.99—1.37 in})** at the engine front cover upper blind plug, secure the tensioner arm at the position where the tension is released.



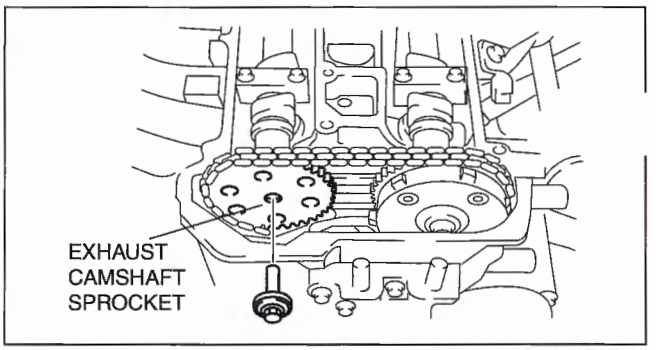
E6U110ZWB045

20. Fix the exhaust camshaft using a wrench on the cast hexagon, and loosen the camshaft sprocket installation bolt.



B3E0110E095

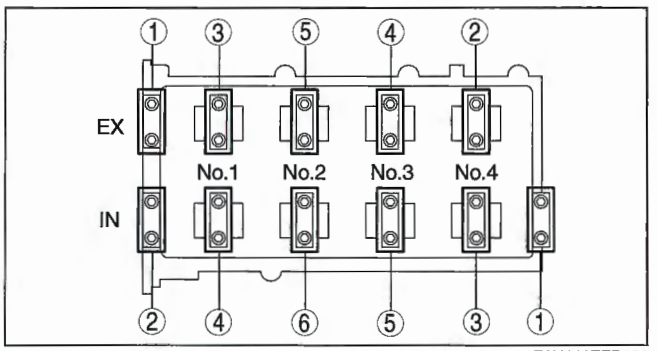
21. Remove the installation bolt and remove the exhaust camshaft sprocket.



E6U110ZWB008

22. Loosen the camshaft cap bolts in two or three passes in the order shown in the figure and remove the camshaft cap.

Note
- The camshaft caps are to be kept ordered for correct reassembly in their original positions. Do not mix the caps.



E6U110ZEB001

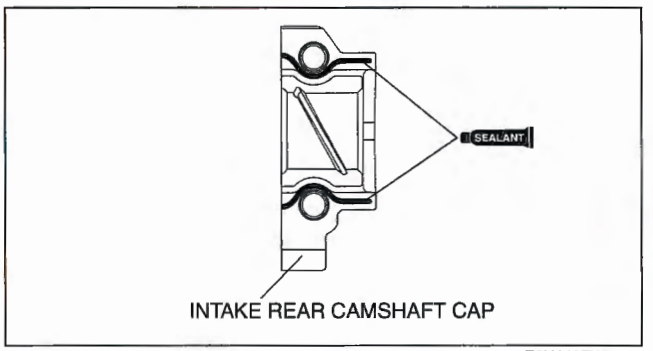
23. Remove the camshafts for the intake and exhaust sides.
24. Remove the tappet.
25. Install an appropriate tappet based on the results of the valve clearance inspection.
Selected tappet = Removed tappet thickness + Measured valve clearance - Standard valve clearance

Standard valve clearance [Engine cold]
IN: 0.22—0.28 mm {0.0087—0.0110 in}
EX: 0.27—0.33 mm {0.0107—0.0129 in}

26. Install the camshaft with No.1 cylinder cam aligned at TDC of the compression stroke.

27. Carefully apply adhesive agent to the area indicated in the figure so that it does not leak into the sliding part.

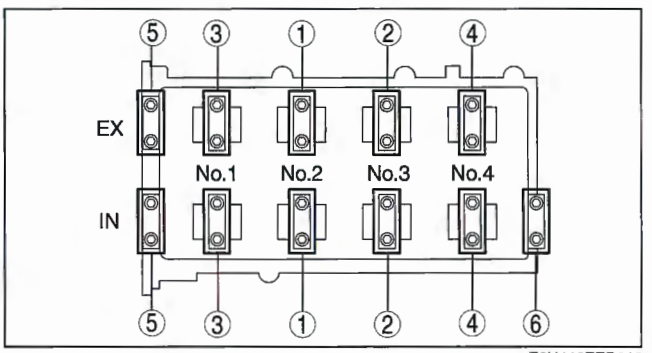
Thickness
1.0 mm {0.039 in}



E6U110ZWB063

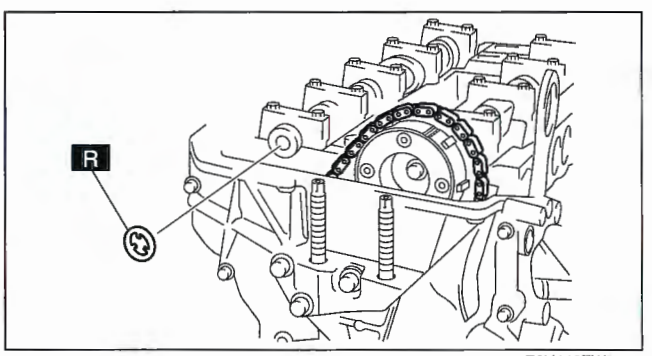
28. Install the camshaft caps and temporarily tighten the camshaft cap bolts evenly in two or three passes, and then tighten the camshaft cap bolts in two passes, using the following two steps and in the order shown in the figure.

Tightening procedure
(1) 5.0—9.0 N·m {51.0—91.7 kgf·cm, 44.3—79.6 in·lbf}
(2) 14.0—17.0 N·m {1.5—1.7 kgf·m, 10.4—12.5 ft·lbf



E6U110ZEB012

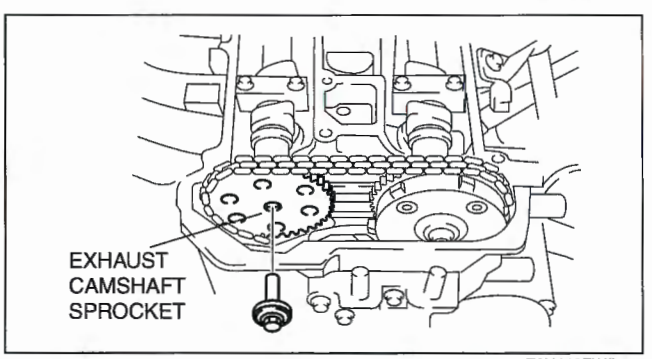
29. Install a new washer.



E6U110ZWB020

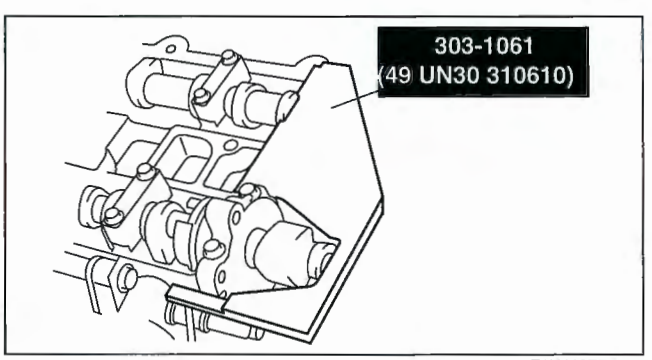
30. Install the exhaust camshaft sprocket.

Caution
- **Do not tighten the camshaft sprocket installation bolt at this stage. Verify the valve timing before performing the bolt tightening.**



E6U110ZWB008

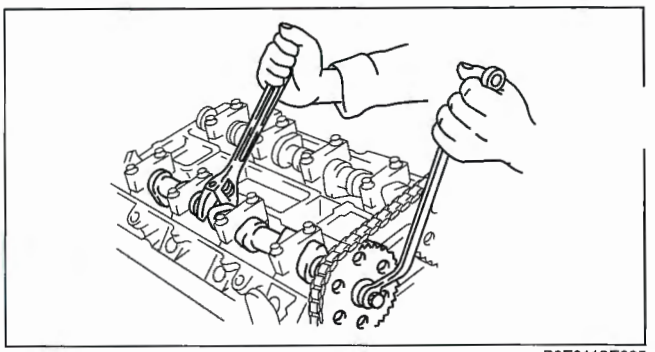
31. Install the **SST** on the camshaft as shown in the figure.
32. Remove the installation bolt for the engine front cover upper blind plug (**M6 X 1.0 length 25—35mm {0.99—1.37 in}**), and apply tension to the timing chain.
33. Rotate the crankshaft clockwise and verify that the No.1 cylinder is at TDC of the compression stroke. (The position crank weight contacts the **SST**.)



E6U110ZEB036

34. Fix the exhaust camshaft using a wrench on the cast hexagon, and tighten the sprocket installation bolt.

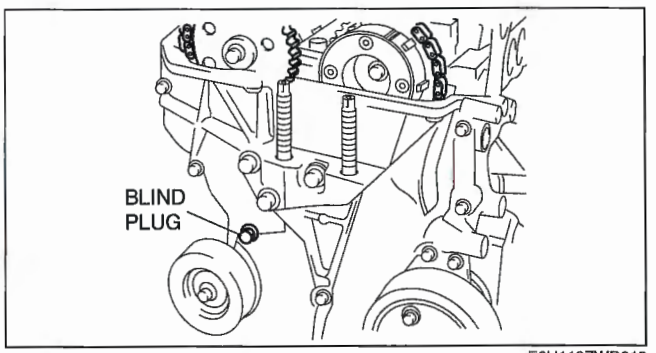
    Tightening torque
    69—75 N·m {7.1—7.6 kgf·m, 50.9—55.3 ft·lbf}



B3E0110E095

35. Remove the **SST** from the camshaft.
36. Remove the **SST** installed in the cylinder block lower blind plug hole.
37. Rotate the crankshaft clockwise two turns and inspect the valve timing.
    - If it is not aligned, repeat the procedure.
38. Apply the silicone sealant and install the engine front cover upper blind plug.

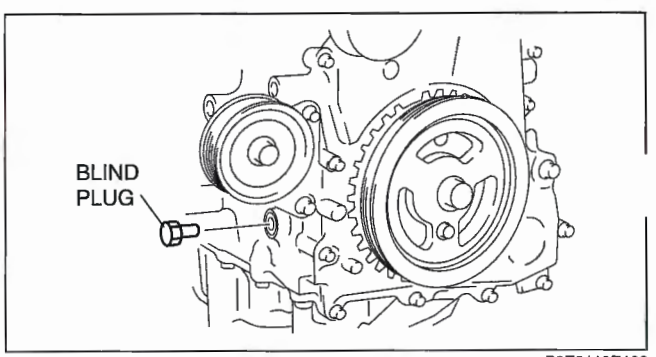
    Tightening torque
    8.0—11.5 N·m {81.6—117.2 kgf·cm, 70.9—101.7 in·lbf}



E6U110ZWB018

39. Install the cylinder block lower blind plug.

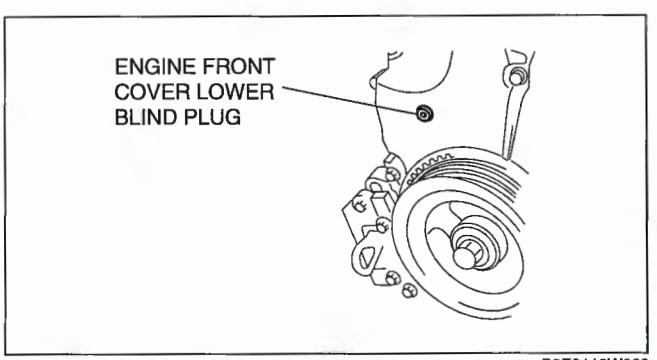
    Tightening torque
    18—22 N·m {1.9—2.2 kgf·m, 13.3—16.2 ft·lbf}



B3E0110E102

40. Install a new engine front cover lower blind plug.

    Tightening torque
    10.0—14.0 N·m {102.0—142.7 kgf·cm, 73.8—103.2 in·lbf}



B3E0110W063

41. Connect the front drive shaft (RH) with the joint shaft. (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC].)
42. Install the drive belt. (See 01–10B–3 DRIVE BELT REPLACEMENT [L3 WITH TC].)
43. Install the cylinder head cover. (See 01–10B–20 Cylinder Head Cover Installation Note.)
44. Install the ventilation hose.
45. Connect the P/S oil pump connector.
46. Connect the CMP sensor connector.
47. Connect the OCV connector.
48. Install the ignition coils. (See 01–18B–2 IGNITION COIL REMOVAL/INSTALLATION [L3 WITH TC].)
49. Install the high pressure fuel pump. (See 01–14B–18 HIGH PRESSURE FUEL PUMP REMOVAL/INSTALLATION [L3 WITH TC].)
50. Install the charge air cooler. (See01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC
51. Install the splash shield (RH).
52. Install the under cover.
53. Install the front tire (RH).
54. Connect the negative battery cable.
55. Bleed the air from the cooling system. (See01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)

COMPRESSION INSPECTION [L3 WITH TC]

E6U011002000W15

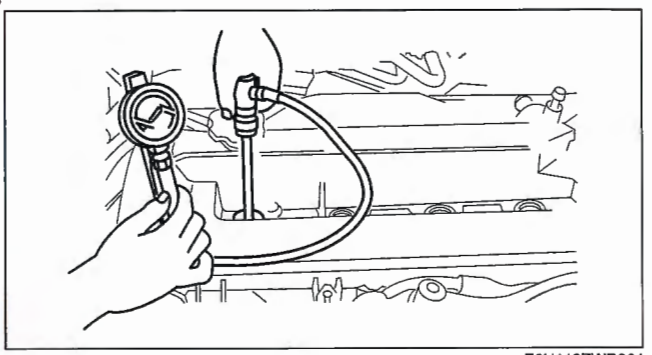
Warning
- **Hot engines can cause severe burns. Be careful not to burn yourself during removal/installation of each component.**
- **Fuel vapor is hazardous. It can very easily ignite, causing death, serious injury, or damage. Always keep sparks and flames away from fuel.**

1. Verify that the battery is completely charged. (See 01–17B–2 BATTERY INSPECTION [L3 WITH TC].)
2. Warm up the engine.

Warning
- **Fuel line spills and leakage from the pressurized fuel system are dangerous. Fuel can easily ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always perform the Fuel Line Safety Procedure. (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)**

3. Remove the charge air cooler.
4. Remove the ignition coils. (See 01–18B–2 IGNITION COIL REMOVAL/INSTALLATION [L3 WITH TC].)
5. Remove all the spark plugs. (See 01–18B–3 SPARK PLUG REMOVAL/INSTALLATION [L3 WITH TC])
6. Remove the fuel pump relay. (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)
7. Disconnect the injector driver module connectors. (See 01–40B–21 INJECTOR DRIVER MODULE REMOVAL/INSTALLATION [L3 WITH TC].)
8. Measure the compression pressure using the following procedure.
   (1) Press the compression gauge into the spark plug hole.
   (2) Fully open the throttle valve.
   (3) Crank the engine and measure the compression pressure.

   Compression
   Standard:1,280 kPa {13.1 kgf/cm^2, 185.65 psi} [250rpm]
   Minimum:896 kPa {9.14 kgf/cm^2, 129.96 psi} [250rpm]
   Maximum difference between cylinders:196.1 kPa {2.0 kgf/cm^2, 28.5 psi}



E6U110ZWB064

   (4) Perform Steps (1) to (3) for all cylinders.
   (5) If it is less than the minimum specification, or there is a cylinder with a compression value that differs from that of other cylinders by **196.1 kPa or more {2.0 kgf/cm^2, 28.5 psi}**, add a small quantity of engine oil through the spark plug hole and perform Steps (1) to (3).
      - If the pressure increases by adding the engine oil, the piston ring or the the cylinder surface is worn, or they are damaged. Perform overhaul servicing.
      - If the pressure does not increase, valve seizure, valve attachment failure, or pressure leakage from the cylinder head gasket might be occurring. Perform overhaul servicing.
9. connect the injector driver module connectors. (See 01–40B–21 INJECTOR DRIVER MODULE REMOVAL/INSTALLATION [L3 WITH TC].)
10. Install the fuel pump relay. (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)
11. Install the spark plugs. (See 01–18B–3 SPARK PLUG REMOVAL/INSTALLATION [L3 WITH TC])
12. Install the ignition coils. (See 01–18B–2 IGNITION COIL REMOVAL/INSTALLATION [L3 WITH TC].)
13. Install the charge air cooler.

TIMING CHAIN REMOVAL/INSTALLATION [L3 WITH TC]

E6U011012201W03

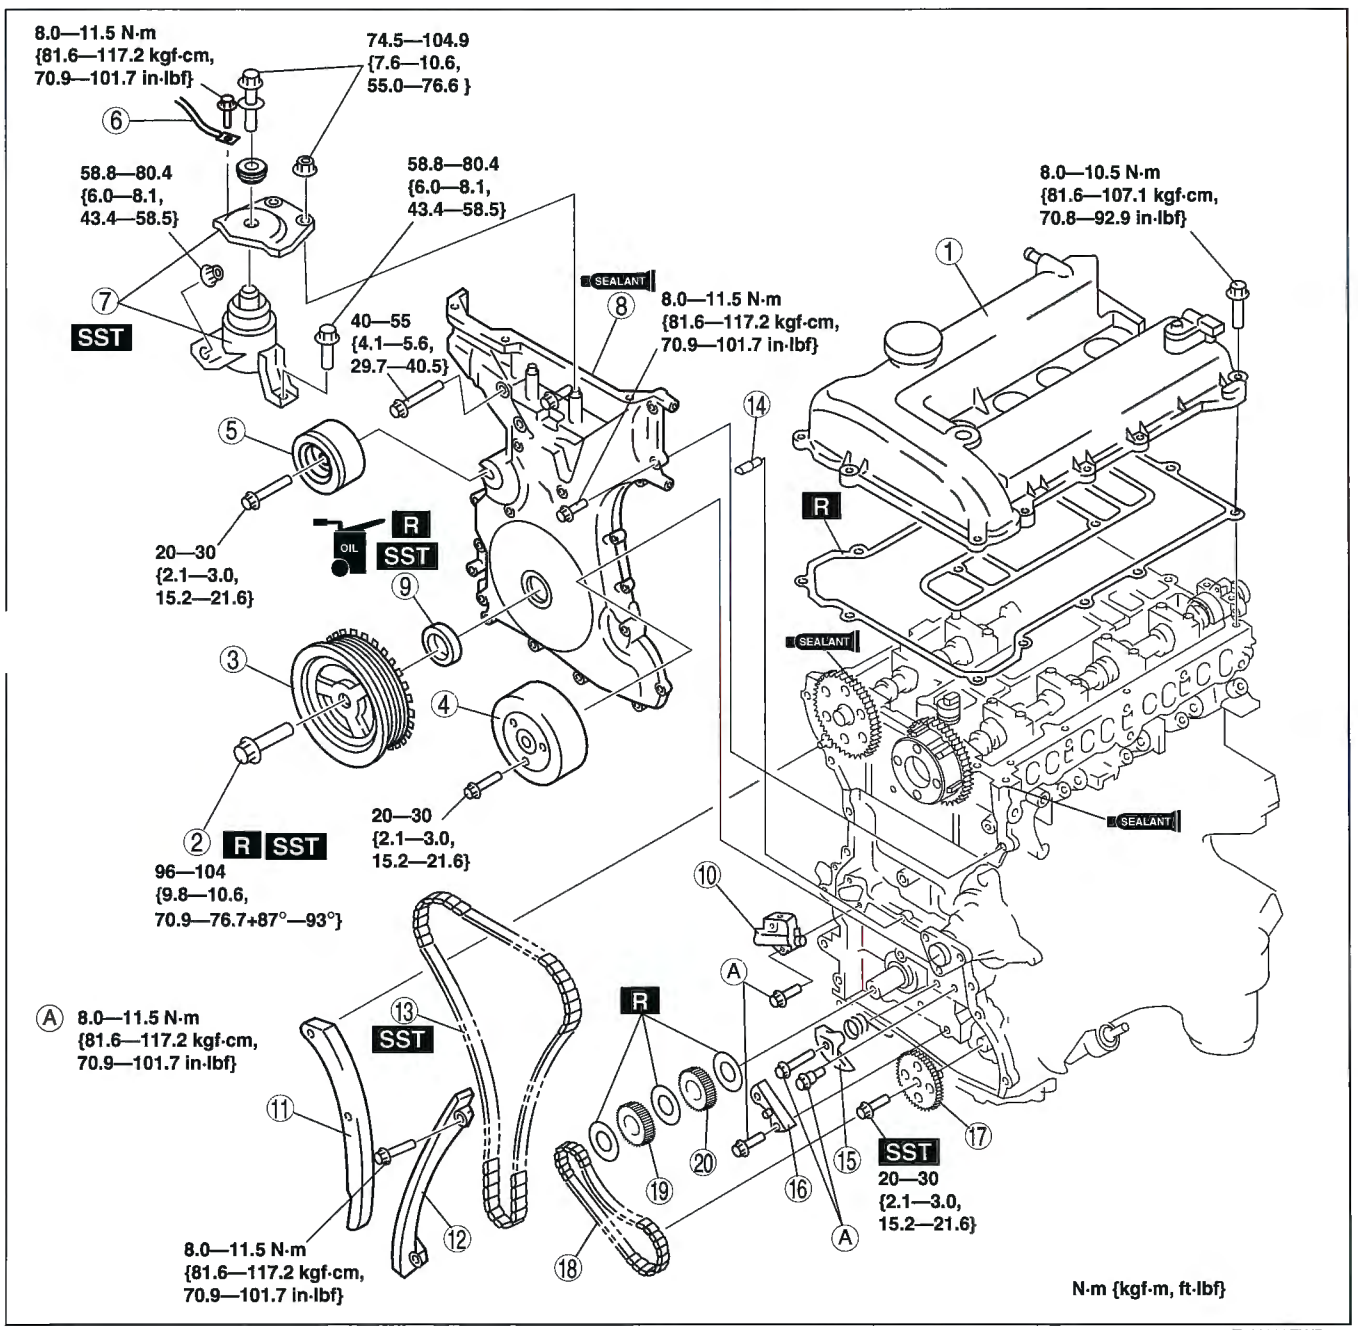
1. Disconnect the negative battery cable.
2. Remove the under cover.
3. Remove the front tire (RH).
4. Remove the splash shield (RH).
5. Remove the charge air cooler. (See01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
6. Remove the high pressure fuel pump. (See 01–14B–18 HIGH PRESSURE FUEL PUMP REMOVAL/INSTALLATION [L3 WITH TC].)
7. Remove the ignition coils. (See 01–18B–2 IGNITION COIL REMOVAL/INSTALLATION [L3 WITH TC].)
8. Disconnect the OCV connector.
9. Disconnect the CMP sensor connector.
10. Disconnect the P/S oil pump connector.
11. Remove the ventilation hose.
12. Remove the cylinder head cover. (See 01–10B–12 Cylinder Head Cover Removal Note.)
13. Loosen the water pump pulley installation bolt and remove the drive belt. (See 01–10B–3 DRIVE BELT REPLACEMENT [L3 WITH TC].)
14. Remove the CKP sensor. (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].)
15. Remove the P/S oil pump with the hoses and pipes still connected. (See 06–12–27 POWER STEERING OIL PUMP REMOVAL/INSTALLATION [L3, L3 WITH TC].)

Note

- Position and secure the P/S oil pump out of the way with a rope or wire.

16. Disconnect the front drive shaft (RH) from the joint shaft. (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC].)

17. Remove in the order indicated in the figure.
18. Install in the reverse order of removal.
19. Start the engine and inspect and adjust the following:
    (1) Bleed the air from the cooling system. (See01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)
    (2) Engine oil amount (See 01–11B–2 ENGINE OIL LEVEL INSPECTION [L3 WITH TC].)
    (3) Runout and contact of pulley and belt.
    (4) Ignition timing, idle speed, and idle mixture (CO and HC) verification (See 01–10B–40 ENGINE TUNE-UP [L3 WITH TC].)
20. Perform a road test and verify that there is no abnormal vibration or noise.



E6U110ZWB015

1	Cylinder head cover (See 01–10B–12 Cylinder Head Cover Removal Note.) (See 01–10B–20 Cylinder Head Cover Installation Note.)

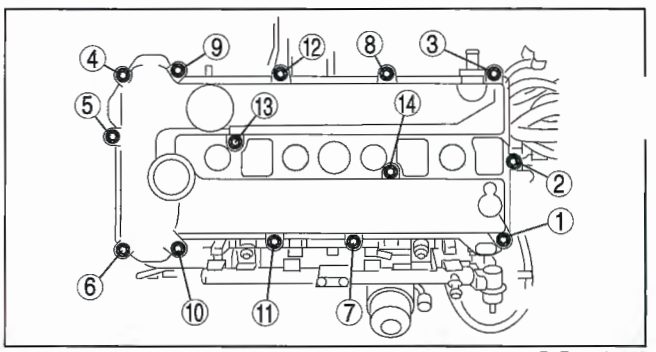
Cylinder Head Cover Removal Note

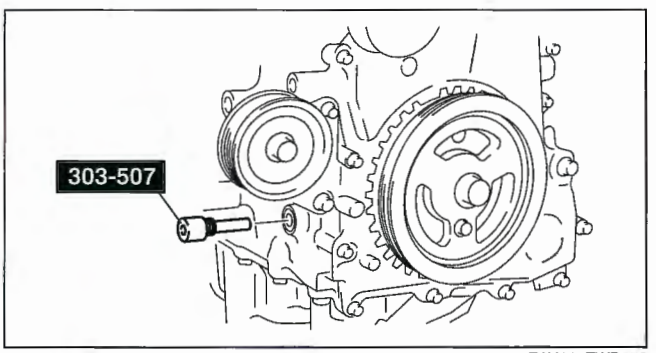
1. Loosen the cylinder head cover bolts in the order shown in the figure.



B3E0110W250

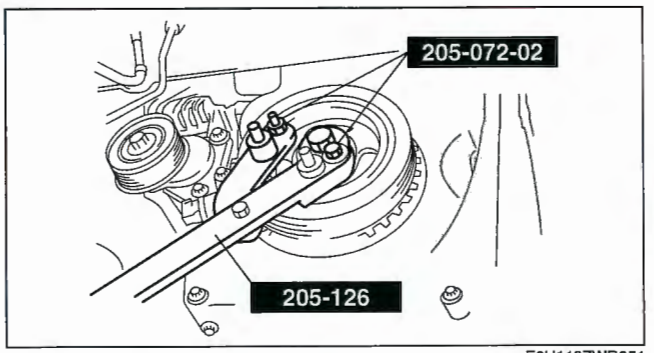
Crankshaft Pulley Lock Bolt Removal Note

1. Remove the cylinder block lower blind plug and install the **SST.**
2. Rotate the crankshaft clockwise so that the No.1 cylinder is at TDC of the compression stroke. (Position crank weight contacts **SST**.)



E6U110ZWB050

3. Install the **SST** to the crankshaft pulley and lock the crankshaft against rotation.



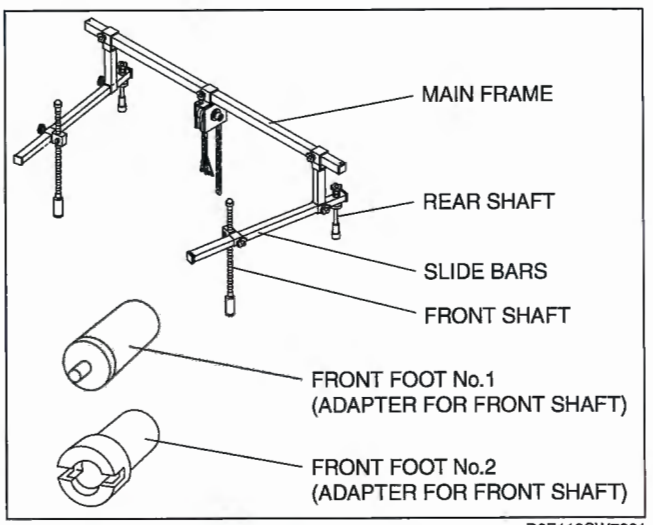
E6U110ZWB051

No.3 Engine Mount Rubber, No.3 Engine Joint Bracket Removal Note

1. Remove the air cleaner. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Install the **SST** using the following procedure.

Caution

- **Refer to the SST instruction manual for the basic handing procedure.**

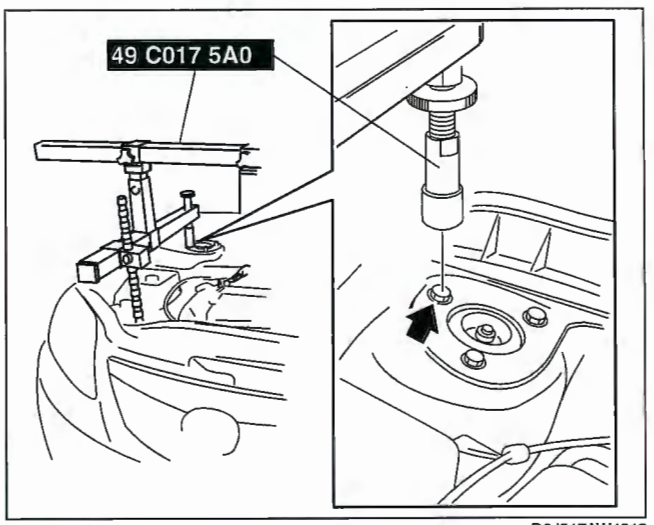


D6E110CW7001

(1) Install the right rear shaft of the **SST** to the bolt of the right shock absorber as shown in the figure.
(2) Install the left rear shaft of the **SST** to the bolt of the left shock absorber. (Identical position to the right side)

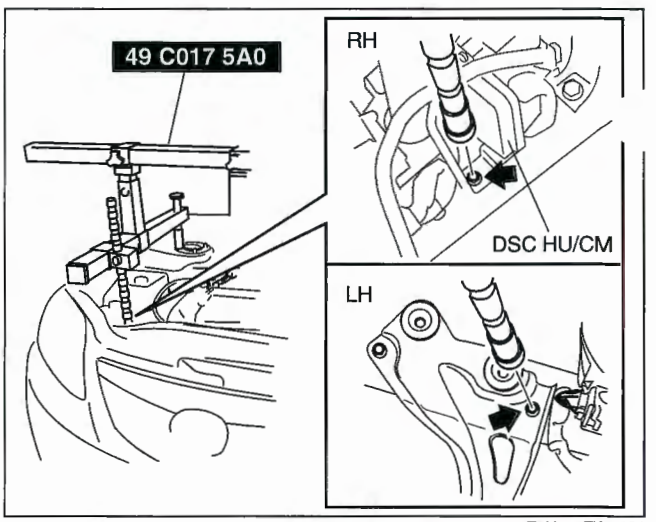
Caution

- **When setting the SST on the right side, make sure it doesn't interfere with the DSC HU/CM.**



D6J517AW4012

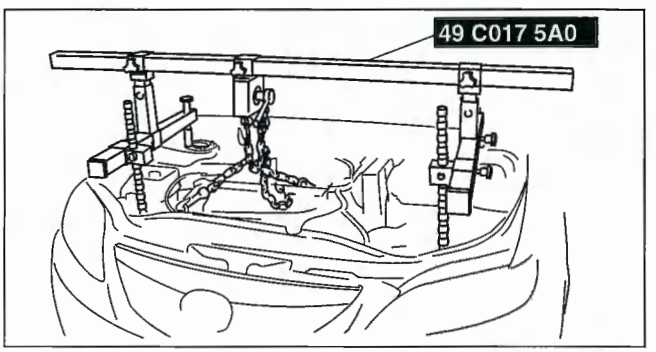
(3) Install the left/right front shaft of the **SST** with front foot No.2 to the bolt as shown in the figure.
(4) Adjust the positions of the **SST** side bars so that they are the same height (left and right) and horizontal.
(5) Make sure each joint is securely tightened.



E6U515ZW7001

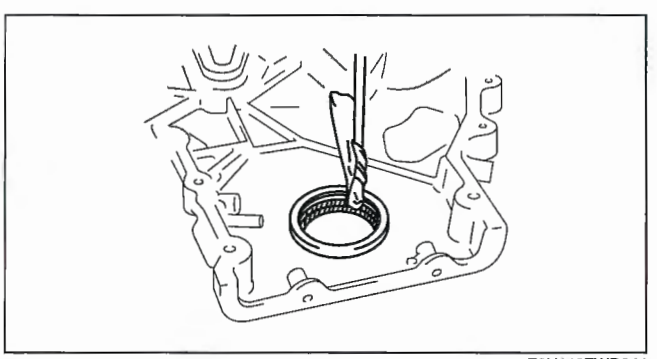
3. Support the engine using the **SST**.

Note
- The SST (49 E017 5A0) can be used in place of the SST (49 C017 5A0).



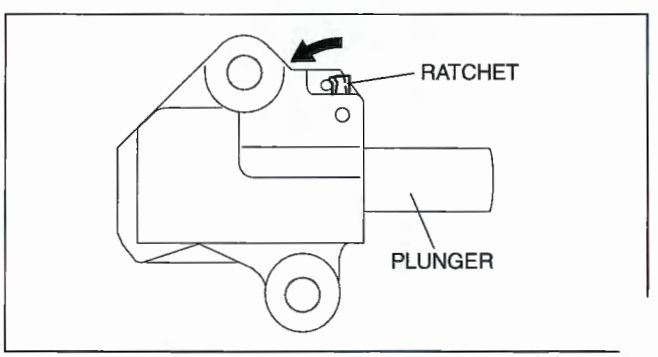
D6J517AW4014

Engine Front Cover Removal Note
1. Remove the front oil seal using a flathead screwdriver or similar tool.



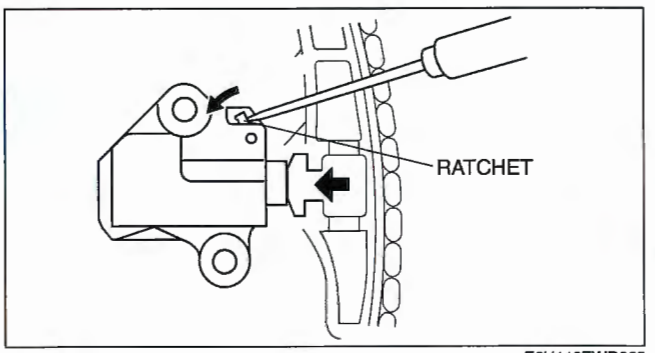
E6U110ZWB044

Chain Tensioner Removal Note
1. Press the timing chain tensioner ratchet to the left using a thin flathead screwdriver (precision screwdriver) to unlock the plunger.



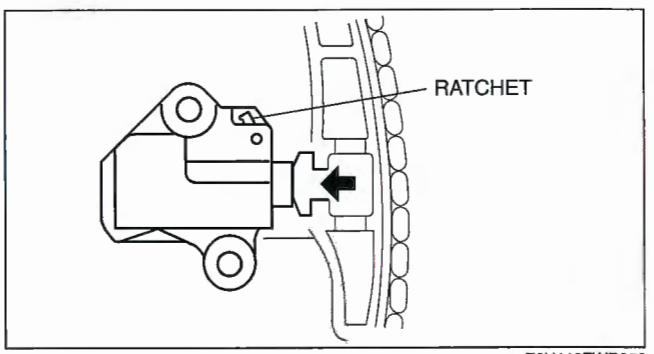
E6U110ZWB054

2. Slowly press the plunger back in the direction shown in the figure while pressing the ratchet.



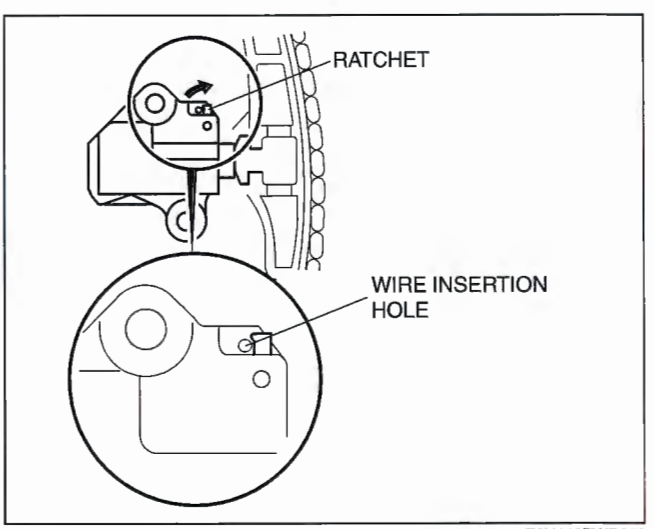
E6U110ZWB055

3. Release the ratchet with the plunger still pressed down.



E6U110ZWB056

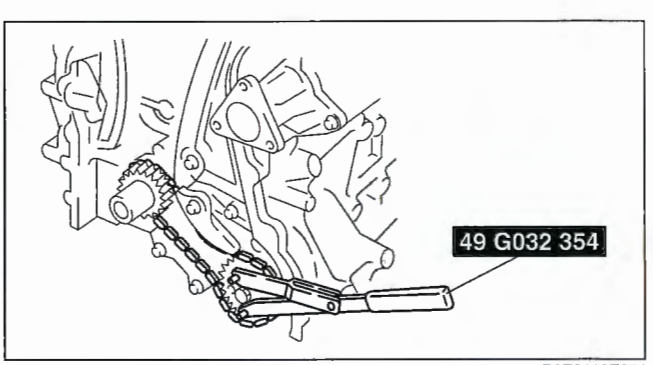
4. Press-in the plunger until the ratchet position is as indicated in the figure, and then insert the wire to lock the plunger.



E6U110ZWB053

Oil Pump Driven Sprocket Removal Note

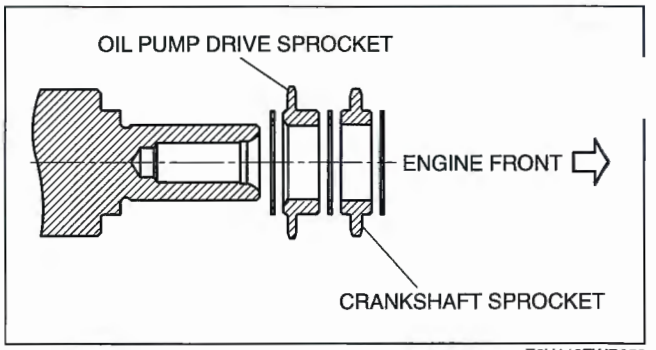
1. Install the **SSTs** to the oil pump driven sprocket, and lock it against rotation.



B3E0110E054

Oil Pump Drive Sprocket Installation Note

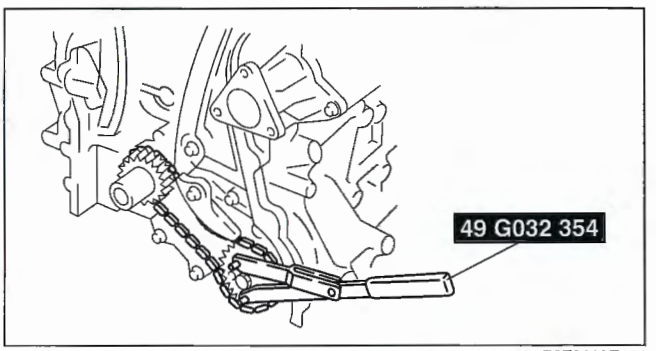
1. The oil pump drive sprocket has the assembly direction as shown in the figure.



E6U110ZWB059

Oil Pump Driven Sprocket Installation Note

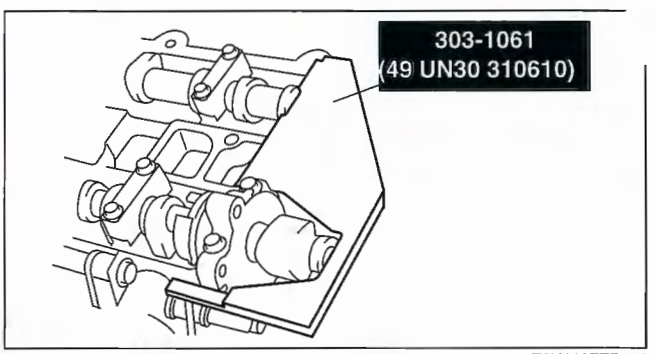
1. Install the **SST** to the oil pump driven sprocket and lock the oil pump against rotation.



B3E0110E054

Timing Chain Installation Note

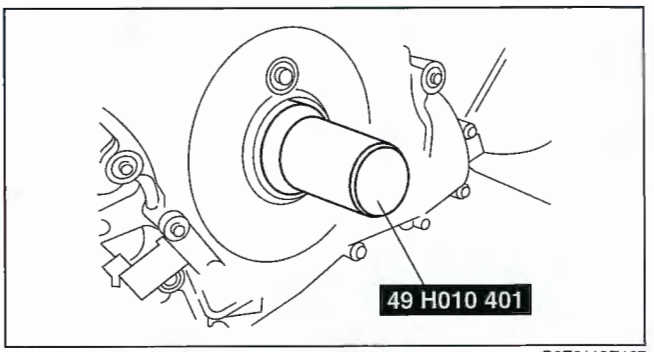
1. Install the **SST** to the camshaft as shown in the figure.
2. Install the timing chain.
3. Remove the wire or paper clip from the chain tensioner piston and apply tension to the timing chain.



E6U110ZEB036

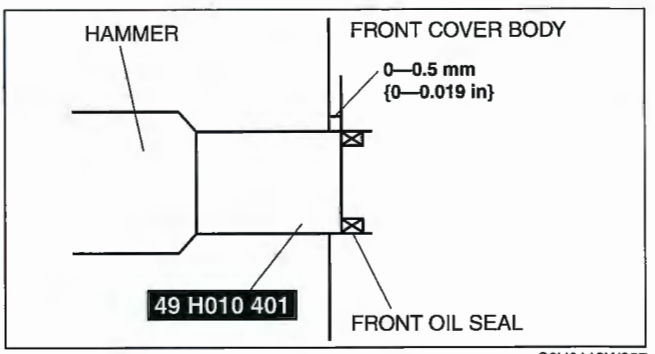
Front Oil Seal Installation Note

1. Apply clean engine oil to a new front oil seal.
2. Push the front oil seal in the engine front cover by hand. Use the SST to tap in the front oil seal.



B3E0110E127

Front oil seal press-in amount
0—0.5 mm {0—0.019 in}



C3U0110W057

Engine Front Cover Installation Note

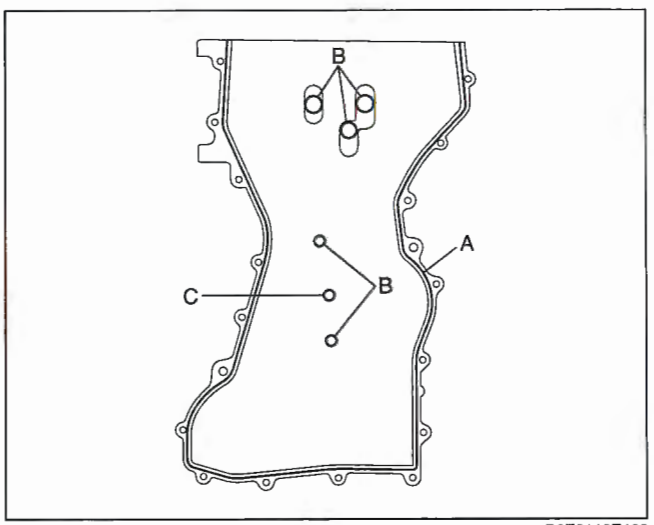
Apply silicone sealant to the engine front cover.

Caution

- **Install the engine front cover within 10 min of applying the silicone sealant.**
- **Silicone sealant is not needed in area C shown in the figure.**

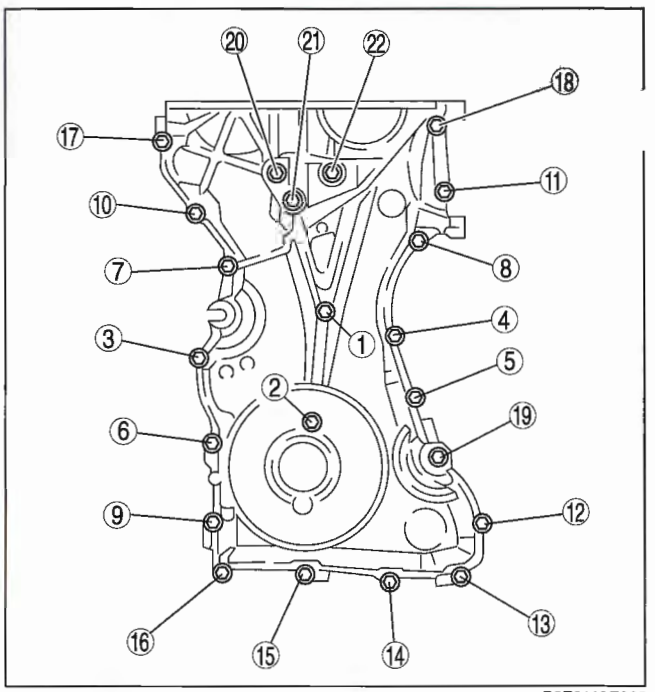
Thickness

A: 2.2—3.2 mm {0.086—0.126 in}
B: 1.5—2.5 mm {0.059—0.098 in}



B3E0110E129

2. Tighten the engine front cover installation bolts in the order shown in the figure.



B3E0110E062

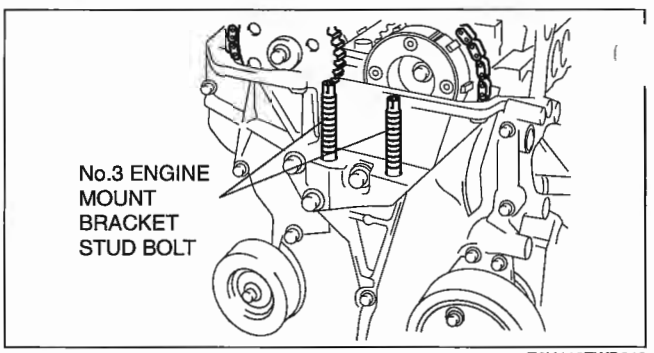
Installation Position	Tightening Torque N·m {kgf·m, ft·lbf}
1—18	8.0—11.5 N·m {81.6—117.2 kgf·cm, 70.9—101.7 in·lbf}
19—22	40—55 {4.1—5.6, 29.7—40.5}

No.3 Engine Mount Rubber, No.3 Engine Joint Bracket Installation Note

1. Tighten the No.3 engine mount bracket stud bolts.

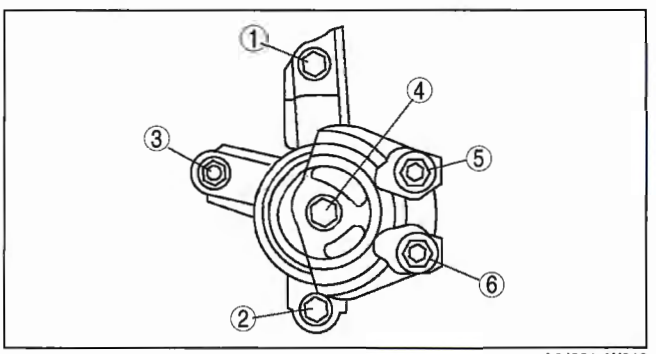
   Tightening torque
   7.0—13 N·m {71.4—132.5 kgf·cm, 62.0—115.0 in·lbf}

2. Temporarily tighten the No.3 engine mount rubber installation bolts.



E6U110ZWB019

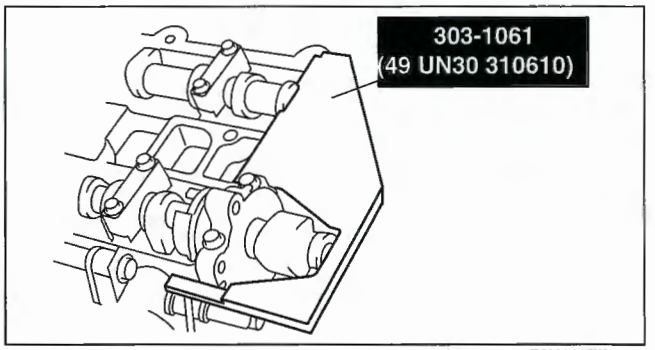
3. Install the No.3 engine joint bracket and tighten the bolts and nuts in the order shown in the figure.



A6J2215W012

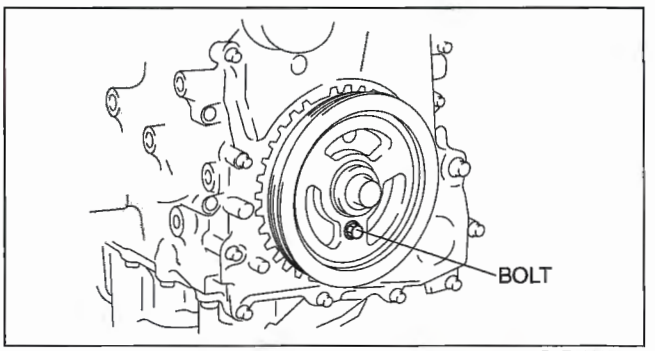
Crankshaft Pulley Lock Bolt Installation Note

1. Install the **SST** to the camshaft as shown in the figure.
   Verify that cylinder No.1 is at TDC of the compression stroke. (Position crank weight contacts **SST**.)



E6U110ZEB036

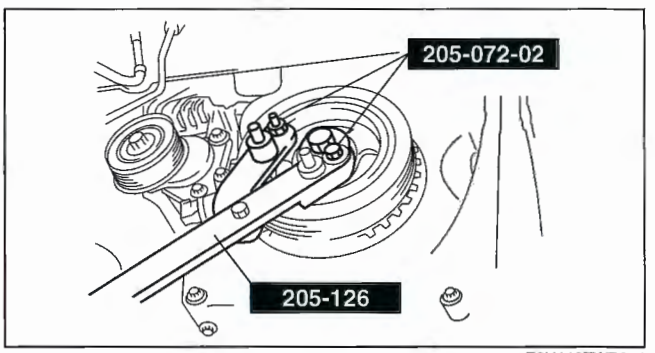
3. To position the crankshaft pulley, temporarily tighten it and, using a suitable bolt **(M6 X 1.0 length 25—35 mm {0.99—1.37 in})**, fix the crankshaft pulley to the engine front cover.



B3E0110E063

4. Install the **SSTs** to the crankshaft pulley, lock the crankshaft against rotation, and tighten the crankshaft pulley lock bolt using the following two steps.

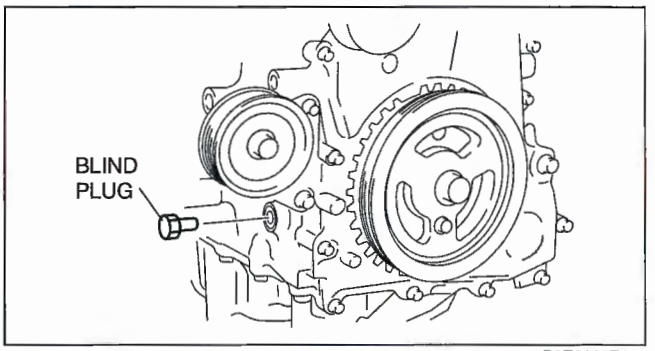
   Tightening procedure
   (1) 96—104 N·m {9.8—10.6 kgf·m, 70.9—76.7 ft·lbf}
   (2) 87°—93°



E6U110ZWB051

5. Remove the bolt **(M6 X 1.0 length 25—35 mm {0.99—1.37 in})** installed to the crankshaft pulley.
6. Remove the **SST** from the camshaft.
7. Remove the **SST** installed in the cylinder block lower blind plug hole.
8. Rotate the crankshaft clockwise two turns and inspect the valve timing.
   - If not aligned, repeat from Step 1.
9. Install the cylinder block lower blind plug.

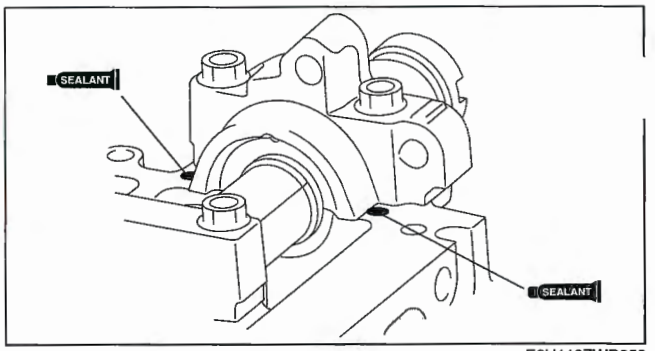
   Tightening torque
   18—22 N·m {1.9—2.2 kgf·m, 13.3—16.2 ft·lbf}



B3E0110E102

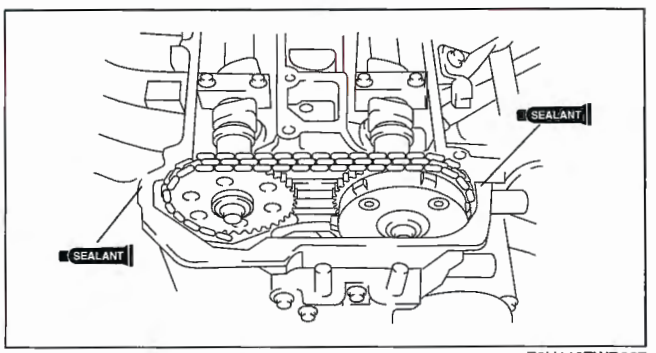
Cylinder Head Cover Installation Note

1. Apply silicone sealant to the areas shown in the figure.



E6U110ZWB058

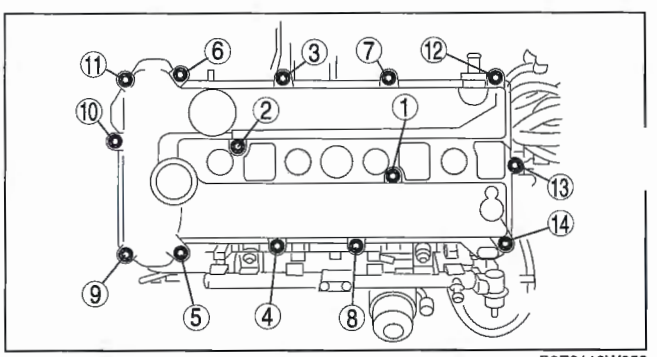
Thickness
5.0 mm {0.196 in}



E6U110ZWB007

2. Tighten the cylinder head cover bolts in the order shown in the figure.

Tightening torque
8.0—10.5 N·m {81.6—107.1 kgf·cm, 70.8—92.9 in·lbf}



B3E0110W050

CYLINDER HEAD GASKET REPLACEMENT [L3 WITH TC]

E6U011010271W03

Warning

- **Fuel vapor is hazardous. It can very easily ignite, causingdeath, serious injury, or damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage from the pressurized fuel system are dangerous. Fuel can easily ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always perform the Fuel Line Safety Procedure. (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)**

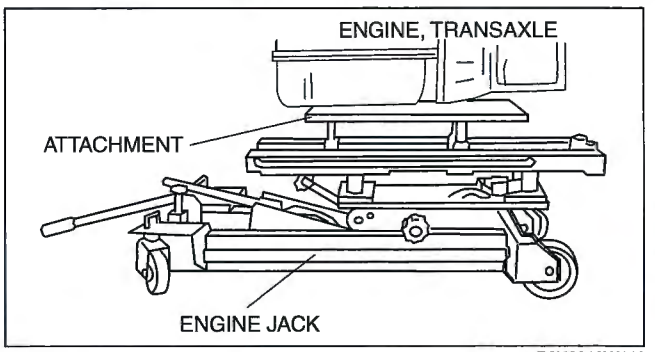
1. Remove the timing chain. (See 01–10B–10 TIMING CHAIN REMOVAL/INSTALLATION [L3 WITH TC].)
2. Remove the generator. (See 01–17B–4 GENERATOR REMOVAL/INSTALLATION [L3 WITH TC].)

Note

- Place the generator out of the way with the wiring harnesses connected.

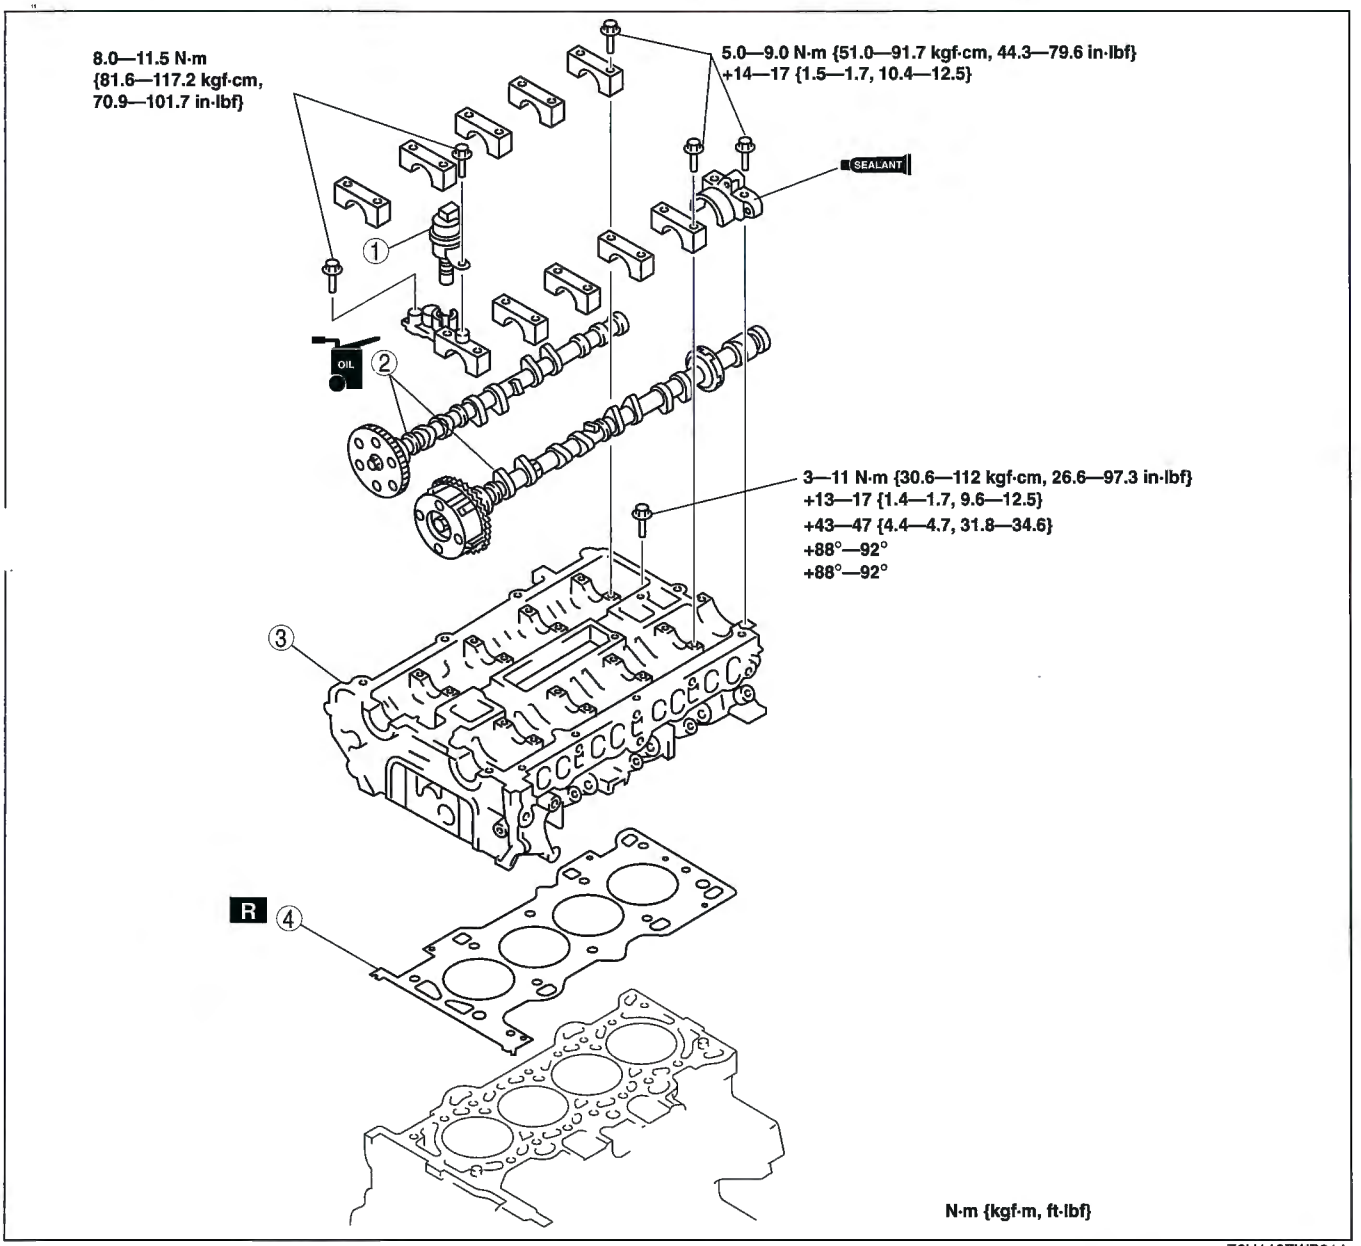
3. Remove the exhaust manifold. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
4. Remove the intake manifold. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
5. Disconnect the heater, bypass, radiator hoses.

6. To firmly support the engine, first set the engine jack and attachment to the oil pan.
7. Remove in the order indicated in the figure. Install in the reverse order of removal.
. Bleed the air from the cooling system. (See01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)



B6U2218W110

10. Inspect the compression pressure. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].)



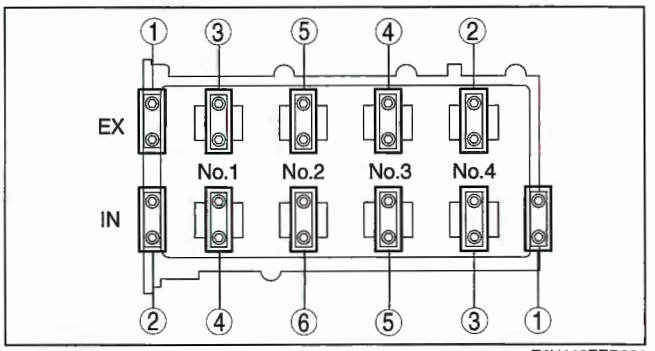
E6U110ZWB014

1	Oil Control Valve (OCV)
2	Camshaft (See 01–10B–22 Camshaft Removal Note.) (See 01–10B–23 Camshaft Installation Note.)
3	Cylinder head (See 01–10B–22 Cylinder Head Removal Note.) (See 01–10B–22 Cylinder Head Installation Note.)
4	Cylinder head gasket

Camshaft Removal Note

Note
- The camshaft caps are to be kept ordered for correct reassembly in their original positions.

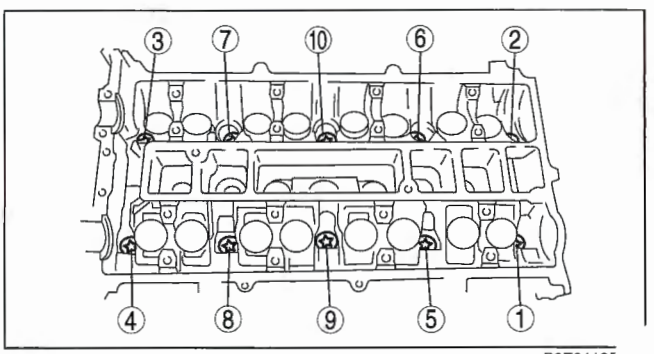
1. Loosen the camshaft cap bolts in two or three passes in the order shown, and remove them.



E6U110ZEB001

Cylinder Head Removal Note

1. Loosen the cylinder head installation bolts in two to three passes in the order shown in the figure and remove them.

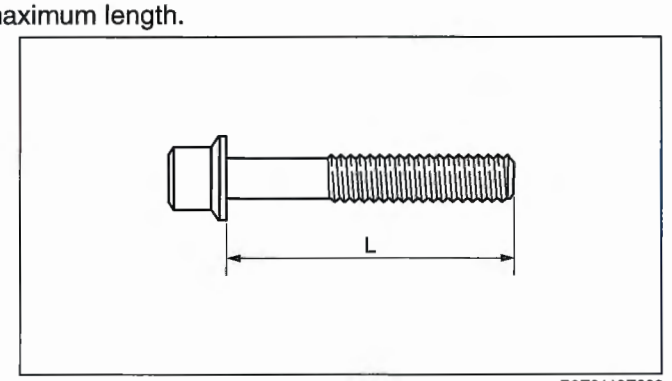


B3E0110E

Cylinder Head Installation Note

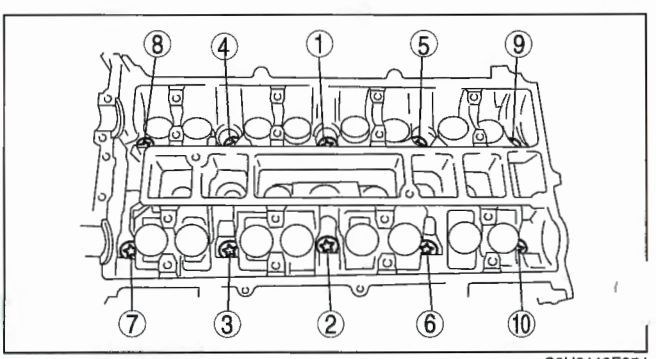
1. Measure the length of each cylinder head bolt.
   - Replace any cylinder head bolts that exceed the maximum length.

Cylinder head bolt length
Standard
144.7—145.3 mm {5.700—5.720 in}
Maximum:
146 mm {5.748 in}



B3E0110E088

Tightening procedure
(1) 3—11 N·m {30.6—112 kgf·cm, 26.6—97.3 in·lbf}
(2) 13—17 N·m {1.4—1.7 kgf·m, 9.6—12.5 ft·lbf}
(3) 43—47 N·m {4.4—4.7 kgf·m, 31.8—34.6 ft·lbf}
(4) 88°—92°
(5) 88°—92°

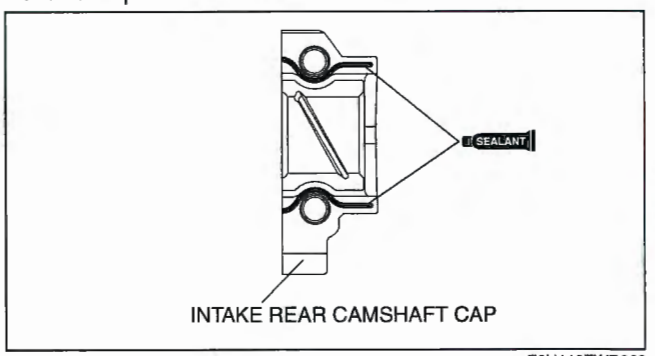


C3U0110E054

Camshaft Installation Note

1. Install the camshaft with No.3 cylinder cam aligned at TDC of compression stroke.
2. Carefully apply adhesive agent to the area indicated in the figure so that it does not leak into the sliding part.

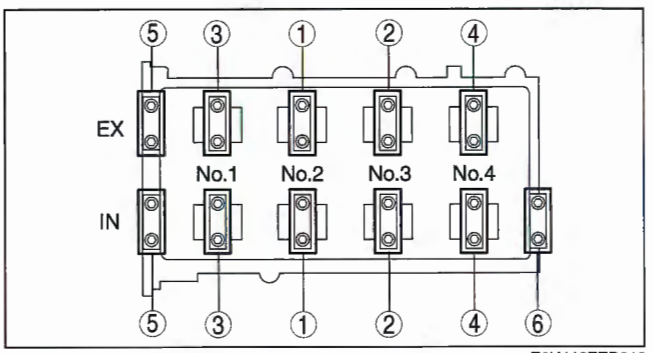
   Thickness
   1.0 mm {0.039 in}



E6U110ZWB063

3. Install the camshaft caps and temporarily tighten the camshaft cap bolts evenly in two or three passes, and then tighten the camshaft cap bolts using the following two steps, in the order shown in the figure.

   Tightening procedure
   (1) 5.0—9.0 N·m {51.0—91.7 kgf·cm, 44.3—79.6 in·lbf}
   (2) 14.0—17.0 N·m {1.5—1.7 kgf·m, 10.4—12.5 ft·lbf}



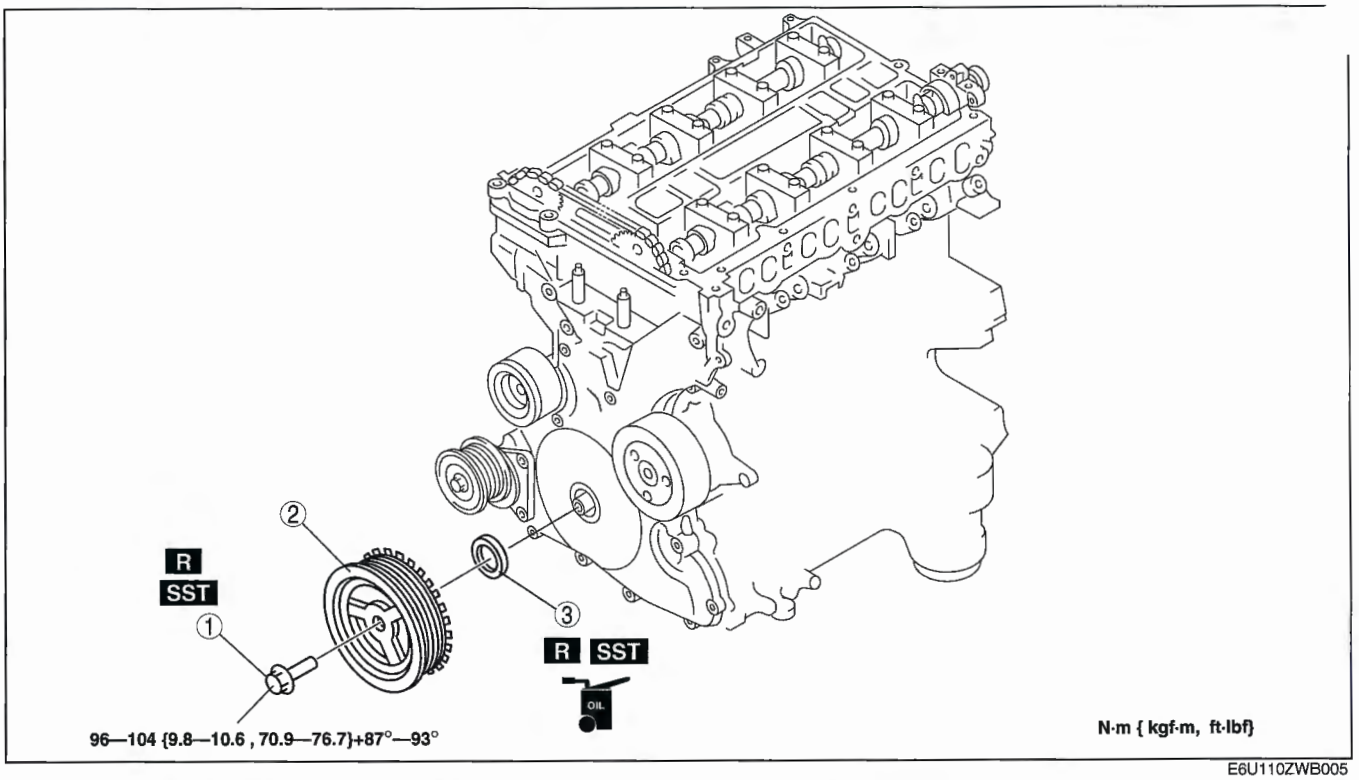
E6U110ZEB012

FRONT OIL SEAL REPLACEMENT [L3 WITH TC]

E6U011010602W03

1. Disconnect the negative battery cable.
2. Remove the front tire (RH).
   Remove the under cover.
3. Remove the splash shield (RH).
5. Remove the charge air cooler. (See01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
6. Remove the high pressure fuel pump. (See 01–14B–18 HIGH PRESSURE FUEL PUMP REMOVAL/INSTALLATION [L3 WITH TC].)
7. Remove the ignition coils. (See 01–18B–2 IGNITION COIL REMOVAL/INSTALLATION [L3 WITH TC].)
8. Disconnect the OCV connectors.
9. Disconnect the CMP sensor connector.
10. Disconnect the P/S oil pump connector.
11. Remove the ventilation hose.
12. Remove cylinder head cover. (See 01–10B–12 Cylinder Head Cover Removal Note.)
13. Remove the drive belt. (See 01–10B–3 DRIVE BELT REPLACEMENT [L3 WITH TC].)
14. Disconnect the front drive shaft (RH) from the joint shaft. (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC].)
15. Remove the CKP sensor. (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].)

16. Remove in the order indicated in the figure.
17. Install in the reverse order of removal.
18. Bleed the air from the cooling system. (See01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)

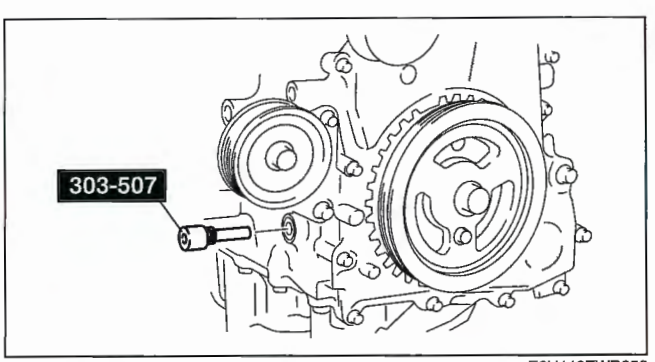


E6U110ZWB005

1	Crankshaft pulley lock bolt (See 01–10B–24 Crankshaft Pulley Lock Bolt Removal Note.) (See 01–10B–24 Crankshaft Pulley Lock Bolt Removal Note.)
2	Crankshaft pulley
3	Front oil seal (See 01–10B–25 Front Oil Seal Removal Note.) (See 01–10B–25 Front Oil Seal Installation Note.)

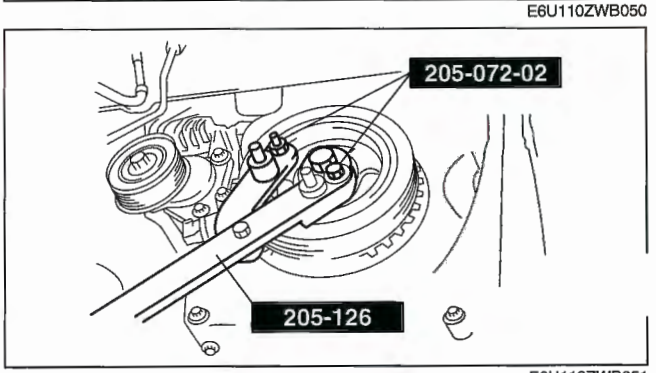
Crankshaft Pulley Lock Bolt Removal Note

1. Remove the cylinder block lower blind plug and install the **SST**.
2. Verify that cylinder No.1 is at TDC of the compression stroke. (Position crank weight contacts **SST**.)



E6U110ZWB050

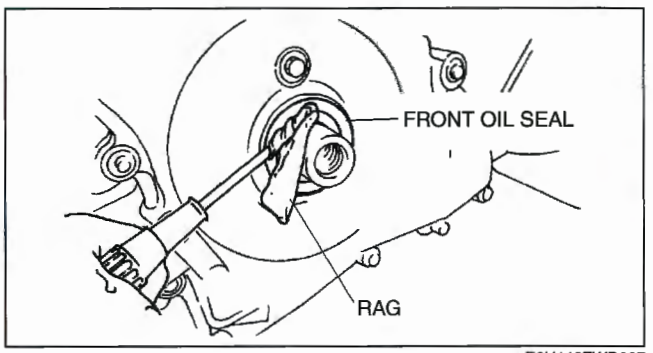
3. Install the **SSTs** to the crankshaft pulley and lock the crankshaft against rotation.



E6U110ZWB051

Front Oil Seal Removal Note

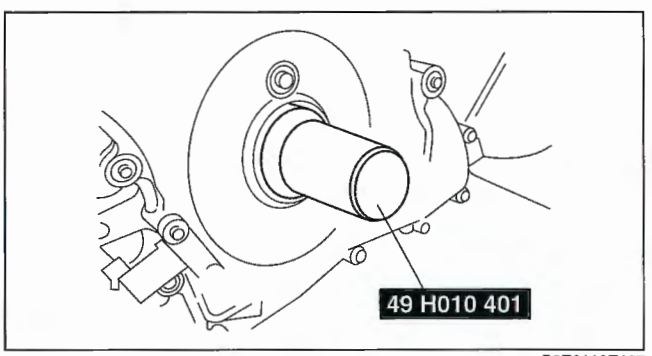
1. Remove the oil seal lip using a razor.
2. Remove the oil seal using a flathead screwdriver with the tip protected by a rag to prevent crankshaft oil seal damage.



E6U110ZWB037

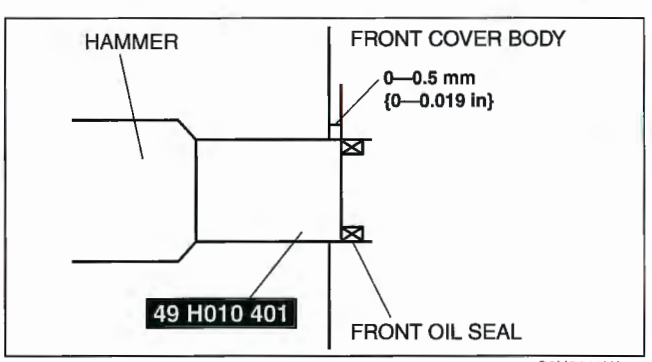
Front Oil Seal Installation Note

1. Apply clean engine oil to a new oil seal.
2. Insert the oil seal into the engine front cover.
3. Tap in the oil seal using the **SST**.



B3E0110E127

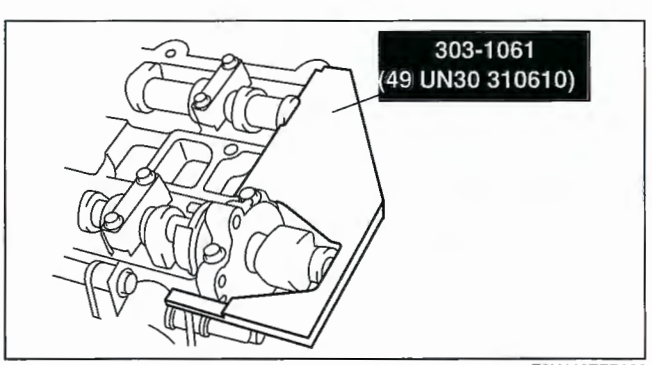
Front oil seal press-in amount
0—0.5 mm {0—0.019 in}



C3U0110W057

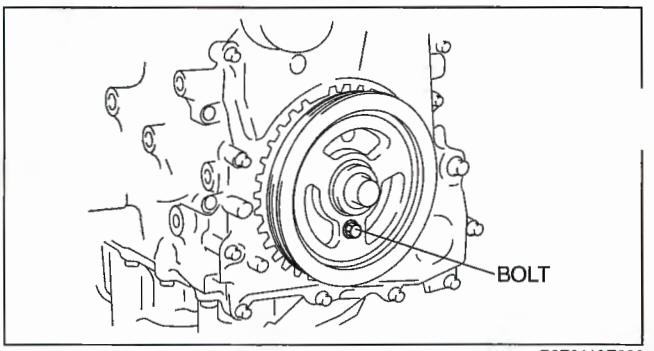
Crankshaft Pulley Lock Bolt Installation Note

1. Install the **SST** to the camshaft as shown in the figure.
2. Verify that cylinder No.1 is at TDC of the compression stroke. (Position crank weight contacts **SST**.)



E6U110ZEB036

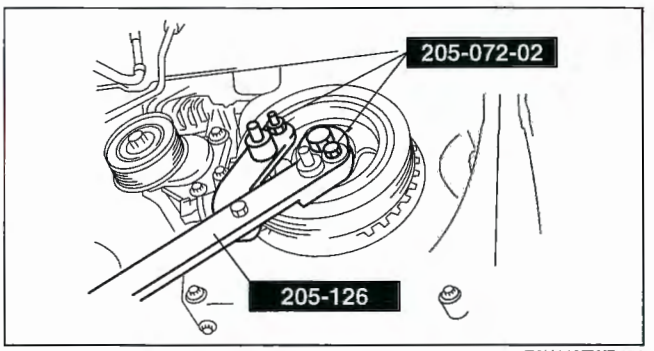
3. To position the crankshaft pulley, temporarily tighten it and, using a suitable bolt **(M6 x 1.0)** , fix the crankshaft pulley to the engine front cover.



B3E0110E063

4. Install the **SSTs** to the crankshaft pulley and lock the crankshaft against rotation, and tighten the crankshaft pulley lock bolt using the following two steps.

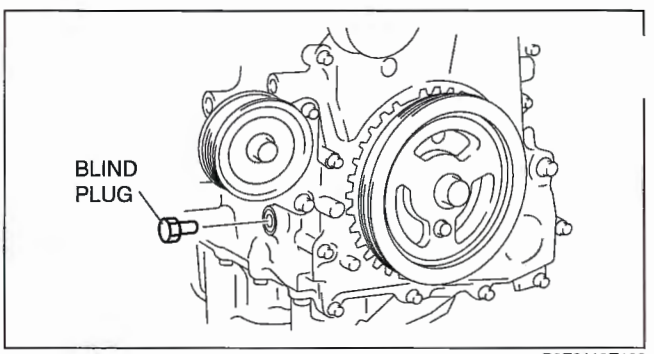
   Tightening procedure
   (1) 96—104 N·m {9.8—10.6 kgf·m, 70.9—76.7 ft·lbf}
   (2) 87°—93°



E6U110ZWB051

5. Remove the crankshaft pulley installation bolt **(M6 X 1.0)**.
6. Remove the **SST** from the camshaft.
7. Remove the **SST** installed in the cylinder block lower blind plug hole.
8. Rotate the crankshaft clockwise **two turns** and inspect the valve timing.
   - If not aligned, repeat from Step 1.
9. Install the cylinder block lower blind plug.

   Tightening torque
   18—22 N·m {1.9—2.2 kgf·m, 13.3—16.2 ft·lbf}



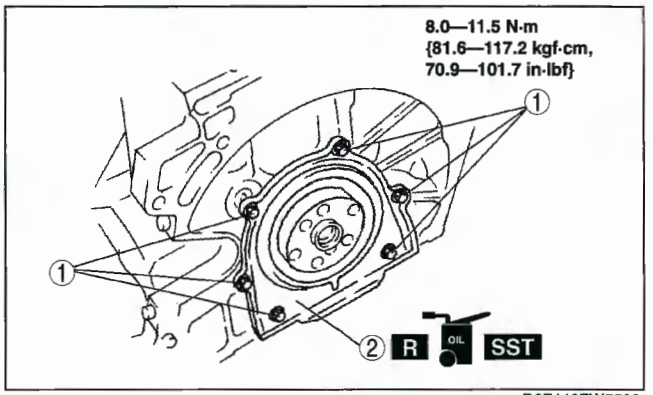
B3E0110E102

REAR OIL SEAL REPLACEMENT [L3 WITH TC]

E6U011011399W03

1. Remove the flywheel. (See 05–10–25 CLUTCH UNIT REMOVAL/INSTALLATION [A26MX-R].)
2. Remove in the order indicated in the figure.
   Install in the reverse order of removal.

1	Bolt
2	Rear oil seal (See 01–10B–27 Rear Oil Seal Installation Note.)



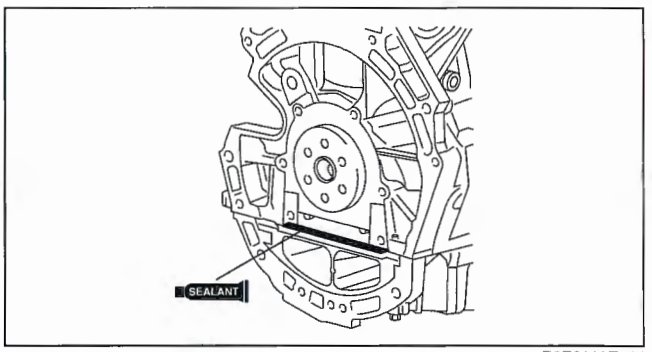
D6E110ZW5502

Rear Oil Seal Installation Note

1. Apply silicone sealant to the areas shown in the figure.

Caution
- **Install the rear oil seal within 10 min of applying the silicone sealant.**

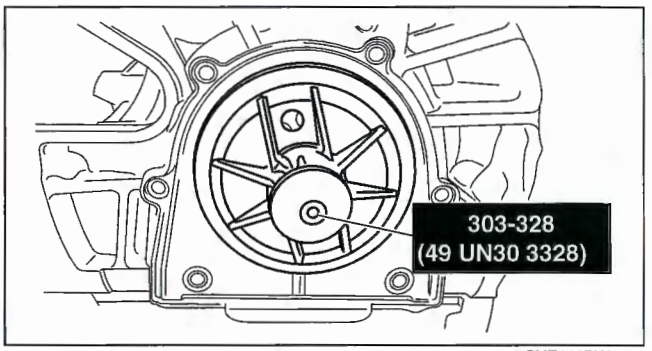
Thickness
4.0—6.0 mm {0.16—0.23 in}



B3E0110E114

2. Apply clean engine oil to a new rear oil seal.

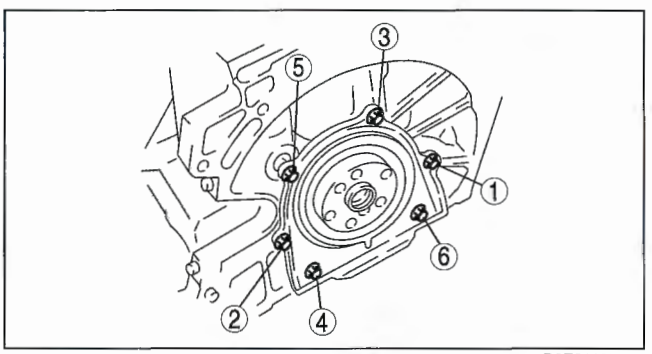
3. Install the rear oil seal using a **SST**.



CUE110BW2005

4. Tighten the rear oil seal installation bolts in the order shown in the figure.

Tightening torque
8.0—11.5 N·m {81.6—117.2 kgf·cm, 70.9—101.7 in·lbf}



B3E0110E116

ENGINE REMOVAL/INSTALLATION [L3 WITH TC]

E6U011002000W16

Warning

- **Fuel vapor is hazardous. It can very easily ignite, causing death, serious injury, or damage. Alway keep sparks and flames away from fuel.'**
- **Fuel line spills and leakage from the pressurized fuel system are dangerous. Fuel can easily ignite and cause serious injury or death and damage. Fuel can also irritate skin and eyes. To prevent this, always perform the Fuel Line Safety Procedure. (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)**

Note

- The engine and manual transaxle component shall be installed or removed from the upper side of the vehicle.

1. Remove the battery. (See 01–17B–2 BATTERY REMOVAL/INSTALLATION [L3 WITH TC].)
2. Remove the battery tray. (See 01–17B–2 BATTERY REMOVAL/INSTALLATION [L3 WITH TC].)
3. Remove the battery bracket.
4. Remove the charge air cooler. (See01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
5. Remove the shroud panel. (See 09–10–17 SHROUD PANEL REMOVAL/INSTALLATION.)
6. Remove the cooling fan component. (See 01–12B–8 COOLING FAN REMOVAL/INSTALLATION [L3 WITH TC].)
7. Remove the radiator. (See 01–12B–6 RADIATOR REMOVAL/INSTALLATION [L3 WITH TC].)
8. Drain the transaxle oil. (See05–15C–2 TRANSAXLE OIL INSPECTION [A26MX-R].)
9. Remove the P/S oil pump with the oil hoses and pipes still connected.

Note

- Position and secure the P/S oil pump out of the way with a rope.

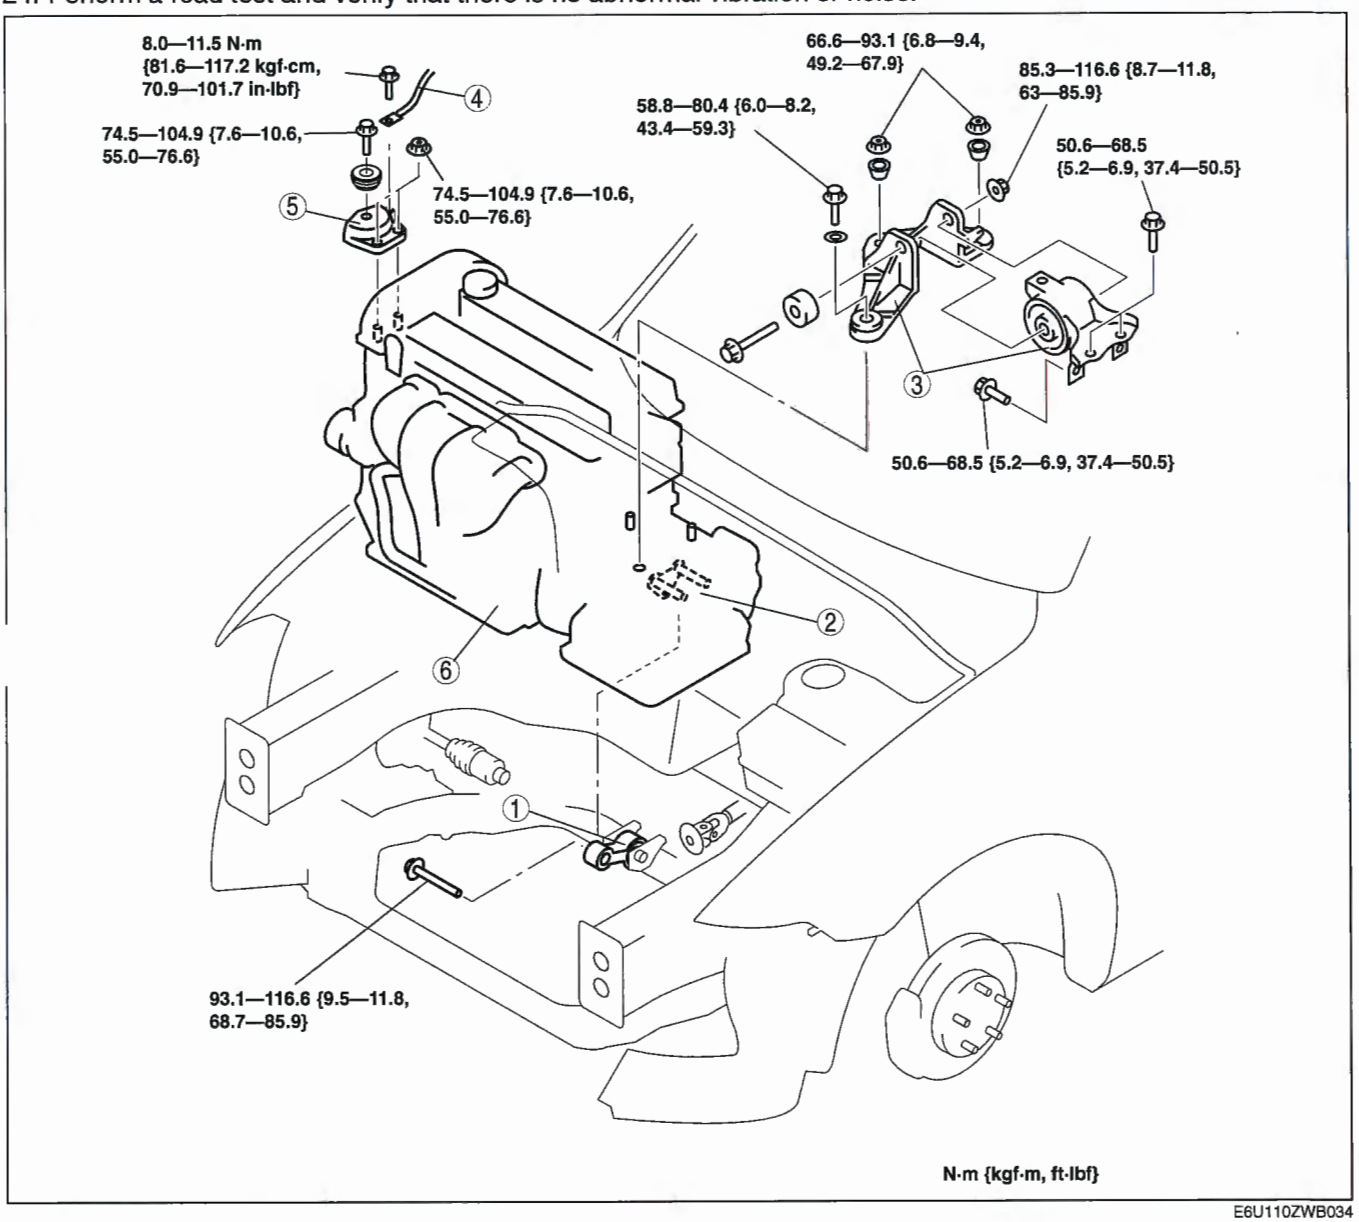
10. Remove the A/C compressor with the pipes still connected.

Note

- Position and secure the A/C compressor out of the way with rope or wire.

11. Disconnect the front drive shaft (RH) from the joint shaft side. (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC].)
12. Disconnect the front drive shaft (LH) from the transaxle side. (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC].)
13. Remove the propeller shaft. (See 03–15–4 PROPELLER SHAFT REMOVAL/INSTALLATION.)
14. Remove the air cleaner, intake air duct, and vacuum hose.
15. Disconnect the shift cable and selector cable from the transaxle side. (See 05–15C–4 MANUAL TRANSAXLE REMOVAL/INSTALLATION [A26MX-R].)
16. Remove the clutch release cylinder with the pipes still connected. (See 05–10–16 CLUTCH RELEASE CYLINDER REMOVAL/INSTALLATION [A26MX-R].)
17. Disconnect the vacuum hose and the heater hose.
18. Disconnect the wiring harnesses.
19. Remove the TWC.
20. Remove the front pipe. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)

21. Remove in the order indicated in the figure.
22. Install in the reverse order of removal.
23. Start the engine, and inspect and adjust the following:
    - Bleed the air from the cooling system. (See01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)
    - Runout and contact on pulley and belt
    - Leakage of engine oil, engine coolant, automatic transmission fluid, or fuel.
    - Ignition timing, idle speed and idle mixture (CO and HC)
    - Engine accessories operation
24. Perform a road test and verify that there is no abnormal vibration or noise.



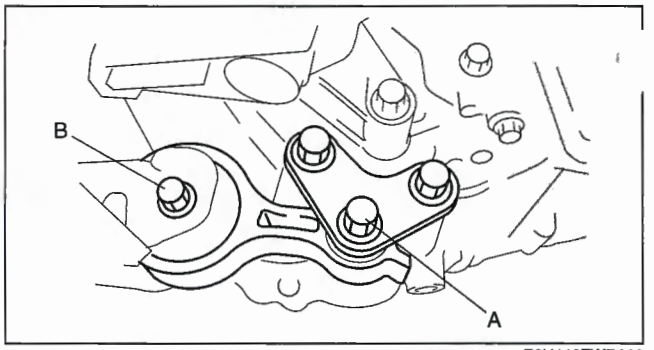
E6U110ZWB034

1	No.1 Engine mount rubber (See 01–10B–30 No.1 Engine Mount Rubber Removal Note.) (See 01–10B–35 No.1 Engine Mount Rubber Installation Note.)
2	No.1 Engine mount bracket (See 01–10B–35 No.1 Engine Mount Bracket Installation Note.)
3	No.4 Engine mount bracket, No.4 engine mount rubber (See 01–10B–34 No.4 Engine Mount Bracket, No.4 Engine Mount Rubber Installation Note.)

4	Engine ground
5	No.3 Engine joint bracket (See 01–10B–32 No.3 Engine Joint Bracket Installation Note.)
6	Engine, manual transaxle

No.1 Engine Mount Rubber Removal Note

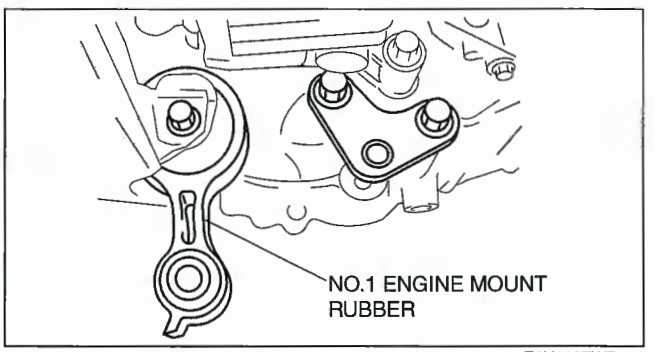
1. Remove through-bolt A on the No.1 engine mount bracket side from the underside of the vehicle.
2. Loosen through-bolt B on the crossmember side until approx. three pitches remain.



E6U110ZWB009

Note

- Do not remove the No.1 engine mount rubber from the crossmember.



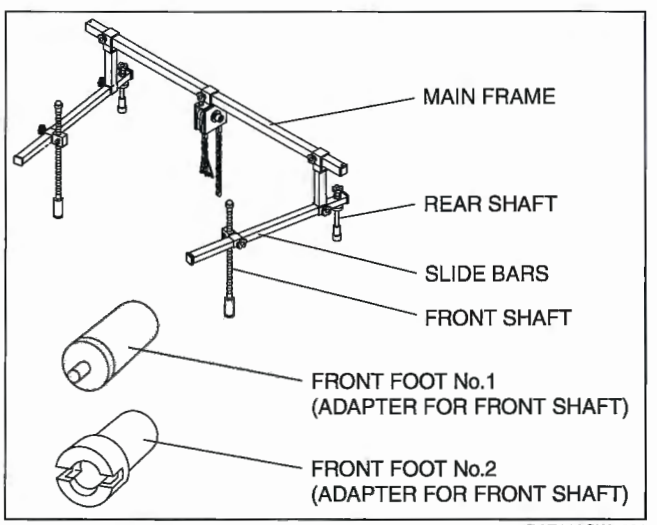
E6U110ZWB010

No.4 Engine Mount Bracket, No.4 Engine Mount Rubber Removal Note

1. Install the **SST** using the following procedure.

Caution

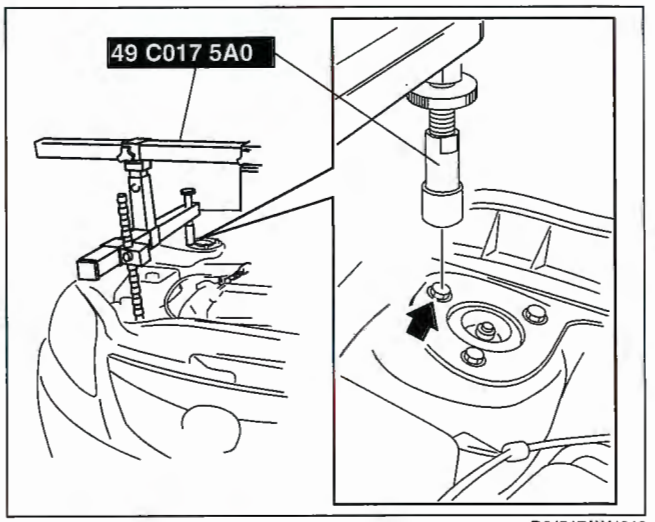
- **Refer to the SST instruction manual for the basic handing procedure.**



D6E110CW7001

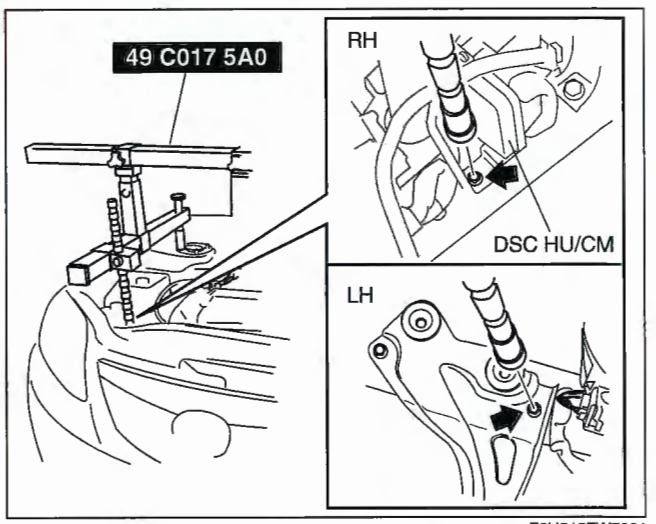
(1) Install the right rear shaft of the **SST** to the bolt of the right shock absorber as shown in the figure.
(2) Install the left rear shaft of the **SST** to the bolt of the left shock absorber. (Identical position to the right side)

Caution
- **When setting the SST on the right side, make sure it doesn't interfere with the DSC HU/CM.**



D6J517AW4012

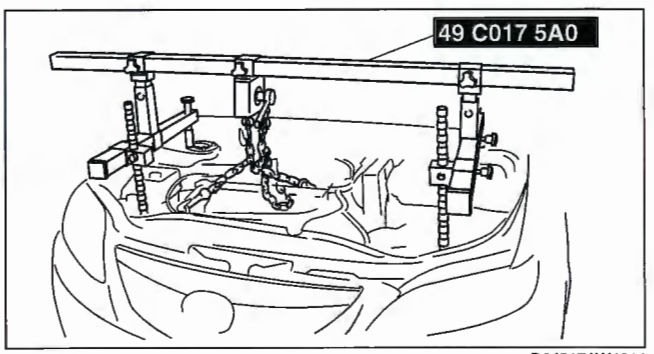
(3) Install the left/right front shaft of the **SST** with front foot No.2 to the bolt as shown in the figure.
(4) Adjust the positions of the **SST** side bars so that they are the same height (left and right) and horizontal.
(5) Make sure each joint is securely tightened.



E6U515ZW7001

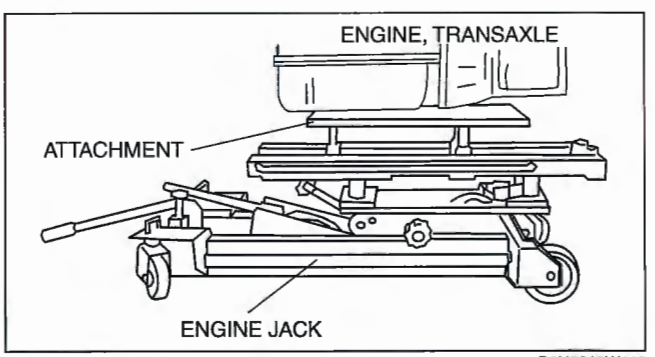
2. Support the engine using the **SST**.

Note
- The SST (49 E017 5A0) can be used in place of the SST (49 C017 5A0).



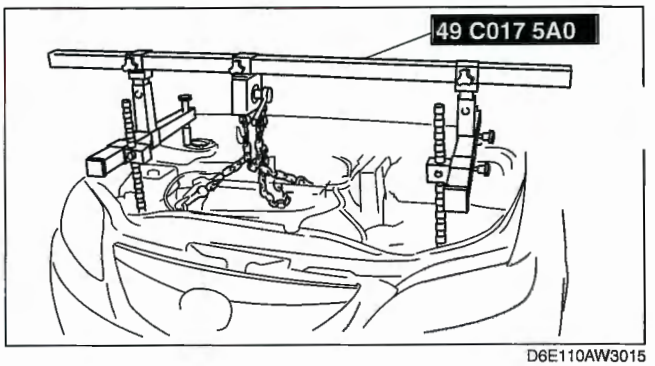
D6J517AW4014

3. Secure the engine and transaxle using an engine jack and attachment.



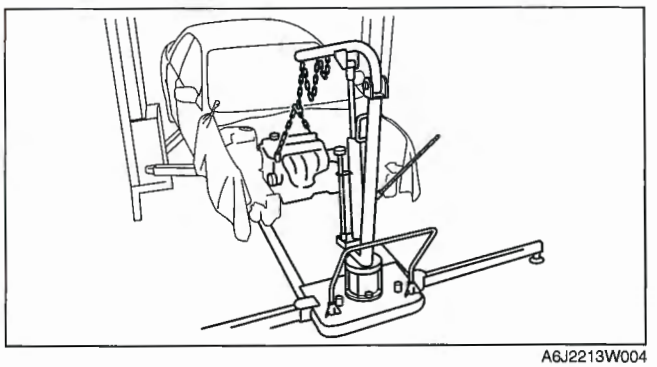
B6U2218W110

4. Remove the **SST**.



D6E110AW3015

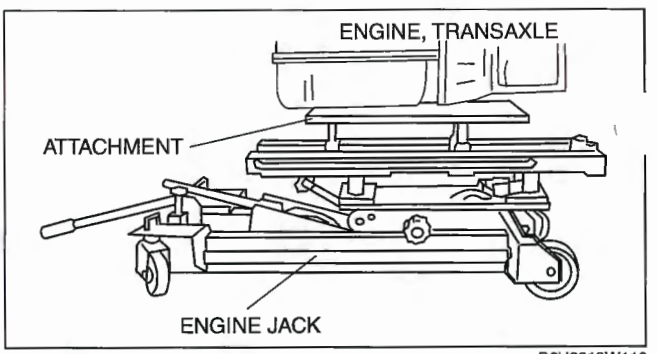
5. Secure the engine using a hoist.



A6J2213W004

No.3 Engine Joint Bracket Installation Note

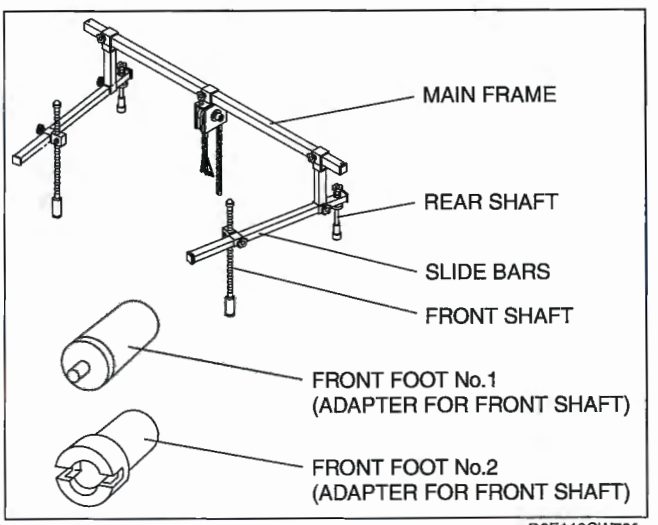
1. Secure the engine and transaxle using an engine jack and attachment.



B6U2218W110

2. Install the SST using the following procedure.

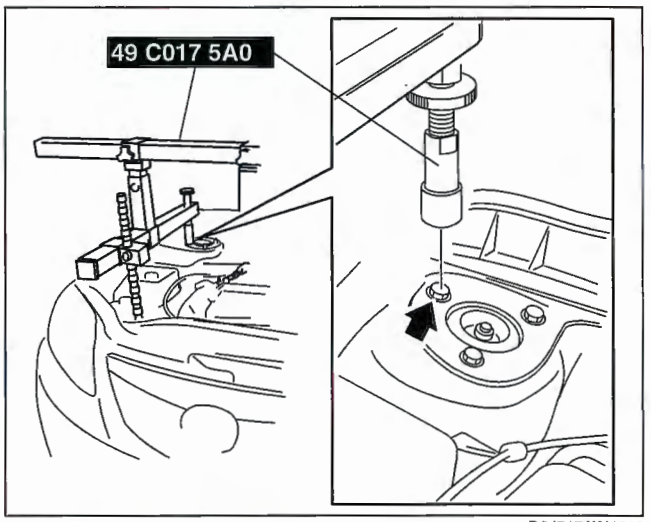
Caution
- **Refer to the SST instruction manual for the basic handing procedure.**



D6E110CW70

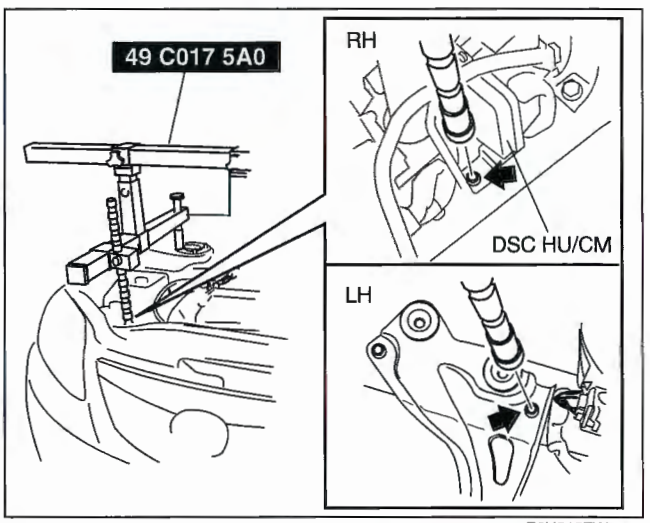
(1) Install the right rear shaft of the **SST** to the bolt of the right shock absorber as shown in the figure.
(2) Install the left rear shaft of the **SST** to the bolt of the left shock absorber. (Identical position to the right side)

Caution
- **When setting the SST on the right side, make sure it doesn't interfere with the DSC HU/CM.**



D6J517AW4012

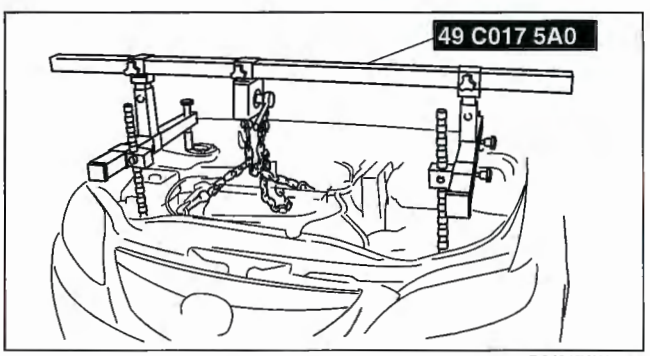
(3) Install the left/right front shaft of the **SST** with front foot No.2 to the bolt as shown in the figure.
(4) Adjust the positions of the **SST** side bars so that they are the same height (left and right) and horizontal.
(5) Make sure each joint is securely tightened.



E6U515ZW7001

3. Support the engine using the **SST**.

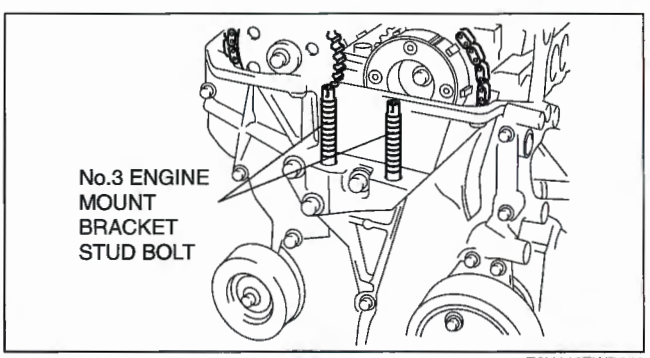
Note
- The SST (49 E017 5A0) can be used in place of the SST (49 C017 5A0).



D6J517AW4014

4. Tighten the No. 3 engine mount bracket stud bolt.

Tightening torque
7.0—13 N·m {71.4—132.5 kgf·cm, 62.0—115.0 in·lbf}

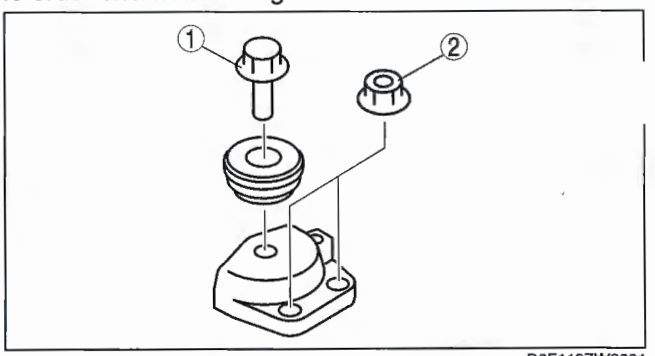


E6U110ZWB019

5. Tighten the No.3 engine joint bracket bolts and nuts in the order shown in the figure.

Tightening procedure
(1) Temporarily tighten (2).
(2) Completely tighten (1).
(3) Completely tighten (2).

Tightening torque
74.5—104.9 N·m {7.6—10.6 kgf·m, 55.0—76.6 ft·lbf}

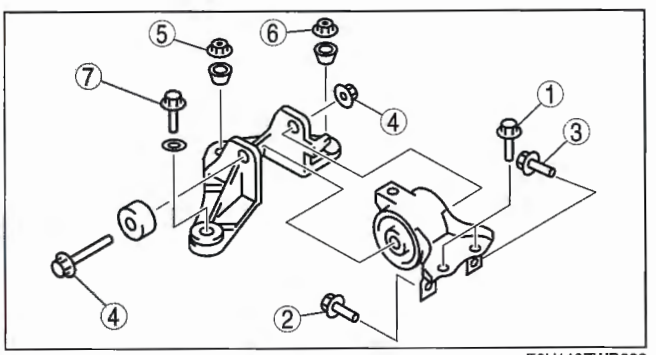


D6E110ZW2001

No.4 Engine Mount Bracket, No.4 Engine Mount Rubber Installation Note

1. Tighten the No.4 engine mount bracket and No.4 engine mount rubber bolts and nuts in the order shown in the figure.

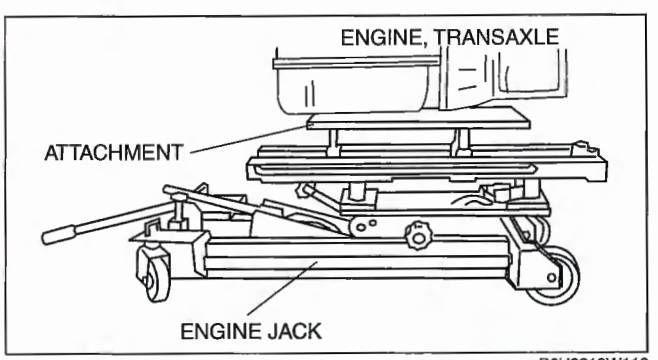
Tightening procedure
(1) Temporarily tighten (1).
(2) Align (2) in position and temporarily tighten.
(3) Completely tighten (1) from the front side.
(4) Completely tighten (2).
(5) Completely tighten (3).
(6) Temporarily tighten (4).
(7) Completely tighten in the order of (5), (6),(7).
(8) Completely tighten (4).



E6U110ZWB033

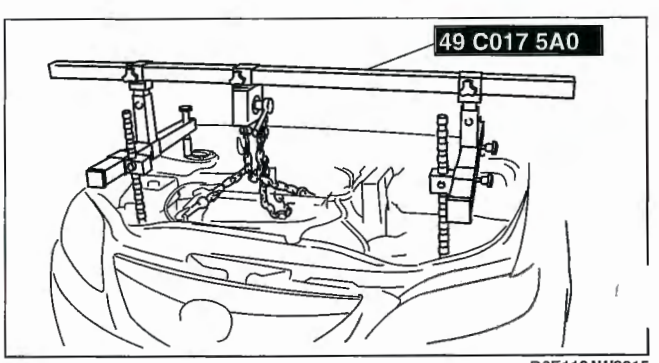
Tightening torque
(1)—(3) 50.6—68.5 N·m {5.2—6.9 kgf·m, 37.4—50.5 ft·lbf}
(4) 85.3—116.6 N·m {8.7—11.8 kgf·m, 63.0—85.9 ft·lbf}
(5)—(7) 66.6—93.1 N·m {6.80—9.49 kgf·m, 49.2—68.6 ft·lbf}

3. Secure the engine and transaxle using an engine jack and attachment.



B6U2218W110

4. Remove the hoist and secure the engine and transaxle using **SST**.
5. Remove the engine jack.



D6E110AW3015

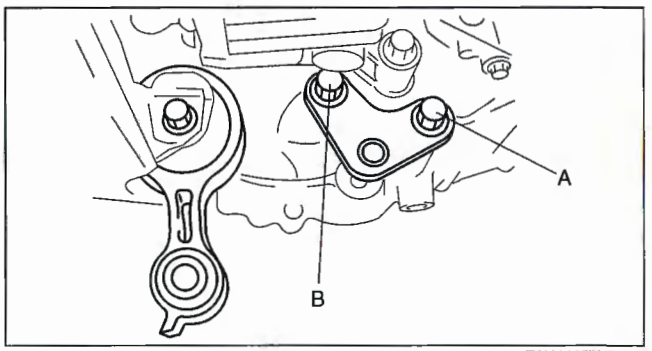
No.1 Engine Mount Bracket Installation Note

1. Tighten No.1 engine mount bracket bolt A.

   Tightening torque
   93.1—116.6 N·m {9.5—11.8 kgf·m, 68.7—85.9 ft·lbf}

2. Tighten No.1 engine mount bracket bolt B.

   Tightening torque
   93.1—116.6 N·m {9.5—11.8 kgf·m, 68.7—85.9 ft·lbf}



E6U110ZWB011

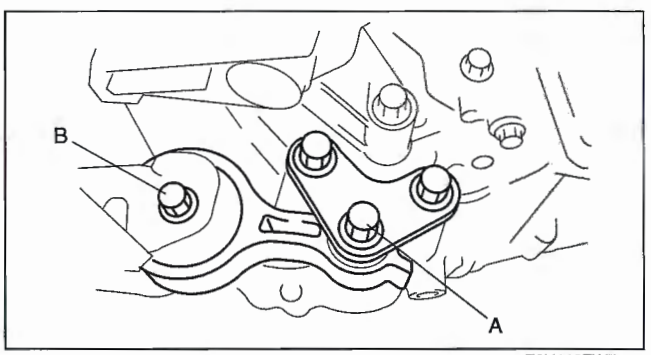
No.1 Engine Mount Rubber Installation Note

1. Remove through-bolt A on the No.1 engine mount bracket side.

   Tightening torque
   93.1—116.6 N·m {9.5—11.8 kgf·m, 68.7—85.9 ft·lbf}

2. Tighten through-bolt B on the crossmember side.

   Tightening torque
   93.1—116.6 N·m {9.5—11.8 kgf·m, 68.7—85.9 ft·lbf}



E6U110ZWB009

ENGINE DISASSEMBLY/ASSEMBLY [L3 WITH TC]

E6U011002000W17

1. Remove the engine from the transaxle. (See 05–15C–4 MANUAL TRANSAXLE REMOVAL/INSTALLATION [A26MX-R].)
2. Remove the intake-air system. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
3. Remove the exhaust system. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
4. Remove the generator. (See 01–17B–4 GENERATOR REMOVAL/INSTALLATION [L3 WITH TC].)
5. Remove the starter. (See 01–19B–2 STARTER REMOVAL/INSTALLATION [L3 WITH TC].)
6. Remove the CKP sensor. (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC].)
7. Install in the reverse order of removal.

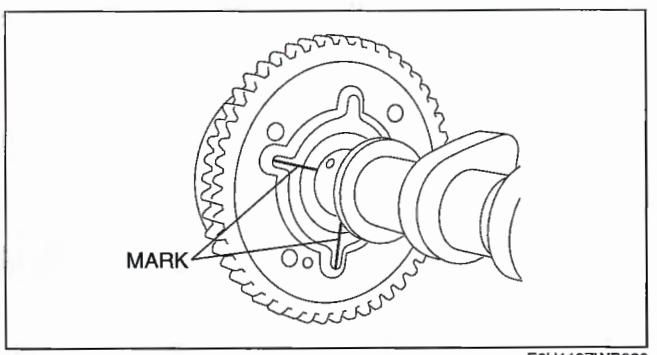
VARIABLE VALVE TIMING ACTUATORE REMOVAL/INSTALLATION [L3 WITH TC]

E6U011012490W05

Caution
- **Remove the variable valve timing actuator and camshaft sprocket as a single unit.**

Note
- The variable valve timing actuator and camshaft sprocket cannot be disassembled.

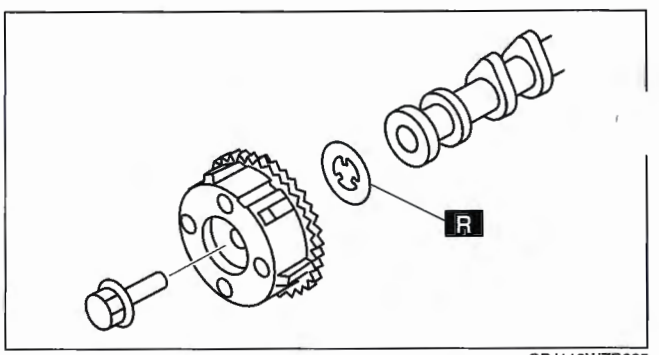
1. Referring to the valve clearance adjustment procedure, remove the variable valve timing actuator and the camshaft on the intake air side as a single unit. (See 01–10B–4 VALVE CLEARANCE INSPECTION/ ADJUSTMENT [L3 WITH TC].)
2. Remove the variable valve timing actuator.
   (1) Place alignment marks on the camshaft and variable valve timing actuator as shown in the figure so that the variable valve timing actuator is re-assembled in its original position.
   (2) Fix the camshaft in a vise.
   (3) Loosen the variable valve timing actuator installation bolt.



E6U110ZWB026

3. Install a new washer.
4. Install the variable valve timing actuator.
   (1) Fix the camshaft in a vise.
   (2) Align the marks on the camshaft and the variable valve timing actuator.

Caution
- **If replacing with a new variable valve timing actuator, place alignment marks in the same positions as those prior to the replacement.**



CPJ110WZB005

   (3) Tighten the variable valve timing actuator installation bolt.

Tightening torque
69—75 N·m {7.1—7.6 kgf·m, 50.9—55.3 ft·lbf}

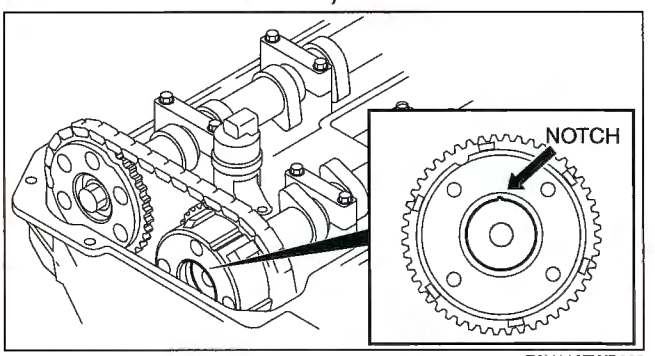
5. Referring to the valve clearance adjustment procedure, install the variable valve timing actuator and camshaft on the intake air side as a single unit. (See 01–10B–4 VALVE CLEARANCE INSPECTION/ADJUSTMENT [L3 WITH TC].)

VARIABLE VALVE TIMING ACTUATOR INSPECTION [L3 WITH TC]

E6U011012490W06

Caution
- **Due to the precision interior construction of the variable valve timing actuator, it cannot be disassembled.**

1. Disconnect the negative battery cable.
2. Remove the charge air cooler.
3. Remove the ignition coils. (See 01–18B–2 IGNITION COIL REMOVAL/INSTALLATION [L3 WITH TC].)
4. Remove the spark plugs. (See 01–18B–3 SPARK PLUG REMOVAL/INSTALLATION [L3 WITH TC].)
5. Disconnect the OCV connectors.
6. Disconnect the CMP sensor connector.
7. Disconnect the P/S oil pump connector.
8. Remove the ventilation hose.
9. Remove cylinder head cover. (See 01–10B–12 Cylinder Head Cover Removal Note.)
10. Verify that the groove of the rotor and notch of the cover on the variable valve timing actuator are aligned and fitted.
    - If they are not aligned, rotate the crankshaft in the direction of engine rotation two times and verify that they are aligned.
      — If they will not align, replace the variable valve timing actuator.
    - If under any condition, the variable valve timing actuator always makes a hitting noise directly after the camshaft exceeds maximum lift while rotating the crankshaft two times in the direction of engine rotation, replace the variable valve timing actuator as it has not been fixed.



E6U110ZWB039

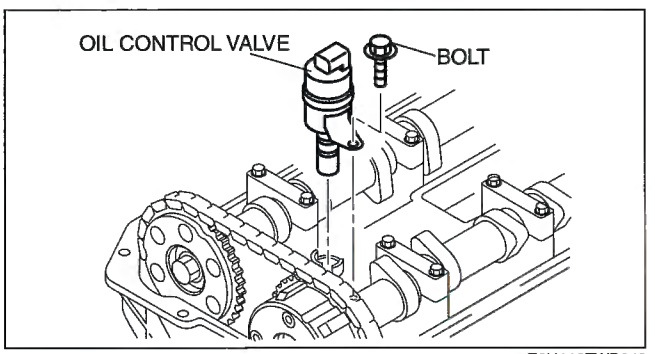
11. Install the cylinder head cover. (See 01–10B–20 Cylinder Head Cover Installation Note.)
12. Install the ventilation hose.
    Connect the P/S oil pump connector.
    . Connect the CMP sensor connector.
15. Connect the OCV connector.
16. Install the spark plugs. (See 01–18B–3 SPARK PLUG REMOVAL/INSTALLATION [L3 WITH TC].)
17. Install the ignition coils. (See 01–18B–2 IGNITION COIL REMOVAL/INSTALLATION [L3 WITH TC].)
18. Install the charge air cooler.
19. Connect the negative battery cable.

OIL CONTROL VALVE (OCV) REMOVAL/INSTALLATION [L3 WITH TC]

E6U011014420W05

1. Disconnect the negative battery cable.
2. Remove the charge air cooler. (See01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
3. Remove the ignition coils. (See 01–18B–2 IGNITION COIL REMOVAL/INSTALLATION [L3 WITH TC].)
4. Disconnect the OCV connectors.
5. Disconnect the CMP connectors.
6. Disconnect the P/S oil pump connector.
7. Remove the ventilation hose.
8. Remove the cylinder head cover. (See 01–10B–20 Cylinder Head Cover Installation Note.)
9. Remove the OCV installation bolt.
10. Install the OCV installation bolt.

    Tightening torque
    8.0—11.5 N·m {81.6—117.2 kgf·cm, 70.9—101.7 in·lbf}



E6U110ZWB043

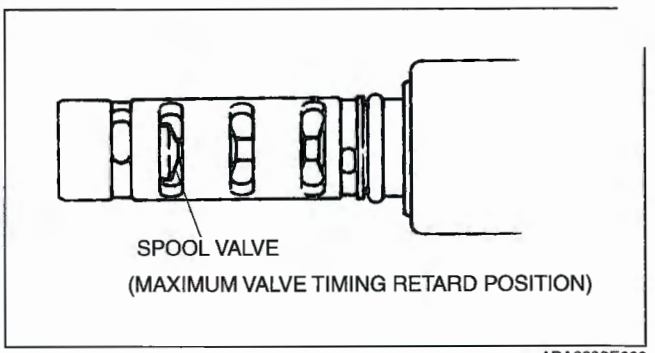
11. Install the cylinder head cover. (See 01–10B–20 Cylinder Head Cover Installation Note.)
12. Install the ventilation hose.
13. Connect the P/S oil pump connector.
14. Connect the CMP connector.
    Connect the OCV connector.
    . Install the spark plugs. (See 01–18B–3 SPARK PLUG REMOVAL/INSTALLATION [L3 WITH TC].)
17. Install the ignition coils. (See 01–18B–2 IGNITION COIL REMOVAL/INSTALLATION [L3 WITH TC].)
18. Install the charge air cooler.
19. Connect the negative battery cable.

OIL CONTROL VALVE (OCV) INSPECTION [L3 WITH TC]

E6U011014420W06

Unable to Keep Idling

1. Remove the OCV.
2. Verify that the spool valve inside the OCV is at the maximum valve timing retard position as shown in the figure.
   - If there is any malfunction, replace the OCV.
3. Connect the OCV connector.
4. Turn the ignition switch to the ON position.
5. Verify that the spool valve inside the OCV is at the maximum valve timing retard position.
   - If there is any malfunction, inspect the harnesses and connectors between the OCV and PCM for a short circuit.
6. Inspect the variable valve timing actuator. (See 01–10B–37 VARIABLE VALVE TIMING ACTUATOR INSPECTION [L3 WITH TC].)



ADA2226E003

Able to Keep Idling

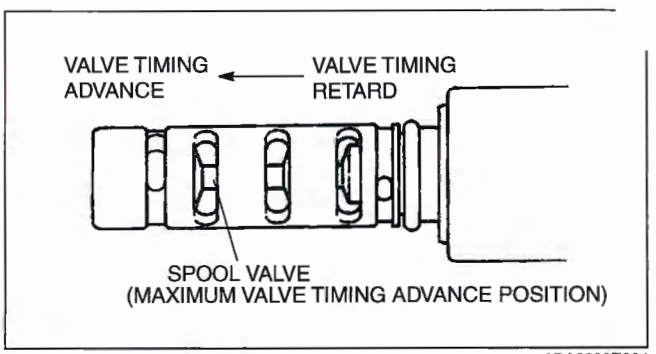
When using the SST (WDS or equivalent).

1. Connect the **SST** (WDS or equivalent).
2. Warm up the engine.
3. Using the VT DUTY1 simulation function, set the duty value of the OCV to **100%** and verify that the engine idles roughly or stalls.
   - If it idles roughly or stalls, verify the timing chain assembly (valve timing).
   - If it does not idle roughly or stall, perform the following inspection.

   (1) Remove the OCV and connect the OCV connector.
   (2) Turn the ignition switch to the ON position.
   (3) Using the VT DUTY1 simulation function, change the duty value for the OCV from **0%** to **100%**, and then verify that the spool valve inside the OCV operates and moves to the maximum valve timing advance position.
      — If it does not operate, inspect OCV operation and the wiring harnesses and connectors between the OCV and PCM for a short circuit or disconnection.
   (4) Inspect the hydraulic passage for leakage.

   Hydraulic passage
   Between the oil pressure switch and the OCV
   Between the OCV and the camshaft
   Oil passage inside the camshaft

   (5) If the inspected parts are normal, replace the variable valve timing actuator.

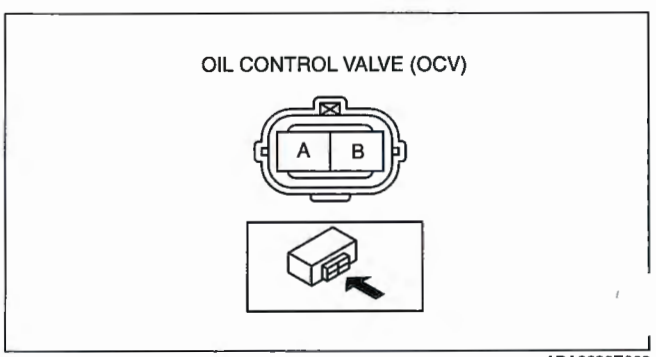


ADA2226E004

When not using the SST (WDS or equivalent)

1. Disconnect the OCV connector.
2. Start the engine and idle it.
3. When applying battery positive voltage between the oil control valve terminals, verify if the engine rough idles or stalls.
   - If it idles roughly or stalls, verify the timing chain assembly (valve timing).
   - If it does not idle roughly or stall, perform the following inspection.

   Note
   - When applying battery positive voltage between the oil control valve terminals, the connection of the positive and negative cables can be either terminal A or B.



ADA2226E002

(1) Inspect OCV operation.
(2) Inspect the harnesses and connectors between the OCV and PCM for a disconnection and short circuit.
(3) Inspect the hydraulic passage for leakage.

Hydraulic passage
Between the oil pressure switch and the OCV
Between the OCV and the camshaft
Oil passage inside the camshaft

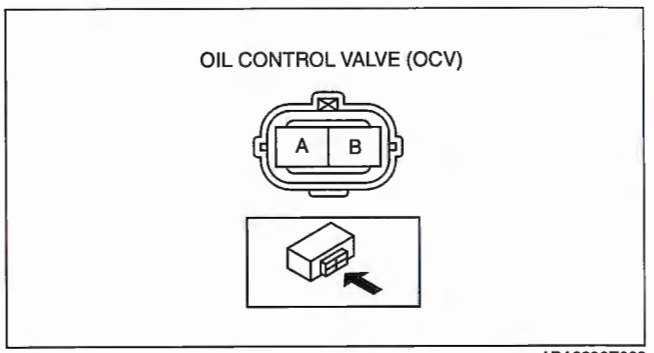
(4) If the inspected parts are normal, replace the variable valve timing actuator.

Coil Resistance Inspection

1. Disconnect the negative battery cable.
2. Disconnect the OCV connector.
3. Measure the coil resistance between terminals A and B using a tester.
   - If it is not within the specification, replace the OCV.

   Oil control valve resistance
   6.9—7.9 ohms [20°C {68°F}]

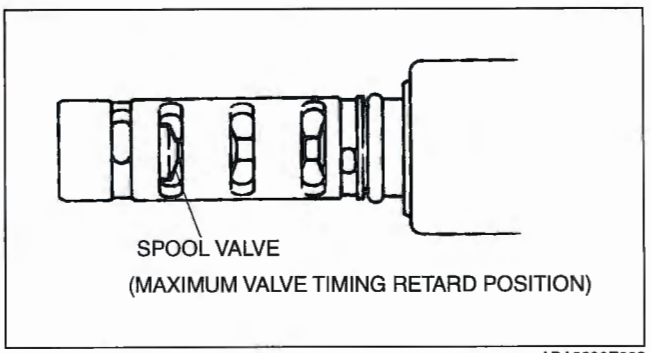
4. Connect the OCV connector.



ADA2226E002

Spool Valve Operation Inspection

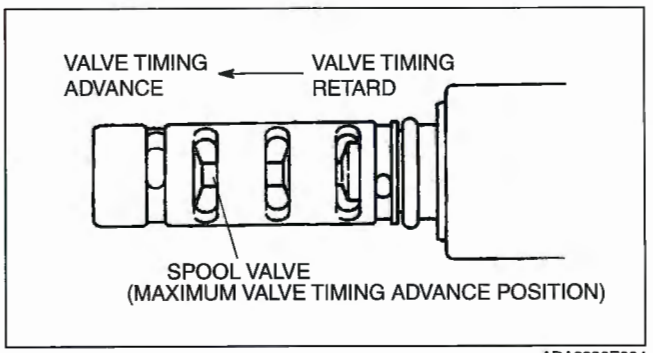
1. Disconnect the negative battery cable.
2. Remove the OCV.
3. Verify that the spool valve inside the OCV is at the maximum valve timing retard position as shown in the figure.
   - If there is any malfunction, replace the OCV.
4. Verify that the battery is completely charged.



ADA2226E003

5. When battery positive voltage is applied between OCV terminals A and B, verify that the spool valve moves to the maximum valve timing retard position.
   - If there is any malfunction, replace the OCV.

   Note
   - When applying battery positive voltage between the OCV terminals, the connection of the positive and negative cables can be either terminal A or B.



ADA2226E004

6. Stop applying battery positive voltage and verify that the spool valve returns to the maximum valve timing advance position.
   - If there is any malfunction, replace the OCV.
7. Install the OCV.

ENGINE TUNE-UP [L3 WITH TC]

E6U011002000W18

Ignition Timing Inspection

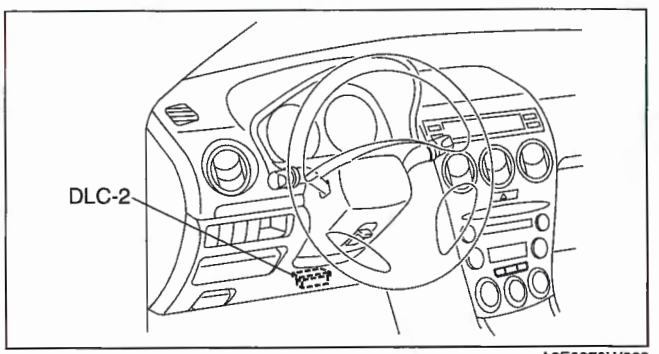
Caution
- **Do not change the crankshaft position sensor installation position. Changing the CKP sensor installation location while attempting to adjust the ignition timing could cause an engine malfunction.**

Note
- The ignition timing cannot be adjusted.
- The **SST** (WDS or equivalent) is required to verify the ignition timing.

1. Warm up the engine.
   (1) Turn off all electrical loads.
   (2) Increase the engine speed to **2,500—3,000 rpm** until the cooling fan starts running.
   (3) When the cooling fan starts running, release the accelerator pedal and wait until the cooling fan stops running.
2. Connect the **SST** (WDS or equivalent) to the DLC-2.
3. Verify the ignition timing (WDS: SPARKADV) using the PID/data monitor function of the **SST** (WDS or equivalent).

   Ignition timing (BTDC)
   10°

4. Gradually raise the engine speed and verify that the ignition timing advances.



A6E3970W002

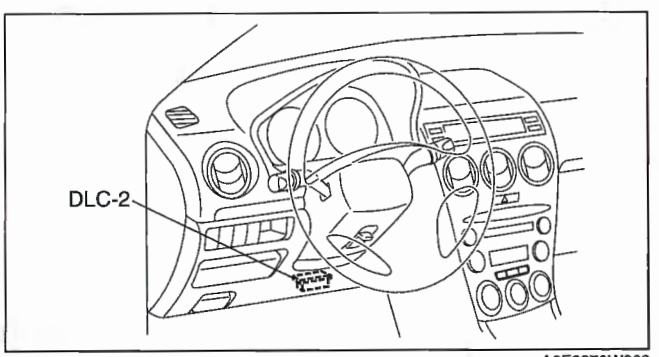
Idle Speed Inspection

Note
- Idle rotation cannot be adjusted.

1. Warm up the engine.
   (1) Turn off all electrical loads.
   (2) Increase the engine speed to **2,500—3,000 rpm** until the cooling fan starts running.
   (3) When the cooling fan starts running, release the accelerator pedal and wait until the cooling fan stops running.
2. Connect the **SST** (WDS or equivalent) to the DLC-2.
3. Verify that the engine speed (WDS: RPM) is as follows using the PID/data monitor function of the **SST (WDS or equivalent)** as follows:

   Idle speed
   No load
   650—750

   Idle-up speed (rpm) *1
   Electrical load on
   650—750
   P/S operation
   650—750
   A/C operation (medium-pressure switch off)
   700—800
   A/C operation (medium-pressure switch on)
   725—825



A6E3970W002

*1. When the following electrical loads are on: Headlights, rear defroster, cooling fan No.1, cooling fan No.2, and the blower motor (2-step or more.)

Idle Mixture Inspection

1. Verify that the idle speed and ignition timing are within the specification. (See 01–10B–40 Idle Speed Inspection.) (See 01–10B–40 Ignition Timing Inspection.)
2. Insert an exhaust gas analyzer to the tailpipe.
3. Verify that the CO and HC concentrations are within the regulation.

   Idle mixture
   HC concentration: Within the regulation
   CO concentration: Within the regulation

DRIVE BELT INSPECTION [AJ]

E6U011015800W01

Symptom Chart

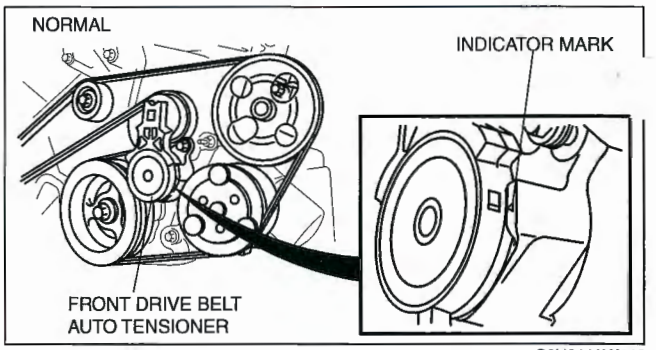
Condition	Possible Source	Action
• Drive belt cracking	• Front and water pump drive belt.	• Replace drive belt. (See 01–10C–4 DRIVE BELT REPLACEMENT [AJ])
• Drive belt chunking	• Front and water pump drive belt.	• Replace drive belt. (See 01–10C–4 DRIVE BELT REPLACEMENT [AJ])
• Drive belt noise or squeal	• Front and water pump drive belt. • Pulley(s).	• Determine what area of pulley(s) noise is coming from, then check that area with straight edge and see if each pulley is out of position in fore or aft direction, or at an angle to the straight edge.
• Drive belt does not hold tension (See 01–10C–4 Front Drive Belt)	• Front and water pump drive belt cracking or damaged.	• Inspect drive belt for cracking parallel with and through to the backing. Replace drive belt if necessary. • Check drive belt tensioner for damage and correct operation. Replace drive belt auto tensioner if necessary.
• Drive belt squeal or chirp	• Incorrect front and water pump drive belt installed. • Lubricant or other contamination on front and water pump drive belt. • Each pulley not aligned properly, damaged or not rotating freely.	• Check drive belt for correct part application. • Check drive belt for oil, coolant, power steering fluid, brake fluid or other contamination. Remove drive belt and wash with detergent and water. If drive belt cannot be cleaned or is damaged (softened) by contamination, replace drive belt. • Check each pulley for proper alignment, pulleys and related parts for proper freedom of rotation and damage. Repair pulleys and related parts if necessary.

Note

- Front and water pump drive belt deflection/tension inspection is not necessary because of the use of the drive belt auto tensioner.

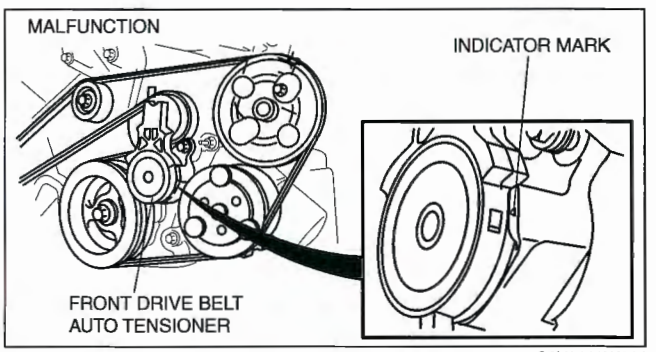
Front Drive Belt

1. Verify that the front drive belt auto tensioner indicator mark does not exceeds the limit.



C6U0110W013

- If it exceeds the limit, replace the front drive belt.(See01–10C–4 Front Drive Belt.)



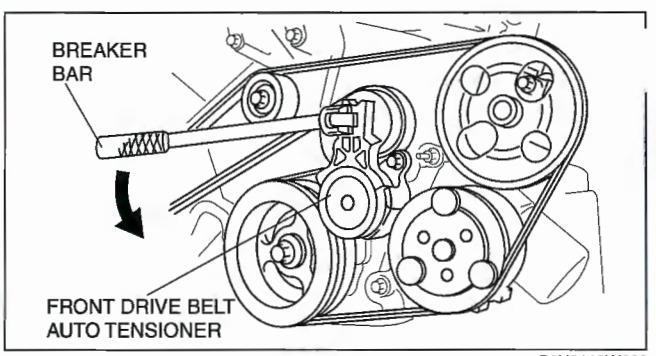
C6U0110W014

DRIVE BELT REPLACEMENT [AJ]

E6U011015800W02

Front Drive Belt

1. Remove the under cover and splash shield (RH).
2. Set a breaker bar on the center of the front drive belt auto tensioner pulley as shown.
3. Using the breaker bar, turn the center of the front drive belt auto tensioner pulley Counterclockwise to release tension to the drive belt.
4. Remove the front drive belt.
5. Reinstall the front drive belt or install a new front drive belt.
6. Verify that the front drive belt auto tensioner indicator mark does not exceed the limit. (See 01–10C–4 Front Drive Belt.)
   - If it exceeds the limit, replace the front drive belt.
7. Install the splash shield (RH).



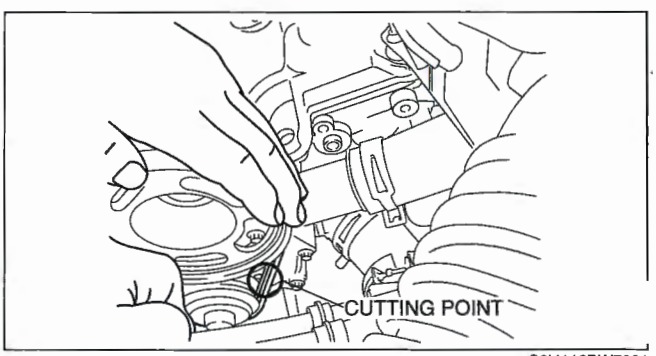
C6U0110W003

Water Pump Drive Belt

1. Remove the plug hole plate.
2. Remove the front wheel and tire (RH).
3. Remove the splash shield (RH).
4. Hold down the belt while cutting as shown in the figure.

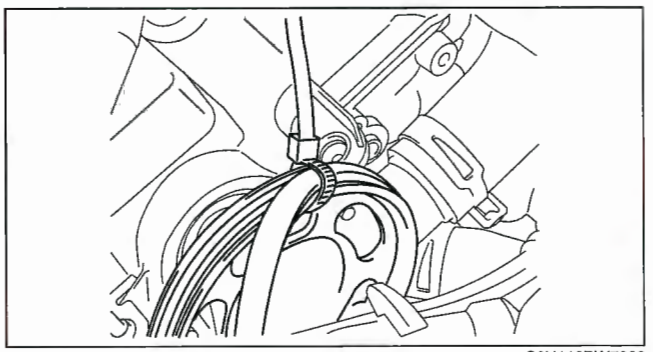
Caution

- **To prevent the belt from snapping back, always hold down the belt while cutting it. Also, keep your face away from the belt.**
- **The belt is not reusable.**



C6U110BW7001

5. Secure the water pump drive pulley and the new belt using a tie wrap.



C6U110BW7002

Note
- It is acceptable to use a tie wrap with a releasable lock.

6. Rotate the crankshaft verifying that the belt engages properly.

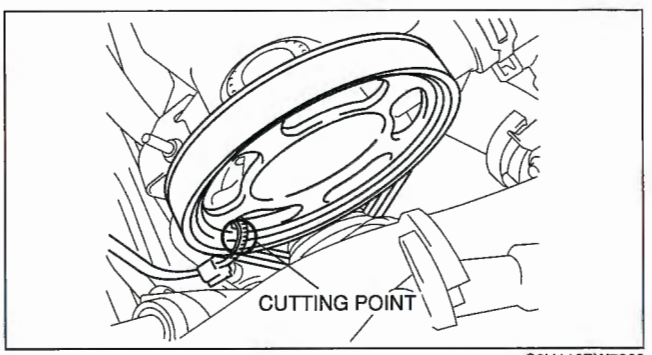
Crankshaft rotating angle (reference)
Approx. 110

7. Verify that the belt is installed securely in the pulley groove.

Caution
- **If the belt slips while rotating the crankshaft, verify that the belt engages properly by rotating the crankshaft further.**

8. Remove the tie wrap.

Caution
- **To prevent damage to the belt, cut the tie wrap at the pulley side using the nipper or scissors when removing the tie wrap by cutting it.**



C6U110BW7003

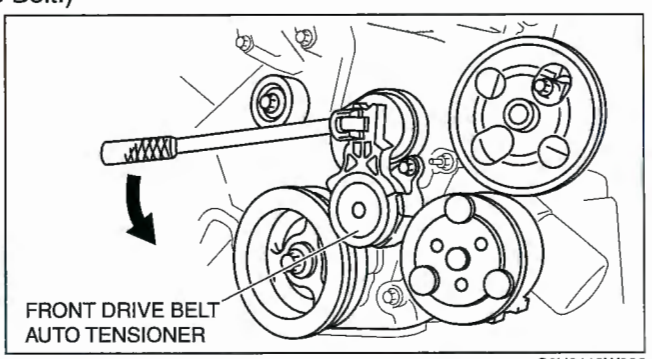
9. Install the splash shield (RH)
10. Install the front wheel and tire (RH).
11. Install the plug hole plate.

DRIVE BELT AUTO TENSIONER INSPECTION [AJ]

E6U011015980W01

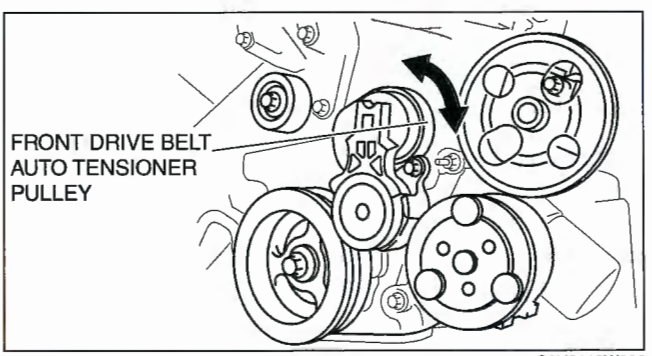
Front Drive Belt Auto Tensioner

1. Remove the front drive belt. (See 01–10C–4 Front Drive Belt.)
2. Verify that the front drive belt auto tensioner moves smoothly in the operational direction.
   - Replace the front drive belt auto tensioner if necessary.
3. Turn the front drive belt auto tensioner pulley and verify that it rotates smoothly.
   - Replace the front drive belt auto tensioner if necessary.



C6U0110W005

4. Install the front drive belt.



C6U0110W006

COMPRESSION INSPECTION [AJ]

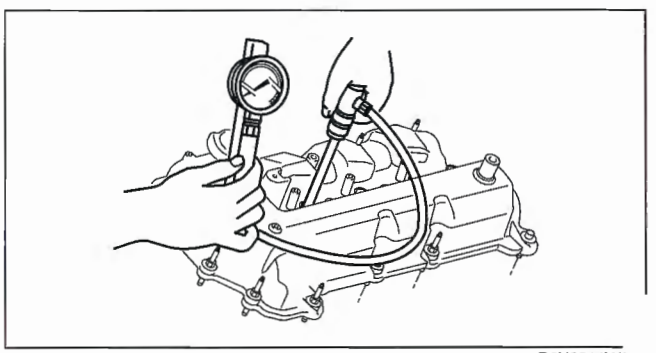
E6U011002000W02

Warning
- **Hot engines and engine oil can cause severe burns. Turn off the engine and wait until it and the engine have cooled.**

1. Verify that the battery is fully charged.
   - Recharge it if necessary. (See 01–17A–3 BATTERY RECHARGING [L3, AJ].)
2. Warm up the engine to the normal operating temperature.
3. Perform "Fuel Line Safety Procedure". Leave the fuel pump relay removed. (See 01–14A–6 Fuel Line Safety Procedure.)

Warning
- **Fuel vapor is hazardous. It can very easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injures or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure". (See 01–14A–6 Fuel Line Safety Procedure.)**

4. Remove the ignition coils. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)
5. Remove the spark plugs.
6. Install the compression gauge into the spark plug hole.
7. Crank the engine a minimum of five compression strokes and record the highest reading. Note the approximate number of compression strokes required to obtain the highest reading.
8. Repeat the test on each cylinder, cranking the engine approximately the same number of compression strokes.
9. The indicated compression pressures are considered within specification if the lowest reading cylinder is within **75%** of the highest reading.



B6U2214W01

   - If the compression in one or more cylinders is low or the compression difference between cylinders exceeds the maximum, pour a small amount of clean engine oil into the cylinder and recheck the compression.
     — If the compression increases, the piston, the piston rings, or cylinder wall may be worn and overhaul is required.
     — If the compression stays low, a valve may be stuck or improperly seated and overhaul is required.
     — If two adjacent cylinders indicate low compression pressures and squirting oil on piston does not increase compression, the head gasket may be leaking between cylinders. Engine oil and/or coolant in the cylinders could result from this condition.
10. Remove the compression gauge.
11. Install the spark plugs.

Tightening torque
9—20 N·m {91—204 kgf·cm, 79—177 in·lbf}

12. Install the ignition coils. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)
13. Install the fuel pump relay.

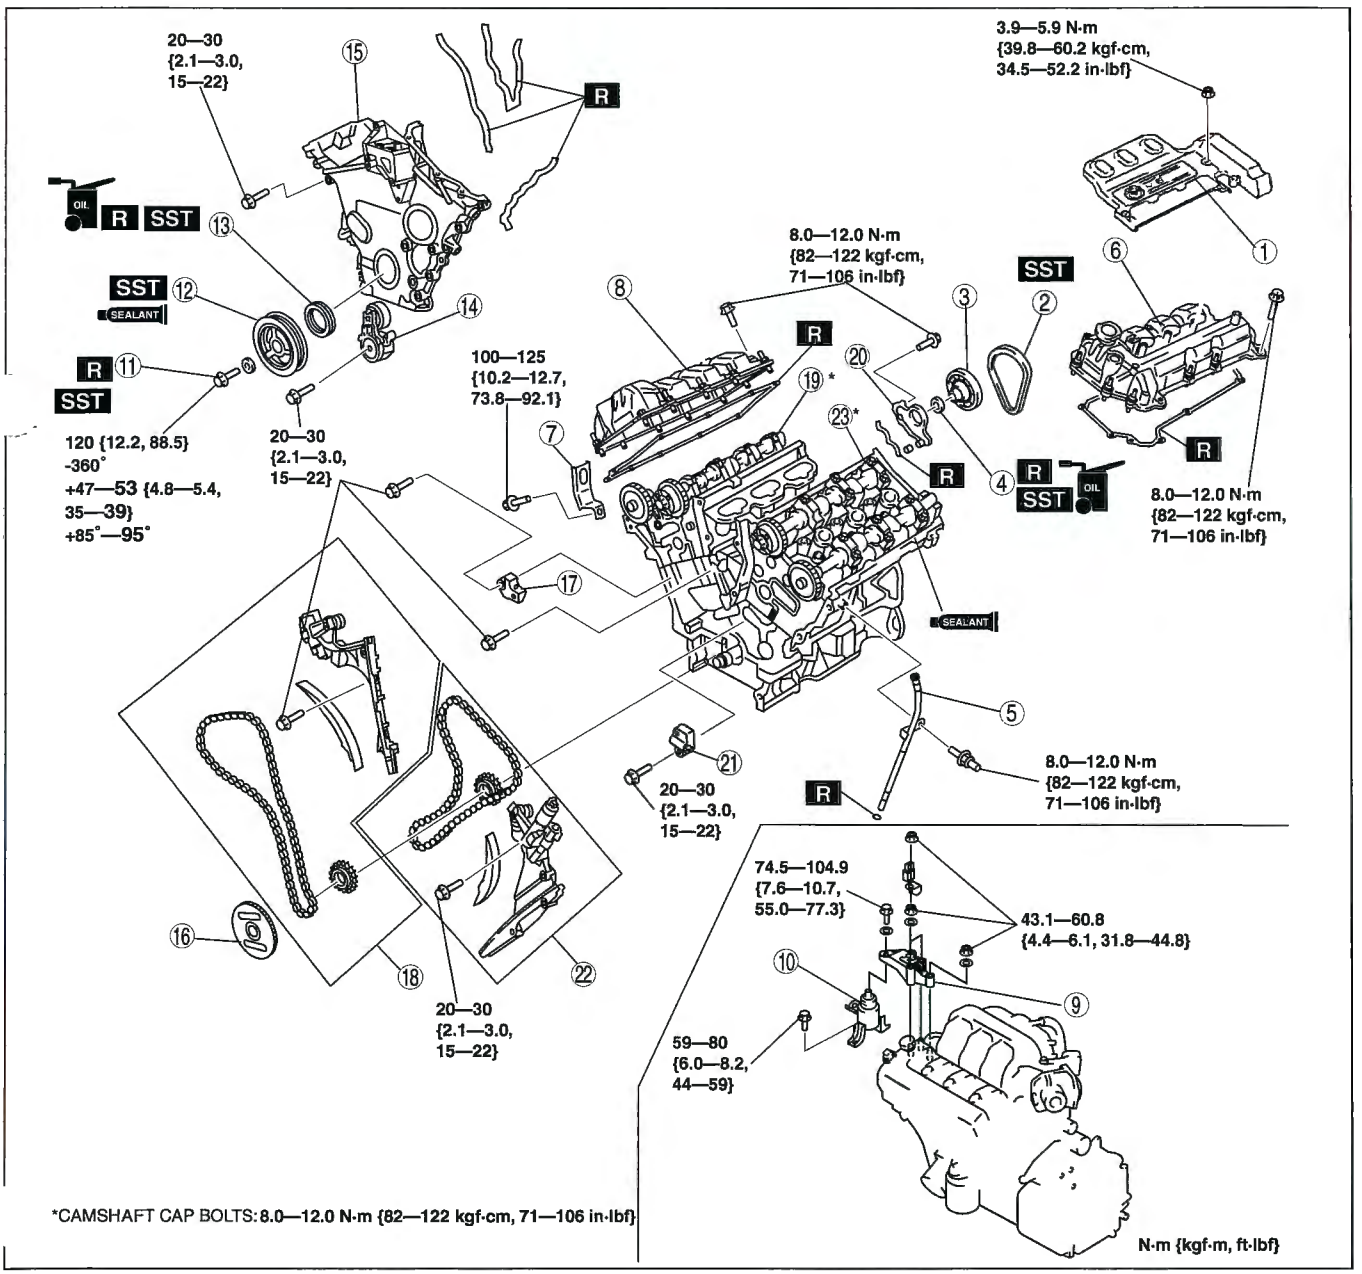
TIMING CHAIN REMOVAL/INSTALLATION [AJ]

E6U011012201W01

Warning
- **Fuel vapor is hazardous. It can very easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injures or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure". (See 01–14A–6 Fuel Line Safety Procedure.)**

1. Disconnect the negative battery cable.
2. Remove the dynamic chamber. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
3. Remove the ignition coils. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)

4. Remove the front drive belt. (See 01–10C–4 Front Drive Belt.)
5. Remove the P/S oil pump and bracket with the P/S pipe connected, and fix the P/S oil pump using a rope to prevent it from falling. (See 06–12–28 POWER STEERING OIL PUMP REMOVAL/INSTALLATION [AJ].) Remove the A/C compressor with the A/C pipe connected, and fix the A/C compressor using a rope to prevent it from falling.
7. Disconnect the generator, but do not remove it from the vehicle. After disconnection, fix the generator using a rope to prevent it from falling. (See 01–17A–4 GENERATOR REMOVAL/INSTALLATION [L3, AJ].)
8. Remove the drive shaft (RH). (See 03–13–19 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [AJ].)
9. Remove the front crossmember. (See 02–13–20 FRONT CROSSMEMBER REMOVAL/INSTALLATION.)
10. Remove the TWC (LH). (See 01–15C–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [AJ].)
11. Remove the oil pan. (See 01–11A–8 OIL PAN REMOVAL/INSTALLATION [L3, AJ].)
12. Remove in the order indicated in the table.
13. Install in the reverse order of removal.
14. Start the engine and:
    - Inspect for the engine oil, engine coolant, transaxle oil and fuel leakage.
    - Verify the ignition timing, idle speed and idle mixture. (See 01–10C–39 Ignition Timing Inspection.) (See 01–10C–39 Idle Speed Inspection.) (See 01–10C–40 Idle Mixture Inspection.)
15. Perform a road test.



E6U110BW5L01

1	Plug hole plate

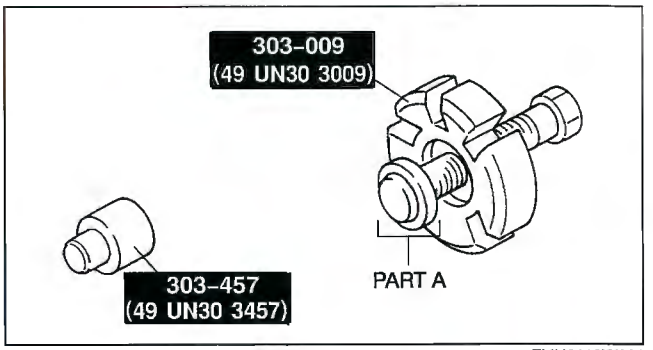
20	Camshaft oil seal housing
21	Chain tensioner (LH) (See 01–10C–17 Chain Tensioner (LH) Installation Note)
22	Timing chain component (LH) (See 01–10C–14 Timing Chain Component (LH) Removal Note.) (See 01–10C–16 Timing Chain Component (LH) Installation Note.)
23	Camshaft cap (LH) (See 01–10C–15 Camshaft Caps (LH) Removal Note.)

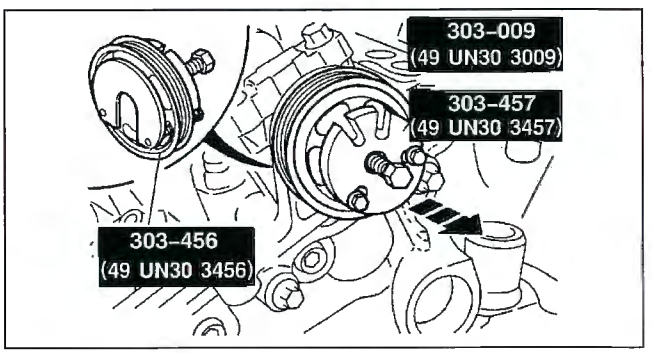
Water Pump Drive Belt Pulley Removal Note

1. Replace part A of the **SST** [303-009 (49 UN30 3009)] with the **SST** [303-457 (49 UN30 3457)].



ZMU0110W001

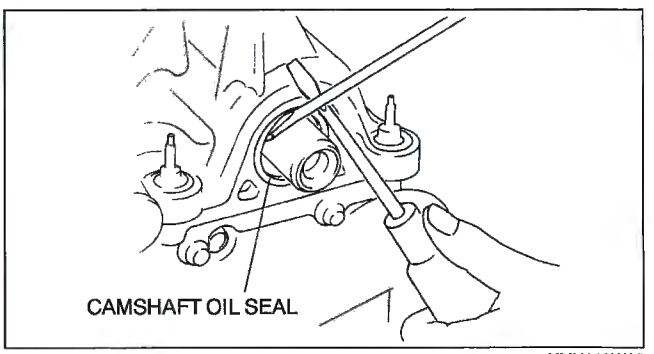
2. Remove the water pump pulley using the **SSTs**.



ZMU0110W002

Camshaft Oil Seal Removal Note

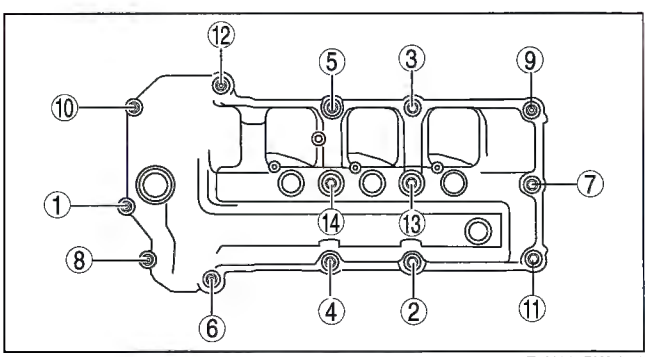
1. Cut the oil seal lip using a razor knife.
2. Remove the oil seal using a screwdriver as shown.



YMU110WA9

Cylinder Head Cover (LH) Removal Note

1. Remove the cylinder head cover bolts in the order shown.



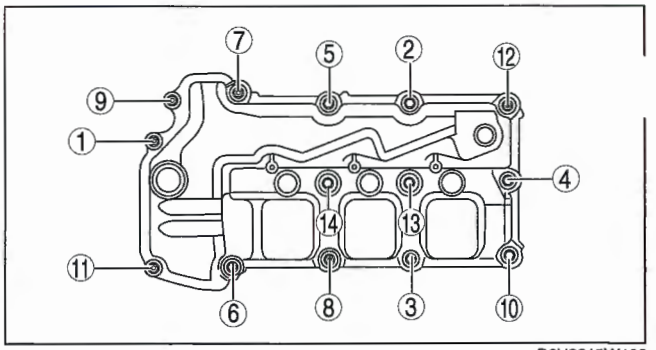
E6U110BW5L03

gine Hanger Removal Note

1. Lift up the vehicle and loosen the engine hanger installation bolts from under the vehicle.

Cylinder Head Cover (RH) Removal Note

1. Remove the cylinder head cover bolts in the order shown.

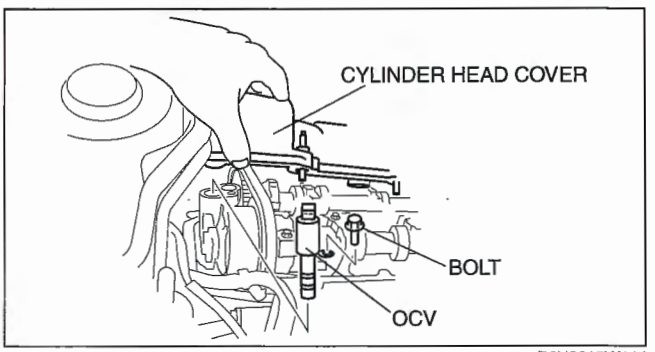


B6U2215W102

2. Remove the oil control valve (OCV) with cylinder head cover raised as shown in the figure.

   Note
   - Take care not to let the OCV tightening bolt slip into the timing chain cover when removing the OCV tightening bolt from engine front.

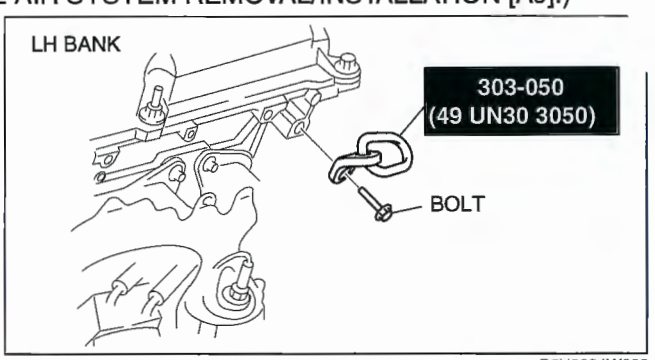
3. Remove the cylinder head cover.



B6U2215W114

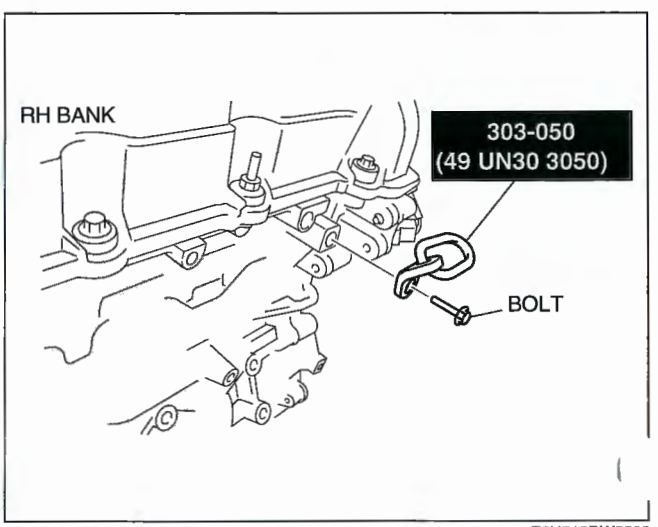
No.3 Engine Joint Bracket Removal Note

1. Remove the ABS/TCS HU/CM connector. (See 04–13–4 ABS/TCS HU/CM REMOVAL/INSTALLATION.)
2. Remove the dynamic chamber. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
3. Using the bolts **M12×1.25, length 25 mm {0.984 in}** to Install the **SST** as shown (LH bank and RH bank).



B6U2324W002

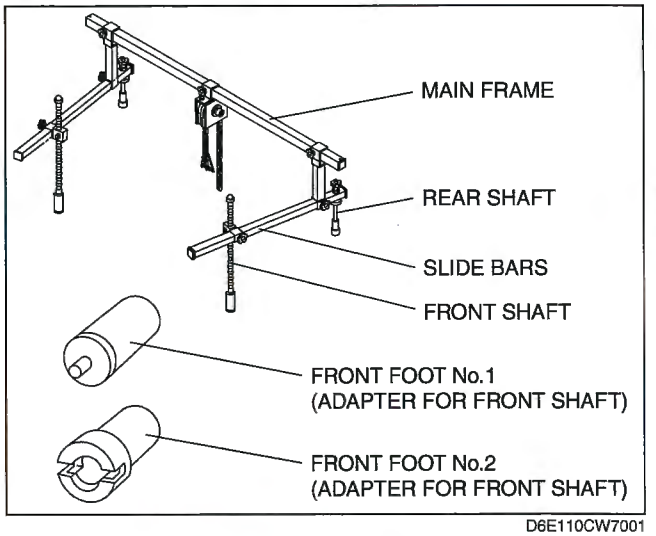
Tightening torque
100—125 N·m {10.2—12.7 kgf·m, 73.8—92.1 ft·lbf}



E6U515BW5502

4. Install the SST using the following procedure.

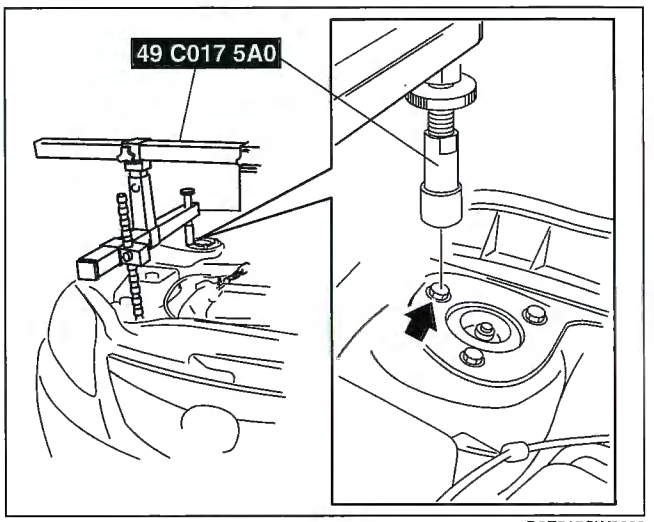
Caution
- **Refer to the SST instruction manual for the basic handing procedure.**



D6E110CW7001

(1) Install the right rear shaft of the **SST** to the bolt of the right shock absorber as shown in the figure.
(2) Install the left rear shaft of the **SST** to the bolt of the left shock absorber. (Identical position to the right side)

Note
- When setting the **SST** on the right side, make sure it doesn't interfere with the ABS (ABS/TCS) HU/CM or the DSC HU/CM.

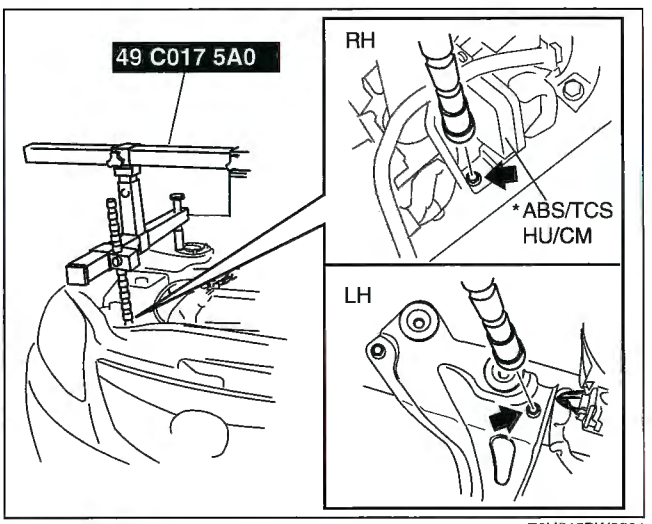


D6E515CW3008

(3) Install the left/right front shaft of the **SST** with front foot No.2 to the bolt as shown in the figure.

* : If equipped

(4) Adjust the positions of the **SST** side bars so that they are the same height (left and right) and horizontal.
(5) Make sure each joint is securely tightened.

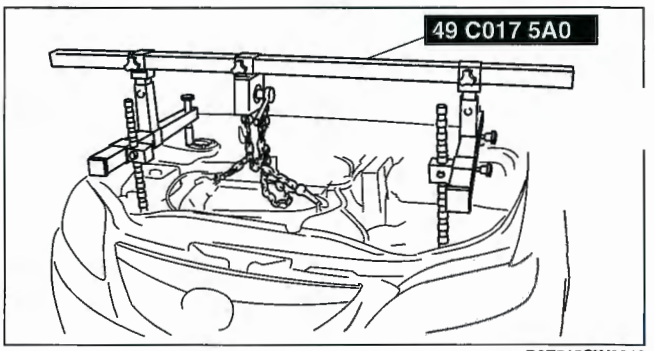


E6U515BW5501

5. Support the engine using the **SST**.

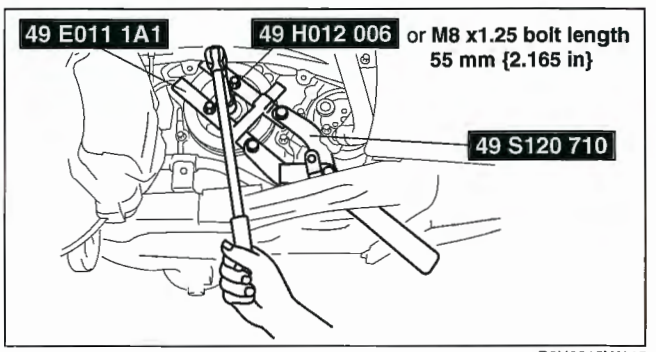
Note
- The **SST** (49 E017 5A0) can be used in place of the **SST** (49 C017 5A0).

6. Remove the No.3 engine joint bracket.



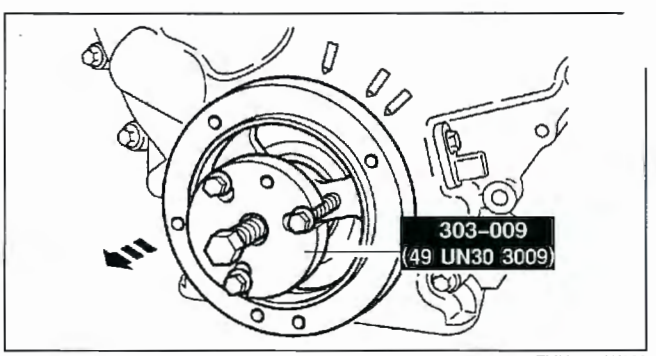
D6E515CW3010

Crankshaft Pulley Lock Bolt Removal Note
1. Remove the A/C compressor with the pipes still connected.
2. Hold the crankshaft pulley using the **SSTs**.



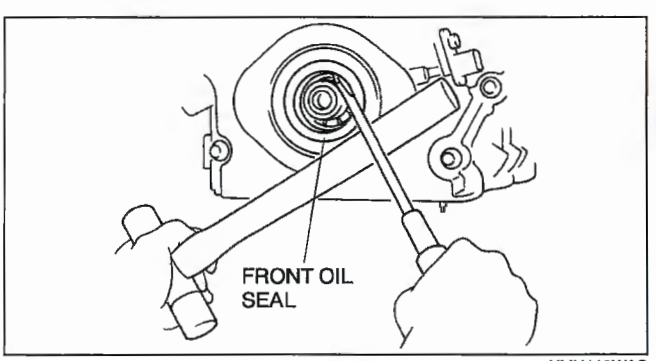
B6U2215W115

Crankshaft Pulley Removal Note
1. Remove the crankshaft pulley using the **SST**.



ZMU0110W003

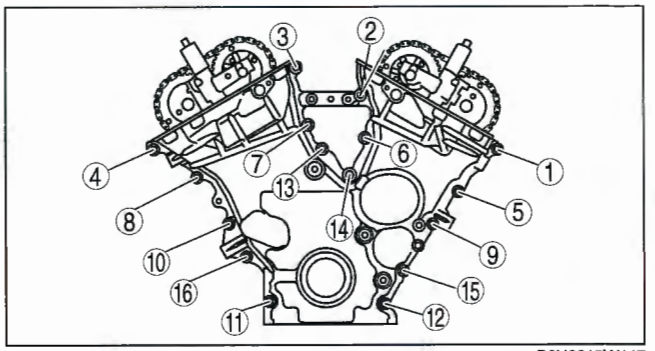
Front Oil Seal Removal Note
1. Remove the front oil seal using a screwdriver as shown.



YMU110WAG

Engine Front Cover Removal Note

1. Remove the engine front cover bolts and studs in the order shown.

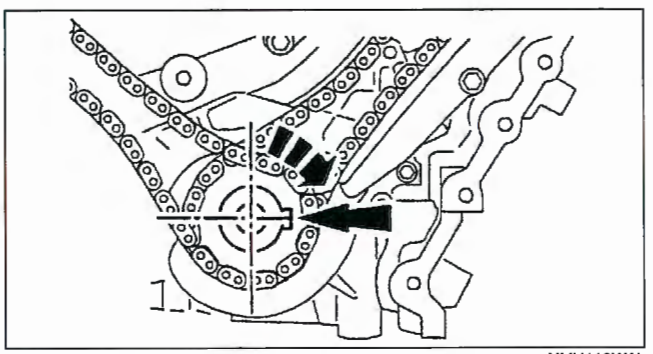


B6U2215W117

Timing Chain Component (RH) Removal Note

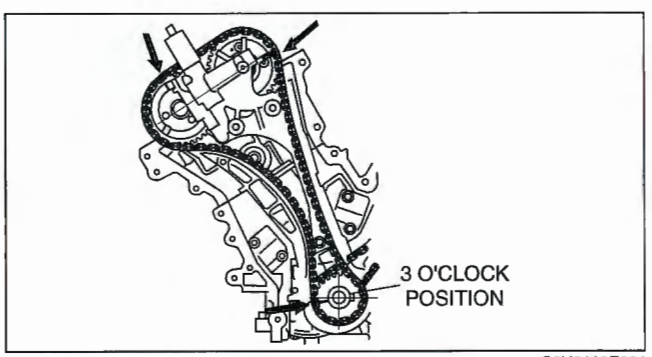
1. Rotate the crankshaft clockwise so that the crankshaft keyway is in the 3 o'clock position. (The camshafts (RH) are in the neutral position.)

   Caution
   - **Do not rotate the crankshaft counterclockwise. The timing chains may bind, causing engine damage.**



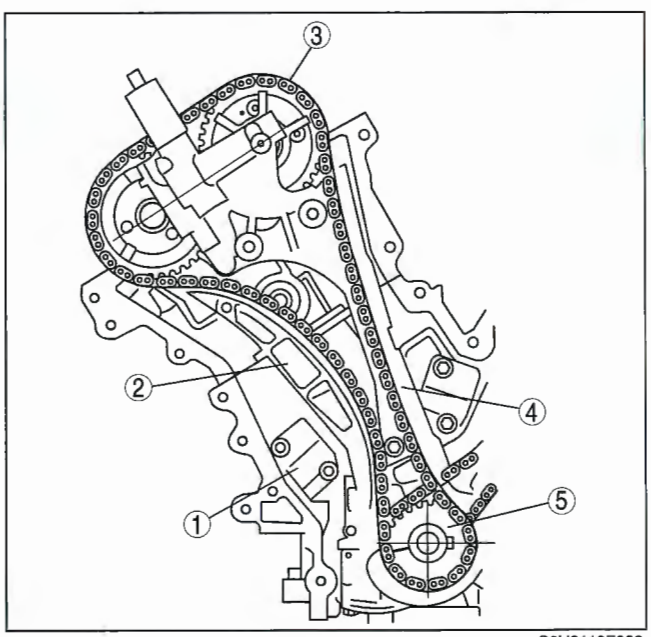
YMU110WAL

2. Place alignment marks on the timing chain corresponding to each of the alignment marks on the timing sprocket.



C6U0110E001

3. Remove the timing chain (RH) in the following order.
   (1) Chain tensioner
   (2) Tensioner arm
   (3) Timing chain
   (4) Chain guide
   (5) Timing chain crankshaft sprocket



C6U0110E002

Camshaft Caps (RH) Removal Note

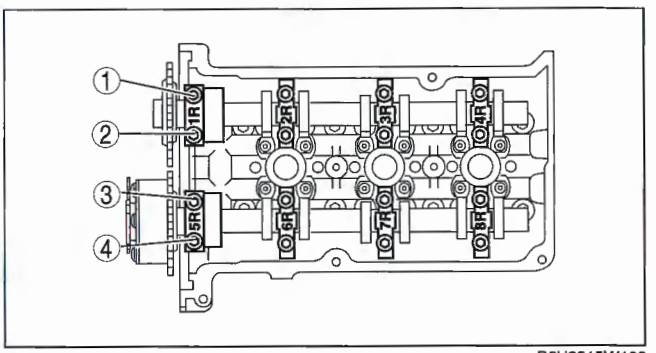
Caution
- **Remove the camshaft bearing thrust caps No. 1R and 5R first. Do not loosen any of the other bolt until the thrust caps are removed, or damage to the thrust caps may occur.**

Note
- Cylinder head and the camshaft bearing caps are numbered to make sure they are assembled in their original position. When removed, keep the bearing caps with the cylinder head from where they were removed together. Do not mix the caps.

1. Loosen bolts in several passes.

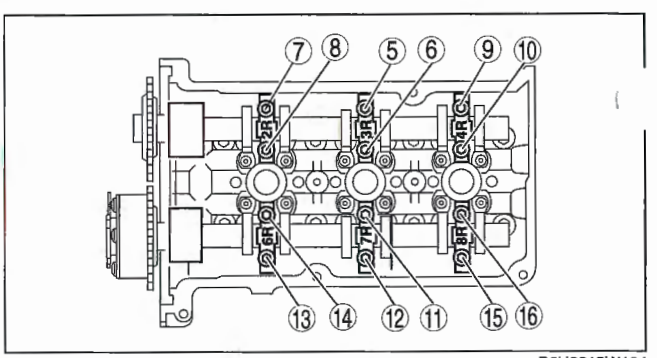
Note
- Do not remove bolts completely.

2. Remove the RH camshaft thrust caps 1R and 5R.



B6U2215W103

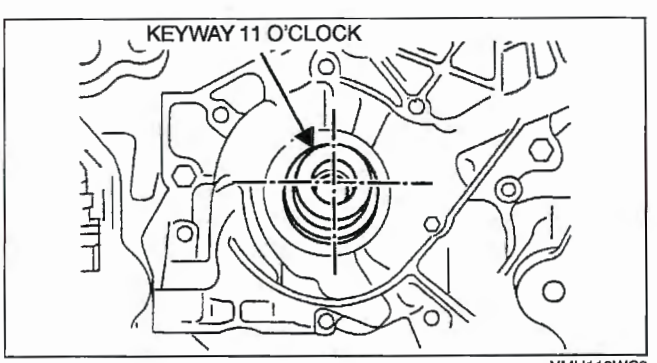
3. Loosen the remaining bolts 7–8 turns in the indicated sequence in several passes to allow the camshafts (RH) to be slowly raised.



B6U2215W104

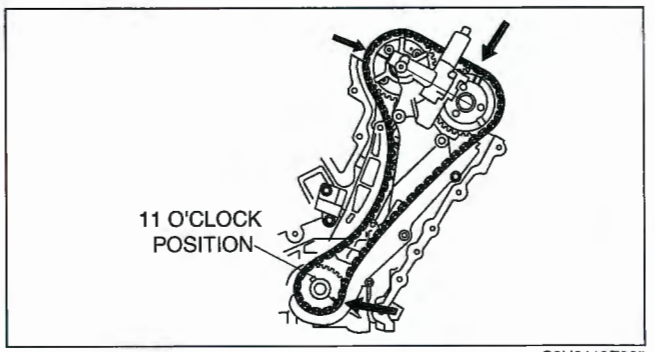
Timing Chain Component (LH) Removal Note

1. Rotate the crankshaft clockwise 1 and 2/3 turns until the keyway is in the 11 o'clock position.



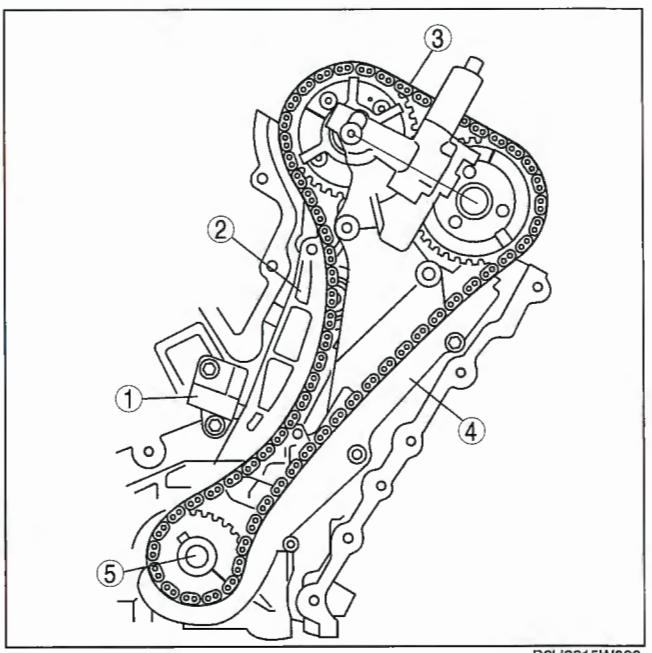
YMU110WC9

2. Place alignment marks on the timing chain corresponding to each of the alignment marks on the timing sprocket.



C6U0110E005

3. Remove the timing chain (LH) in the following order.
   (1) Chain tensioner
   (2) Tensioner arm
   (3) Timing chain
   (4) Chain guide
   (5) Timing chain crankshaft sprocket



B6U2215W003

Camshaft Caps (LH) Removal Note

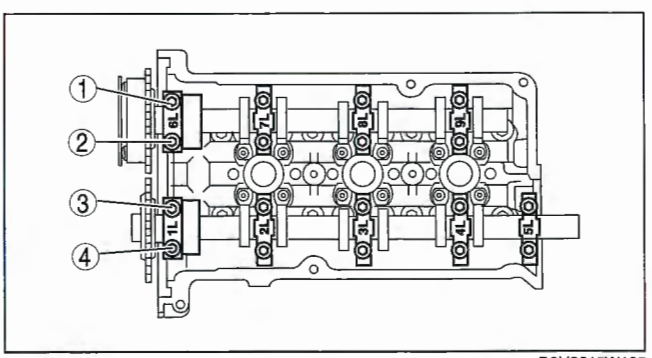
Caution
- **Remove the camshaft bearing thrust caps No. 1L and 6L first. Do not loosen any of the other bolts until the thrust caps are removed, or damage to the thrust caps may occur.**

Note
- Cylinder head and the camshaft bearing caps are numbered to make sure they are assembled in their original position. When removed, keep the bearing caps with the cylinder head from where they were removed together. Do not mix the caps.

1. Loosen bolts in several passes.

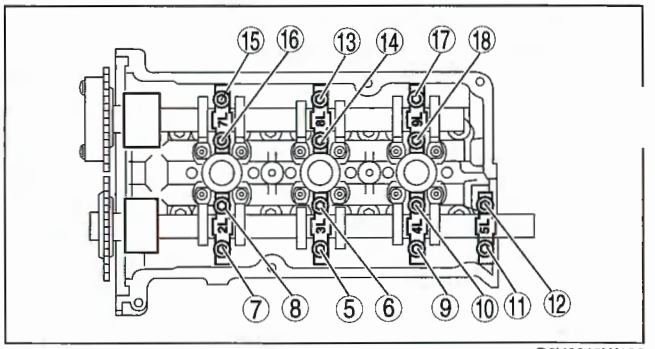
Note
- Do not remove bolts completely.

2. Remove the camshaft (LH) thrust caps 1L and 6L.



B6U2215W105

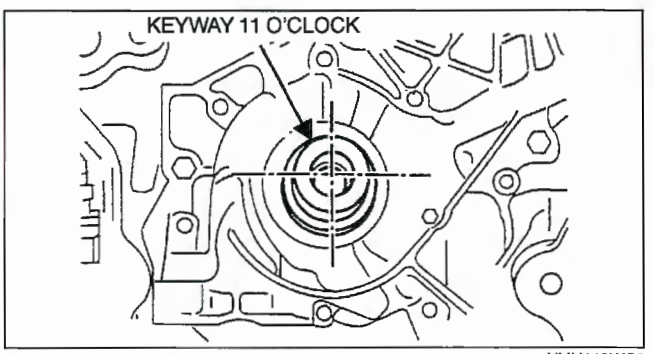
3. Loosen the remaining bolts 7—8 turns in the indicated sequence to allow the camshaft (LH) to rise.



B6U2215W106

Timing Chain Component (LH) Installation Note

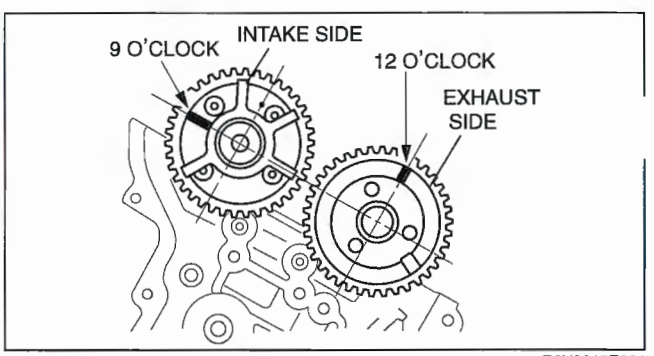
1. Verify that the crankshaft keyway is at 11 o'clock position.



YMU110WC9

2. Position the mark on the intake camshaft to 9 o'clock position.
3. Position the mark on the exhaust camshaft to 12 o'clock position.

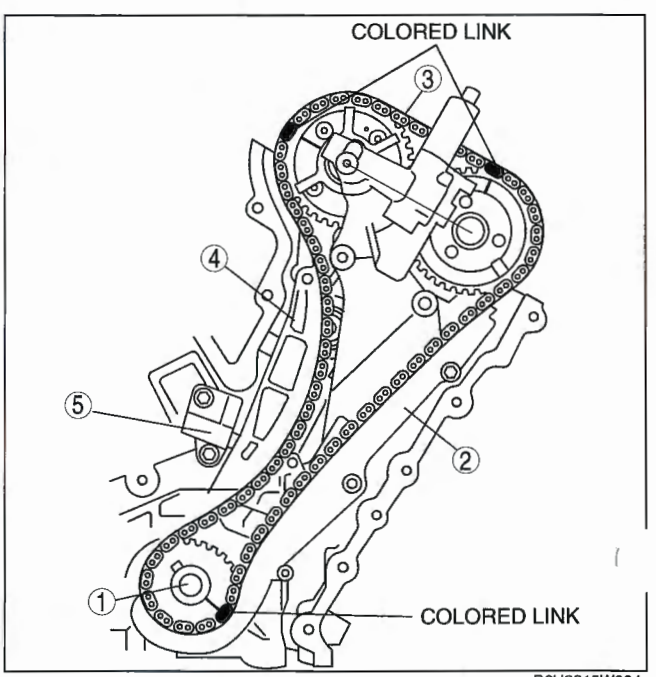
Note
- Install the timing chain by aligning the colored links on the timing chain with the marks on the timing sprockets.



B6U2215E001

4. Install the timing chain (LH) in the following order.
   (1) Timing chain crankshaft sprocket
   (2) Chain guide
   (3) Timing chain
   (4) Tensioner arm
   (5) Chain tensioner

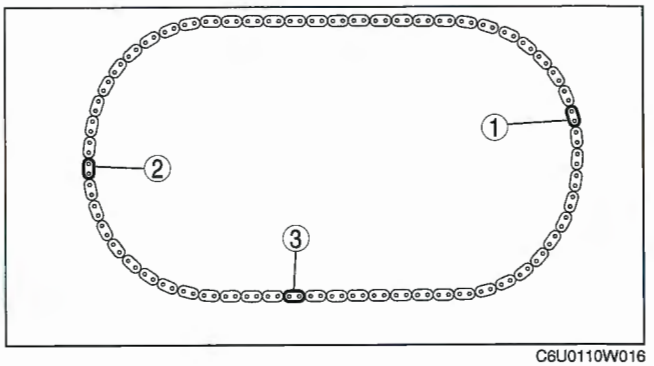
Note
- The chain guide should be installed to the actuator and allowed to hang freely when the bolts are installed. Do not hold the chain guide in an upward position when the bolts are installed. The actuator causes a wear O-ring and this installation method will allow that wear to continue.



B6U2215W004

Note

- If timing marks in the timing chains are not evident, use a permanent-type marker to mark the crankshaft and camshaft timing marks on the timing chain.
  1. Mark any link to use as the crankshaft timing mark.
  2. Count 29 links from the crankshaft timing mark and mark as the exhaust camshaft sprocket timing mark.
  3. Continue counting to 42 mark the link as the intake camshaft sprocket timing mark.



C6U0110W016

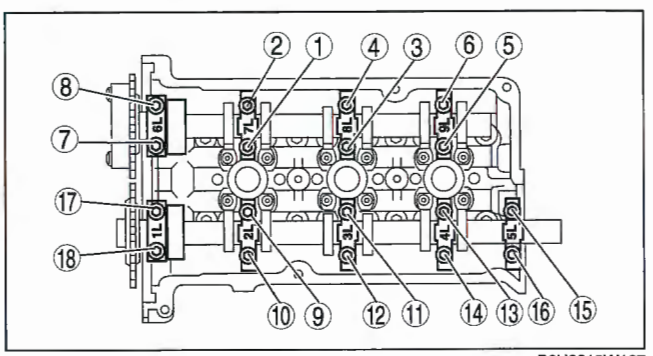
Caution

- **Install the camshaft journal thrust caps last, or damage to the thrust caps may occur.**

5. Tighten the bearing caps evenly in the order shown in several passes.

Note

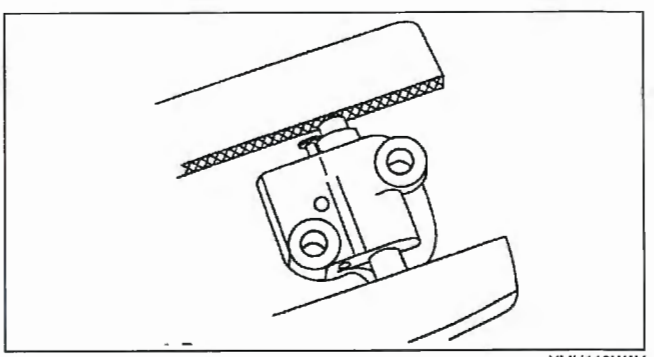
- After adjusting the camshaft end play using the thrust caps 1L and 6L, tighten the other bearing caps.



B6U2215W107

ain Tensioner (LH) Installation Note

1. Set the chain tensioner (LH) in a vise with jaw protectors.



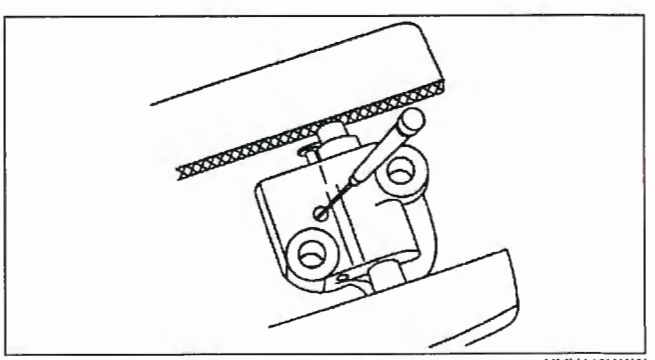
YMU110WAV

2. Using a thin screwdriver, hold the chain tensioner (LH) ratchet lock mechanism away from the ratchet stem.

Note

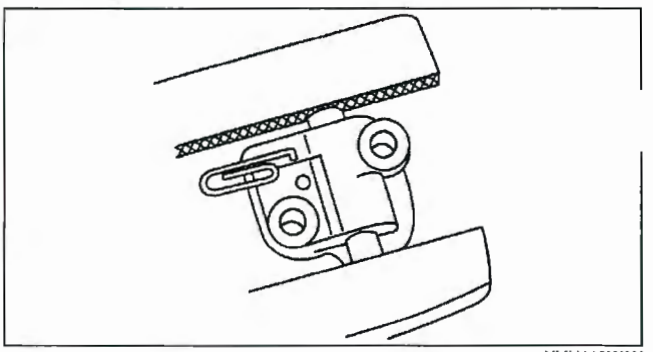
- The piston should retract with minimal force. If binding occurs, remove the tensioner from the vise and reset it in the vise.

3. Slowly compress the tensioner piston.



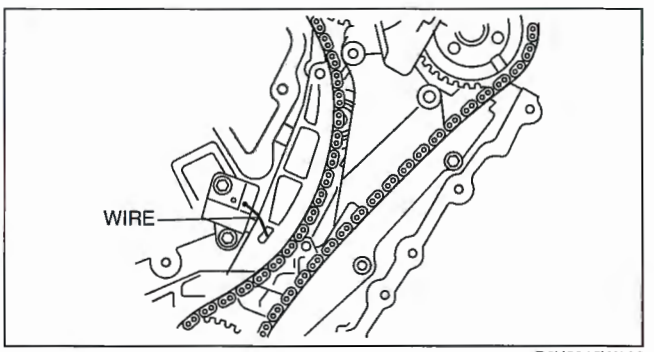
YMU110WAW

4. Hold the tensioner piston using a **1.5 mm {0.059 in}** wire or paper clip.



YMU110WAX

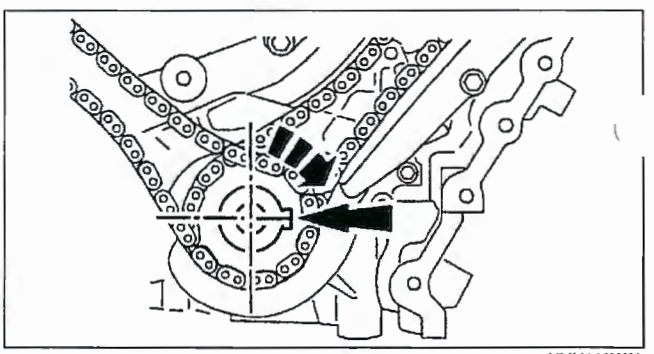
5. Install the chain tensioner (LH) and remove the retaining wire.



B6U2215W006

Timing Chain Component (RH) Installation Note

1. Rotate the crankshaft clockwise until the keyway is in the 3 o'clock position.

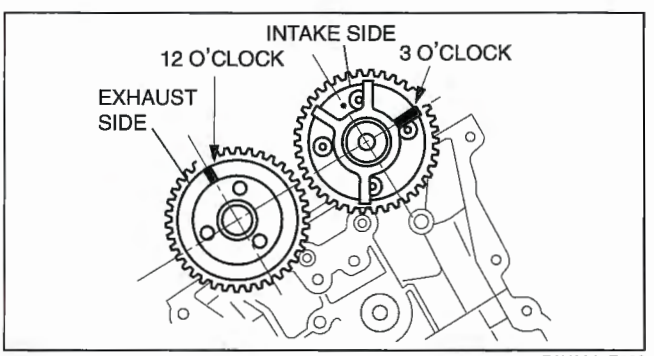


YMU110WAL

2. Position the mark on the exhaust camshaft to 12 o'clock position.
3. Position the mark on the intake camshaft to 3 o'clock position.

Note

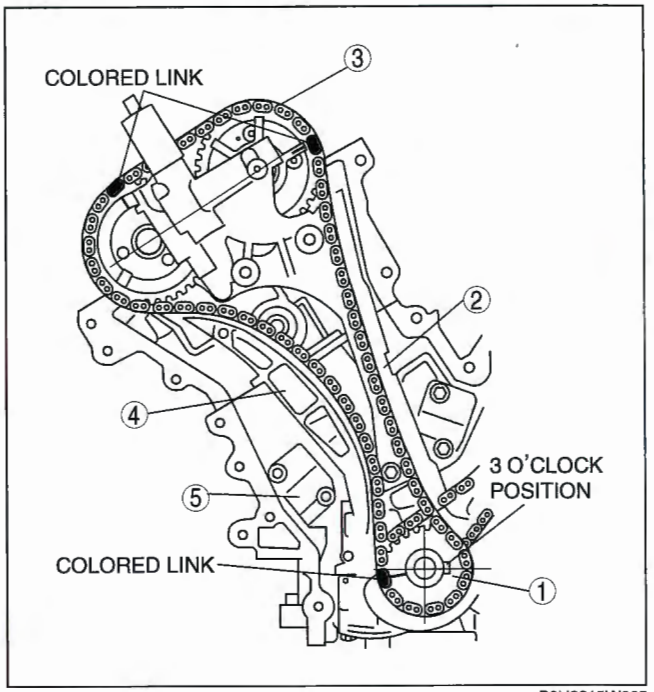
- Install the timing chain (RH) by aligning the colored links on the timing chain (RH) with the marks on the timing sprockets.



B6U2215E003

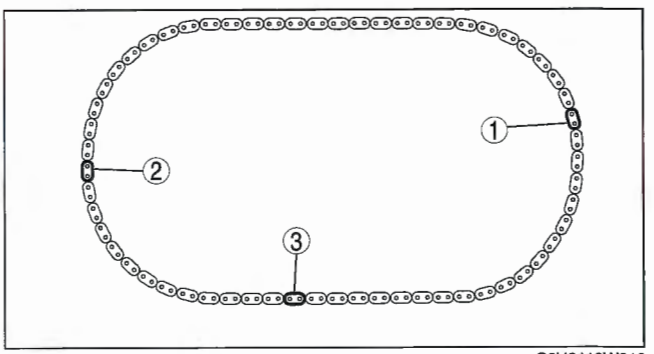
4. Install the timing chain (RH) in the following order.
   (1) Timing chain crankshaft sprocket
   (2) Chain guide
   (3) Timing chain
   (4) Tensioner arm
   (5) Chain tensioner

Note
- The chain guide should be installed to the actuator and allowed to hang freely when the bolts are installed. Do not hold the chain guide in an upward position when the bolts are installed. The actuator causes a wear O-ring and this installation method will allow that wear to continue.



B6U2215W005

Note
- If timing marks in the timing chains are not evident, use a permanent-type marker to mark the crankshaft and camshaft timing marks on the timing chain.
  1. Mark any link to use as the crankshaft timing mark.
  2. Count 29 links from the crankshaft timing mark and mark as the exhaust camshaft sprocket timing mark.
  3. Continue counting to 42 mark the link as the intake camshaft sprocket timing mark.

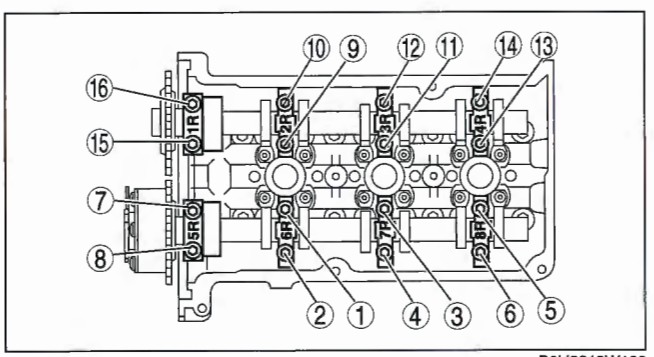


C6U0110W016

Caution
- **Install the camshaft journal thrust caps last, or damage to the thrust caps may occur.**

5. Tighten the bearing caps evenly in several passes in the order shown.

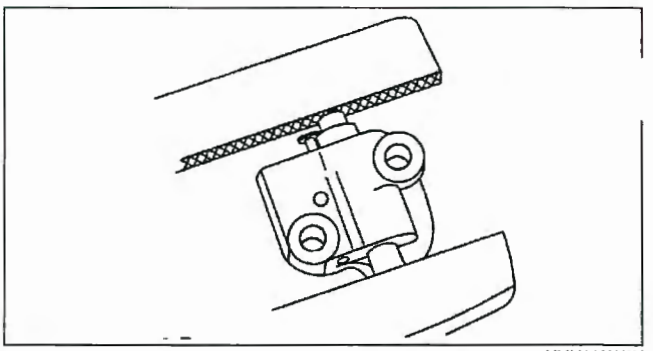
Note
- After adjusting the camshaft end play using the thrust caps 1R and 5R, tighten the other bearing caps.



B6U2215W108

Chain Tensioner (RH) Installation Note

1. Set the chain tensioner (RH) in a vise with jaw protectors.

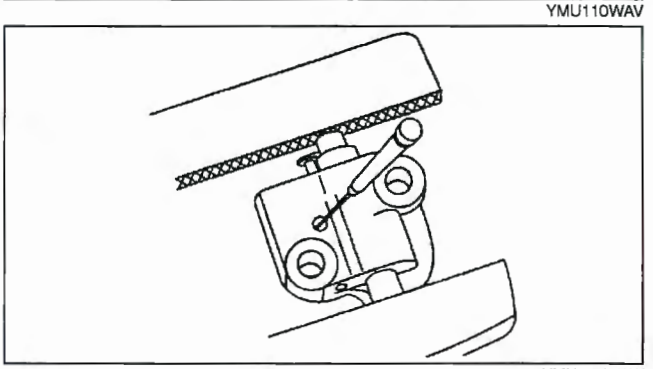


YMU110WAV

2. Using a thin screwdriver, hold the chain tensioner (RH) ratchet lock mechanism away from the ratchet stem.

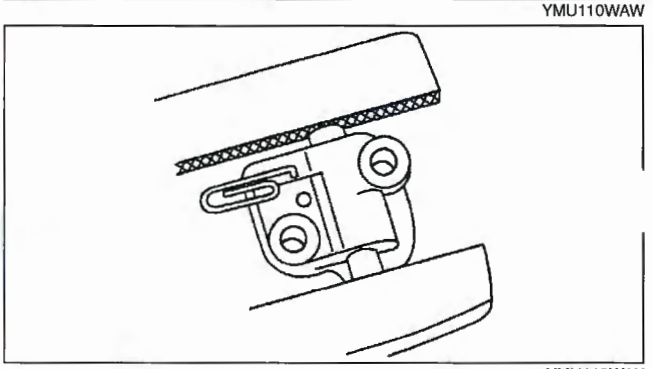
   Note
   - The piston should retract with minimal force. If binding occurs, remove the tensioner from the vise and reset it in the vise.

3. Slowly compress the tensioner piston.



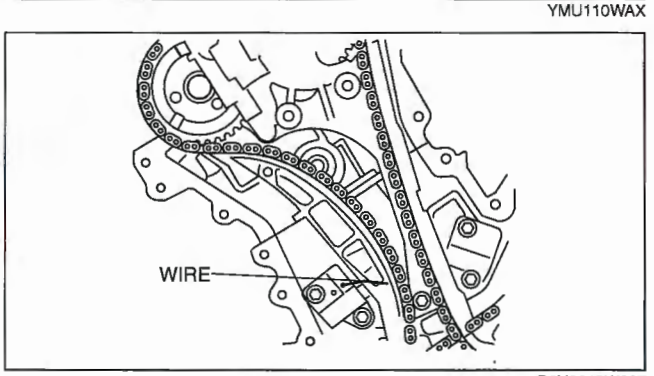
YMU110WAW

4. Hold the tensioner piston using a **1.5 mm {0.059 in}** wire or paper clip.



YMU110WAX

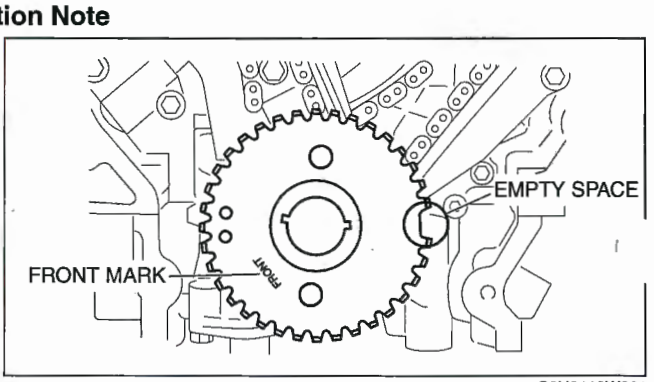
5. Install the chain tensioner (RH) and remove the retaining wire.



B6U2215W007

Crankshaft Position (CKP) Sensor Pulse Wheel Installation Note

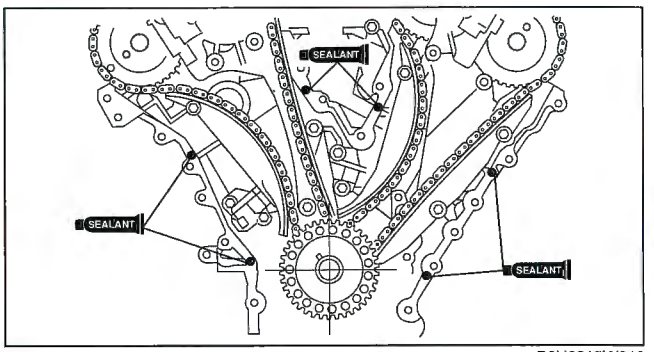
1. With the "FRONT" mark of the pulse wheel facing you, install the crankshaft position (CKP) sensor pulse wheel using the keyway on the same side as the empty space shown in figure.



C6U0110W001

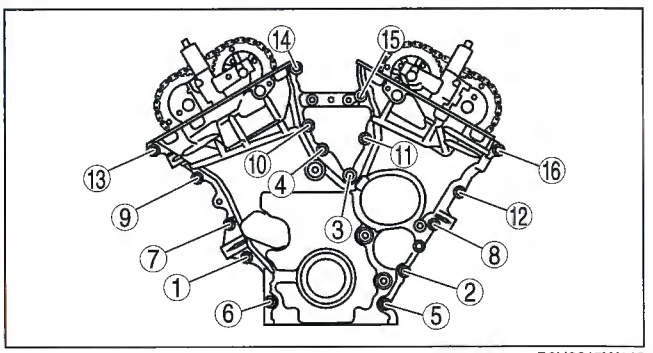
Engine Front Cover Installation Note

1. Apply a **6 mm {0.24 in}** dot of silicone sealant at the indicated location.



B6U2215W010

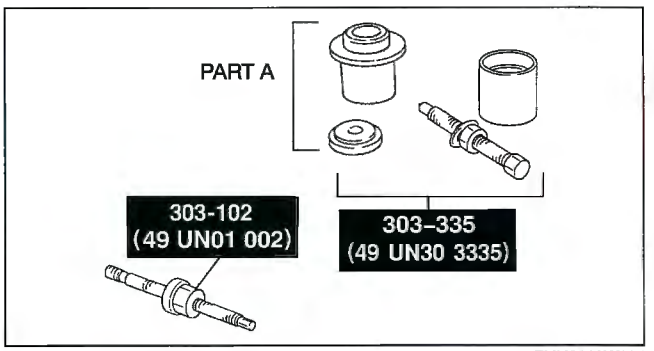
2. Install the remaining bolts and studs, and then tighten all bolts and studs in the order shown.



B6U2215W116

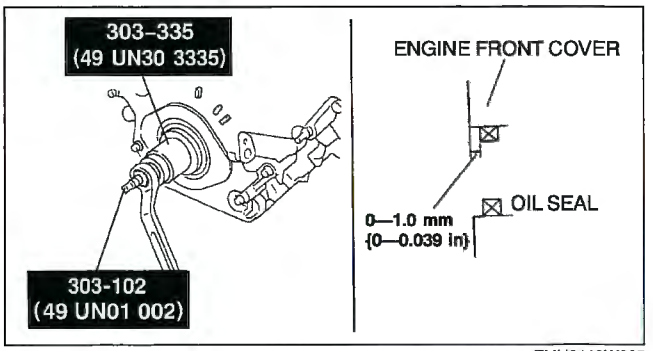
Front Oil Seal Installation Note

1. Assemble the front oil seal using part A of the **SST**[303-335 (49 UN30 3335)] and the **SST** [303-102 (49 UN01 002)].
2. Apply clean engine oil to the oil seal.
3. Push the oil seal slightly in by hand.



ZMU0110W004

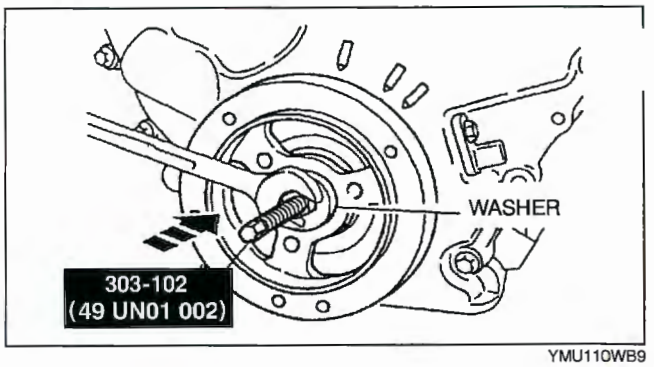
4. Compress the oil seal using the **SSTs**.



ZMU0110W005

Crankshaft Pulley Installation Note

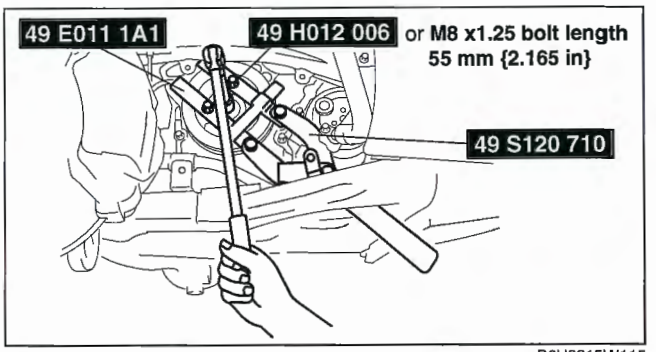
1. Seal the keyway in the crankshaft pulley using silicone sealant.
2. Install the crankshaft pulley using the **SST** and the crankshaft pulley lock bolt washer.



YMU110WB9

Crankshaft Pulley Lock Bolt Installation Note

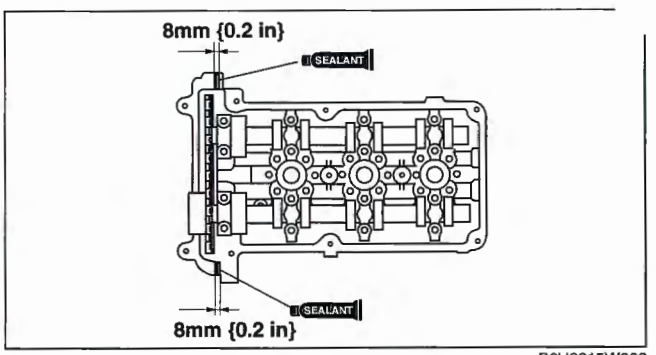
1. Hold the crankshaft pulley using the **SSTs.**
2. Tighten the new crankshaft pulley lock bolt in four steps.
   (1) Tighten to **120 N·m {12.2 kgf·m, 88.5 ft·lbf}**.
   (2) Loosen **360°** (one full turn) in reverse order.
   (3) Tighten to **47—53 N·m {4.8—5.4 kgf·m, 35—39 ft·lbf}**.
   (4) Tighten **85°—95°**.
3. Install the A/C compressor.



B6U2215W115

Cylinder Head Cover (RH) Installation Note

1. Apply silicone sealant to the mating faces as shown.
2. Install the cylinder head cover with a new gasket.

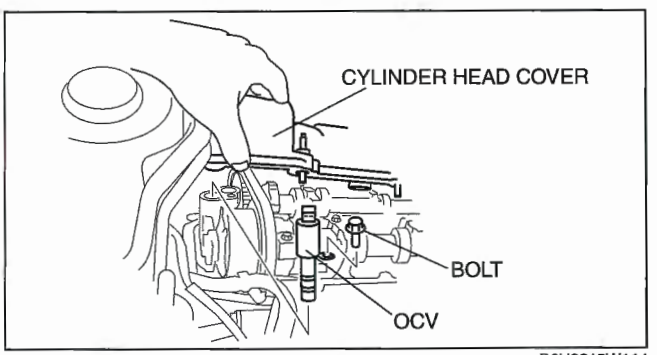


B6U2215W008

3. Install the oil control valve (OCV) with cylinder head cover raised as shown in the figure.

   Note
   - Take care not to let the OCV tightening bolt slip into the timing chain cover when Installing the OCV tightening bolt from engine front.

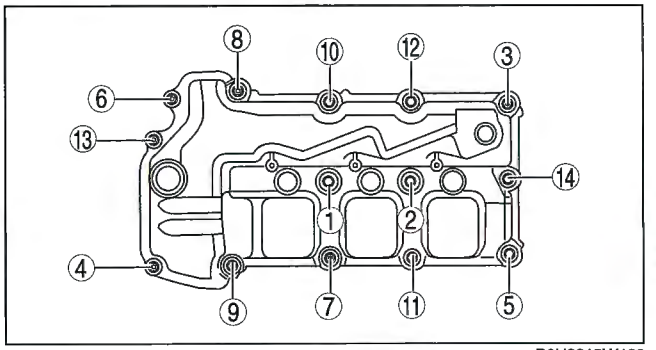
   Tightening torque
   8.0—12.0 N·m {82—122 kgf·cm, 71—106 in·lbf}



B6U2215W114

4. Install the cylinder head cover.

5. Tighten the bolts in the order shown.



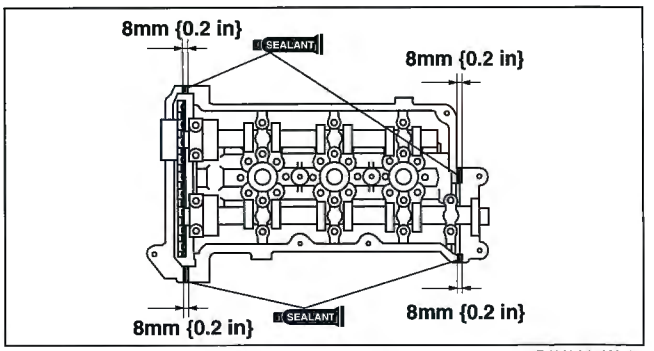
B6U2215W109

Engine Hanger Installation Note

1. Lift up the vehicle and tighten the engine hanger installation bolts from under the vehicle.

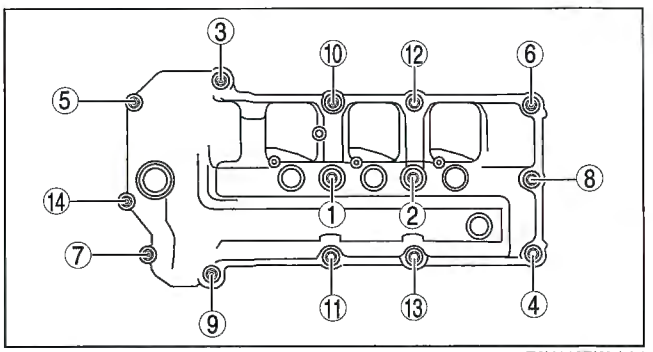
Cylinder Head Cover (LH) Installation Note

1. Apply silicone sealant to the mating faces as shown.
2. Install the cylinder head cover with a new gasket.



B6U2215W009

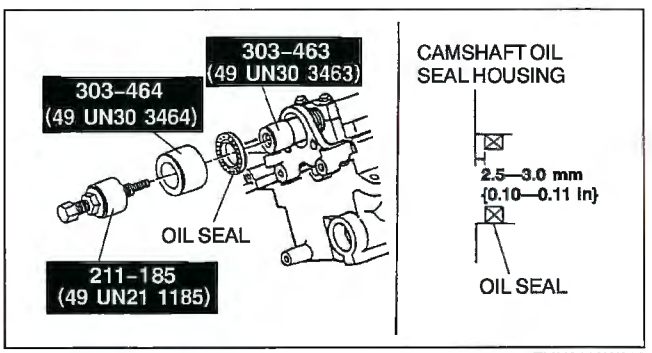
Tighten the bolts in the order shown.



E6U110BW5L04

Camshaft Oil Seal Installation Note

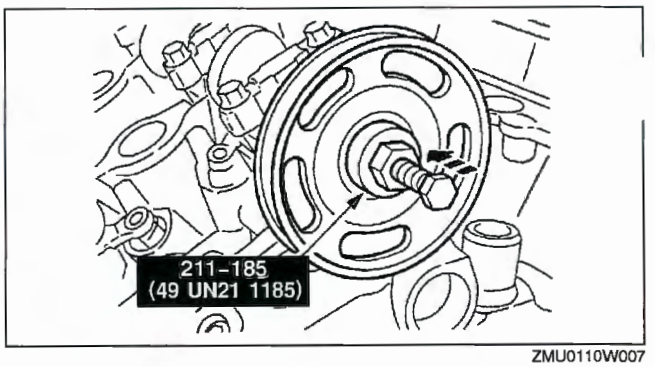
1. Apply clean engine oil to the camshaft oil seal.
2. Install the camshaft oil seal using the **SSTs**.



ZMU0110W006

Water Pump Drive Belt Pulley Installation Note

1. Install the water pump pulley using the **SST**.



ZMU0110W007

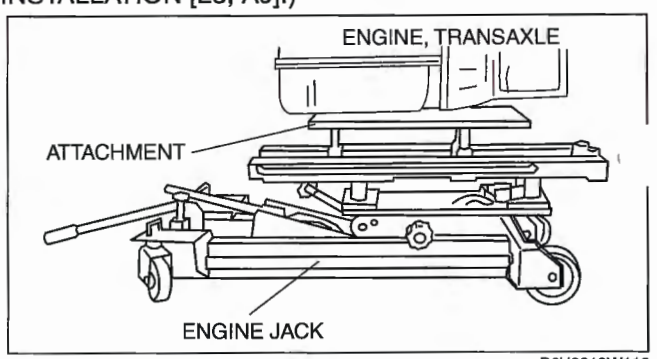
CYLINDER HEAD GASKET REPLACEMENT [AJ]

E6U011010271W01

Warning

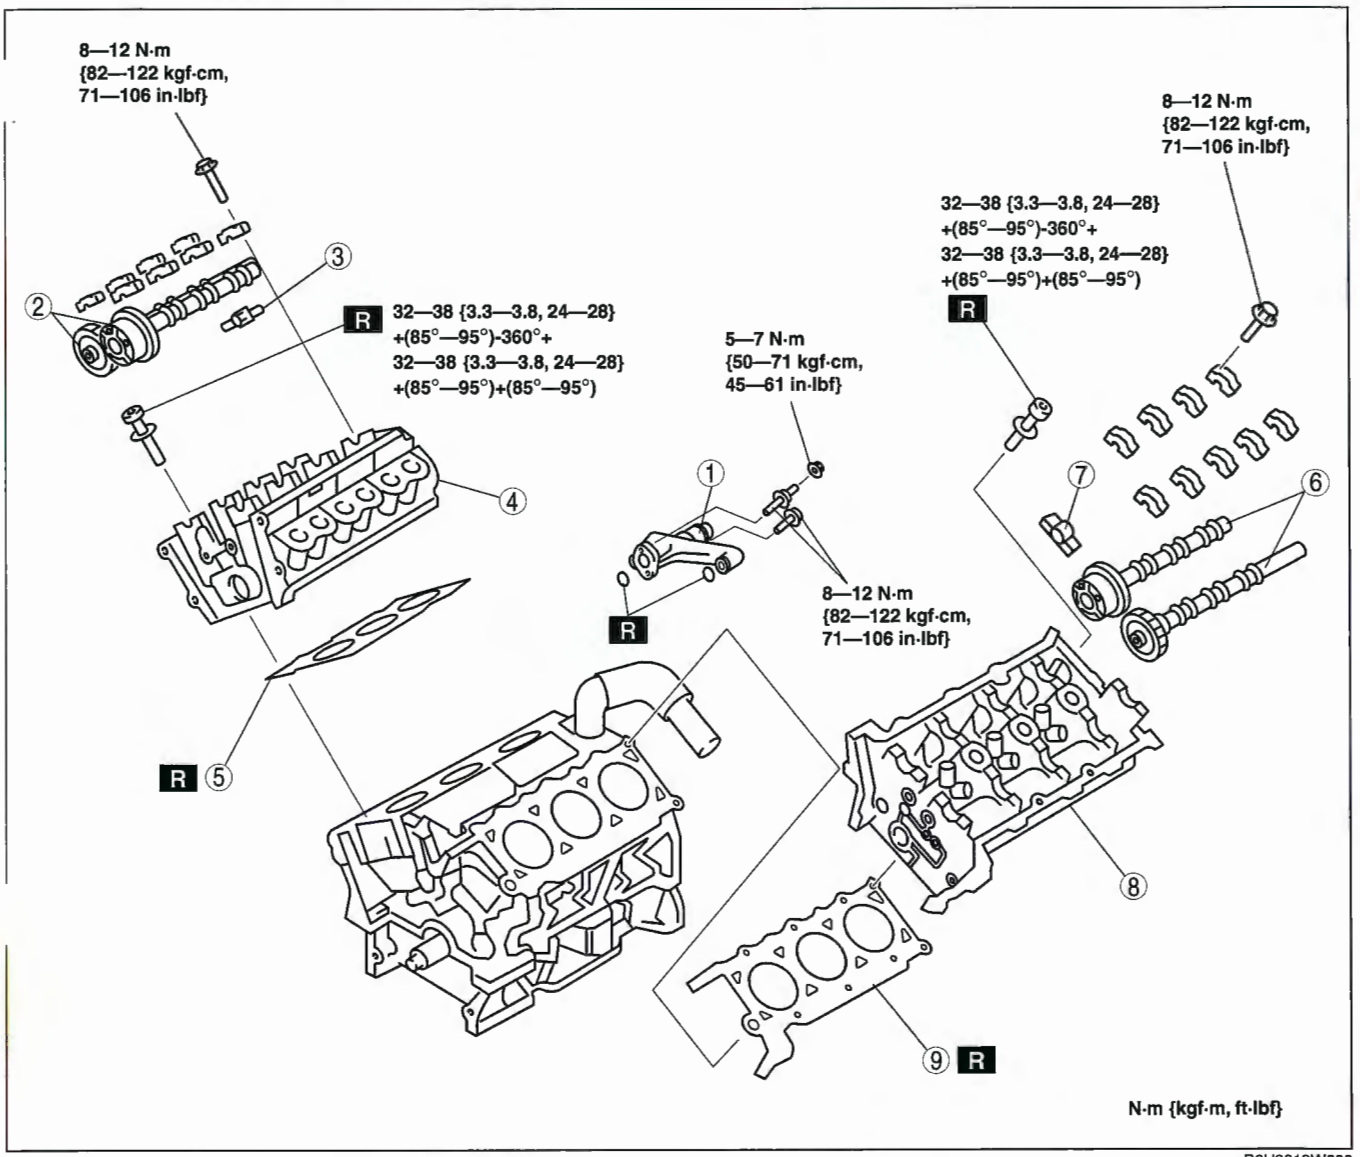
- **Fuel vapor is hazardous. It can very easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure". (See 01–14A–6 Fuel Line Safety Procedure.)**

1. Drain the engine coolant. (See 01–12A–3 COOLING SYSTEM SERVICE WARNINGS [L3, AJ].)
2. Remove the water pump. (See 01–12A–10 WATER PUMP REMOVAL/INSTALLATION [L3, AJ].)
3. Remove the timing chain. (See 01–10C–6 TIMING CHAIN REMOVAL/INSTALLATION [AJ].)
4. Install the oil pan. (See 01–11A–8 OIL PAN REMOVAL/INSTALLATION [L3, AJ].)
5. Secure the engine and the transaxle using an engine jack and attachment as shown.
6. Remove in the order indicated in the table.



B6U2218W110

7. Install in the reverse order of removal.



B6U2218W003

1	Water bypass tube (See 01–10C–26 Water Bypass Tube Removal Note)
2	Camshaft (RH) (See 01–10C–26 Camshaft (RH) Removal Note) (See 01–10C–28 Camshaft (RH) Installation Note)
3	Rocker arm (RH)
4	Cylinder head (RH) (See 01–10C–27 Cylinder Head (RH) Removal Note) (See 01–10C–28 Cylinder Head (RH) Installation Note)

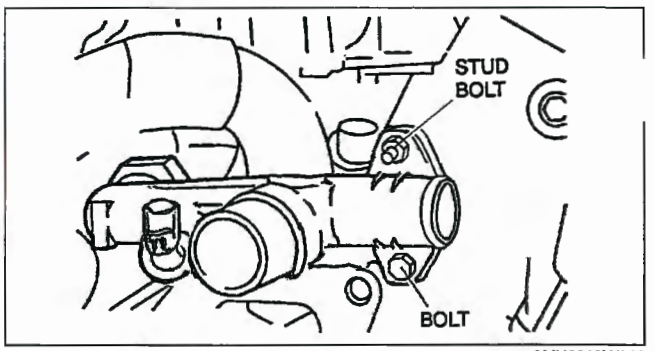
9	Cylinder head gasket (LH)

Water Bypass Tube Removal Note

1. Remove the water bypass tube installation stud bolt and bolt, and disconnect the water bypass tube from the cylinder head.



AMU2218W002

Camshaft (RH) Removal Note

Caution

- **Remove the camshaft bearing thrust caps No. 1R and 5R first. Do not loosen any of the other bolts until the thrust caps are removed, or damage to the thrust caps may occur.**

Note

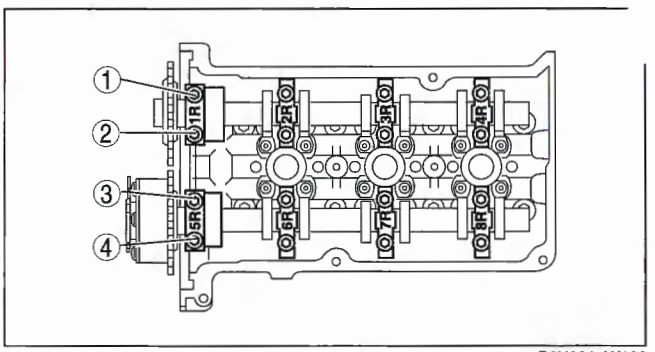
- Cylinder head and the camshaft bearing caps are numbered to make sure they are assembled in their original position. When removed, keep the bearing caps with the cylinder head from where they were removed together. Do not mix the caps.

1. Loosen bolts in several passes.

Note

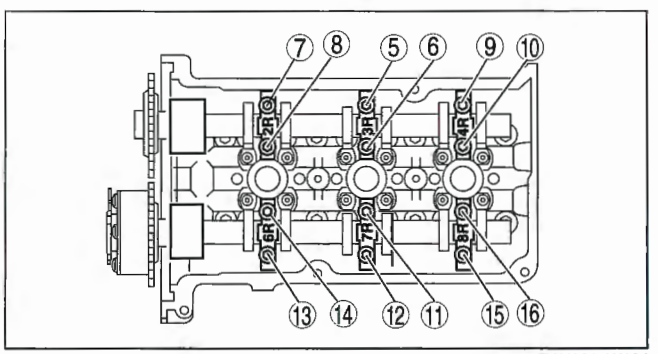
- Do not remove bolts completely.

2. Remove the RH camshaft thrust caps 1R and 5R.



B6U2215W103

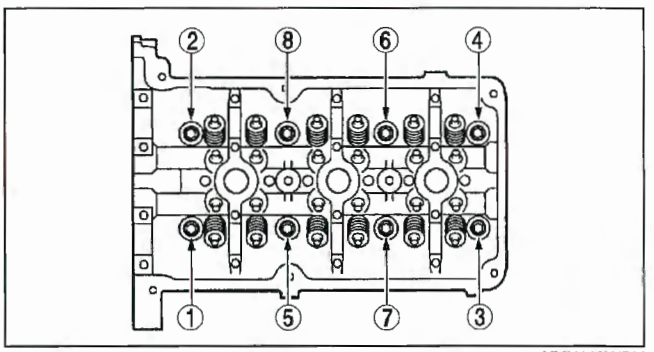
3. Loosen the remaining bolts 7–8 turns in the indicated sequence in several passes to allow the camshafts (RH) to be slowly raised.



B6U2215W104

Cylinder Head (RH) Removal Note

1. Loosen the cylinder head bolts in several passes in the order shown.



YMU110WBM

Camshaft (LH) Removal Note

Caution

- **Remove the camshaft bearing thrust caps No. 1L and 6L first. Do not loosen any of the other bolts until the thrust caps are removed, or damage to the thrust caps may occur.**

Note

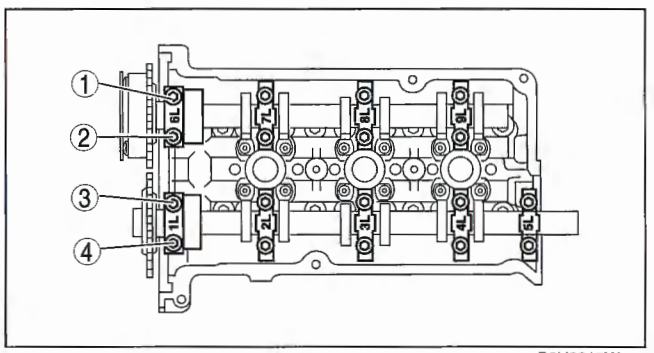
- Cylinder head and the camshaft bearing caps are numbered to make sure they are assembled in their original position. When removed, keep the bearing caps with the cylinder head from where they were removed together. Do not mix the caps.

1. Loosen bolts in several passes.

Note

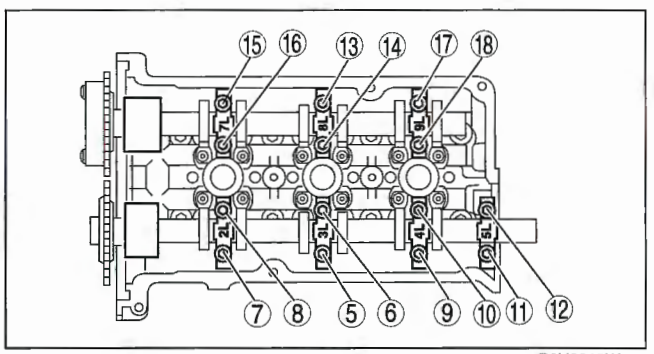
- Do not remove bolts completely.

Remove the camshaft (LH) thrust caps 1L and 6L.



B6U2215W105

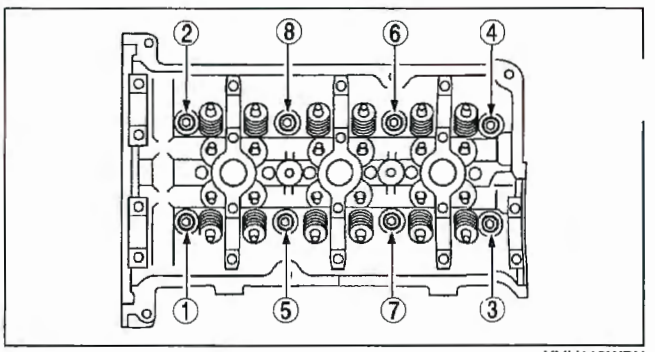
3. Loosen the remaining bolts 7—8 turns in the indicated sequence to allow the camshaft (LH) to rise.



B6U2215W106

Cylinder Head (LH) Removal Note

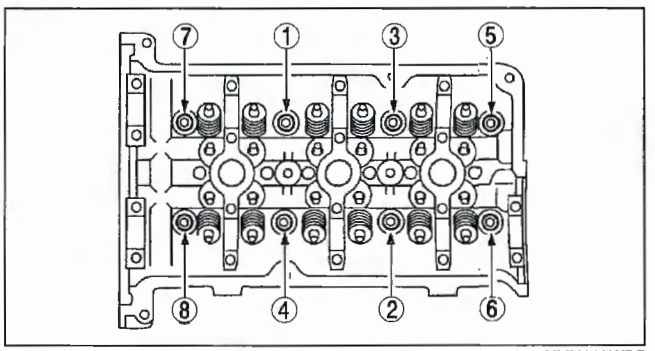
1. Loosen the cylinder head bolts in several passes in the order shown.



YMU110WBN

Cylinder Head (LH) Installation Note

1. Tighten the cylinder head bolts in the order shown using the following 6 steps.
   (1) Tighten to **32—38 N·m {3.3—3.8 kgf·m, 24—28 ft·lbf}**.
   (2) Tighten **85°—95°**.
   (3) Loosen **360°** (one full turn) in reverse order.
   (4) Tighten to **32—38 N·m {3.3—3.8 kgf·m, 24—28 ft·lbf}**.
   (5) Tighten **85°—95°**.
   (6) Tighten **85°—95°**.



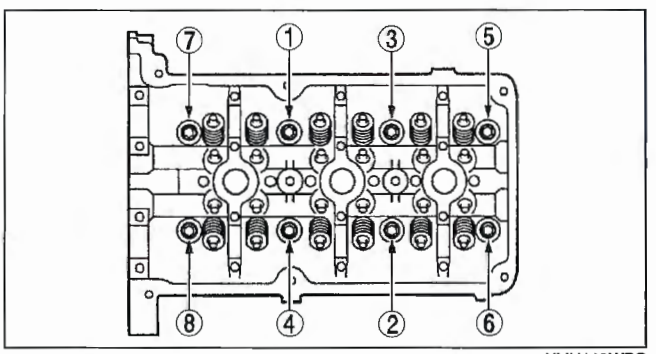
YMU110WBP

Camshaft (LH) Installation Note

1. Install the camshaft (LH) referring to Timing Chain Component (LH) Installation Note in TIMING CHAIN REMOVAL/INSTALLATION. (See 01–10C–16 Timing Chain Component (LH) Installation Note.)

Cylinder Head (RH) Installation Note

1. Tighten the cylinder head bolts in the order shown using the following 6 steps.
   (1) Tighten to **32—38 N·m {3.3—3.8 kgf·m, 24—28 ft·lbf}**.
   (2) Tighten **85°—95°**.
   (3) Loosen **360°** (one full turn) in reverse order.
   (4) Tighten to **32—38 N·m {3.3—3.8 kgf·m, 24—28 ft·lbf}**.
   (5) Tighten **85°—95°**.
   (6) Tighten **85°—95°**.



YMU110WBQ

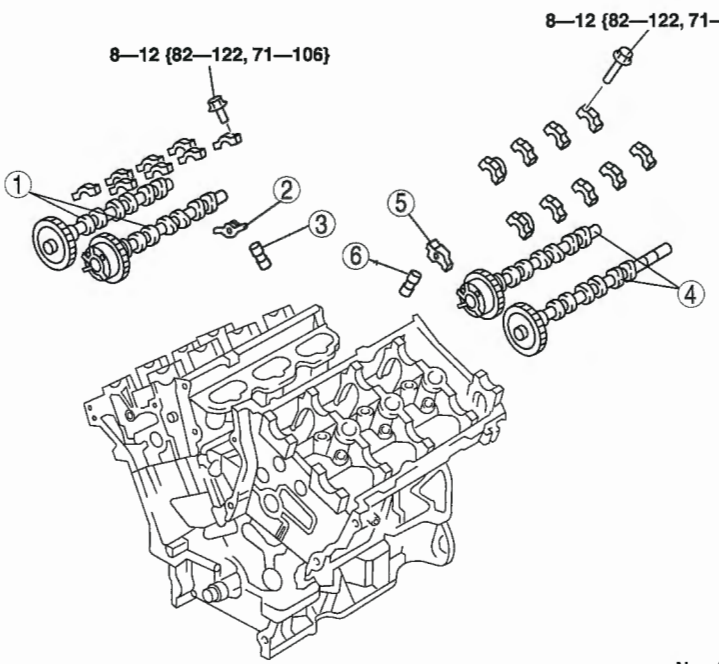
Camshaft (RH) Installation Note

1. Install the camshaft (RH) referring to Timing Chain Component (RH) Installation Note in TIMING CHAIN REMOVAL/INSTALLATION. (See 01–10C–18 Timing Chain Component (RH) Installation Note.)

HYDRAULIC LASH ADJUSTER (HLA) REMOVAL/INSTALLATION [AJ]

E6U011012100W01

1. Remove the timing chain. (See 01–10C–6 TIMING CHAIN REMOVAL/INSTALLATION [AJ].)
2. Remove in the order indicated in the table.
   Install in the reverse order of removal.



B6U2224W215

1	Camshaft (RH) (See 01–10C–29 Camshaft (RH) Removal Note) (See 01–10C–31 Camshaft (RH) Installation Note)

6	HLA (LH)

Camshaft (RH) Removal Note

Caution

- **Remove the camshaft bearing thrust caps No. 1R and 5R first. Do not loosen any of the other bolts until the thrust caps are removed, or damage to the thrust caps may occur.**

Note

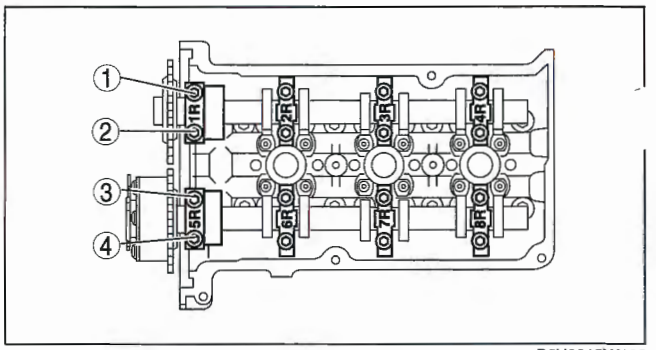
- Cylinder head and the camshaft bearing caps are numbered to make sure they are assembled in their original position. When removed, keep the bearing caps with the cylinder head from where they were removed together. Do not mix the caps.

1. Loosen bolts in several passes.

Note

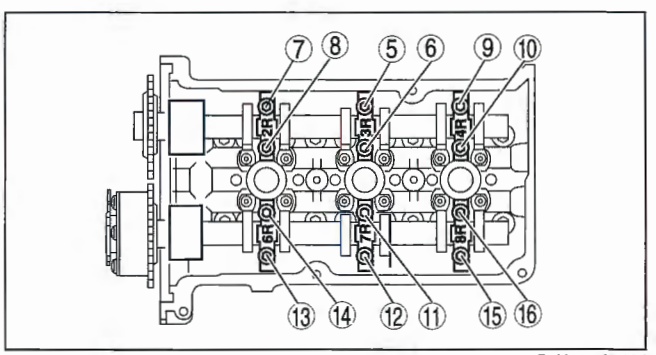
- Do not remove bolts completely.

2. Remove the RH camshaft thrust caps 1R and 5R.



B6U2215W103

3. Loosen the remaining bolts 7–8 turns in the indicated sequence in several passes to allow the camshafts (RH) to be slowly raised.



B6U2215W104

Rocker Arm (RH) Removal Note

Note
- If the rocker arm and HLA are to be reused, mark their positions to make sure they are assembled in the original location.
- Take care not to let the rocker arm slip into the timing chain cover when removing the rocker arm from engine front.

Camshaft (LH) Removal Note

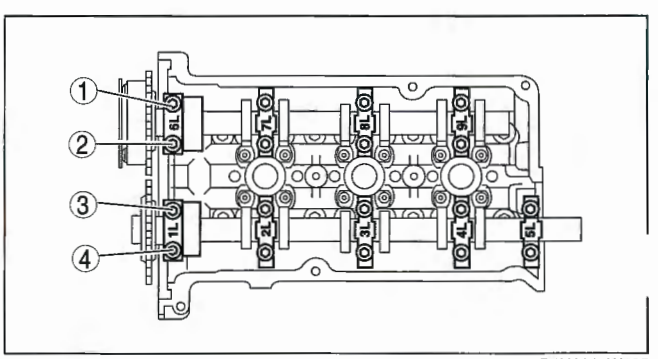
Caution
- **Remove the camshaft bearing thrust caps No. 1L and 6L first. Do not loosen any of the other bolts until the thrust caps are removed, or damage to the thrust caps may occur.**

Note
- Cylinder head and the camshaft bearing caps are numbered to make sure they are assembled in their original position. When removed, keep the bearing caps with the cylinder head from where they were removed together. Do not mix the caps.

1. Loosen bolts in several passes.

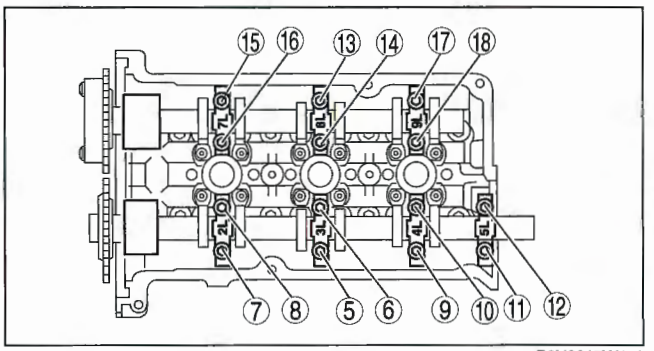
Note
- Do not remove bolts completely.

2. Remove the camshaft (LH) thrust caps 1L and 6L.



B6U2215W105

3. Loosen the remaining bolts 7—8 turns in the indicated sequence to allow the camshaft (LH) to rise.



B6U2215W106

Rocker Arm (LH) Removal Note

Note
- If the rocker arm and HLA are to be reused, mark their positions to make sure they are assembled in the original location.
- Take care not to let the rocker arm slip into the timing chain cover when removing the rocker arm from engine front.

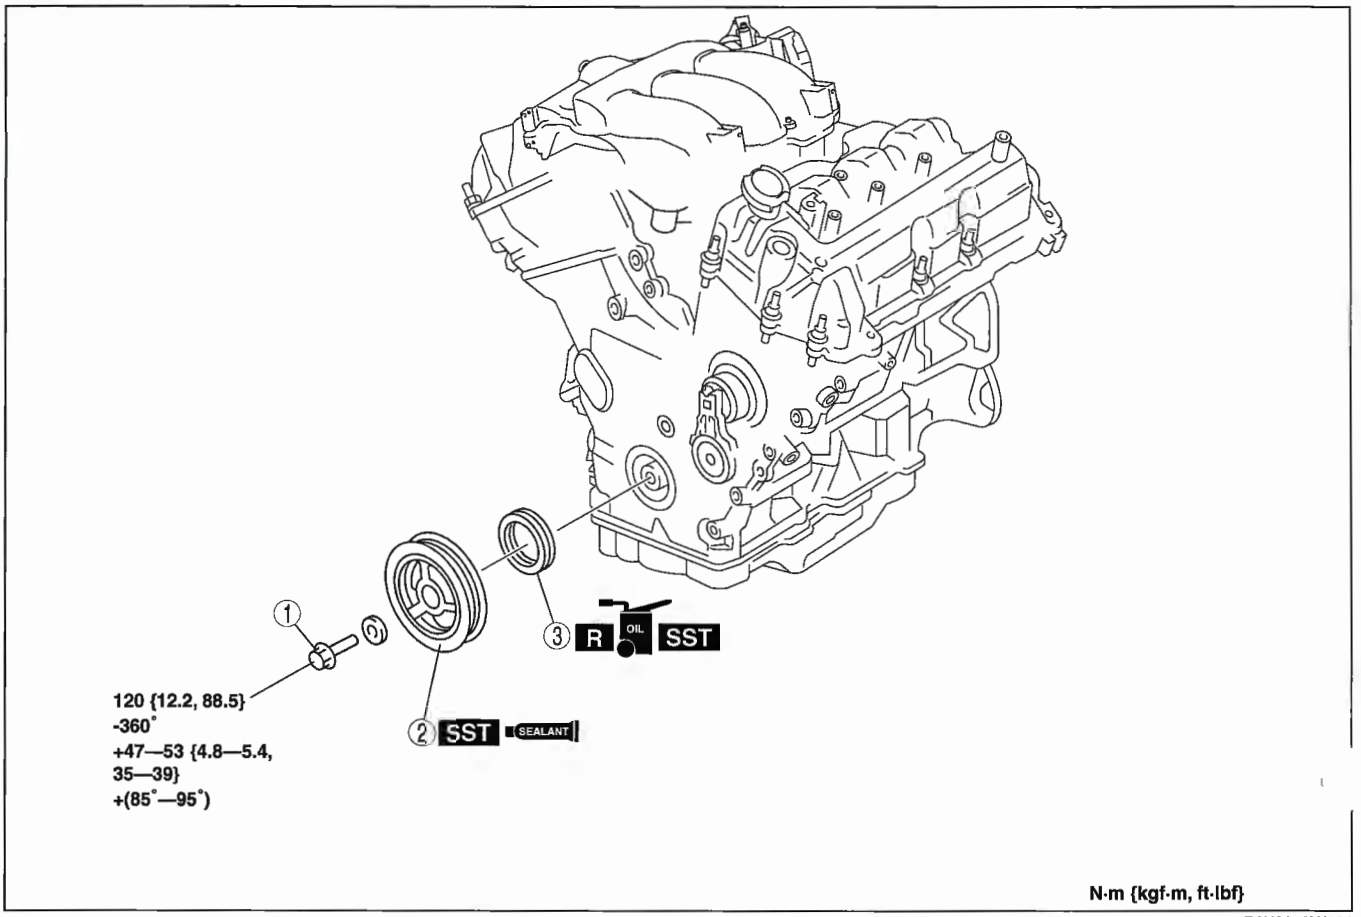
Camshaft (LH) Installation Note
1. Install the camshaft (LH) referring to Timing Chain Component (LH) Installation Note in TIMING CHAIN REMOVAL/INSTALLATION. (See 01–10C–16 Timing Chain Component (LH) Installation Note.)

Camshaft (RH) Installation Note
1. Install the camshaft (RH) referring to Timing Chain Component (RH) Installation Note in TIMING CHAIN REMOVAL/INSTALLATION. (See 01–10C–18 Timing Chain Component (RH) Installation Note.)

FRONT OIL SEAL REPLACEMENT [AJ]

E6U011010602W01

1. Disconnect the negative battery cable.
2. Remove the drive belt. (See 01–10C–4 DRIVE BELT REPLACEMENT [AJ].)
3. Remove in the order indicated in the table.
4. Install in the reverse order of removal.



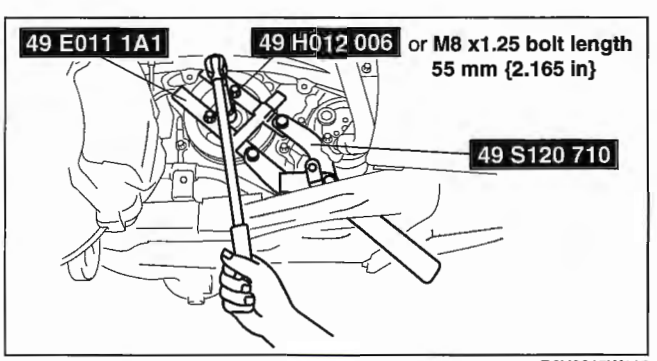
B6U2220W001

1	Crankshaft pulley lock bolt (See 01–10C–32 Crankshaft Pulley Lock Bolt Removal Note) (See 01–10C–34 Crankshaft Pulley Lock Bolt Installation Note)

2	Crankshaft pulley
3	Front oil seal (See 01–10C–33 Front Oil Seal Removal Note) (See 01–10C–33 Front Oil Seal Installation Note)

Crankshaft Pulley Lock Bolt Removal Note

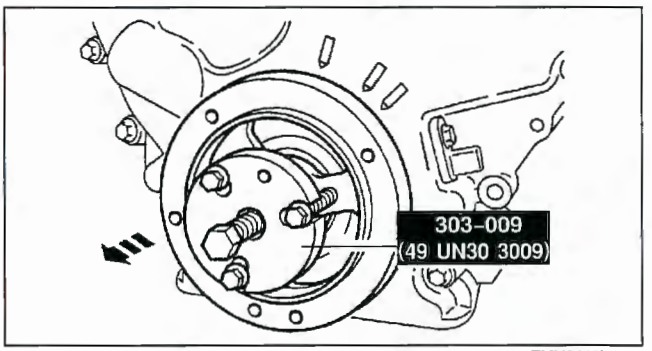
1. Hold the crankshaft pulley using the **SSTs**.



B6U2215W115

Crankshaft Pulley Removal Note

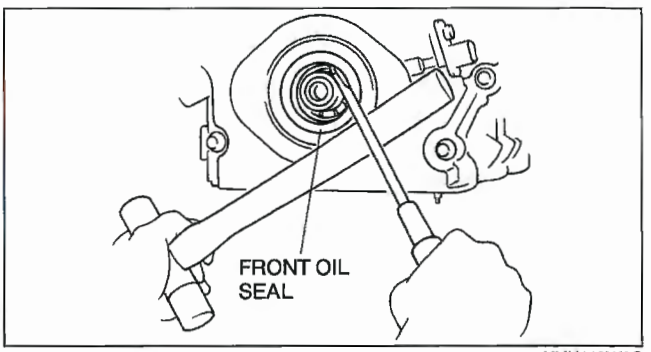
1. Remove the A/C compressor with the pipes still connected.
2. Remove the crankshaft pulley using the **SST**.



ZMU0110W003

Front Oil Seal Removal Note

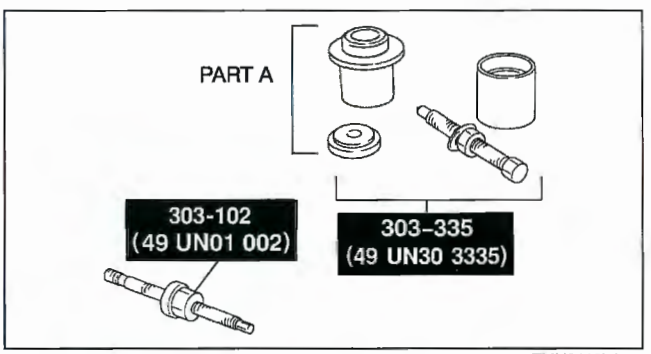
1. Remove the front oil seal using a screwdriver as shown.



YMU110WAG

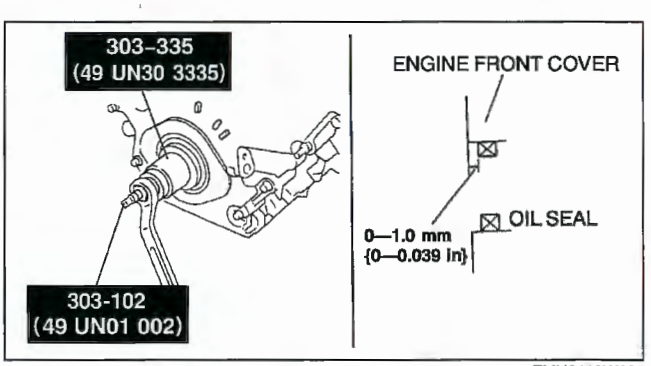
ɔnt Oil Seal Installation Note

. Assemble the front oil seal using part A of the **SST** [303-335 (49 UN30 3335)] and the **SST** [303-102 (49 UN01 002)].
2. Apply clean engine oil to the oil seal.
3. Push the oil seal slightly in by hand.



ZMU0110W004

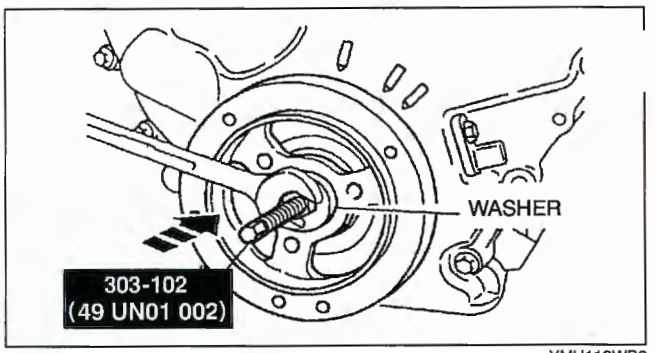
4. Compress the oil seal using the **SSTs**.



ZMU0110W005

Crankshaft Pulley Installation Note

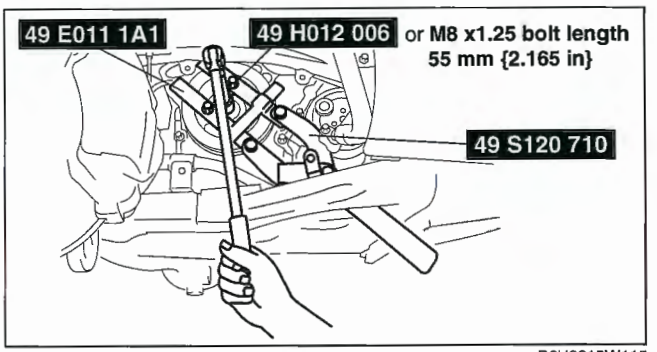
1. Seal the keyway in the crankshaft pulley using silicone sealant.
2. Install the crankshaft pulley using the **SST** and the crankshaft pulley lock bolt washer.



YMU110WB9

Crankshaft Pulley Lock Bolt Installation Note

1. Hold the crankshaft pulley using the **SSTs**.
2. Tighten the new crankshaft pulley lock bolt in four steps.
   (1) Tighten to **120 N·m {12.2 kgf·m, 88.5 ft·lbf}**.
   (2) Loosen **360°** (one full turn) in reverse order.
   (3) Tighten to **47—53 N·m {4.8—5.4 kgf·m, 35—39 ft·lbf}**.
   (4) Tighten **85°—95°**.
3. Install the A/C compressor.

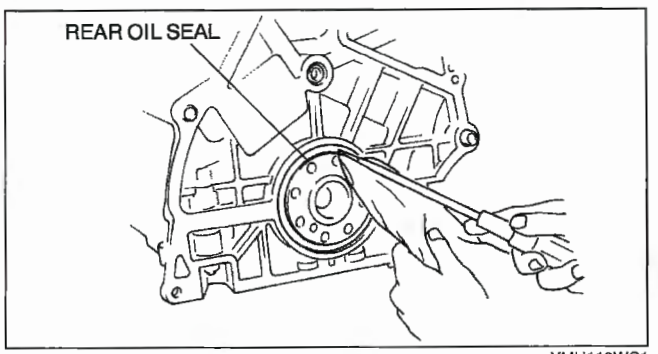


B6U2215W115

REAR OIL SEAL REPLACEMENT [AJ]

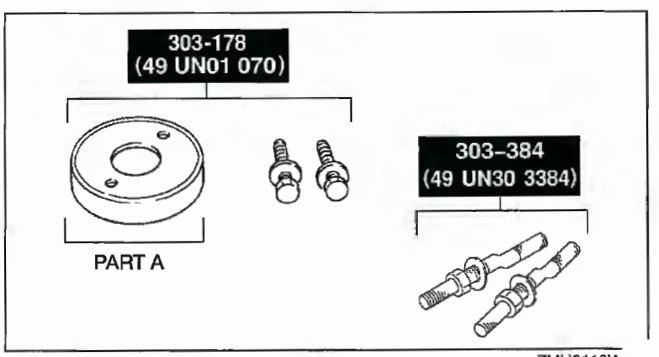
E6U011011399W01

1. Remove the flywheel. (MTX) (See 05–10–19 CLUTCH UNIT REMOVAL/INSTALLATION [G35M-R, A65M-R].)
2. Remove the drive plate. (ATX) (See 05–17B–54 DRIVE PLATE REMOVAL/INSTALLATION [AW6A-EL].)
3. Cut the oil seal lip using a razor knife.
4. Remove the rear oil seal using a screwdriver as shown.



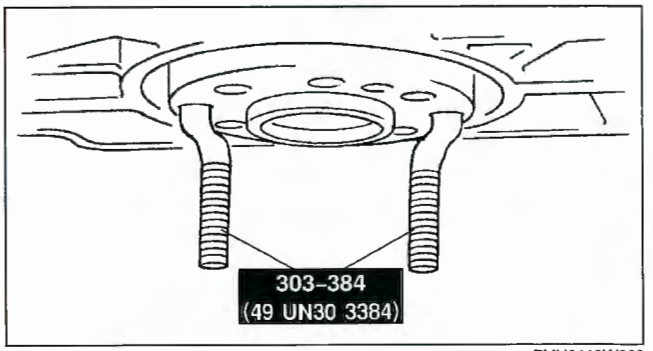
YMU110WC1

5. Install the rear oil seal with part A of the **SST** [303-178 (49 UN01 070)] and the **SST** [303-384 (49 UN30 3384)].



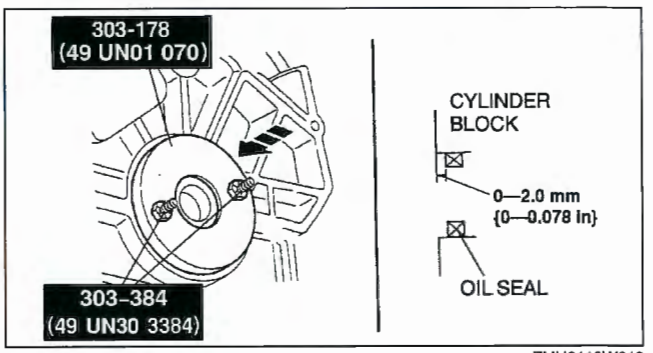
ZMU0110W

6. Install the studs of the **SST** [303-384 (49 UN30 3384)] as indicated in the figure.
7. Apply clean engine oil to the new oil seal. Push the oil seal slightly in by hand.



ZMU0110W009

9. Install part A of the **SST** [303-178 (49 UN01 070)] and compress the oil seal with the nuts of the **SST** [303-384 (49 UN30 3384)].
10. Install the drive plate. (ATX) (See 05–17B–54 DRIVE PLATE REMOVAL/INSTALLATION [AW6A-EL].)
11. Install the flywheel. (MTX) (See 05–10–19 CLUTCH UNIT REMOVAL/INSTALLATION [G35M-R, A65M-R].)



ZMU0110W010

ENGINE REMOVAL/INSTALLATION [AJ]

E6U011002000W03

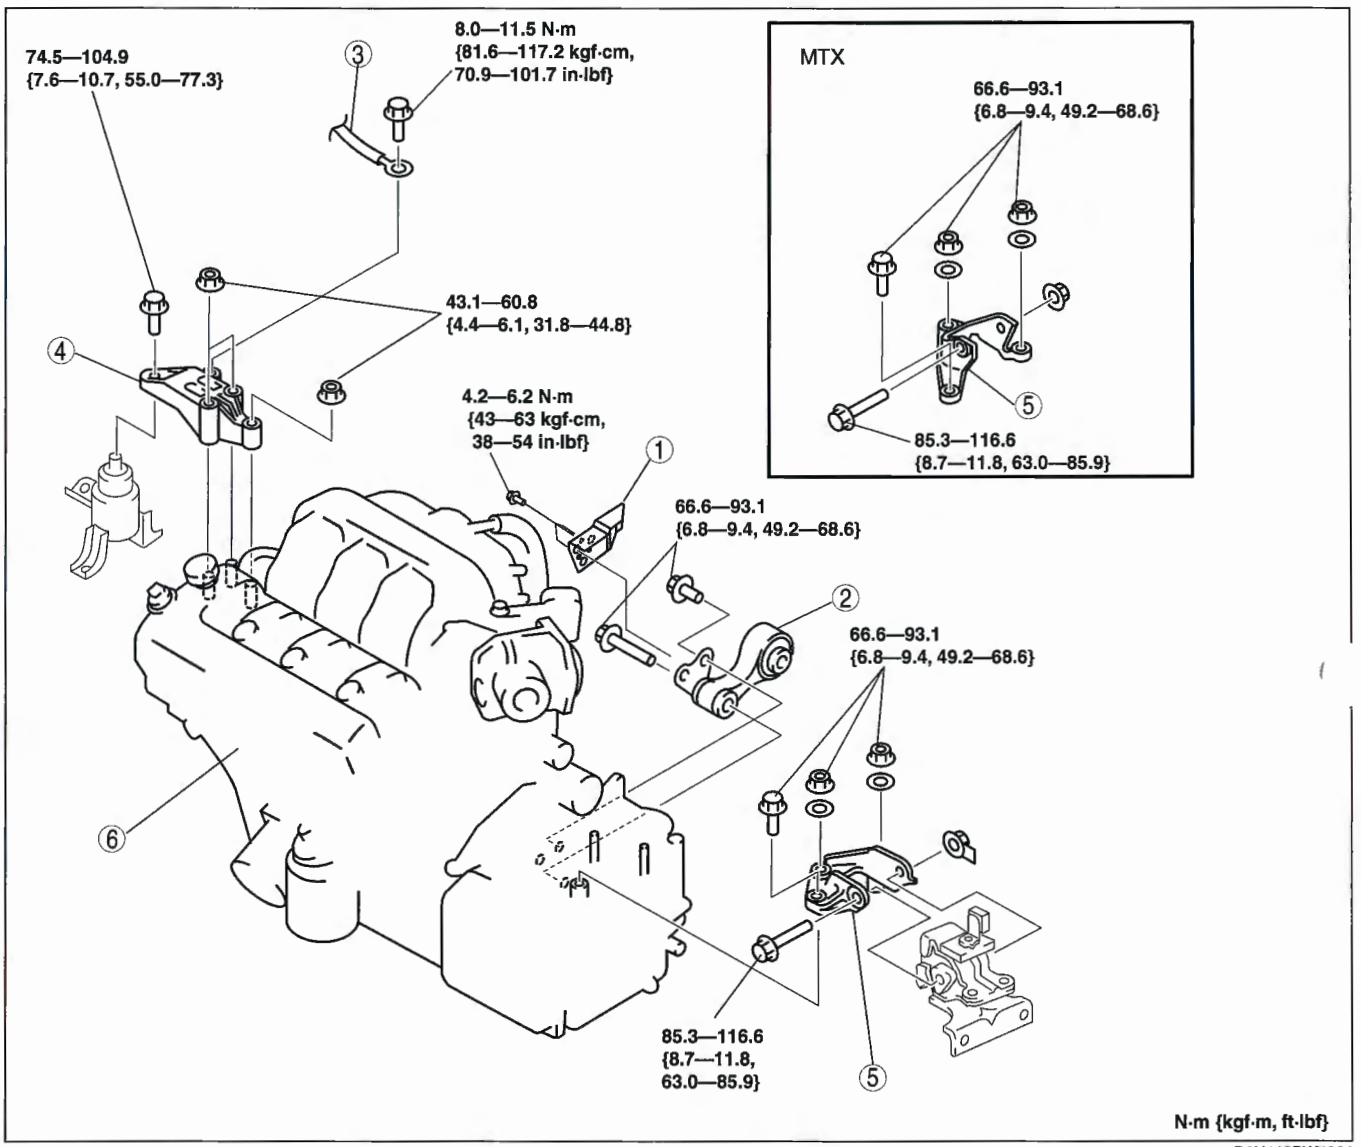
Warning

- **Fuel vapor is hazardous. It can very easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure". (See 01–14A–6 Fuel Line Safety Procedure.)**

1. Remove the under cover.
2. Drain the engine coolant. (See 01–12A–3 COOLING SYSTEM SERVICE WARNINGS [L3, AJ].)
3. Drain the ATF (ATX). (See 05–17B–12 AUTOMATIC TRANSAXLE FLUID (ATF) REPLACEMENT [AW6A-EL].) (See 05–17A–12 AUTOMATIC TRANSAXLE FLUID (ATF) REPLACEMENT [FS5A-EL].)
4. Remove the plug hole plate. (See 01–10C–6 TIMING CHAIN REMOVAL/INSTALLATION [AJ].)
5. Remove the battery and battery tray. (See 01–17A–1 BATTERY REMOVAL/INSTALLATION [L3, AJ].)
6. Remove the air cleaner, intake air duct and vacuum hose. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
7. Disconnect the ATF hose and selector cable (ATX). (See 05–17B–30 AUTOMATIC TRANSAXLE REMOVAL/INSTALLATION [AW6A-EL].)
8. Disconnect the shift cable, selector cable and clutch release cylinder (MTX). (See 05–15B–5 MANUAL TRANSAXLE REMOVAL/INSTALLATION [A65M-R].)
9. Disconnect the plastic fuel hose. (See 01–14A–28 Plastic Fuel Hose Removal Note.) (See 01–14A–29 Plastic Fuel Hose Installation Note.)
10. Disconnect the engine and PCM wiring harness
11. Remove the joint shaft (RH). (See 03–13–5 JOINT SHAFT REMOVAL/INSTALLATION [AJ].)
12. Disconnect the drive shaft (LH) from the transaxle. (See 03–13–19 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [AJ].)
13. Remove the front crossmember. (See 02–13–20 FRONT CROSSMEMBER REMOVAL/INSTALLATION.)
14. Remove the front drive belt. (See 01–10C–4 DRIVE BELT REPLACEMENT [AJ].)
15. Remove the oil level gauge pipe. (See 01–10C–6 TIMING CHAIN REMOVAL/INSTALLATION [AJ].)
16. Disconnect the P/S oil pump pipes and drain the P/S fluid reservoir. (See 06–12–32 POWER STEERING OIL PUMP DISASSEMBLY/ASSEMBLY [AJ].)
17. Remove the A/C compressor. (See 07–11–15 A/C COMPRESSOR REMOVAL/INSTALLATION [L3, AJ].)
    Remove the TWC (LH) (See 01–15C–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [AJ].)
19. Remove the front pipe. (See 01–15C–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [AJ].)
20. Disconnect the radiator hose and heater hose.
21. Remove in the order indicated in the table.
22. Install in the reverse order of removal.

23. Start the engine and:
    (1) Inspect for the engine oil, engine coolant, transaxle oil and fuel leakage.
    (2) Verify the ignition timing, idle speed and idle mixture. (See 01–10C–39 Ignition Timing Inspection.) (See 01–10C–39 Idle Speed Inspection.) (See 01–10C–40 Idle Mixture Inspection.)

Note
- If the engine is overhauled and installed to the vehicle, perform the road test and verify that there is no abnormality.



D6U110BW7001

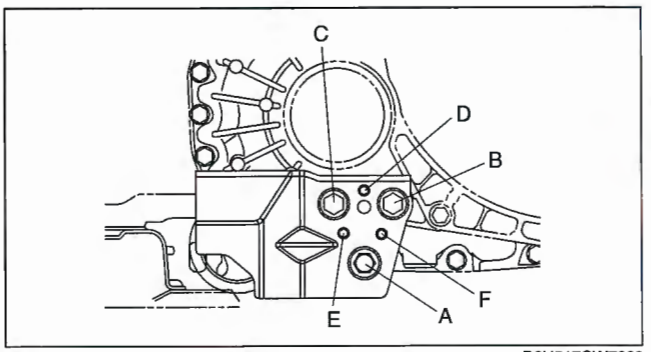
6	Engine, transaxle

No.1 Engine Mount and Insulator Installation Note

1. Align the hole of the No.1 engine mount rubber with the bolt hole of the transaxle.
2. Temporarily tighten bolt A, then tighten bolts B, C.
   Tighten bolt A.

   Tightening torque
   A, B, C: 66.6—93.1 N·m {6.8—9.4 kgf·m, 49.2—68.6 ft·lbf}

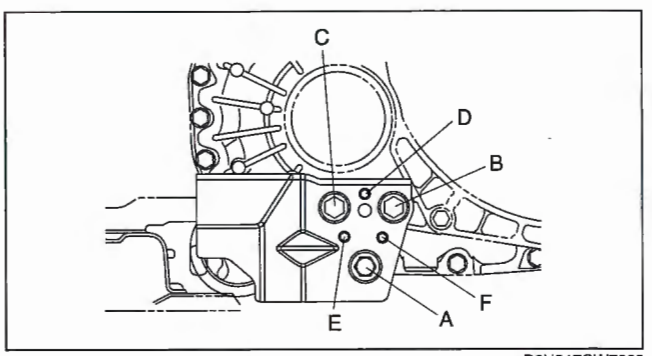
4. Align the hole of the insulator with the bolt hole of the No.1 engine mount rubber.
5. Temporarily tighten bolt D.
6. Tighten bolt E and F in the order of E→F.



D6U517CW7038

7. Tighten bolt D.

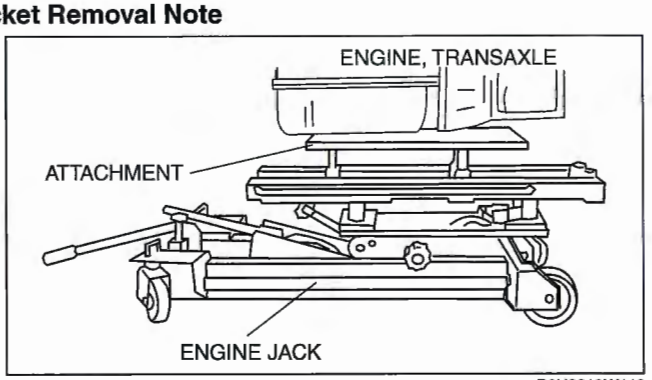
   Tightening torque
   D, E, F: 4.2—6.2 N·m {43—63 kgf·cm, 38—54 in·lbf}



D6U517CW7038

No.3 Engine Joint Bracket and No.4 Engine Mount Bracket Removal Note

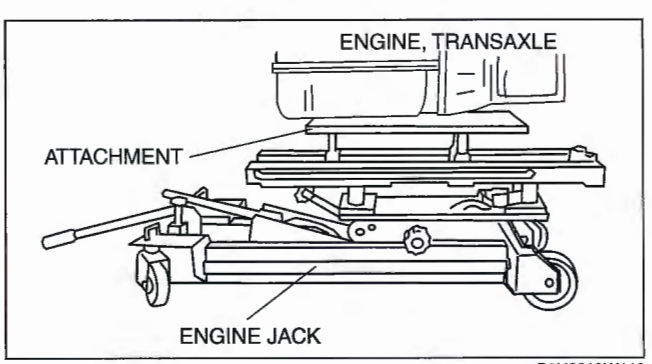
Secure the engine and the transaxle using an engine jack and attachment as shown.



B6U2218W110

No.3 Engine Joint Bracket Installation Note

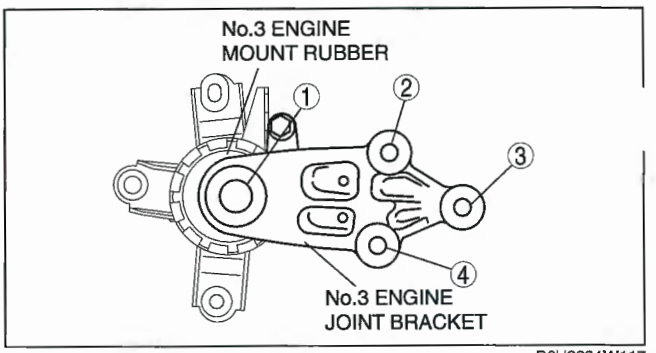
1. Secure the engine and the transaxle using an engine jack and attachment as shown.



B6U2218W110

2. Tighten the No.3 engine joint bracket bolts and nuts in the order shown.

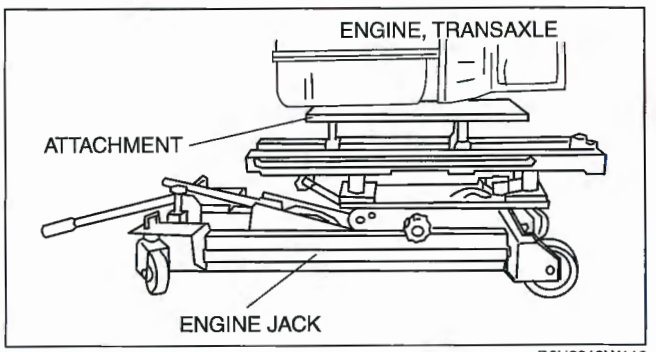
Bolt and nut No.	Tightening torque (N·m {kgf·m, ft·lbf})
1	74.5—104.9 {7.6—10.7, 55.0—77.3}
2, 3, 4	43.1—60.8 {4.4—6.1, 31.8—44.8}



B6U2224W117

No.4 Engine Mount Bracket Installation Note

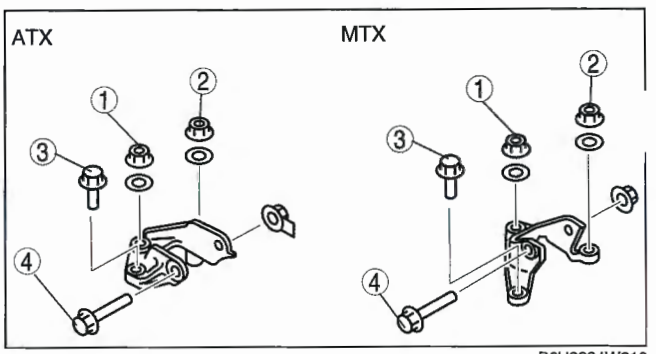
1. Secure the engine and the transaxle using an engine jack and attachment as shown.



B6U2218W110

2. Tighten the No.4 engine joint bracket bolts and nuts in the order shown.

Bolt and nut No.	Tightening torque (N·m {kgf·m, ft·lbf})
1, 2, 3	66.6—93.1 {6.8—9.4, 49.2—68.6}
4	85.3—116.6 {8.7—11.8, 63.0—85.9}



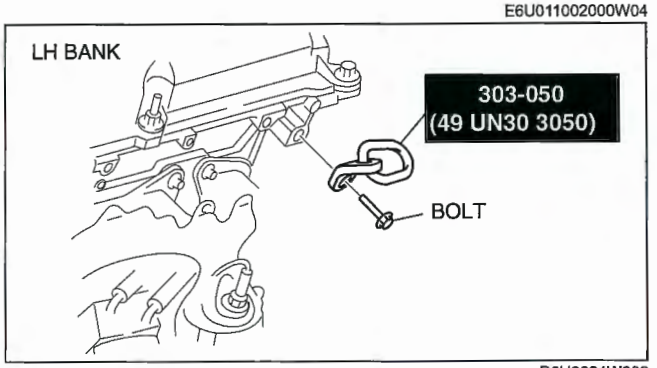
B6U2224W218

ENGINE DISASSEMBLY/ASSEMBLY [AJ]

E6U011002000W04

1. Using the bolts **part number 99794 1025** or **M10×1.25, length 25 mm {0.984 in}** to Install the **SST** as shown.

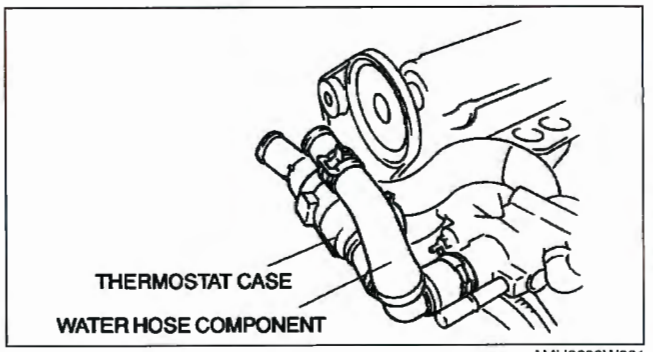
   Tightening torque
   100—125 N·m {10.2—12.7 kgf·m, 73.8—92.1 ft·lbf}



B6U2324W002

2. Remove the engine and transaxle from the engine jack.
3. Disconnect the engine and transaxle. (See 05–17B–30 AUTOMATIC TRANSAXLE REMOVAL/INSTALLATION [AW6A-EL].)
4. Remove the generator. (See 01–17A–4 GENERATOR REMOVAL/INSTALLATION [L3, AJ].)
5. Remove the P/S oil pump. (See 06–12–32 POWER STEERING OIL PUMP DISASSEMBLY/ASSEMBLY [AJ
6. Remove the intake-air system. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
7. Remove the exhaust system. (See 01–15C–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [AJ].)

8. Remove the thermostat case and water hose component.
9. Remove the water bypass tube. (See 01–10C–26 Water Bypass Tube Removal Note.)
10. Remove the Ignition coils. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)
11. Assemble in the reverse order of disassembly.



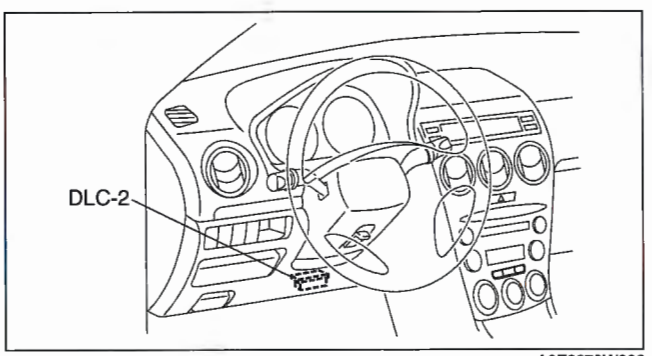
AMU3630W001

ENGINE TUNE-UP [AJ]

E6U011002000W05

Engine Tune-up Preparation

1. Turn off the electrical loads.
2. Warm up the engine as follows.
   (1) Start the engine.
   (2) Maintain the engine speed **2,500—3,000 rpm** until the cooling fans start to operate.
   (3) Release the accelerator pedal.
   (4) Wait until the cooling fans stop.
3. Connect the **SST** (WDS or equivalent) to the DLC-2.



A6E3970W002

Ignition Timing Inspection

Note
- Ignition timing is not adjustable.
- Ignition timing verification requires WDS or equivalent.

1. Verify that the ignition timing (WDS: SPARKADV PID) is within the specification using WDS or equivalent.

Ignition timing
Approx. BTDC 10°

2. Verify that ignition timing advances when the engine speed increases gradually.

Idle Speed Inspection

Note
- Idle speed is not adjustable.
- Idle speed verification requires WDS or equivalent.

1. Verify that the idle speed (WDS: RPM PID) is within the specification using WDS or equivalent.

Standard

Condition	Engine speed (rpm)*1 N,D position (ATX), Neutral position (MTX)		
	ATX		MTX
	N range	D range	
No load	650—750	600—700	700—800
Electrical loads*2 ON	700—800	600—700	700—800
PS ON	700—800	700—800	700—800
AC ON	700—800	700—800	700—800

*1 : Excludes temporary idle speed drop just after the electrical loads are turned on.
*2 : Blower motor is operating at high speed. Headlight switch is turned on. Rear window defroster switch is turned on. Cooling fans are operating.

Idle Mixture Inspection

1. Verify that the idle speed and ignition timing are within the specification. (See 01–10C–39 Idle Speed Inspection.) (See 01–10C–39 Ignition Timing Inspection.)
2. Insert an exhaust gas analyzer to the tailpipe.
3. Verify that the CO and HC concentrations are within the regulation.

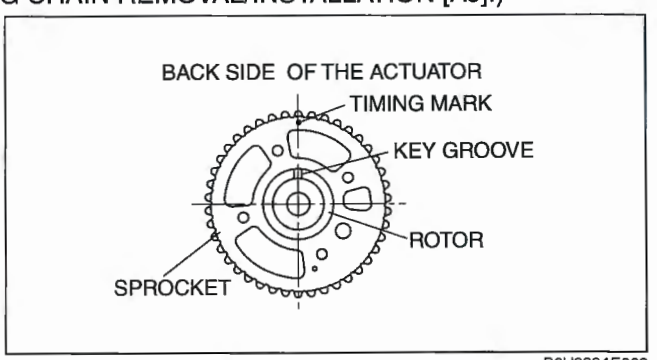
VARIABLE VALVE TIMING ACTUATOR INSPECTION [AJ]

E6U011012490W01

Caution

- **The variable valve timing actuator cannot be disassembled because it is a precision unit.**

1. Remove the cylinder head cover.(See 01–10C–6 TIMING CHAIN REMOVAL/INSTALLATION [AJ].)
2. Confirm that the key groove on the rotor and the timing mark on the sprocket of the variable valve timing actuator are aligned and fitted.
   - If the key groove and the timing mark are not aligned, rotate the crankshaft clockwise one rotation and then counterclockwise one rotation. Verify that the key groove and the timing mark are aligned.
   - If the key groove and timing mark are still not aligned, replace the variable valve timing actuator.
   - If, when rotating the crankshaft, there is a hitting noise from the variable valve timing actuator each time the cam passes the fully lifted position, it means that the actuator is not secured. Replace the actuator.



B6U2224E002

3. Install the cylinder head cover. (See 01–10C–6 TIMING CHAIN REMOVAL/INSTALLATION [AJ].)

VARIABLE VALVE TIMING ACTUATOR REMOVAL/INSTALLATION [AJ]

E6U011012490W02

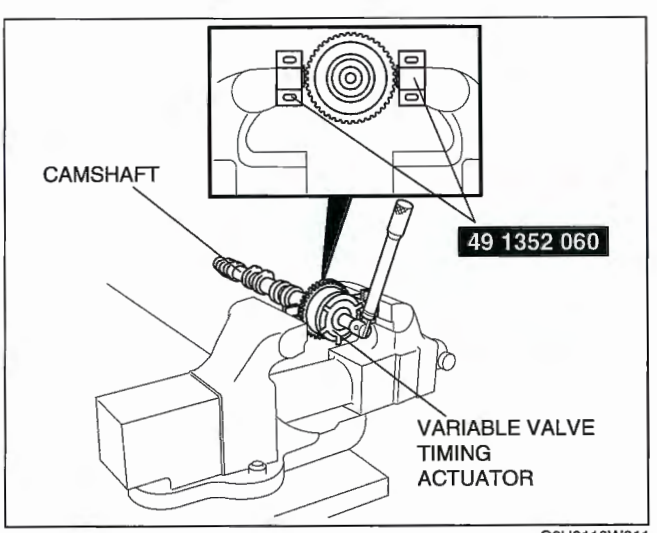
Caution

- **The variable valve timing actuator cannot be disassembled because it is a precision unit.**

Note

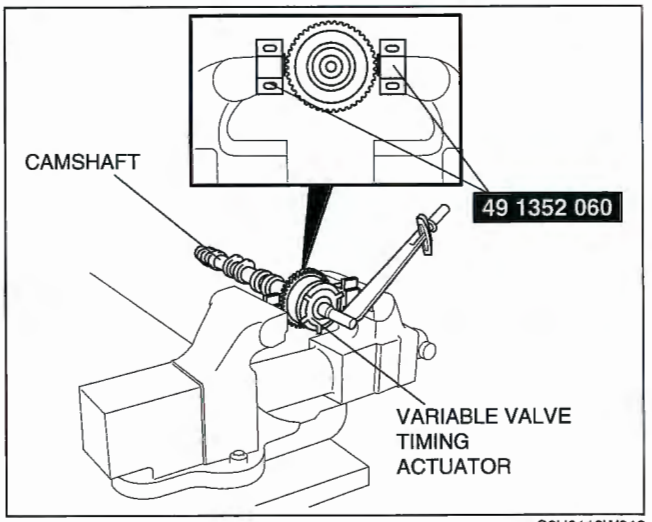
- The camshaft sprocket is integrated with the variable valve timing actuator and cannot be disassembled.

1. Remove the camshaft component. (See 01–10C–29 HYDRAULIC LASH ADJUSTER (HLA) REMOVAL/ INSTALLATION [AJ].)
2. Secure the camshaft sprocket in a vise using the **SST**.
3. Loosen the variable valve timing actuator tightening bolt.
4. Remove the variable valve timing actuator.
5. Install the variable valve timing actuator using a new tightening bolt.



C6U0110W011

6. Secure the camshaft sprocket in a vise using the **SST**.
7. Tighten the variable valve timing actuator tightening bolt in two steps.
   (1) Tighten to **40 N·m {4.1 kgf·m, 29.5 ft·lbf}**.
   (2) Tighten **90°**.



C6U0110W012

OIL CONTROL VALVE (OCV) REMOVAL/INSTALLATION [AJ]

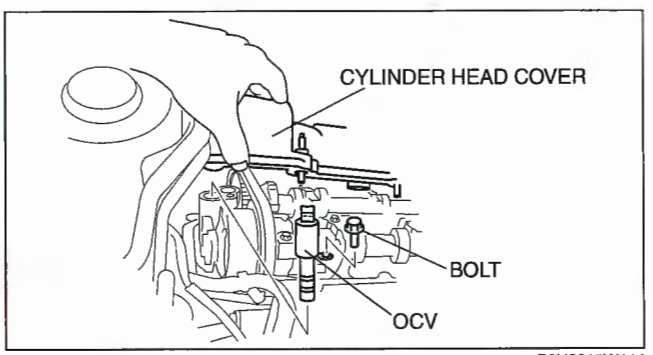
E6U011014420W01

RH bank

1. Disconnect the negative battery cable.
2. Remove the plug hole plate.
3. Remove the dynamic chamber. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
4. Remove the ignition coil. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)
5. Remove the OCV connector.
6. Remove the ventilation hose.
7. Remove the cylinder head cover tightening bolt.
8. Remove the OCV with cylinder head cover raised as shown in the figure.

Note

- Take care not to let the OCV tightening bolt slip into the timing chain cover when removing the OCV tightening bolt from engine front.



B6U2215W114

9. Install the OCV.

Tightening torque
8.0—12.0 N·m {82—122 kgf·cm, 71—106 in·lbf}

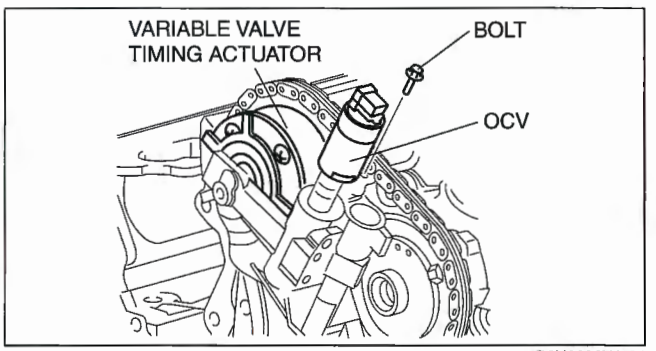
10. Install the cylinder head cover. (See 01–10C–22 Cylinder Head Cover (RH) Installation Note.)
11. Install the ventilation hose.
12. Install the OCV connector.
13. Install the ignition coil. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)
14. Install the plug hole plate.
15. Install the dynamic chamber. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)

LH bank

1. Disconnect the negative battery cable.
2. Remove the plug hole plate.
3. Remove the ignition coil. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)
4. Remove the OCV connector.
5. Remove the ventilation hose.
6. Remove the cylinder head cover.
7. Remove the OCV.
8. Install the OCV.

   Tightening torque
   8.0—12.0 N·m {82—122 kgf·cm, 71—106 in·lbf}

9. Install the cylinder head cover. (See 01–10C–22 Cylinder Head Cover (RH) Installation Note.)
10. Install the ventilation hose.
11. Install the OCV connector.
12. Install the ignition coil. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)
13. Install the plug hole plate.



B6U2226W101

OIL CONTROL VALVE (OCV) INSPECTION [AJ]

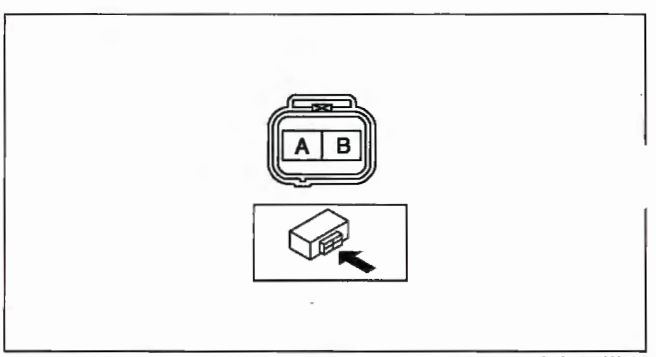
E6U011014420W02

Coil Resistance Inspection

1. Disconnect the negative battery cable.
2. Disconnect the oil control valve (OCV) connector.
3. Measure the resistance between terminals A and B using an ohmmeter.
   - If not as specified, replace the oil control valve (OCV).

   Specification
   7.05—7.95 ohms

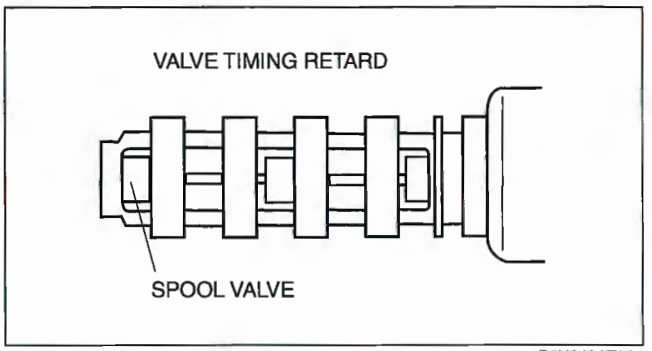
4. Connect the oil control valve (OCV) connector.



A6A2226W101

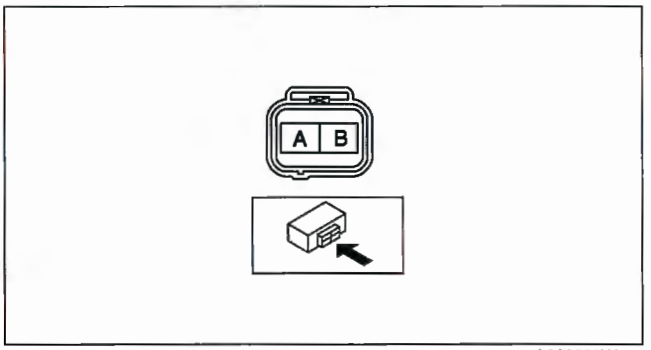
Spool Valve Operation Inspection

1. Disconnect the negative battery cable.
2. Remove the oil control valve (OCV).
   Verify that the spool valve in the oil control valve (OCV) is in the maximum valve timing retard position as indicated in the figure.
   - If not as specified, replace the oil control valve (OCV).
4. Verify that the battery is fully charged.
   - If not as specified, recharge the battery.



B6U2424E001

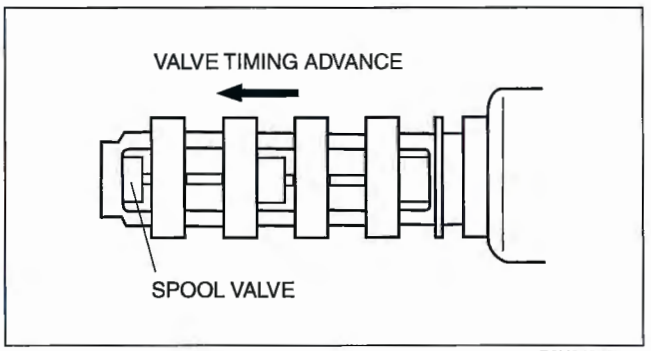
5. Apply battery positive voltage between the oil control valve (OCV) terminals and verify that the spool valve operates and moves to the maximum valve timing advance position.



A6A2226W101

   - If not as specified, replace the oil control valve (OCV).

   Note
   - When applying battery positive voltage between the oil control valve (OCV) terminals, the connection can be either of the following:
     — Positive battery cable to terminal A, negative battery cable to terminal B
     — Positive battery cable to terminal B, negative battery cable to terminal A



B6U2424E002

6. Stop applying battery positive voltage and verify that the spool valve returns to the maximum valve timing retard position.
   - If not as specified, replace the oil control valve (OCV).

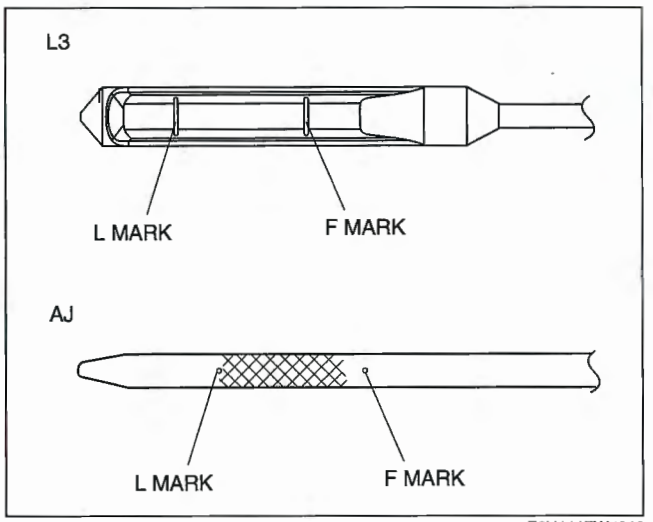
ENGINE OIL LEVEL INSPECTION [L3, AJ]

E6U011114001W01

1. Position the vehicle on level ground.
2. Warm up the engine to normal operating temperature. Stop the engine and wait for **5 min**.
3. Remove the dipstick and verify that the oil level is between the F and L marks on the dipstick and inspect the engine oil condition.
   - If the oil level is below the L mark, add the recommended engine oil.
   - If necessary, replace with the recommended engine oil.



E6U111ZW5013

ENGINE OIL REPLACEMENT [L3, AJ]

E6U011114001W02

Warning

- **Hot engines and engine oil can cause severe burns. Turn off the engine and wait until it and the engine oil have cooled.**
- **A vehicle that is lifted but not securely supported on safety stands is dangerous. It can slip or fall, causing death or serious injury. Never work around or under a lifted vehicle if it is not securely supported on safety stands.**
- **Continuous exposure to USED engine oil has caused skin cancer in laboratory mice. Protect your skin by washing with soap and water immediately after working with engine oil.**

Caution

- **In case you spill the engine oil on the exhaust system, wipe it off completely. If you fail to wipe the spilled engine oil, it will produce fumes because of the heat.**

L3

1. Position the vehicle on level ground.
2. Remove the oil filler cap.
3. Remove the under cover.
4. Remove the oil pan drain plug.
5. Drain the engine oil into a container.
6. Inspect the rubber seal of the oil pan drain plug and make sure there are no cracks or damage.
   - If necessary, replace the oil pan drain plug.
7. Clean the flange surface (seal rubber) on the oil pan drain plug, then install the oil pan drain plug.

Oil pan drain plug tightening torque
25—30 N·m {2.6—3.0 kgf·m, 19—22 ft·lbf}

Note

- The amount of residual oil in the engine can vary according to factors such as the replacement method, oil temperature. Verify the oil level after engine oil replacement.

8. Refill the following type and amount of the engine oil.

Oil capacity

L {US qt, Imp qt}

Item	Specification
	L3
Oil replacement	3.9 {4.1, 3.4}
Oil and oil filter replacement	4.3 {4.5, 3.8}
Total (dry engine)	4.6 {4.8, 4.0}

Engine oil specification

Item	U.S.A. and CANADA	Except U.S.A. and CANADA
Engine oil grade	(ILSAC)	API SL or ILSAC
Engine oil viscosity	5W-20	

9. Install the oil filler cap.
10. Start the engine and confirm that there is no oil leakage.
    - If there is oil leakage, repair or replace the applicable part.
11. Inspect the oil level. (See 01–11A–3 ENGINE OIL LEVEL INSPECTION [L3, AJ].)
12. Install the under cover.

AJ

1. Position the vehicle on level ground.
2. Remove the oil filler cap.
3. Remove the under cover.
4. Remove the oil pan drain plug.
5. Drain the engine oil into a container.
6. Inspect the rubber seal of the oil pan drain plug and make sure there are no cracks or damage.
    - If necessary, replace the oil pan drain plug.
7. Clean the flange surface (seal rubber) on the oil pan drain plug, then install the oil pan drain plug.

Tightening torque
22—30 N·m {2.2—3.0 kgf·m, 16.3—21.6 ft·lbf}

Note
- The amount of residual oil in the engine can vary according to the replacement method, oil temperature, etc. Verify the oil level after engine oil replacement.

8. Refill the following type and amount of the engine oil.

Oil capacity

L {US qt, Imp qt}

Item	Specifications
	AJ
Oil replacement	5.2 {5.5, 4.6}
Oil and oil filter replacement	5.7 {6.0, 5.0}
Total (dry engine)	6.2 {6.6, 5.5}

Engine oil specification

Item	U.S.A. and CANADA	Except U.S.A. and CANADA
Engine oil grade	(ILSAC)	(ILSAC) API SL or ILSAC
Engine oil viscosity	5W-20	

9. Install the oil filler cap.
10. Start the engine and confirm that there is no oil leakage.
    - If there is oil leakage, repair or replace the applicable part.

Inspect the oil level. (See 01–11A–3 ENGINE OIL LEVEL INSPECTION [L3, AJ].)

Install the under cover.

OIL PRESSURE INSPECTION [L3, AJ]

E6U011118500W01

L3

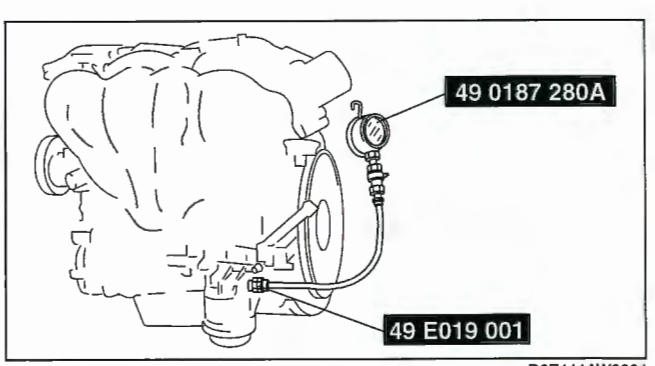
Warning

- **Continuous exposure to USED engine oil has caused skin cancer in laboratory mice. Protect your skin by washing with soap and water immediately after working with engine oil.**
- **Hot engines and the engine oil can cause severe burns. Turn off the engine and wait until it and the engine oil have cooled.**

1. Remove the under cover.
2. Remove the oil pressure switch.
3. Screw the **SSTs** into the oil pressure switch installation hole.
4. Warm up the engine to normal operating temperature.
5. Run the engine at the specified speed, and note the gauge readings.
   - If not within the specification, inspect for the cause and repair or replace if necessary.

Note

- The oil pressure can vary with oil viscosity and temperature.



D6E111AW3004

Oil pressure

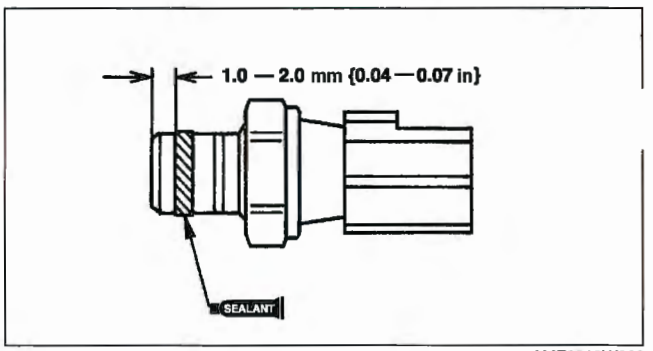
337—591 kPa {3.44—6.03 kgf/cm^2, 33.9—75.5 psi} [3,000 rpm]

6. Stop the engine and wait until it is cool.
7. Remove the **SSTs**.

8. Apply silicone sealant to the oil pressure switch threads as shown in the figure.
9. Install the oil pressure switch.

   Tightening torque
   12—18 N·m {1.2—1.8 kgf·m, 9—13 ft·lbf}

10. Start the engine and confirm that there is no oil leakage.
    - If there is oil leakage, repair or replace applicable part.
11. Install the under cover.

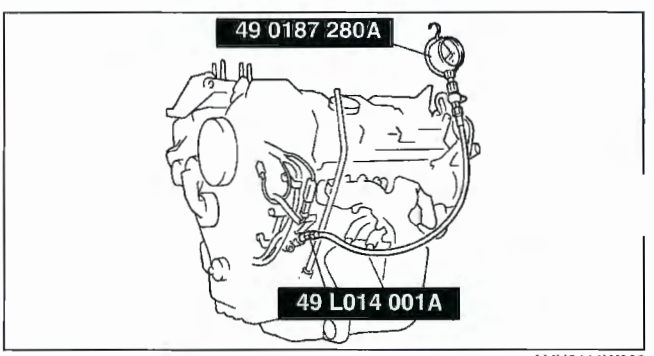


AME3310W002

AJ

Warning
- **Continuous exposure to USED engine oil has caused skin cancer in laboratory mice. Protect your skin by washing with soap and water immediately after working with engine oil.**
- **Hot engines and the engine oil can cause severe burns. Turn off the engine and wait until it and the engine oil have cooled.**

1. Remove the under cover.
2. Remove the drive belt. (See 01–10C–4 DRIVE BELT REPLACEMENT [AJ].)
3. Remove the A/C compressor with the pipe still connected. Position the A/C compressor so that it is out of the way. (See 07–11–15 A/C COMPRESSOR REMOVAL/INSTALLATION [L3, AJ].)
4. Remove the oil pressure switch.
5. Screw the **SSTs** into the oil pressure switch installation hole.
6. Install the A/C compressor. (See 07–11–15 A/C COMPRESSOR REMOVAL/INSTALLATION [L3, AJ].)
7. Install the drive belt. (See 01–10C–4 DRIVE BELT REPLACEMENT [AJ].)
8. Warm up the engine to normal operating temperature.
9. Run the engine at the specified speed, and note the gauge readings.
   - If not within the specification, inspect for the cause and repair or replace if necessary.



AMU0111W003

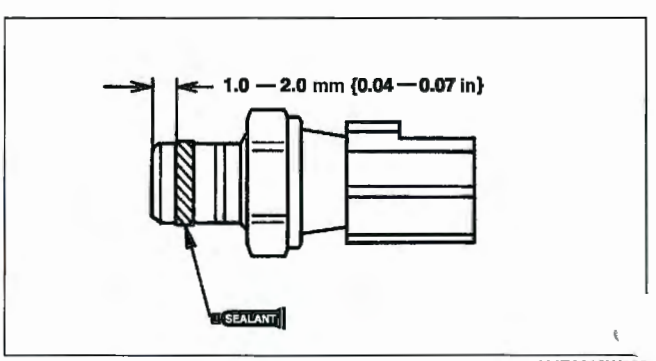
Note
- The oil pressure can vary with oil viscosity and temperature.

Oil pressure
138—310 kPa {1.40—3.17 kgf/cm^2, 20—45 psi} [1,500 rpm]

10. Stop the engine and wait until it is cool.
11. Remove the drive belt. (See 01–10C–4 DRIVE BELT REPLACEMENT [AJ].)
12. Remove the A/C compressor with the pipe still connected. Position the A/C compressor so that it is out of the way. (See 07–11–15 A/C COMPRESSOR REMOVAL/INSTALLATION [L3, AJ].)
13. Remove the **SSTs**.
14. Apply silicone sealant to the oil pressure switch threads as shown in the figure.
15. Install the oil pressure switch.

    Tightening torque
    19.1—25.9 N·m {1.95—2.64 kgf·m, 14.1—19.0 ft·lbf}

16. Install the A/C compressor. (See 07–11–15 A/C COMPRESSOR REMOVAL/INSTALLATION [L3, AJ].)
17. Install the drive belt. (See 01–10C–4 DRIVE BELT REPLACEMENT [AJ].)
18. Start the engine and confirm that there is no oil leakage.
    - If there is oil leakage, repair or replace applicable part.
19. Install the under cover.



AME3310W002

OIL FILTER REPLACEMENT [L3, AJ]

E6U011114300W01

Warning
- **Continuous exposure with USED engine oil has caused skin cancer in laboratory mice. Protect your skin by washing with soap and water immediately after this work.**
- **Hot engines and engine oil can cause severe burns. Turn off the engine and wait until it and the engine oil have cooled.**

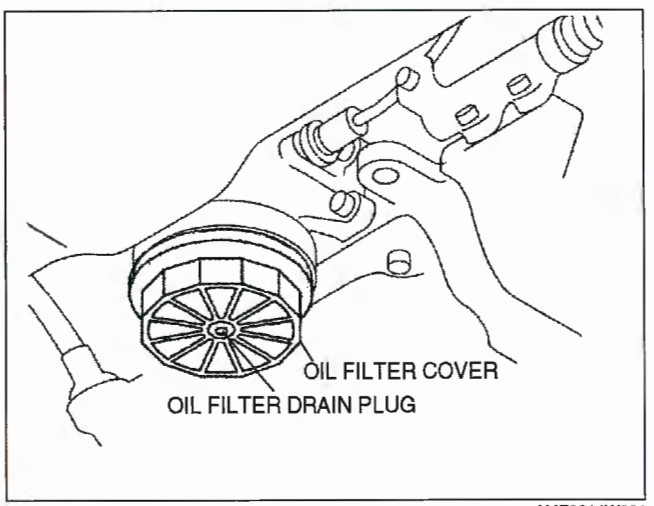
L3

Caution
- **To avoid damage to the oil filter, use only specified oil filter.**

1. Remove the under cover.
2. Loosen the oil filter drain plug. (Do not remove.)
3. Loosen the filter cover for 1 turn using a commercially available, cup-type oil filter wrench (**diameter- 74 mm {2.9 in}, 14 sided**).
4. Remove the oil filter drain plug, and drain the engine oil.

Note
- Oil could be easily drained when the air is in the filter.

5. Loosen the oil filter cover for another 1 turn.

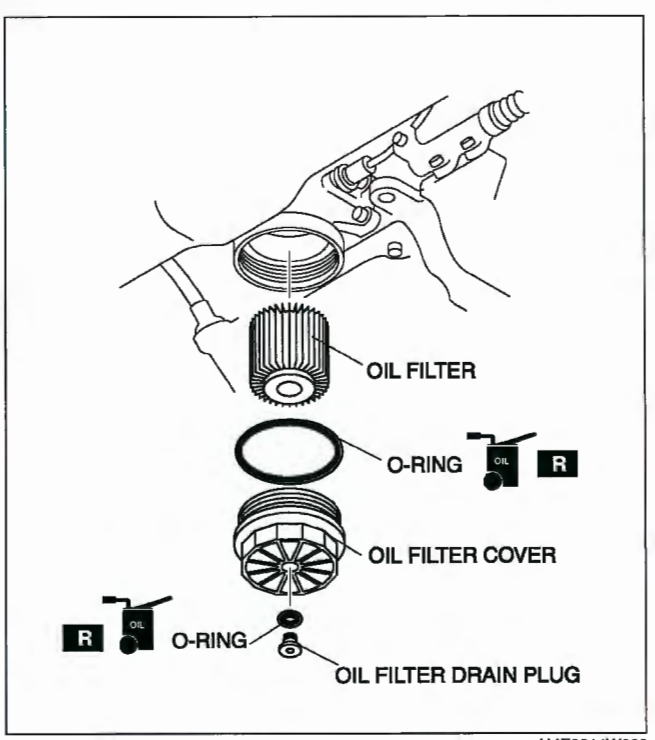


AME3314W001

6. Remove the oil filter cover and the oil filter.
7. Use a clean rag to wipe off the mounting surface on the oil filter adapter and the oil filter cover.
8. Apply clean oil to a new O-ring of the oil filter cover.
9. Apply clean oil to a new O-ring of the oil filter drain plug.
10. Install the oil filter, oil filter drain plug, and oil filter cover.
11. Tighten the oil filter cover and the oil filter drain plug.

Tightening torque
Oil filter cover:30—35 N·m {3.1—3.5 kgf·m, 22.2—25.8 ft·lbf}
Oil filter drain plug:9—11 N·m {91.8—112.2 kgf·cm, 79.6—97.2 in·lbf}

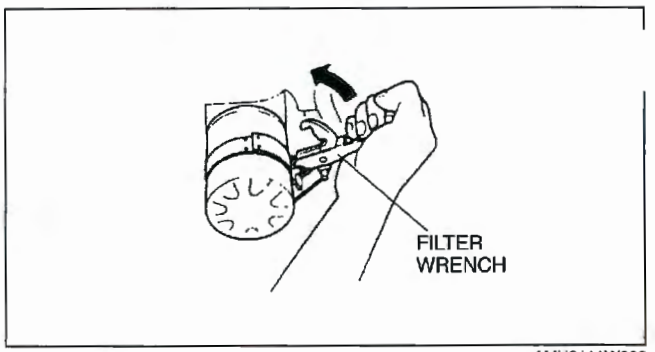
12. Start the engine and confirm that there is no oil leakage.
    - If there is oil leakage, repair or replace applicable part.
13. Inspect the oil level. (See 01–11A–3 ENGINE OIL LEVEL INSPECTION [L3, AJ].)
14. Install the under cover.



AME3314W002

AJ

1. Remove the under cover.
2. Remove the oil filter from above using a filter wrench.
3. Use a clean rag to wipe off the mounting surface.
4. Apply clean engine oil to the O-ring of new oil filter.
5. Install the oil filter until the O-ring contacts the sealing surface.
6. Tighten the filter 3/4 turns by hand.



AMU0111W002

Caution

- **In case you spill engine oil on the exhaust system or the engine, wipe it off completely. If you fail to wipe the spilled engine oil, it will produce fumes because of the heat.**

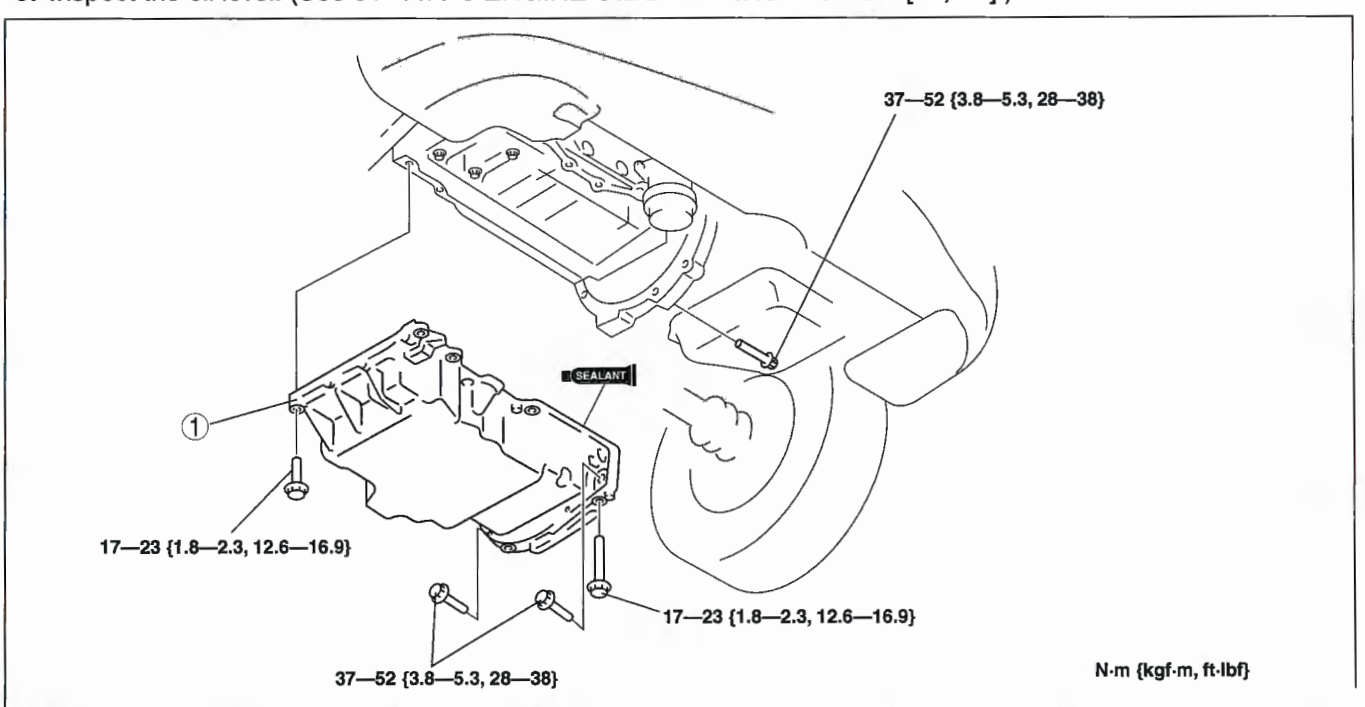
7. Start the engine and confirm that there is no oil leakage.
   - If there is oil leakage, repair or replace applicable part.
8. Inspect the oil level. (See 01–11A–3 ENGINE OIL LEVEL INSPECTION [L3, AJ].)
9. Install the under cover.

OIL PAN REMOVAL/INSTALLATION [L3, AJ]

E6U011110040W01

L3

1. Disconnect the negative battery cable.
2. Remove the under cover.
3. Drain the engine oil. (See 01–11A–3 ENGINE OIL REPLACEMENT [L3, AJ].)
4. Remove the engine front cover. (See 01–10A–9 TIMING CHAIN REMOVAL/INSTALLATION [L3].)
5. Remove in the order indicated in the table.
6. Install in the reverse order of removal.
7. Refill the specified type and amount of the engine oil. (See 01–11A–3 ENGINE OIL REPLACEMENT [L3, A
8. Start the engine and confirm that there is no oil leakage.
   - If there is oil leakage, repair or replace applicable part.
9. Inspect the oil level. (See 01–11A–3 ENGINE OIL LEVEL INSPECTION [L3, AJ].)

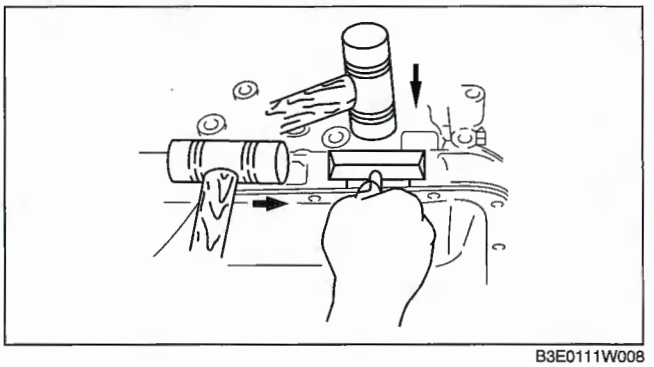


E6U111ZW

1	Oil pan (See 01–11A–9 Oil Pan Removal Note (L3).) (See 01–11A–9 Oil Pan Installation Note (L3).)

Oil Pan Removal Note (L3)

1. Remove the oil pan using the separator tool.

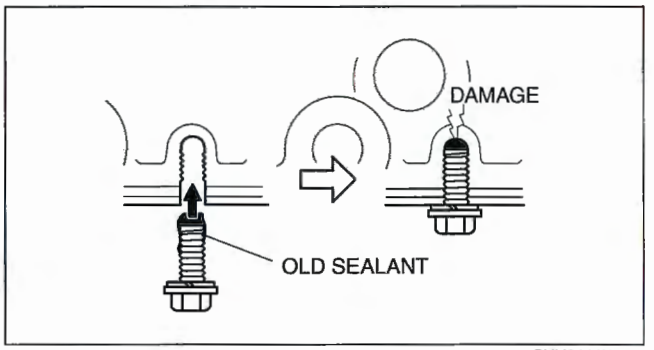


B3E0111W008

Oil Pan Installation Note (L3)

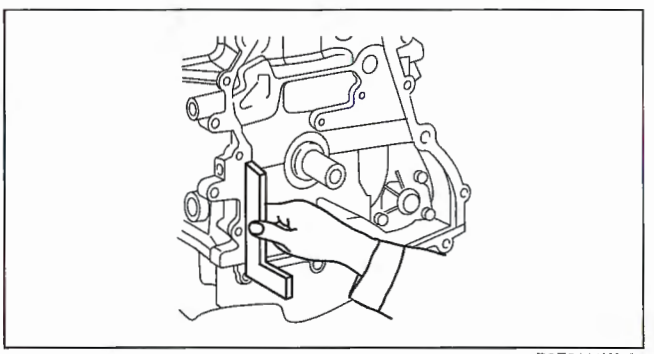
Caution
- **Apply the silicon sealant in a single, unbroken line around the whole perimeter.**
- **Using bolts with the old seal adhering could cause cracks in the housing.**

1. Completely clean and remove any oil, dirt, sealant or other foreign material that may be adhering to the housing and oil pan.
2. When reusing the oil pan installation bolts, clean any old sealant from the bolts.



CHU0111W004

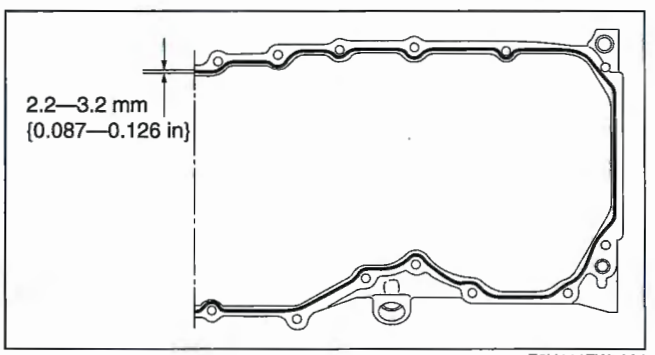
. Use a square ruler to align the oil pan and the cylinder block junction side on the engine front cover side.



B3E0111W007

4. Apply silicone sealant to the oil pan along the inside of the bolt holes as shown in the figure.

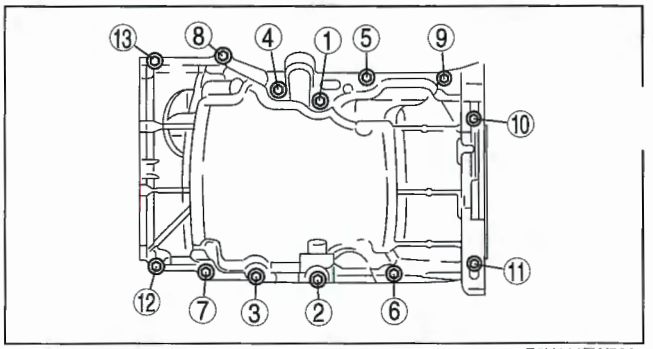
Thickness
2.2—3.2 mm {0.087—0.126 in}



E6U111ZW5004

5. Tighten the bolts in the order shown in the figure.

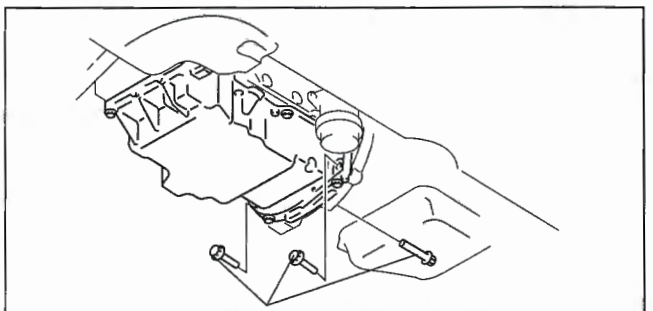
Tightening torque
17—23 N·m {1.8—2.3 kgf·m, 12.6—16.9 ft·lbf}



E6U111ZW5005

6. Tighten the oil pan-transaxle installation bolts.

Tightening torque
37—52 N·m {3.8—5.3 kgf·m, 28—38 ft·lbf}

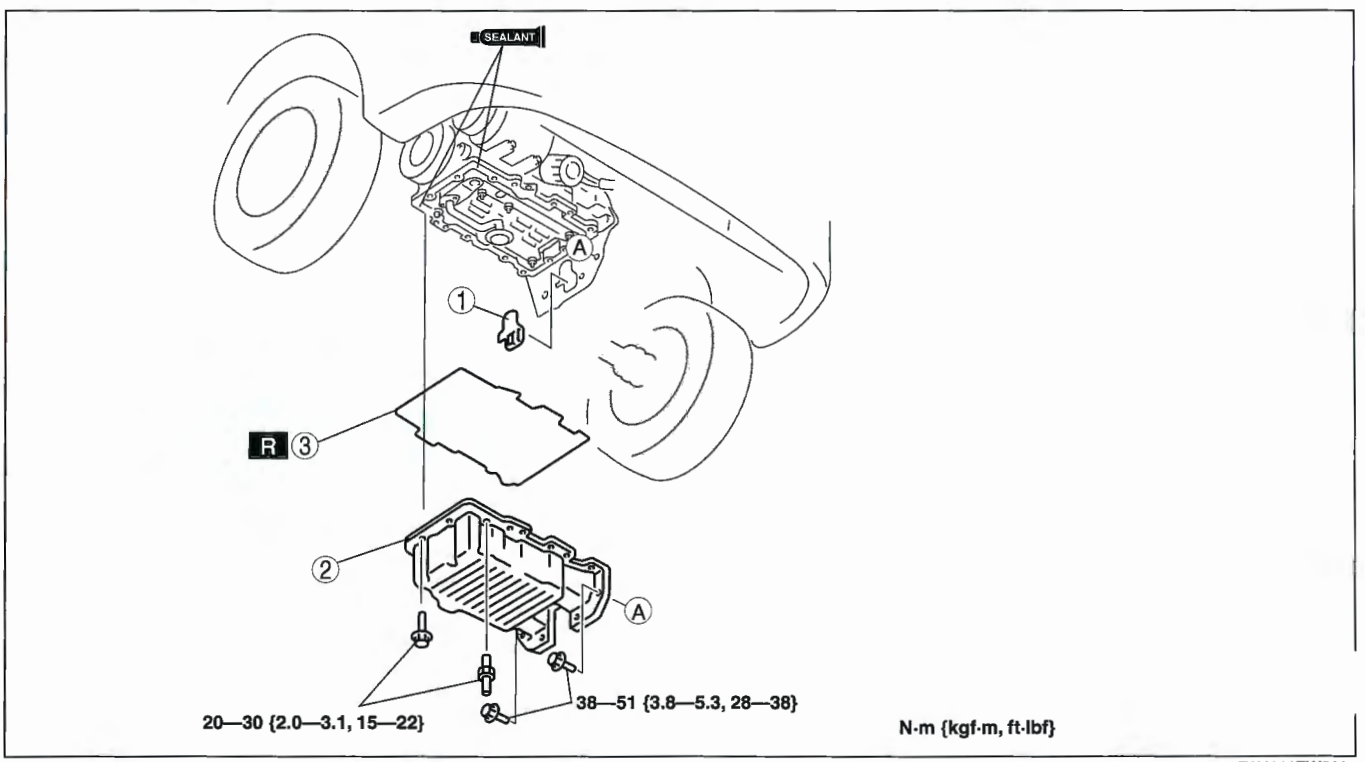


OIL PAN-TRANSAXLE INSTALLATION BOLTS

E6U111ZW5006

AJ

1. Disconnect the negative battery cable.
2. Remove the under cover.
3. Drain the engine oil. (See 01–11A–3 ENGINE OIL REPLACEMENT [L3, AJ].)
4. Remove the TWC (RH). (See 01–15C–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [AJ].)
5. Remove in the order indicated in the table.
6. Install in the reverse order of removal.
7. Refill the specified type and amount of the engine oil. (See 01–11A–3 ENGINE OIL REPLACEMENT [L3, AJ].)
8. Start the engine and confirm that there is no oil leakage.
   - If there is oil leakage, repair or replace applicable part.
9. Inspect the oil level. (See 01–11A–3 ENGINE OIL LEVEL INSPECTION [L3, AJ].)

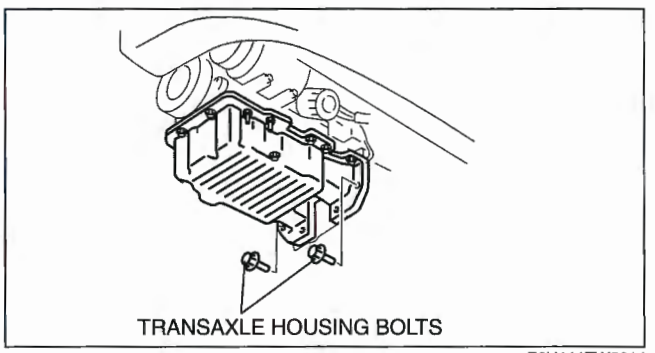


E6U111ZW5007

1	End plate cover
2	Oil Pan (See 01–11A–11 Oil Pan Removal Note (AJ).) (See 01–11A–11 Oil Pan Installation Note (AJ).)
3	Oil pan gasket (See 01–11A–11 Oil Pan Gasket Installation Note (AJ).)

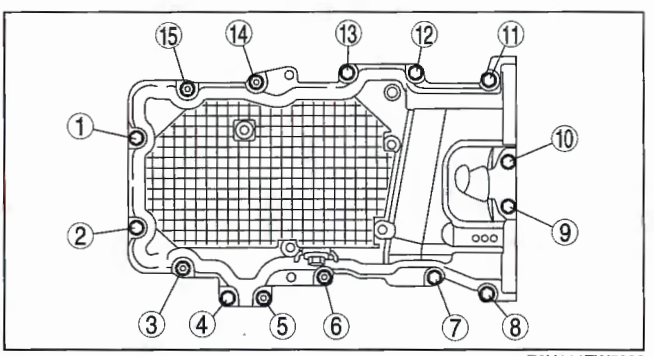
Oil Pan Removal Note (AJ)

1. Remove the transaxle housing bolts from oil pan.



E6U111ZW5014

2. Loosen the oil pan bolts and studs in two or three passes in the order shown in the figure.

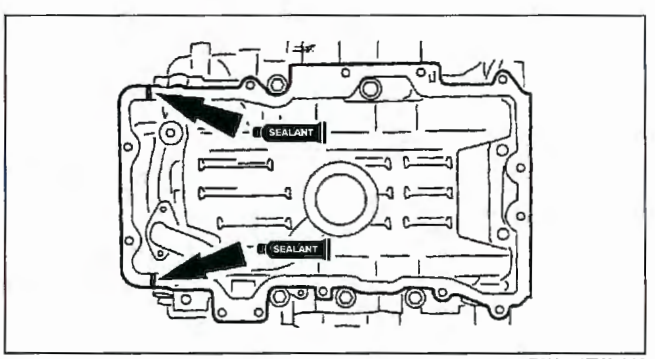


E6U111ZW5008

Oil Pan Gasket Installation Note (AJ)

1. Apply silicone sealant to the cylinder block as shown in the figure.

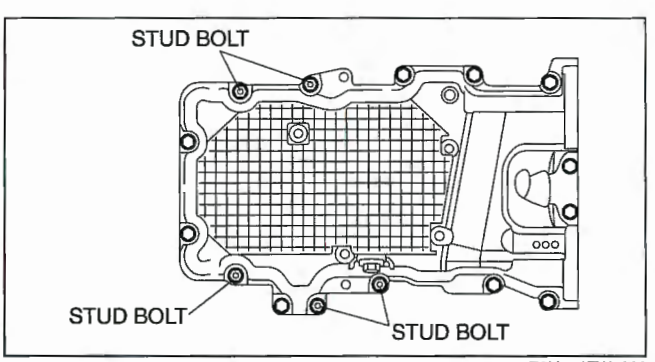
   Dot diameter
   10 mm {0.39 in}



E6U111ZW5012

Oil Pan Installation Note (AJ)

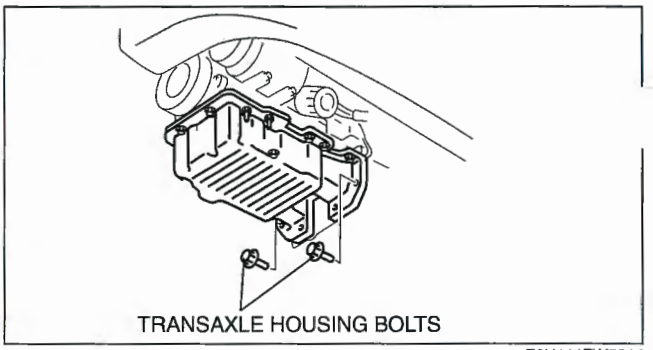
1. Install the oil pan bolts and studs as shown in the figure.



E6U111ZW5009

2. Tighten the transaxle housing bolts to oil pan.

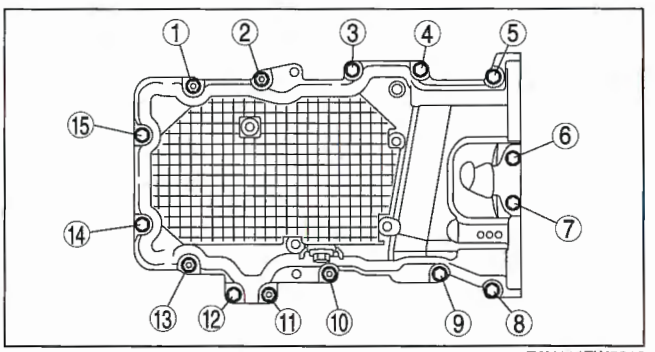
Tightening torque
38—51 N·m {3.8—5.3 kgf·m, 28—38 ft·lbf}



E6U111ZW5014

3. Tighten the oil pan bolts and studs in several passes in the order shown in the figure.

Tightening torque
20—30 N·m {2.0—3.1 kgf·m, 15—22 ft·lbf}



E6U111ZW5010

OIL PUMP REMOVAL/INSTALLATION [L3, AJ]

E6U011119220W01

L3

1. Disconnect the negative battery cable.
2. Remove the under cover.
3. Remove the oil pan. (See 01–11A–8 OIL PAN REMOVAL/INSTALLATION [L3, AJ].)
4. Remove in the order indicated in the table.
5. Install in the reverse order of removal.
6. Start the engine and confirm that there is no oil leakage.
   - If there is oil leakage, repair or replace applicable part.
7. Inspect the oil level. (See 01–11A–3 ENGINE OIL LEVEL INSPECTION [L3, AJ].)
8. Inspect the oil pressure. (See 01–11A–5 OIL PRESSURE INSPECTION [L3, AJ].)

ENGINE OIL REPLACEMENT [L3 WITH TC]

E6U011114001W04

Warning

- **Hot engines and engine oil can cause severe burns. Turn off the engine and wait until it and the engine oil have cooled.**
- **A vehicle that is lifted but not securely supported on safety stands is dangerous. It can slip or fall, causing death or serious injury. Never work around or under a lifted vehicle if it is not securely supported on safety stands.**
- **Continuous exposure to USED engine oil has caused skin cancer in laboratory mice. Protect your skin by washing with soap and water immediately after working with engine oil.**

Caution

- **In case you spill the engine oil on the exhaust system, wipe it off completely. If you fail to wipe the spilled engine oil, it will produce fumes because of the heat.**

1. Position the vehicle on level ground.
2. Remove the oil filler cap.
3. Remove the under cover.
4. Remove the oil pan drain plug.
5. Drain the engine oil into a container.
6. Install the oil pan drain plug with a new washer.

Oil pan drain plug tightening torque
30—41 N·m {3.1—4.1 kgf·m, 23—30 ft·lbf}

Note

- The amount of residual oil in the engine can vary according to factors such as the replacement method and oil temperature. Verify the oil level after engine oil replacement.

7. Refill with the following type and amount of the engine oil.

Engine oil capacity (approx. quantity)
Oil replacement: 5.3 L {5.6 US qt, 4.7 Imp qt}
Oil and oil filter replacement: 5.7 L {6.0 US qt, 5.0 Imp qt}
Total (dry engine): 6.4 L {6.8 US qt, 5.6 Imp qt}

Engine oil specification

Item	U.S.A. and CANADA	Except U.S.A. and CANADA
Engine oil grade	(ILSAC)	API SL or ILSAC
Engine oil viscosity	5W-30	

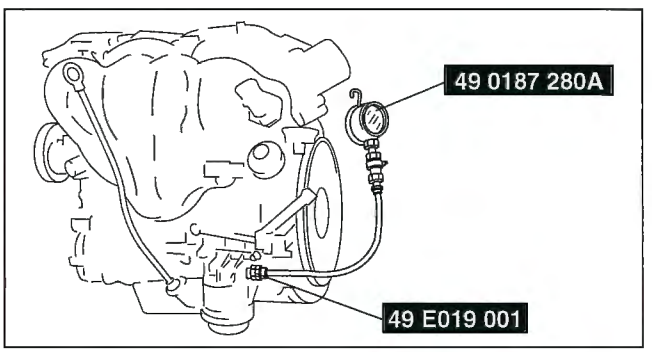
8. Install the oil filler cap.
9. Start the engine and confirm that there is no oil leakage.
   - If there is oil leakage, repair or replace the applicable part.
10. Inspect the oil level. (See 01–11B–2 ENGINE OIL LEVEL INSPECTION [L3 WITH TC].)
11. Install the under cover.

OIL PRESSURE INSPECTION [L3 WITH TC]

E6U011114000W01

Warning
- **Hot engines and engine oil can cause severe burns. Turn off the engine and wait until it and the engine oil have cooled.**
- **A vehicle that is lifted but not securely supported on safety stands is dangerous. It can slip or fall, causing death or serious injury. Never work around or under a lifted vehicle if it is not securely supported on safety stands.**
- **Continuous exposure to USED engine oil has caused skin cancer in laboratory mice. Protect your skin by washing with soap and water immediately after working with engine oil.**

1. Remove the under cover.
2. Remove the oil pressure switch.
3. Screw the **SSTs** into the oil pressure switch installation hole.
4. Warm up the engine to normal operating temperature.
5. Run the engine at the specified speed, and note the gauge readings.
   - If not within the specification, inspect for the cause and repair or replace if necessary.



B3E0111W004

Note
- The oil pressure can vary with oil viscosity and temperature.

Oil pressure (reference value) [oil temperature: 100 °C {212 °F}]
297—551 kPa {3.03—5.61 kgf/cm^2, 43.1—79.9 psi} [3,000 rpm]

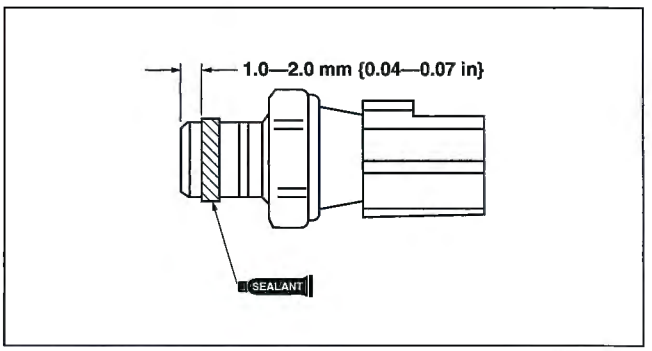
6. Stop the engine and wait until it is cool.
7. Remove the **SSTs**.

Caution
- **Make sure that there is no sealant between 1.0—2.0 mm {0.04—0.07 in} from the end of the oil pressure switch to prevent a possible operation malfunction.**

8. Apply silicone sealant to the oil pressure switch threads as shown in the figure.
9. Install the oil pressure switch.

Tightening torque
12—18 N·m {1.3—1.8 kgf·m, 9—13 ft·lbf}

10. Start the engine and confirm that there is no oil leakage.
    - If there is oil leakage, repair or replace the applicable part.
11. Install the under cover.



B3E0111W003

OIL FILTER REPLACEMENT [L3 WITH TC]

E6U011114300W02

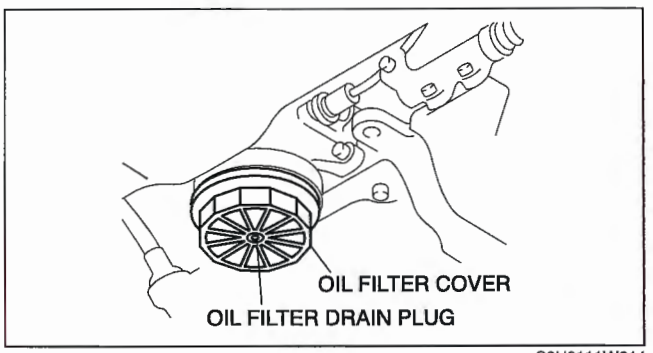
Warning
- **Hot engines and engine oil can cause severe burns. Turn off the engine and wait until it and the engine oil have cooled.**
- **A vehicle that is lifted but not securely supported on safety stands is dangerous. It can slip or fall, causing death or serious injury. Never work around or under a lifted vehicle if it is not securely supported on safety stands.**
- **Continuous exposure to USED engine oil has caused skin cancer in laboratory mice. Protect your skin by washing with soap and water immediately after working with engine oil.**

Caution
- **In case you spill engine oil on the exhaust system, wipe it off completely. If you fail to wipe the spilled engine oil, it will produce fumes because of the heat.**
- **To avoid damage to the oil filter, use only specified oil filter.**

1. Remove the under cover.
2. Loosen the oil filter drain plug. (Do not remove.)
3. Loosen the filter cover for 1 turn using a commercially available, cup-type oil filter wrench (**74 mm {2.9 in} diameter, 14 sided**).
4. Remove the oil filter drain plug, and drain the engine oil.

Note
- Oil could be easily drained when the air is in the filter.

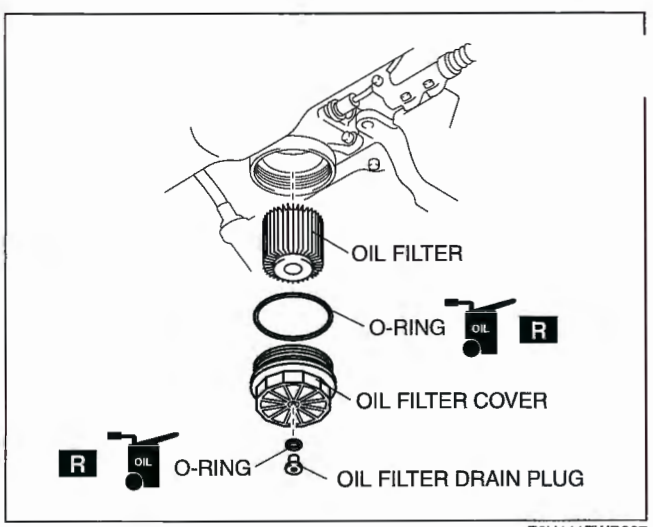
5. Loosen the oil filter cover for another 1 turn.



C3U0111W014

6. Remove the oil filter cover and the oil filter.
7. Use a clean rag to wipe off the mounting surface on the oil filter adapter and the oil filter cover.
8. Apply clean oil to a new O-ring of the oil filter cover.
9. Apply clean oil to a new O-ring of the oil filter drain plug.
10. Install the oil filter, oil filter drain plug, and oil filter cover.
11. Tighten the oil filter cover and the oil filter drain plug.

Tightening torque
Oil filter cover: 30—35 N·m {3.1—3.5 kgf·m, 22.2—25.8 ft·lbf}
Oil filter drain plug: 9—11 N·m {91.8—112.2 kgf·cm, 79.6—97.2 in·lbf}



E6U111ZWB007

12. Start the engine and confirm that there is no oil leakage.
    - If there is oil leakage, repair or replace the applicable part.
13. Inspect the oil level. (See 01–11B–2 ENGINE OIL LEVEL INSPECTION [L3 WITH TC].)
14. Install the under cover.

OIL COOLER REMOVAL/INSTALLATION [L3 WITH TC]

E6U011114700W01

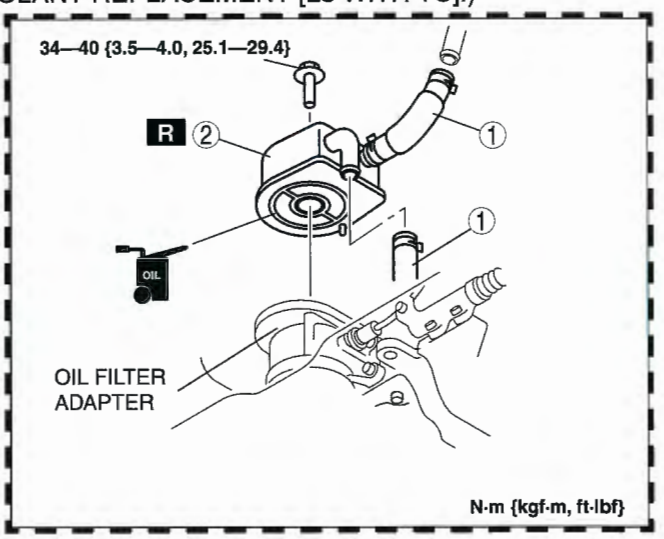
Warning

- **Hot engines and engine oil can cause severe burns. Turn off the engine and wait until it and the engine oil have cooled.**
- **A vehicle that is lifted but not securely supported on safety stands is dangerous. It can slip or fall, causing death or serious injury. Never work around or under a lifted vehicle if it is not securely supported on safety stands.**
- **Continuous exposure to USED engine oil has caused skin cancer in laboratory mice. Protect your skin by washing with soap and water immediately after working with engine oil.**

1. Disconnect the negative battery cable.
2. Remove the under cover.
3. Drain the engine coolant. (See 01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)
4. Remove in the order indicated in the table.

1	Water hose
2	Oil cooler

5. Use a clean rag to wipe off the mounting surface on the oil filter adapter and the oil cooler.
6. Install in the reverse order of the removal.
7. Refill the engine coolant. (See 01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)
8. Start the engine and confirm that there is no oil leakage.
   - If there is oil leakage, repair or replace the applicable part.
9. Inspect the oil level. (See 01–11B–2 ENGINE OIL LEVEL INSPECTION [L3 WITH TC].)



E6U111ZLA002

OIL PAN REMOVAL/INSTALLATION [L3 WITH TC]

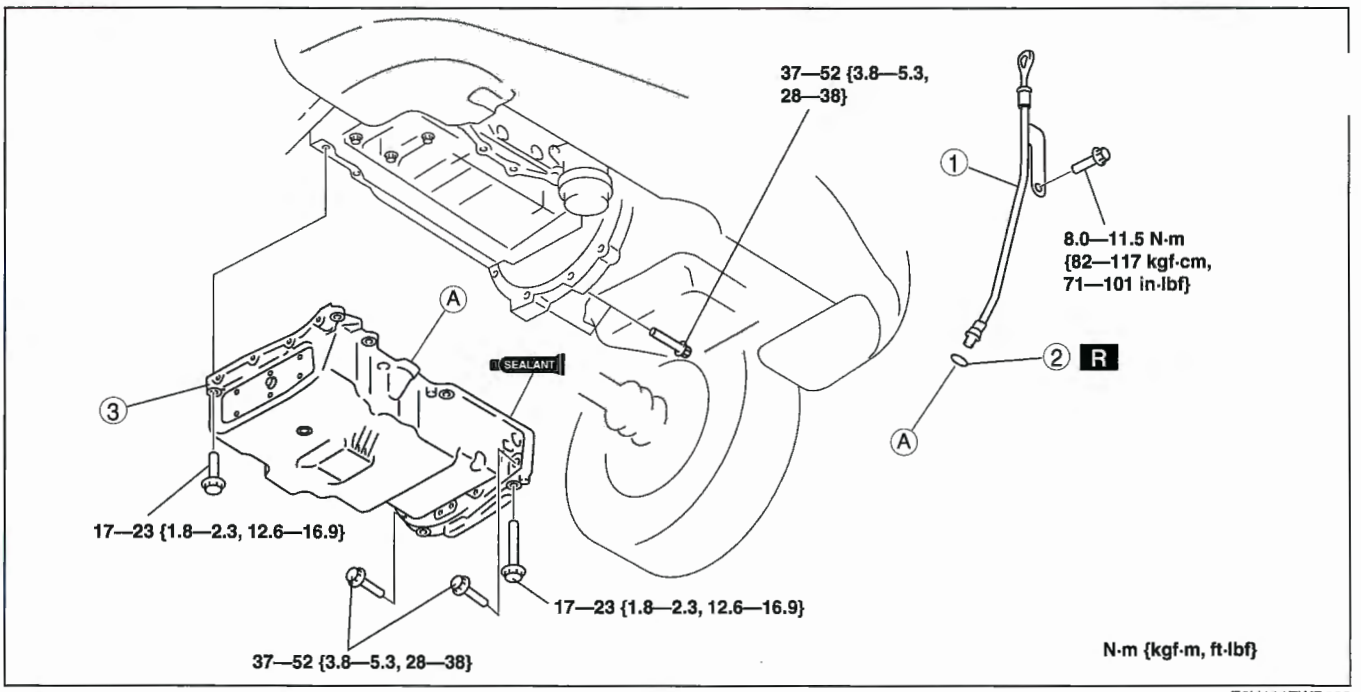
E6U011110040W02

Warning

- **Hot engines and engine oil can cause severe burns. Turn off the engine and wait until it and the engine oil have cooled.**
- **A vehicle that is lifted but not securely supported on safety stands is dangerous. It can slip or fall, causing death or serious injury. Never work around or under a lifted vehicle if it is not securely supported on safety stands.**
- **Continuous exposure to USED engine oil has caused skin cancer in laboratory mice. Protect your skin by washing with soap and water immediately after working with engine oil.**

1. Disconnect the negative battery cable.
2. Remove the under cover.
3. Drain the engine oil. (See 01–11B–2 ENGINE OIL REPLACEMENT [L3 WITH TC].)
4. Remove the engine front cover. (See 01–10B–10 TIMING CHAIN REMOVAL/INSTALLATION [L3 WITH TC].)
5. Remove in the order indicated in the table.
6. Install in the reverse order of removal.
7. Refill with the specified type and amount of the engine oil. (See 01–11B–2 ENGINE OIL REPLACEMENT [L3 WITH TC].)
8. Start the engine and confirm that there is no oil leakage.
   - If there is oil leakage, repair or replace the applicable part.

9. Inspect the oil level. (See 01–11B–2 ENGINE OIL LEVEL INSPECTION [L3 WITH TC].)



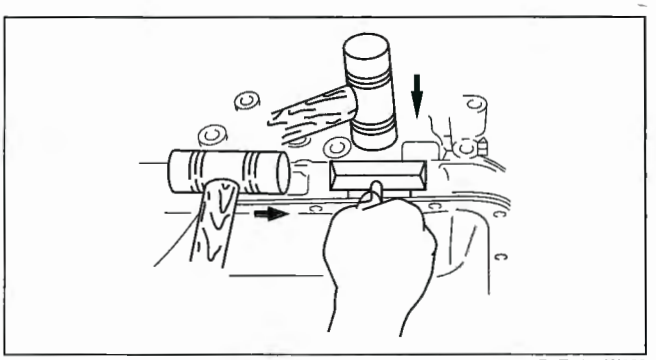
E6U111ZWB003

1	Oil level gauge pipe
2	O-ring

3	Oil pan (See 01–11B–6 Oil Pan Removal Note.) (See 01–11B–6 Oil Pan Installation Note.)

Oil Pan Removal Note

1. Remove the oil pan using the separator tool.



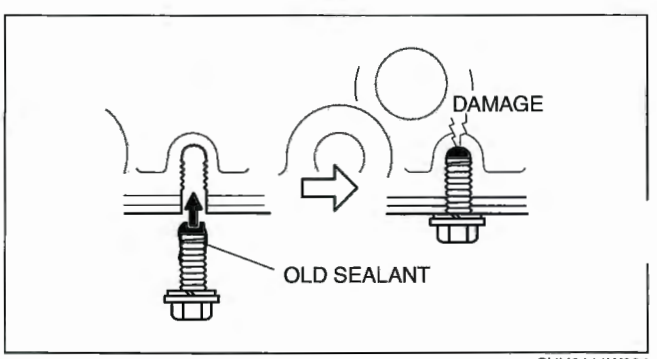
B3E0111W008

Oil Pan Installation Note

Caution

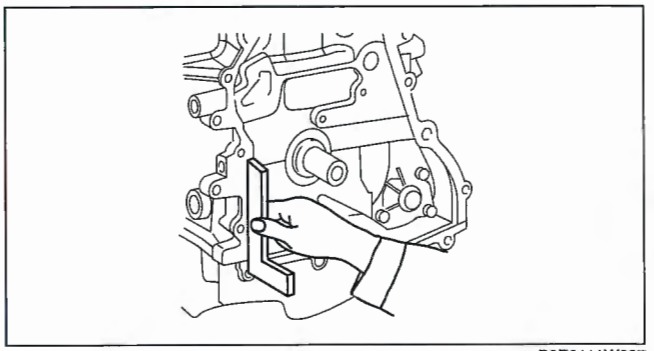
- **Apply the silicon sealant in a single, unbroken line around the whole perimeter.**
- **Using bolts with the old seal adhering could cause cracks in the housing.**

1. Completely clean and remove any oil, dirt, sealant or other foreign material that may be adhering to the housing and oil pan.
2. When reusing the oil pan installation bolts, clean any old sealant from the bolts.



CHU0111W004

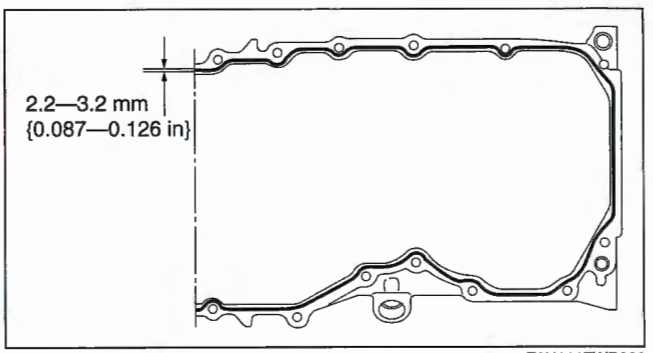
3. Use a square ruler to align the oil pan and the cylinder block junction side on the engine front cover side.



B3E0111W007

4. Apply silicone sealant to the oil pan along the inside of the bolt holes as shown in the figure.

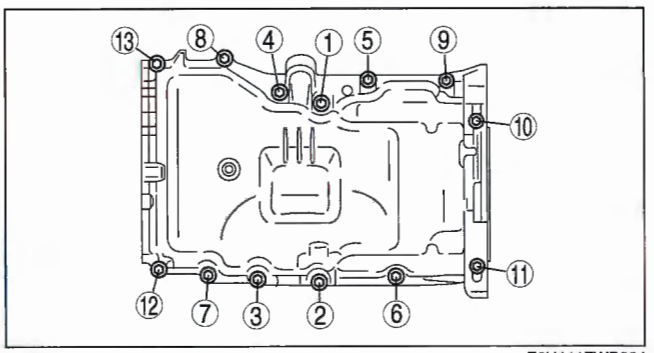
   Thickness
   2.2—3.2 mm {0.087—0.126 in}



E6U111ZWB006

5. Tighten the bolts in the order shown in the figure.

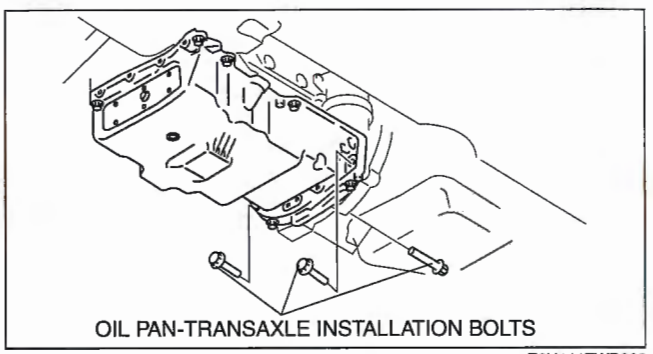
   Tightening torque
   17—23 N·m {1.8—2.3 kgf·m, 12.6—16.9 ft·lbf}



E6U111ZWB004

6. Tighten the oil pan-transaxle installation bolts.

   Tightening torque
   37—52 N·m {3.8—5.3 kgf·m, 28—38 ft·lbf}



OIL PAN-TRANSAXLE INSTALLATION BOLTS

E6U111ZWB008

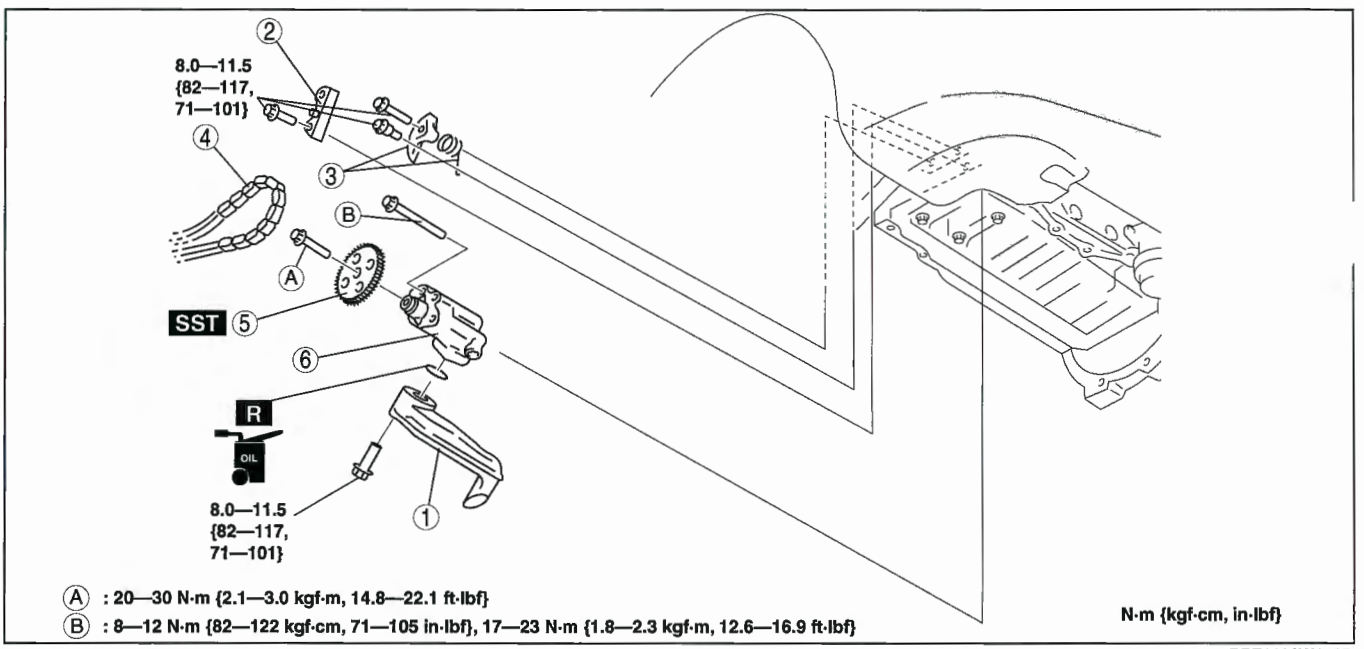
OIL PUMP REMOVAL/INSTALLATION [L3 WITH TC]

E6U011114100W01

Warning

- **Hot engines and engine oil can cause severe burns. Turn off the engine and wait until it and the engine oil have cooled.**
- **A vehicle that is lifted but not securely supported on safety stands is dangerous. It can slip or fall, causing death or serious injury. Never work around or under a lifted vehicle if it is not securely supported on safety stands.**
- **Continuous exposure to USED engine oil has caused skin cancer in laboratory mice. Protect your skin by washing with soap and water immediately after working with engine oil.**

1. Disconnect the negative battery cable.
2. Remove the under cover.
3. Drain the engine oil. (See 01–11B–2 ENGINE OIL REPLACEMENT [L3 WITH TC].)
4. Remove the engine front cover. (See 01–10B–10 TIMING CHAIN REMOVAL/INSTALLATION [L3 WITH TC].)
5. Remove the oil pan. (See 01–11B–5 OIL PAN REMOVAL/INSTALLATION [L3 WITH TC].)
6. Remove in the order indicated in the table.
7. Install in the reverse order of removal.
8. Refill with the specified type and amount of the engine oil. (See 01–11B–2 ENGINE OIL REPLACEMENT [L3 WITH TC].)
9. Start the engine and confirm that there is no oil leakage.
   - If there is oil leakage, repair or replace the applicable part.
10. Inspect the oil level. (See 01–11B–2 ENGINE OIL LEVEL INSPECTION [L3 WITH TC].)
11. Inspect the oil pressure. (See 01–11B–3 OIL PRESSURE INSPECTION [L3 WITH TC].)



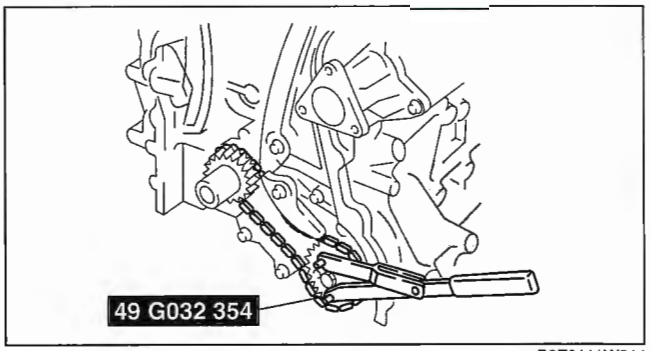
DPE111AW1005

1	Oil strainer
2	Oil pump chain guide
3	Oil pump chain tensioner
4	Oil pump chain

5	Oil pump sprocket (See 01–11B–9 Oil Pump Sprocket Removal/ Installation Note.)
6	Oil pump (See 01–11B–9 Oil Pump Installation Note.)

Oil Pump Sprocket Removal/Installation Note

1. Install the **SST** to the oil pump sprocket to stop the oil pump from rotating.



B3E0111W014

Oil Pump Installation Note

1. Tighten the oil pump bolts in two steps in the order shown in the figure.

Tightening torque
Step 1: 8—12 N·m {82—122 kgf·cm, 71—105 in·lbf}
Step 2: 17—23 N·m {1.8—2.3 kgf·m, 12.6—16.9 ft·lbf}

COOLING SYSTEM SERVICE WARNINGS [L3, AJ]

E6U011200000W02

Warning

- **Never remove the cooling system cap or loosen the radiator drain plug while the engine is running, or when the engine and radiator are hot. Scalding engine coolant and steam may shoot out and cause serious injury. It may also damage the engine and cooling system.**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise to the first stop. Step back while the pressure escapes. (L3)**
- **When you are sure all the pressure is gone, press down on the cap using the cloth, turn it, and remove it. (L3)**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise 2.5 turns. Step back while the pressure escapes. (AJ)**
- **When you are sure all the pressure is gone, turn the cap using the cloth, and remove it. (AJ)**

ENGINE COOLANT LEVEL INSPECTION [L3, AJ]

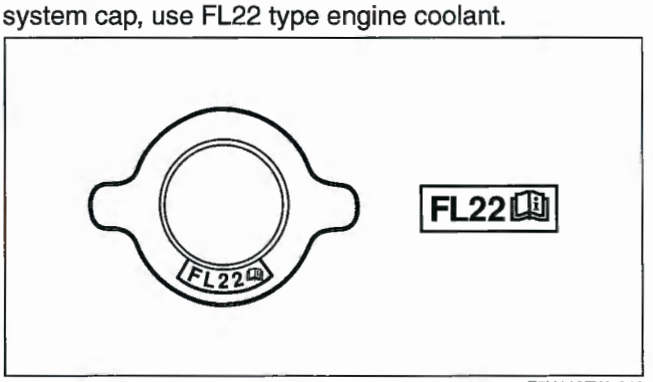
E6U011215001W01

Warning

- **Never remove the cooling system cap or loosen the radiator drain plug while the engine is running, or when the engine and radiator are hot. Scalding engine coolant and steam may shoot out and cause serious injury. It may also damage the engine and cooling system.**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise to the first stop. Step back while the pressure escapes. (L3)**
- **When you are sure all the pressure is gone, press down on the cap using the cloth, turn it, and remove it. (L3)**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise 2.5 turns. Step back while the pressure escapes. (AJ)**
- **When you are sure all the pressure is gone, turn the cap using the cloth, and remove it. (AJ)**

Note

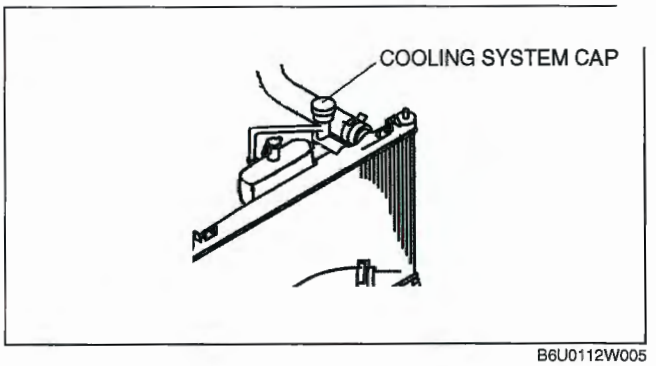
- If the "FL22" mark is shown on or near the cooling system cap, use FL22 type engine coolant.
- FL22 type engine coolant is shipped as a diluted solution (55% coolant, 45% water). Use the solution as is when replacing coolant.



E5U112ZW5010

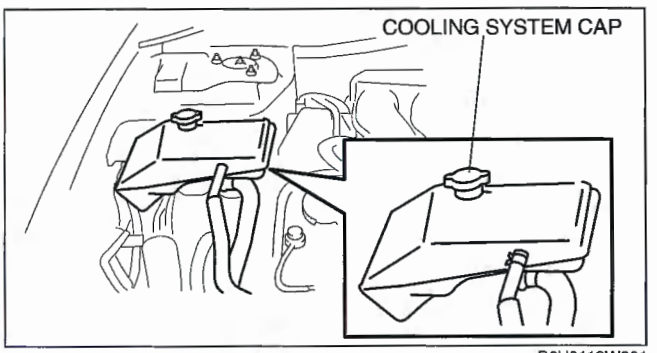
1. Verify that the engine coolant level in the engine coolant reserve tank is between the F and L marks.
   - If the engine coolant level is below L, remove the cooling system cap and add engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)

L3



B6U0112W005

AJ



B6U0112W001

ENGINE COOLANT PROTECTION INSPECTION [L3, AJ]

E6U011215001W

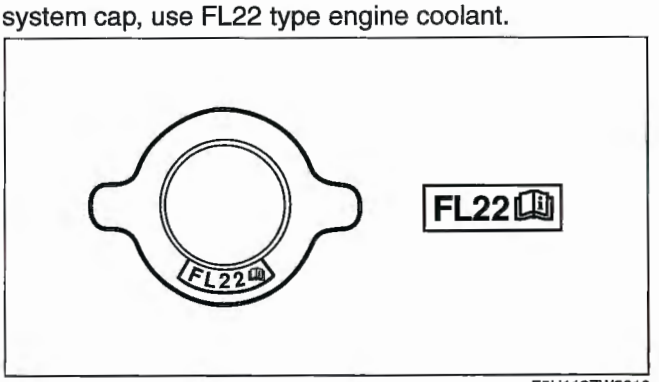
1. Measure the engine coolant temperature and specific gravity with a thermometer and a hydrometer.

Caution

- **Use engine coolant at a concentration that meets the environmental conditions in which the vehicle is driven, otherwise engine damage could occur.**
- **The engine has aluminum parts and must be protected by an ethylene-glycol-based coolant to prevent corrosion and freezing.**
- **Do not use coolants containing Alcohol, Methanol, Borate or Silicate. These coolants could damage the cooling system.**
- **Use only soft (demineralized) water in the coolant mixture. Water that contains minerals will cut down on the coolant's effectiveness.**
- **Engine coolant damages paint. If engine coolant does get on a painted surface, rinse it off quickly.**

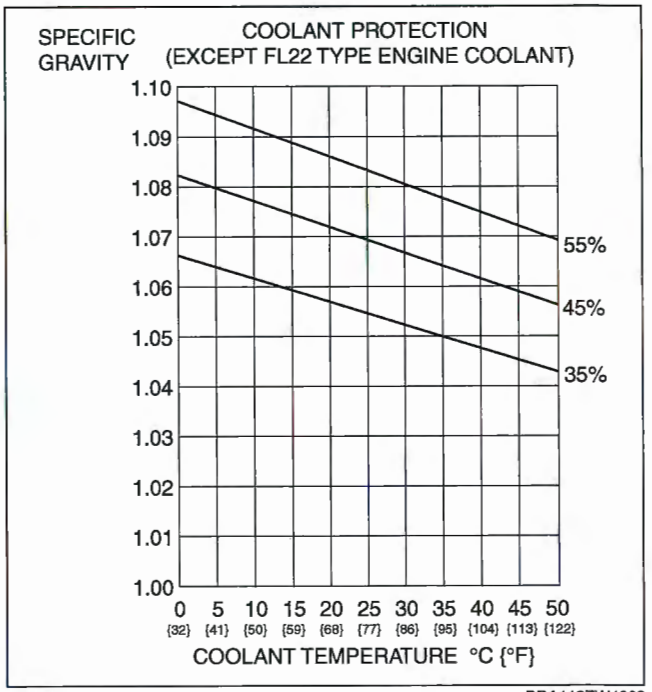
Note

- If the "FL22" mark is shown on or near the cooling system cap, use FL22 type engine coolant.
- FL22 type engine coolant is shipped as a diluted solution (55% coolant, 45% water). Use the solution as is when replacing coolant.



E5U112ZW501

2. Determine the engine coolant protection by referring to the graph shown.
   - If the engine coolant protection is not proper, add water or engine coolant.



DDA112ZW4003

ENGINE COOLANT REPLACEMENT [L3, AJ]

E6U011215001W03

Warning

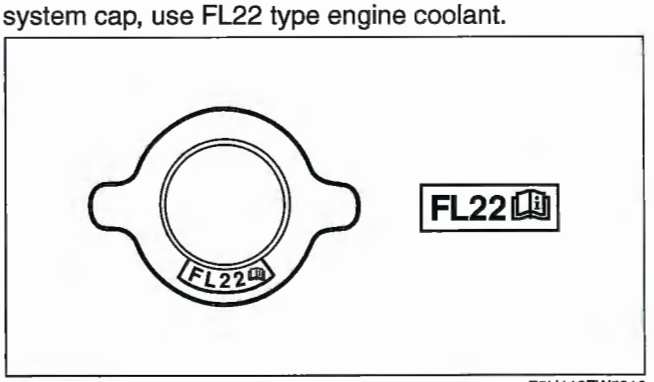
- **Never remove the cooling system cap or loosen the radiator drain plug while the engine is running, or when the engine and radiator are hot. Scalding engine coolant and steam may shoot out and cause serious injury. It may also damage the engine and cooling system.**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise to the first stop. Step back while the pressure escapes. (L3)**
- **When you are sure all the pressure is gone, press down on the cap using the cloth, turn it, and remove it. (L3)**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise 2.5 turns. Step back while the pressure escapes. (AJ)**
- **When you are sure all the pressure is gone, turn the cap using the cloth, and remove it. (AJ)**

Caution

- **Use engine coolant at a concentration that meets the environmental conditions in which the vehicle is driven, otherwise engine damage could occur.**
- **The engine has aluminum parts and must be protected by an ethylene-glycol-based coolant to prevent corrosion and freezing.**
- **Do not use coolants containing Alcohol, Methanol, Borate or Silicate. These coolants could damage the cooling system.**
- **Use only soft (demineralized) water in the coolant mixture. Water that contains minerals will cut down on the coolant's effectiveness.**
- **Engine coolant damages paint. If engine coolant does get on a painted surface, rinse it off quickly.**

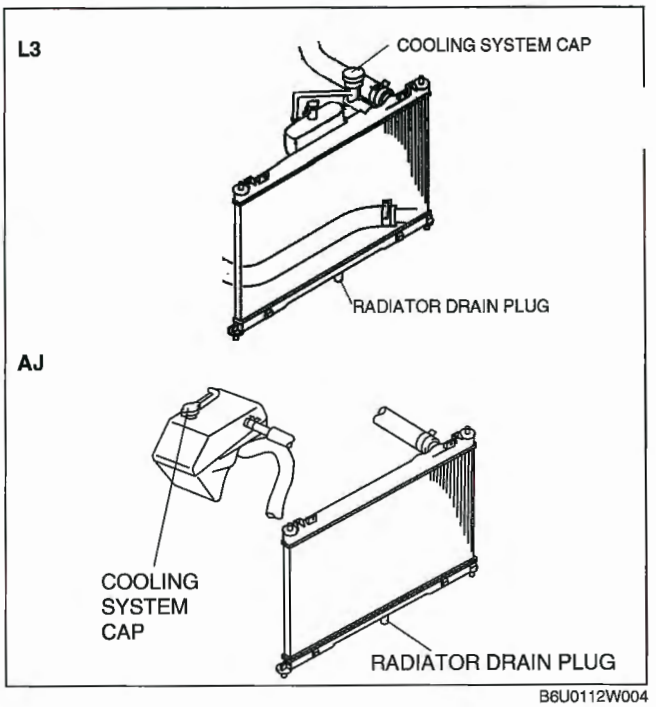
Note

- If the "FL22" mark is shown on or near the cooling system cap, use FL22 type engine coolant.
- FL22 type engine coolant is shipped as a diluted solution (55% coolant, 45% water). Use the solution as is when replacing coolant.



E5U112ZW5010

1. Remove the cooling system cap and the radiator drain plug.
2. Drain the engine coolant into a container.
3. Flush the cooling system with water until all traces of color are gone.
4. Let the system drain completely.
5. Tighten the radiator drain plug.
6. Referring to the following chart, select proper volume percentage of the water and engine coolant.



B6U0112W004

Antifreeze solution mixture percentage (Except FL22 type engine coolant)

Engine coolant protection	Volume percentage (%)		Gravity at 20 °C {68 °F}
	Water	Coolant	
Above -16 °C {3 °F}	65	35	1.057
Above -26 °C {-15 °F}	55	45	1.072
Above -40 °C {-40 °F}	45	55	1.086

7. Slowly pour the engine coolant into the radiator up to the engine coolant filler port. (L3 engine model)
8. Fill the engine coolant into the engine coolant reserve tank up to the F mark on the engine coolant reserve tank.
9. Tighten the cooling system cap.

Caution
- **If the water temperature gauge rises too high, stop the engine and decrease the water temperature to prevent overheating. Then, verify the malfunctioning part and repair or replace it.**
- **If the engine coolant level in the coolant reserve tank is below the L mark during engine coolant air bleeding operation, stop the engine, and after the engine coolant temperature decreases, add engine coolant. Then, resume the engine coolant air bleeding operation.**

10. Start the engine and idle it until the cooling fan operates.
11. After engine warms up, perform the following steps.
    (1) Run the engine at **2,500 rpm** for **5 min**.
    (2) Run the engine at **3,000 rpm** for **5 s**, then idle.
    (3) Repeat steps (2) several times.
    (4) Idle the engine for **1 min**.
12. Stop the engine and wait until it is cool.
13. Inspect the engine coolant level.
    - If it is low, repeat Steps 7—13 (L3 engine model), Steps 8—13 (AJ engine model).
14. Install the cooling system cap.
15. Inspect for engine coolant leakage. (See 01–12A–7 ENGINE COOLANT LEAKAGE INSPECTION [L3, AJ].)

ENGINE COOLANT LEAKAGE INSPECTION [L3, AJ]

E6U011215001W04

Warning

- **Never remove the cooling system cap or loosen the radiator drain plug while the engine is running, or when the engine and radiator are hot. Scalding engine coolant and steam may shoot out and cause serious injury. It may also damage the engine and cooling system.**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise to the first stop. Step back while the pressure escapes. (L3)**
- **When you are sure all the pressure is gone, press down on the cap using the cloth, turn it, and remove it. (L3)**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise 2.5 turns. Step back while the pressure escapes. (AJ)**
- **When you are sure all the pressure is gone, turn the cap using the cloth, and remove it. (AJ)**

1. Inspect the engine coolant level. (See 01–12A–3 ENGINE COOLANT LEVEL INSPECTION [L3, AJ].)
2. Remove the cooling system cap.
3. Clean the installation parts of the cooling system cap.
4. Install the **SST** and a radiator cap tester (L3 engine model), commercially available radiator cap tester (AJ engine model) to the engine coolant filler port.
5. Apply pressure using the radiator cap tester.

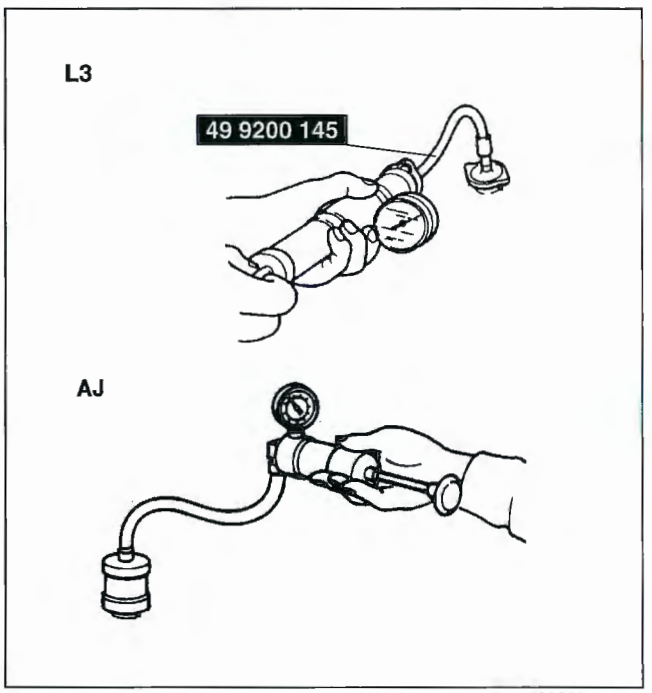
Caution

- **Applying more than 127 kPa {1.3 kgf/cm^2, 18 psi} (L3 engine model), 107.9 kPa {1.1 kgf/cm^2, 15.6 psi} (AJ engine model) can damage the hoses, fittings, and other components, and cause leakage.**

Pressure

L3: 127 kPa {1.3 kgf/cm^2, 18 psi}
AJ: 107.9 kPa {1.1 kgf/cm^2, 15.6 psi}

6. When pressurizing the cooling system, verify that the pressure is maintained.
   - If the gauge needle drops, it may indicate water leakage. Repair or replace the applicable part.



A6A3612W202

COOLING SYSTEM CAP INSPECTION [L3, AJ]

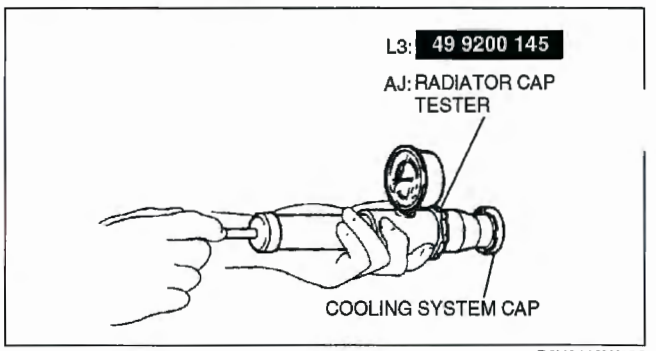
E6U011215201W01

Warning

- **Never remove the cooling system cap or loosen the radiator drain plug while the engine is running, or when the engine and radiator are hot. Scalding engine coolant and steam may shoot out and cause serious injury. It may also damage the engine and cooling system.**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise to the first stop. Step back while the pressure escapes. (L3)**
- **When you are sure all the pressure is gone, press down on the cap using the cloth, turn it, and remove it. (L3)**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise 2.5 turns. Step back while the pressure escapes. (AJ)**
- **When you are sure all the pressure is gone, turn the cap using the cloth, and remove it. (AJ)**

1. Clean the cooling system cap and the sealed part.
2. Inspect the crack or turn over on the sealed part of the cooling system cap.
   - If not as specified, replace the cooling system cap.

3. Fill the **SST** (L3 engine model), commercially available radiator cap tester (AJ engine model) with the water or the engine coolant to the full level and attach the cooling system cap to the **SST** (L3 engine model), radiator cap tester (AJ engine model).
4. Hold the cooling system cap downward and apply pressure gradually. Verify that the pressure become held for **10 s** within the specification.
   - If the pressure is not held stable within the specification, replace the cooling system cap.



B6U0112W050

Pressure
L3: 113—142 kPa {1.15—1.44 kgf/cm^2, 16.4—20.4 psi}
AJ: 94—122 kPa {0.95—1.25 kgf/cm^2, 13.6—17.7 psi}

RADIATOR REMOVAL/INSTALLATION [L3, AJ]

E6U011215200W01

1. Disconnect the negative battery cable.
2. Drain the engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)
3. Remove the air cleaner. (See L3: 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3], AJ: 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
4. Remove the shroud panel. (See 09–10–17 SHROUD PANEL REMOVAL/INSTALLATION.)
5. Remove the cooling fan. (See 01–12A–12 COOLING FAN REMOVAL/INSTALLATION [L3, AJ].)
6. Disconnect the upper radiator hose from the radiator. (L3 engine model)
7. Disconnect the oil hose from the radiator. (ATX)
8. Remove the engine coolant reserve hose. (AJ engine model)
9. Remove in the order indicated in the table.
10. Install in the reverse order of the removal.
11. Add the engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)
12. Inspect for engine coolant leakage. (01–12A–7 ENGINE COOLANT LEAKAGE INSPECTION [L3, AJ].)
13. Inspect the ATF level. (ATX) (See 05–17A–10 AUTOMATIC TRANSAXLE FLUID (ATF) INSPECTION [FS5A-EL].) (See 05–17B–11 AUTOMATIC TRANSAXLE FLUID (ATF) INSPECTION [AW6A-EL].)

1. Disconnect the negative battery cable.
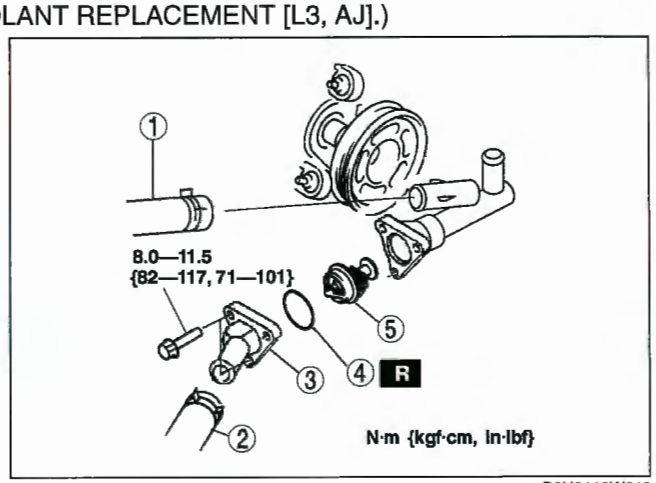
2. Remove the air cleaner. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
3. Drain the engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)
4. Remove in the order indicated in the table.
5. Install in the reverse order of removal.
6. Add the engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)
7. Inspect the engine coolant leakage. (See 01–12A–7 ENGINE COOLANT LEAKAGE INSPECTION [L3, AJ].)

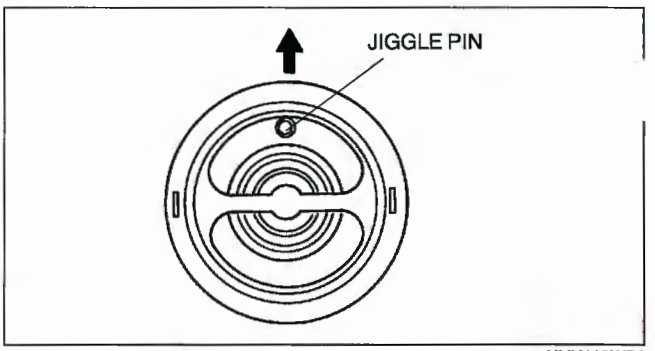
1	Upper radiator hose
2	Lower radiator hose
3	Thermostat cover
4	O-ring
5	Thermostat (See 01–12A–10 Thermostat Installation Note (AJ).)



B6U0112W010

Thermostat Installation Note (AJ)

1. Install the thermostat into the thermostat case with the jiggle pin at the top.



YMU112WB2

THERMOSTAT INSPECTION [L3, AJ]

E6U011215171W02

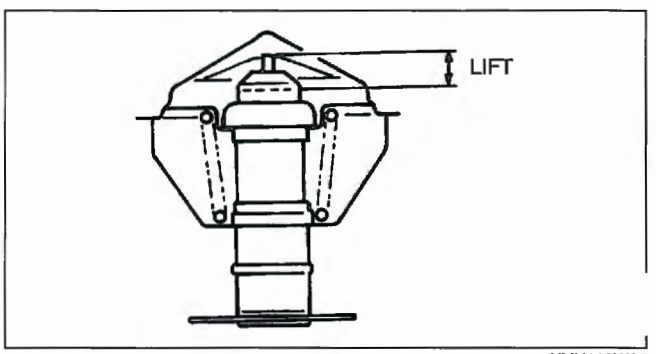
1. Visually inspect that the thermostat valve is closed.
2. Place the thermostat and a thermometer in water.

Warning

- **During inspection, the thermostat and water are extremely hot and can cause severe burns. Do not touch the thermostat and water directly.**

3. Heat the water and inspect the following.
   - If not as specified, replace the thermostat.

Condition	Engine	
	L3	AJ
Initial-opening temperature (°C {°F})	80—84 {176—183}	84—88 {184—190}
Full-open temperature (°C {°F})	97 {206}	99 {210}
Full-open lift (mm {in})	More than 8.0 {0.31}	More than 7.3 {0.29}



YMU112WA7

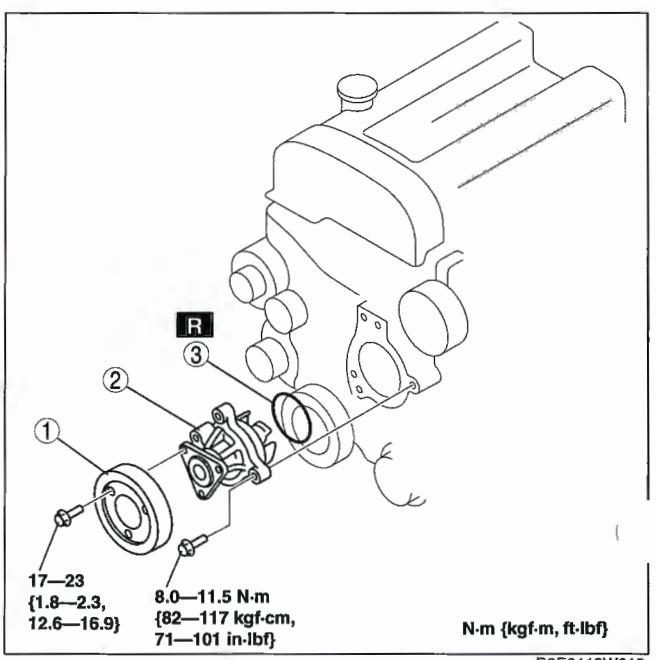
WATER PUMP REMOVAL/INSTALLATION [L3, AJ]

E6U011215010W01

L3

1. Disconnect the negative battery cable.
2. Drain the engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)
3. Remove the drive belt. (See 01–10A–3 DRIVE BELT REPLACEMENT [L3].)
4. Remove in the order indicated in the table.
5. Install in the reverse order of removal.
6. Add the engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)

1	Water pump pulley
2	Water pump
3	O-ring

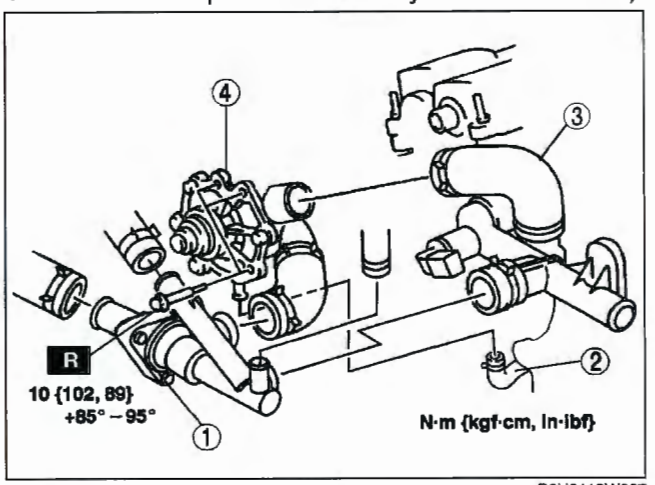


B3E0112W015

AJ

1. Disconnect the negative battery cable.
2. Remove the under cover.
   Remove the air cleaner. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
   . Drain the engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)
5. Remove the water pump drive belt pulley. (See 01–10C–9 Water Pump Drive Belt Pulley Removal Note.)
6. Remove in the order indicated in the table.
7. Install in the reverse order of removal.
8. Install the new water pump drive belt pulley. (See 01–10C–24 Water Pump Drive Belt Pulley Installation Note.)
9. Add the engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)

1	Thermostat case
2	Heater hose
3	Water outlet pipe
4	Water pump (See 01–12A–11 Water Pump Installation Note (AJ).)



B6U0112W007

Water Pump Installation Note (AJ)

1. Tighten the bolts to the specified torque, then tighten them further **85°—95°**.

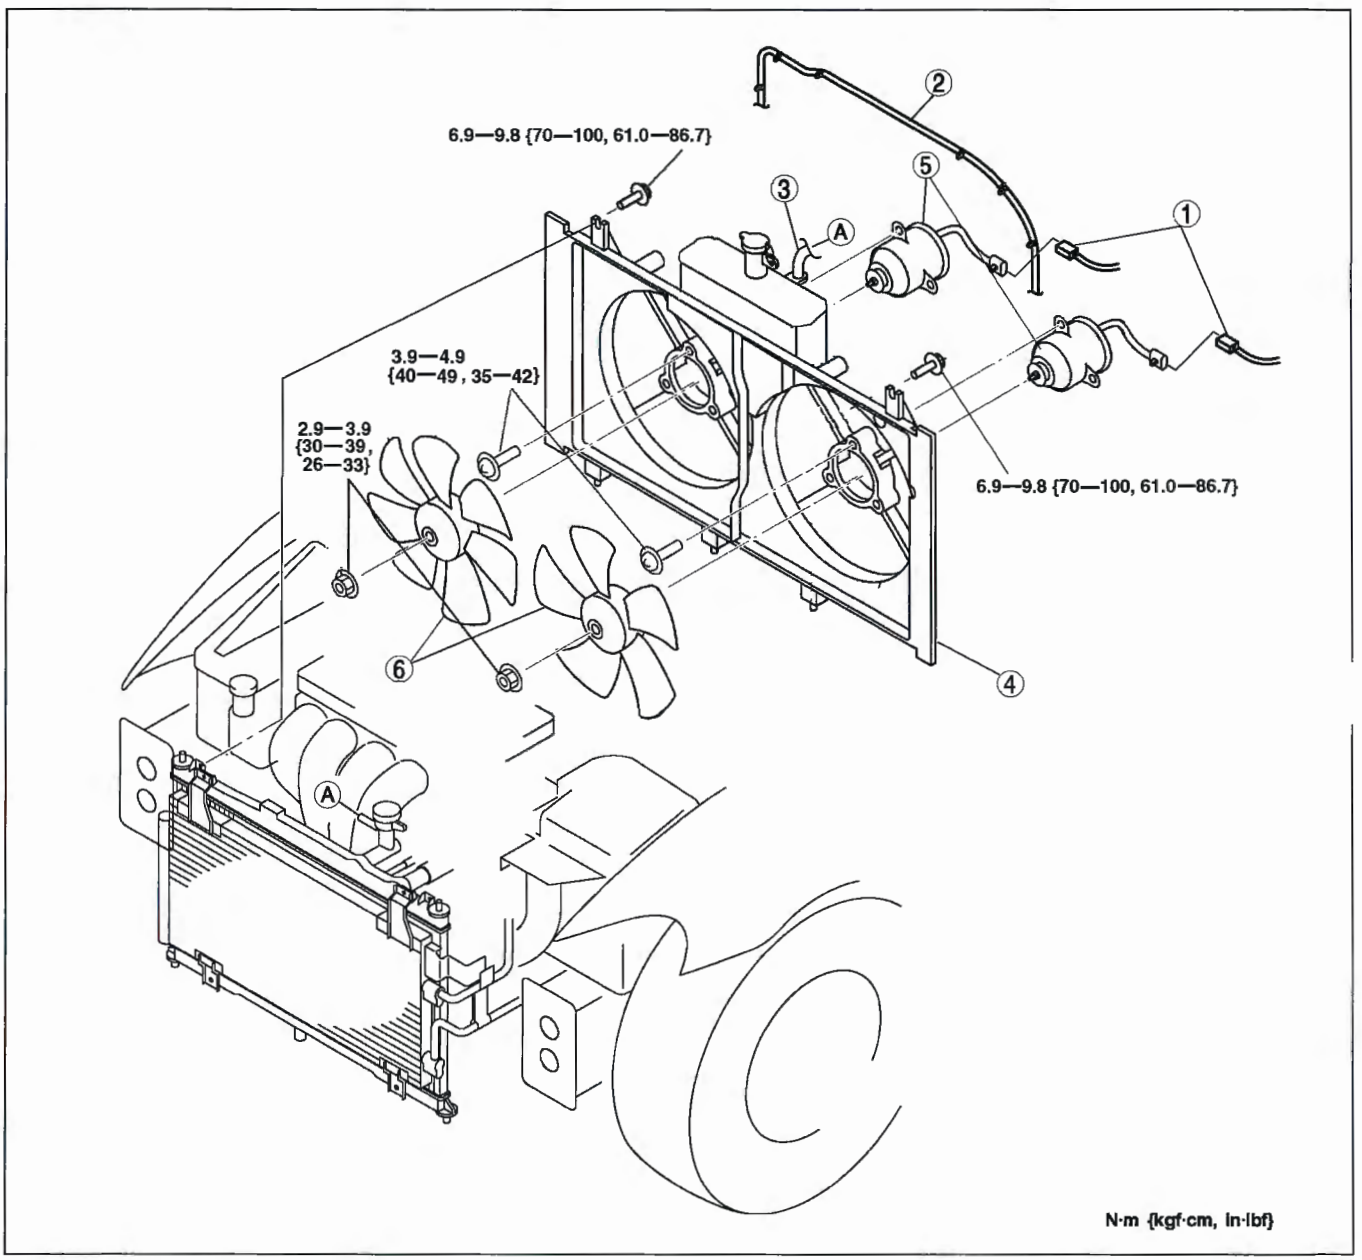
Tightening torque
10 N·m {102 kgf·cm, 89 in·lbf}

COOLING FAN REMOVAL/INSTALLATION [L3, AJ]

E6U011215025W01

L3

1. Disconnect the negative battery cable.
2. Remove the shroud panel. (See 09–10–17 SHROUD PANEL REMOVAL/INSTALLATION.)
3. Remove the cooler pipe stay. (See 07–11–17 CONDENSER REMOVAL/INSTALLATION [L3, AJ].)
4. Remove the oil hose stay. (ATX)
5. Remove in the order indicated in the table.
6. Install in the reverse order of removal.



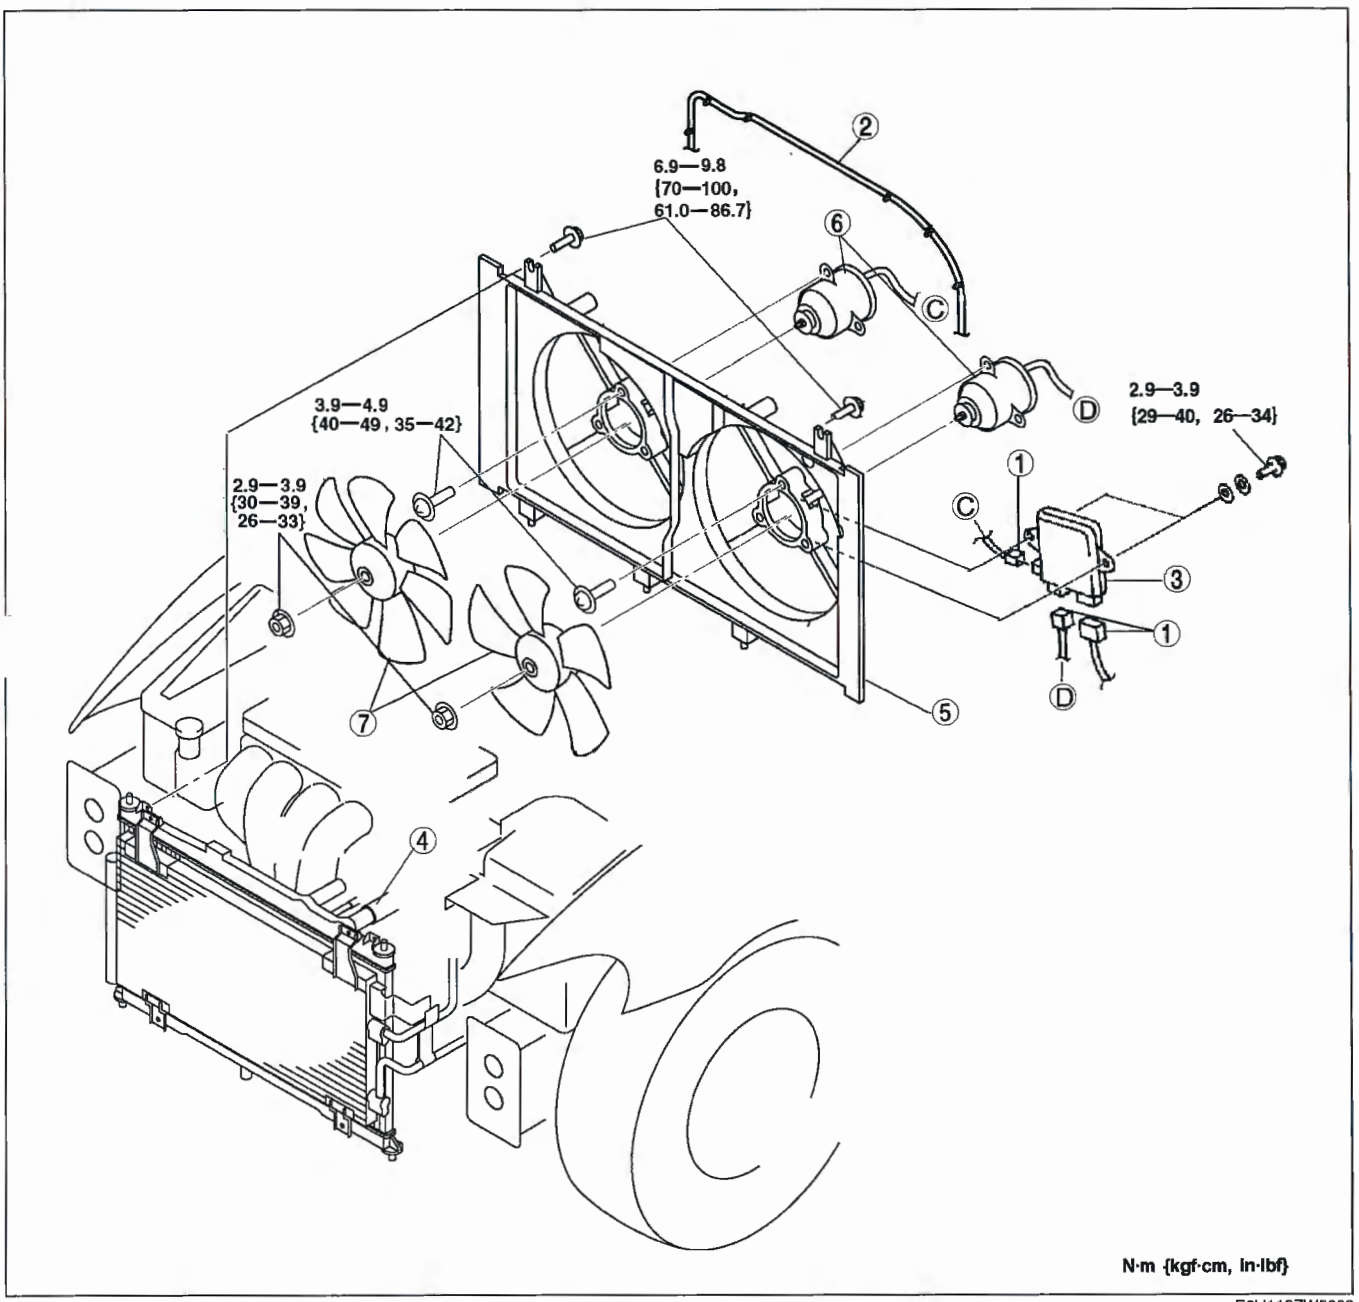
E6U112ZW5001

1	Cooling fan motor connector
2	Cooling fan wiring harness
3	Engine coolant reserve hose

4	Cooling fan component
5	Cooling fan motor
6	Cooling fan blades

AJ

1. Disconnect the negative battery cable.
2. Drain the engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)
   Remove the shroud panel. (See 09–10–17 SHROUD PANEL REMOVAL/INSTALLATION.)
   . Remove the cooler pipe stay. (See 07–11–17 CONDENSER REMOVAL/INSTALLATION [L3, AJ].)
5. Remove the oil hose stay. (ATX)
6. Disconnect the engine coolant reserve hose from the radiator.
7. Remove in the order indicated in the table.
8. Install in the reverse order of removal.
9. Add the engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)



E6U112ZW5002

1	Fan control module connectors
2	Cooling fan wiring harness
3	Fan control module
4	Radiator upper hose

5	Cooling fan component
6	Cooling fan motor
7	Cooling fan blades

COOLING FAN MOTOR INSPECTION [L3, AJ]

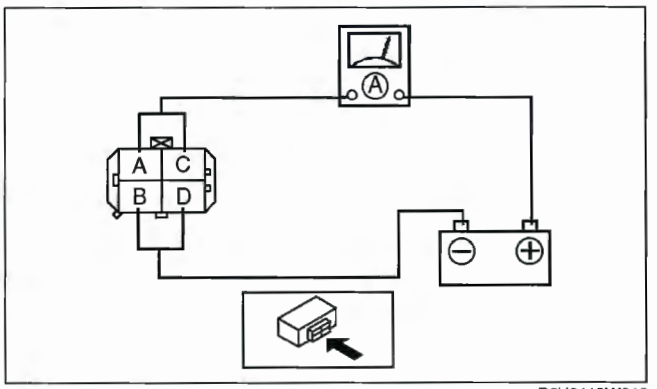
E6U011215025W02

L3

1. Verify that the battery is fully charged. (See 01–17A–2 BATTERY INSPECTION [L3, AJ].)
2. Connect the battery positive voltage and an ammeter to the fan motor connector.
3. Verify that the fan motor operates smoothly at the standard current draw.
   - If not within the specification, replace the fan motor.

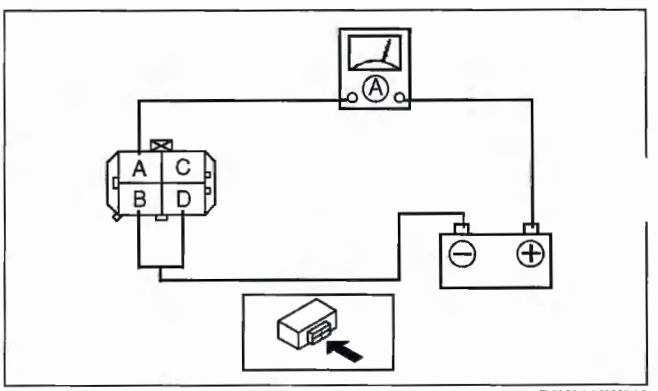
Standard current [12 V]
8.5—11.5 (A)

High (Cooling fan motor No.1 and No.2)



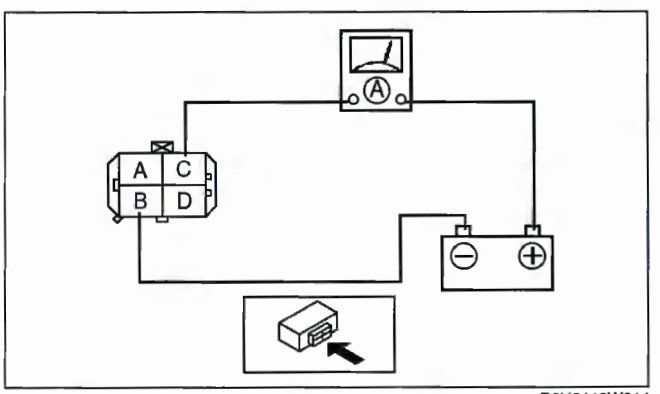
B6U0112W012

Middle (Cooling fan motor No.2)



B6U0112W013

Low (Cooling fan motor No.1 and No.2)



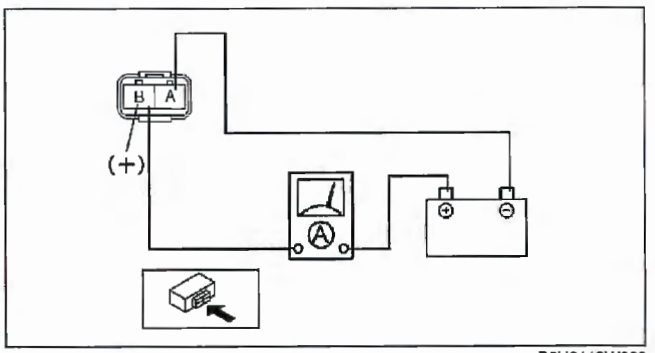
B6U0112W014

AJ

1. Verify that the battery is fully charged. (See 01–17A–2 BATTERY INSPECTION [L3, AJ].)
2. Disconnect the fan control module connector (3 terminals).
   Connect the positive battery voltage and an ammeter to the fan control module connector on fan motor side. (2 terminals)
4. Verify that the fan motor operates smoothly at the standard current draw.
   - If not within the specification, replace the fan motor.

   Standard current [12 V]
   11.8—14.8 (A)

5. Perform the same procedure as Step 2 for the cooling fan motor No.2.

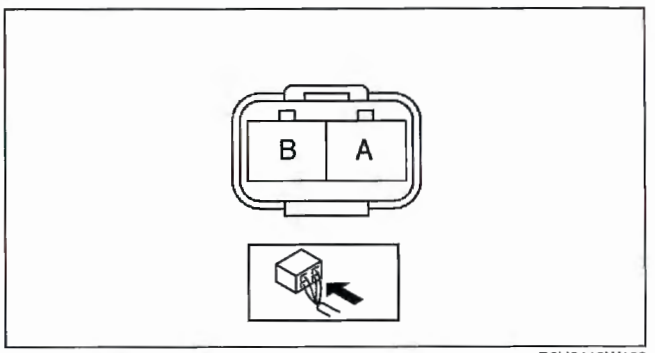


B6U0112W030

FAN CONTROL MODULE INSPECTION [AJ]

E6U011215150W01

1. Remove the two bolts from the fan control module with the connectors still connected.
2. Start and warm up the engine.
3. Monitor the engine coolant temperature with the WDS or equivalent.
4. Measure the voltage at the terminal B of fan control module connector (2 terminals) as shown in the table.
   - If there is any malfunction, replace the fan control module.



B6U0112W100

Inspection			Result
Condition	A/C	Engine coolant temp.	
IG SW ON	OFF	95 °C {203 °F} or less	Fan stops
IG SW ON (Idling)	OFF	95 °C {203 °F} or less	Fan stops
IG SW ON (Idling)	ON*	95 °C {203 °F} or less	6.9V—12.1V
IG SW ON (Idling)	OFF	100 °C {212 °F} or more	0.6V—14.6V

* : When the magnetic clutch and the middle pressure SW are on.

COOLING SYSTEM SERVICE WARNINGS [L3 WITH TC]

E6U011200000W04

Warning

- **Never remove the cooling system cap or loosen the radiator drain plug while the engine is running, or when the engine and radiator are hot. Scalding engine coolant and steam may shoot out and cause serious injury. It may also damage the engine and cooling system.**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise to the first stop. Step back while the pressure escapes.**
- **When you are sure all the pressure is gone, press down on the cap using the cloth, turn it, and remove it.**

ENGINE COOLANT LEVEL INSPECTION [L3 WITH TC]

E6U011215001W05

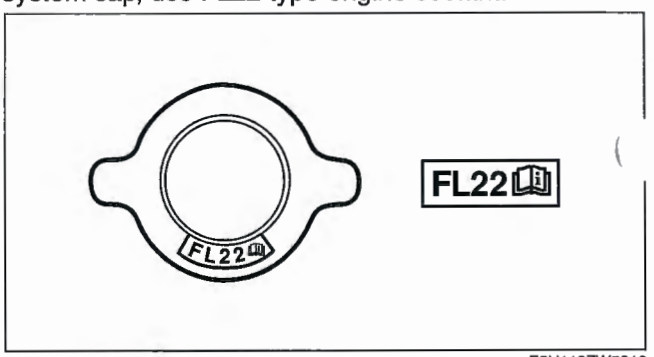
Warning

- **Never remove the cooling system cap or loosen the radiator drain plug while the engine is running, or when the engine and radiator are hot. Scalding engine coolant and steam may shoot out and cause serious injury. It may also damage the engine and cooling system.**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise to the first stop. Step back while the pressure escapes.**
- **When you are sure all the pressure is gone, press down on the cap using the cloth, turn it, and remove it.**

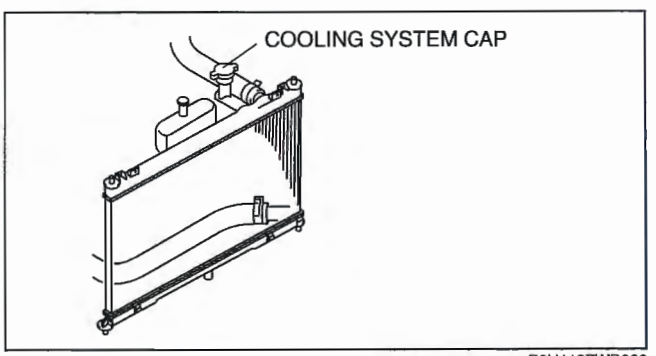
Note

- If the "FL22" mark is shown on or near the cooling system cap, use FL22 type engine coolant.
- FL22 type engine coolant is shipped as a diluted solution (55% coolant, 45% water). Use the solution as is when replacing coolant.

1. Verify that the engine coolant level in the engine coolant reserve tank is between the FULL and LOW marks.
   - If the engine coolant level is below LOW, remove the cooling system cap and add engine coolant. (See 01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)



E5U112ZW5010



E6U112ZWB002

ENGINE COOLANT PROTECTION INSPECTION [L3 WITH TC]

E6U011215001W06

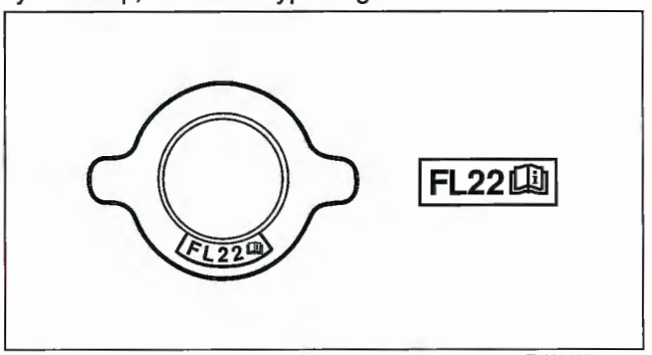
1. Measure the engine coolant temperature and specific gravity using a thermometer and a hydrometer.

Caution

- **Use engine coolant at a concentration that meets the environmental conditions in which the vehicle is driven, otherwise engine damage could occur.**
- **The engine has aluminum parts and must be protected by an ethylene-glycol-based coolant to prevent corrosion and freezing.**
- **Do not use coolants containing Alcohol, Methanol, Borate or Silicate. These coolants could damage the cooling system.**
- **Use only soft (demineralized) water in the coolant mixture. Water that contains minerals will cut down on the coolant's effectiveness.**
- **Engine coolant damages paint. If engine coolant does get on a painted surface, rinse it off quickly.**

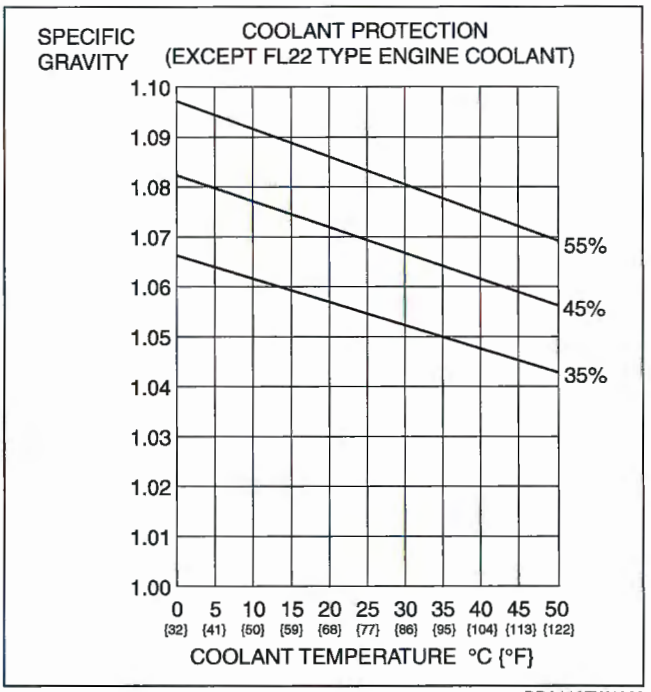
Note

- If the "FL22" mark is shown on or near the cooling system cap, use FL22 type engine coolant.
- FL22 type engine coolant is shipped as a diluted solution (55% coolant, 45% water). Use the solution as is when replacing coolant.



E5U112ZW5010

2. Determine the engine coolant protection level by referring to the graph shown.
   - If the engine coolant protection level is not correct, add water or engine coolant.



DDA112ZW4003

ENGINE COOLANT REPLACEMENT [L3 WITH TC]

E6U011215001W07

Warning

- **Never remove the cooling system cap or loosen the radiator drain plug while the engine is running, or when the engine and radiator are hot. Scalding engine coolant and steam may shoot out and cause serious injury. It may also damage the engine and cooling system.**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise to the first stop. Step back while the pressure escapes.**
- **When you are sure all the pressure is gone, press down on the cap using the cloth, turn it, and remove it.**

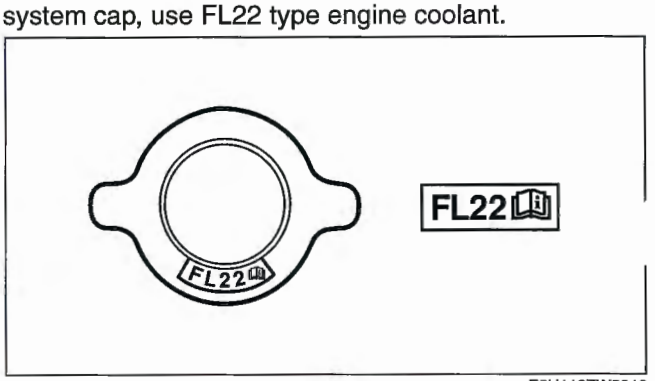
Caution

- **Use engine coolant at a concentration that meets the environmental conditions in which the vehicle is driven, otherwise engine damage could occur.**
- **The engine has aluminum parts and must be protected by an ethylene-glycol-based coolant to prevent corrosion and freezing.**
- **Do not use coolants containing Alcohol, Methanol, Borate or Silicate. These coolants could damage the cooling system.**
- **Use only soft (demineralized) water in the coolant mixture. Water that contains minerals will cut down on the coolant's effectiveness.**
- **Engine coolant damages paint. If engine coolant does get on a painted surface, rinse it off quickly.**

Note

- If the "FL22" mark is shown on or near the cooling system cap, use FL22 type engine coolant.
- FL22 type engine coolant is shipped as a diluted solution (55% coolant, 45% water). Use the solution as is when replacing coolant.

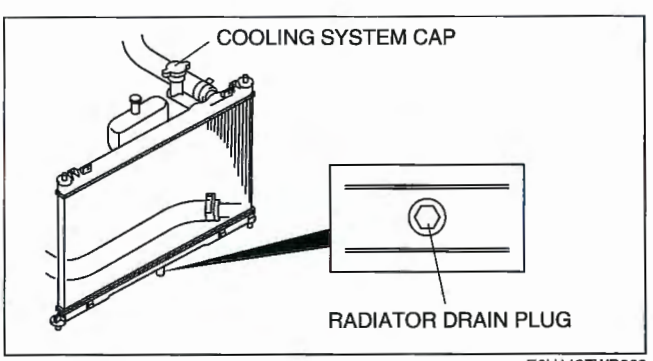
Engine coolant capacity (approx. quantity)
8.0 L {8.5 US qt, 7.0 Imp qt}



E5U112ZW5010

1. Remove the cooling system cap and the radiator drain plug.
2. Drain the engine coolant into a container.
3. Flush the cooling system with water until all traces of color are gone.
4. Let the system drain completely.
5. Tighten the radiator drain plug.

Tightening torque
1.5—2.4 N·m {15—25 kgf·cm, 13—21 in·lbf}



E6U112ZWB003

6. Referring to the following chart, select the correct volume percentage of the water and engine coolant.

Antifreeze solution mixture percentage (Except FL22 type engine coolant)

Engine coolant protection	Volume percentage (%)		Gravity at 20 °C {68 °F}
	Water	Coolant	
Above -16 °C {3 °F}	65	35	1.057
Above -26 °C {-15 °F}	55	45	1.072
Above -40 °C {-40 °F}	45	55	1.086

7. Slowly pour the engine coolant into the radiator up to the engine coolant filler port.
8. Fill the engine coolant into the engine coolant reserve tank up to the FULL mark on the engine coolant reserve tank.

9. Install the cooling system cap.

Caution
- **If the engine coolant temperature becomes too high, stop the engine to prevent it from overheating.**

10. Start the engine and idle it until the cooling fan operates.
11. After engine warms up, perform the following steps.
    (1) Run the engine at **2,500 rpm** for **5 min.**
    (2) Run the engine at **3,000 rpm** for **5 s**, then idle.
    (3) Repeat step (2) several times.
    (4) Idle the engine for **1 min.**
12. Stop the engine and wait until it is cools.
13. Inspect the engine coolant level.
    - If it is low, repeat steps 7—13.
14. Inspect for engine coolant leakage. (See 01–12B–5 ENGINE COOLANT LEAKAGE INSPECTION [L3 WITH TC].)

ENGINE COOLANT LEAKAGE INSPECTION [L3 WITH TC]

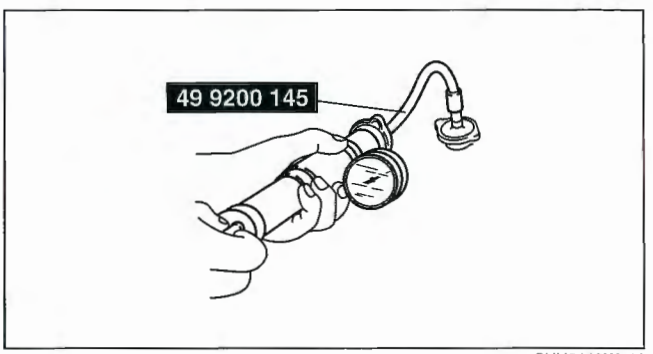
E6U011215001W08

Warning
- **Never remove the cooling system cap or loosen the radiator drain plug while the engine is running, or when the engine and radiator are hot. Scalding engine coolant and steam may shoot out and cause serious injury. It may also damage the engine and cooling system.**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise to the first stop. Step back while the pressure escapes.**
- **When you are sure all the pressure is gone, press down on the cap using the cloth, turn it, and remove it.**

1. Inspect the engine coolant level. (See 01–12B–2 ENGINE COOLANT LEVEL INSPECTION [L3 WITH TC].) Remove the cooling system cap.
2. Install the **SST** to the engine coolant filler port.
4. Apply specified pressure to the cooling system.

Caution
- **Applying more than 142.2 kPa {1.45 kgf/cm^2, 20.6 psi} can damage the hoses, fittings, and other components, and cause leaks.**

Pressure
142.2 kPa {1.45 kgf/cm^2, 20.6 psi}



CHU0112W013

5. When pressurizing the cooling system, verify that the pressure is maintained.
    - If the gauge needle drops, it may indicate water leakage. Repair or replace the applicable part.

COOLING SYSTEM CAP INSPECTION [L3 WITH TC]

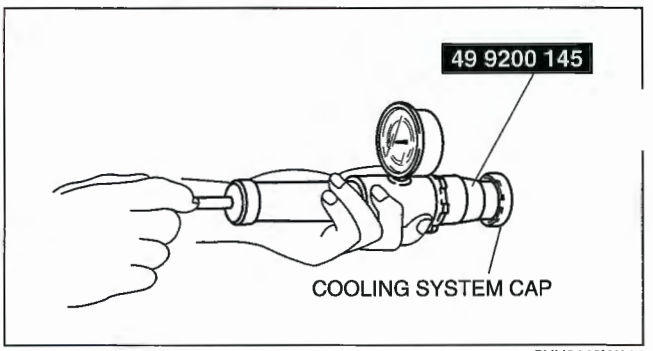
E6U011215201W02

Warning
- **Never remove the cooling system cap or loosen the radiator drain plug while the engine is running, or when the engine and radiator are hot. Scalding engine coolant and steam may shoot out and cause serious injury. It may also damage the engine and cooling system.**
- **Turn off the engine and wait until it has cooled. Even then, be very careful when removing the cap. Wrap a thick cloth around it and slowly turn it counterclockwise to the first stop. Step back while the pressure escapes.**
- **When you are sure all the pressure is gone, press down on the cap using the cloth, turn it, and remove it.**

1. Clean the cooling system cap and the sealed part.
2. Inspect the cooling system cap for cracks or everted seal.
    - If there is any malfunction, replace the cooling system cap.

3. Fill the **SST** with water or engine coolant to the full level and attach the cooling system cap to the **SST**.
4. Hold the cooling system cap downward and apply pressure gradually. Verify that the pressure is held stable for **10 s**.
   - If the pressure is not held stable, replace the cooling system cap.

Cooling system cap valve opening pressure
112.8—142.2 kPa {1.15—1.45 kgf/cm^2, 16.4—20.6 psi}



CHU0112W011

RADIATOR REMOVAL/INSTALLATION [L3 WITH TC]

E6U011215200W02

Warning
- **Remove and install all parts when the engine is cold, otherwise they can cause severe burns or serious injury.**

1. Disconnect the negative battery cable.
2. Drain the engine coolant. (See 01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)
3. Remove the air cleaner. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
4. Remove the shroud panel. (See 09–10–17 SHROUD PANEL REMOVAL/INSTALLATION.)
5. Remove the cooling fan component. (See 01–12B–8 COOLING FAN REMOVAL/INSTALLATION [L3 WITH TC].)
6. Remove in the order indicated in the table.
7. Install in the reverse order of the removal.
8. Refill the engine coolant. (See 01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)
9. Inspect for engine coolant leakage. (See 01–12B–5 ENGINE COOLANT LEAKAGE INSPECTION [L3 WITH TC].)

THERMOSTAT INSPECTION [L3 WITH TC]

E6U011215171W04

1. Visually inspect that the thermostat valve is closed.
2. Place the thermostat and a thermometer in water.

Warning
- **During inspection, the thermostat and water are extremely hot and can cause severe burns. Do not touch the thermostat and water directly.**

3. Heat the water and inspect the following.
   - If not as specified, replace the thermostat.

Thermostat initial-opening temperature
80—84 °C {176—183 °F}

Thermostat full-open temperature
97 °C {206 °F}

Thermostat full-open lift
More than 8.0 mm {0.31 in}

WATER PUMP REMOVAL/INSTALLATION [L3 WITH TC]

E6U011215010W02

Warning
- **Remove and install all parts when the engine is cold, otherwise they can cause severe burns or serious injury.**

1. Disconnect the negative battery cable.
2. Drain the engine coolant. (See 01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)
3. Remove the drive belt. (See 01–10B–3 DRIVE BELT REPLACEMENT [L3 WITH TC].)
4. Remove the P/S oil pump with hoses and pipe still connected. Position the P/S oil pump out of the way. (See 06–12–27 POWER STEERING OIL PUMP REMOVAL/INSTALLATION [L3, L3 WITH TC].)
5. Remove in the order indicated in the table.
6. Install in the reverse order of removal.
7. Refill the engine coolant. (See 01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)

8	Cooling fan No.2
9	Cooling fan motor No.1 and fan control module component
10	Cooling fan motor No.2

Fan Control Module Removal Note

Note
- Cooling fan component cannot be removed with the fan control module attached to the fan cowling.

1. Remove the two fan control module installation screws with the connector still connected so that the fan control module is movable.

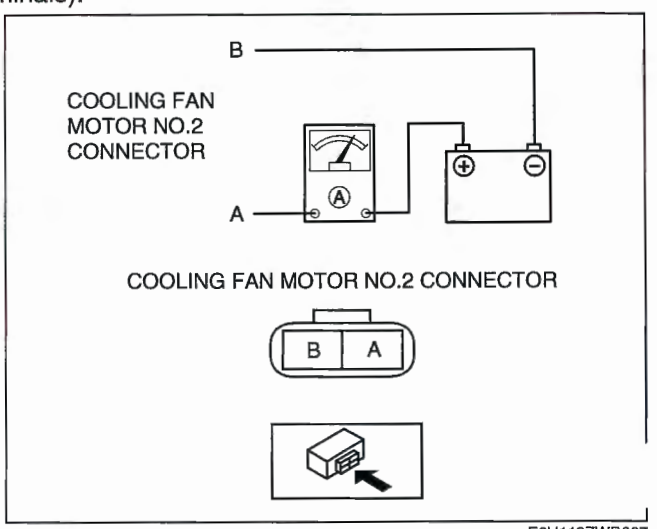
COOLING FAN MOTOR INSPECTION [L3 WITH TC]

E6U011215025W04

Note
- Cooling fan motor No.2 can be inspected, however, cooling fan motor No.1 cannot be inspected because it is integrated with the fan control module.

1. Verify that the battery is fully charged. (See 01–17B–2 BATTERY INSPECTION [L3 WITH TC].)
2. Disconnect the cooling fan motor No.2 connector (2 terminals).
3. Install a tester and battery to the cooling fan motor No.2 connector (2 terminals) as shown in the figure.
4. Verify that fan motor No.2 operates smoothly at the standard current.
   - If not within the specification, replace the fan motor No.2.

Cooling fan motor No.2 current
12.8—16.8 A

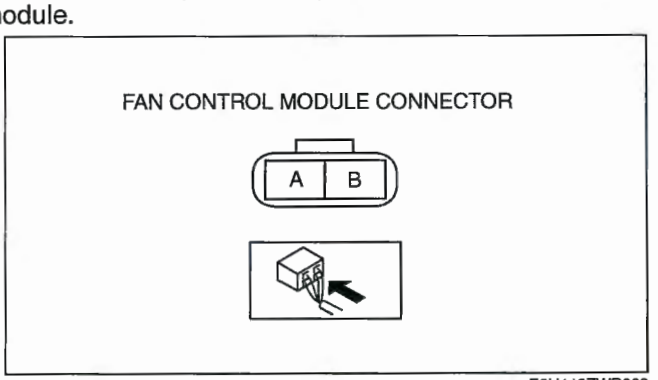


E6U112ZWB007

FAN CONTROL MODULE INSPECTION [L3 WITH TC]

E6U011215150W02

1. Remove the two bolts from the fan control module with the connectors still connected.
2. Start and warm up the engine.
3. Monitor the engine coolant temperature with the WDS or equivalent.
4. Measure the voltage at terminal A of the fan control module connector (2 terminals) as shown in the table.
   - If there is any malfunction, replace the fan control module.



E6U112ZWB008

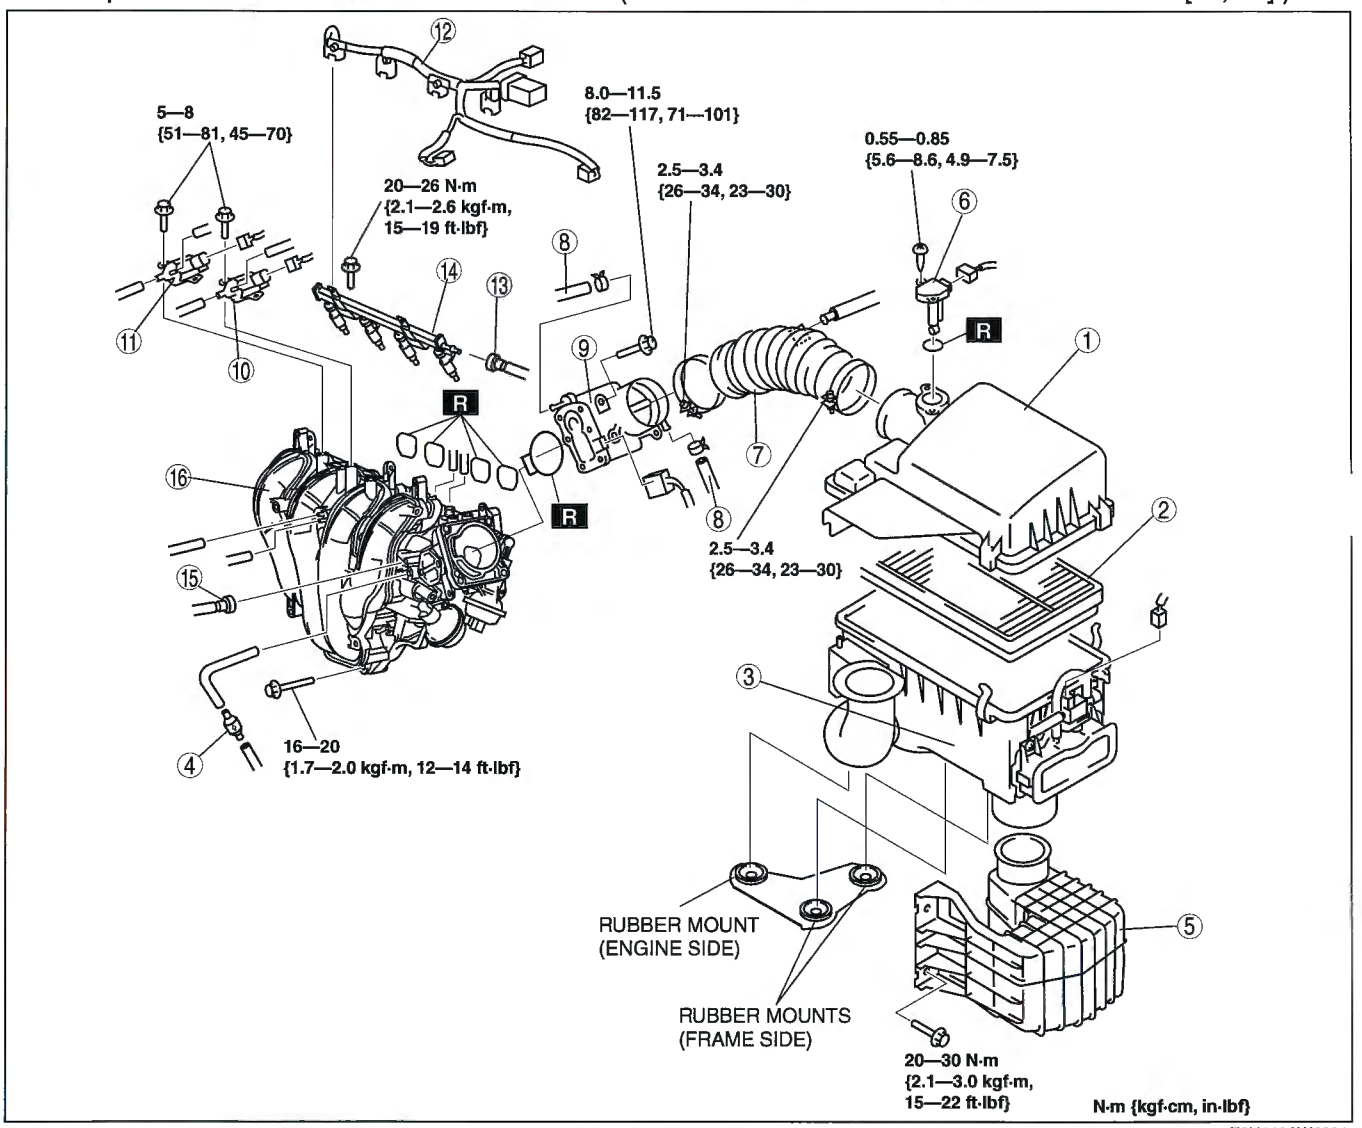
INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3]

E6U011300000W12

Warning

- **A hot engine and intake-air system can cause severe burns. Turn off the engine and wait until the are cool before removing the intake-air system.**
- **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure". (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)**

1. Disconnect the negative battery cable.
2. Remove in the order indicated in the table.
3. Install in the reverse order of removal.
4. Complete the "AFTER REPAIR PROCEDURE". (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)



E6U113AW5001

6	MAF/IAT sensor

7	Air hose
8	Water hose (See 01–13A–5 Water Hose Removal Note)
9	Throttle body
10	Variable tumble solenoid valve
11	Variable intake air solenoid valve
12	Fuel injector connector

13	Plastic fuel hose (See 01–14A–24 Plastic Fuel Hose Removal Note) (See 01–14A–26 Plastic Fuel Hose Installation Note)

14	Fuel distributor
15	Evaporative hose (See 01–16A–7 Evaporative Hose Removal Note (Type A)) (See 01–16A–9 Evaporative Hose Installation Note)
16	Intake manifold

Resonance Chamber Removal Note

1. Remove the front mudguard (LH) before removing the resonance chamber.

Water Hose Removal Note

1. Drain the engine coolant before removing the water hose. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)

Air Cleaner Case Installation Note

Caution

- **Before assembling the air cleaner, verify that the rubber mounts have not fallen off from the air cleaner bracket (3 locations).**
- **Always install the air cleaner case using the following procedure.**

Note

- When inserting the rubber mounts into the air cleaner case, soapy water can be applied.

1. Verify that the rubber mounts are set in the air cleaner bracket (3 locations).
2. Install the projections on the frame side (2 locations).
3. Verify that the projections on the frame side are installed securely.
4. Install the projection on the engine side (remaining location).
5. Verify that the projection on the engine side installed securely.

AIR CLEANER ELEMENT INSPECTION [L3]

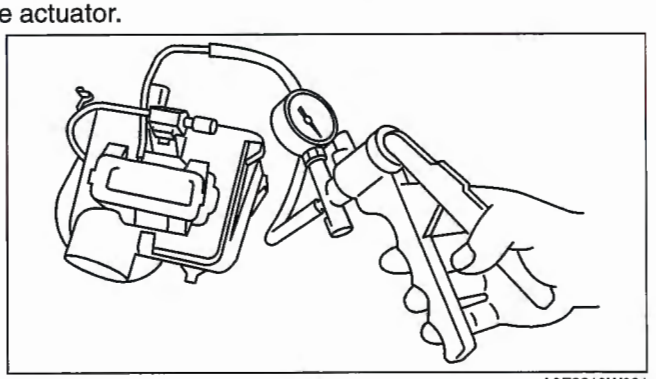
E6U011313300W01

1. Remove the air cleaner element. (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].)
2. Verify that the air cleaner element surface is free of dirt.
   - If there is dirt, use an air gun or similar tool to clean the element.
   - If the replacement time limit has passed, replace the element.

vARIABLE AIR DUCT (VAD) SHUTTER VALVE INSPECTION [L3]

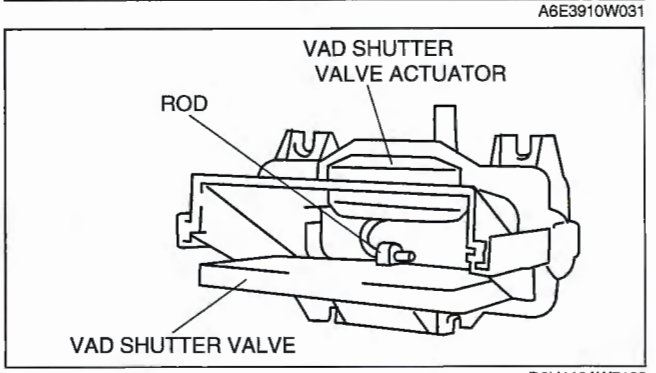
E6U011320131W01

1. Remove the air cleaner case. (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].)
2. Disconnect the vacuum hose from the VAD shutter valve actuator.
3. Connect a vacuum pump to the VAD shutter valve actuator.
4. Apply vacuum and verify that the rod moves.
   - If the rod does not move, replace the air cleaner.



A6E3910W031

Vacuum kPa {mmHg, inHg}	Rod movement
Below –10 {–75, –3.0}	Not move
Above –35 {–263, –10.4}	Fully pulled



D6U113AW7108

VARIABLE AIR DUCT (VAD) CONTROL SOLENOID VALVE INSPECTION [L3]

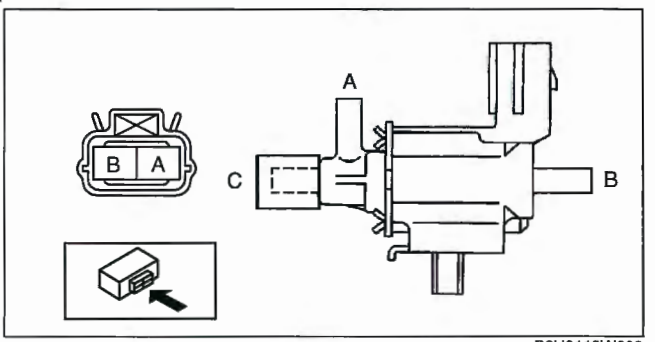
E6U011318741W01

1. Remove the VAD control solenoid valve. (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].)
2. Inspect airflow between the ports under the following conditions.
   - If not as specified, replace the VAD control solenoid valve.
   - If as specified, carry out the "Circuit Open/Short Inspection".

○—○ : Continuity ○═○ : Airflow

Step	Terminal		Port		
	A	B	A	B	C
1	○	○	○	○	
2	B+	GND	○		○

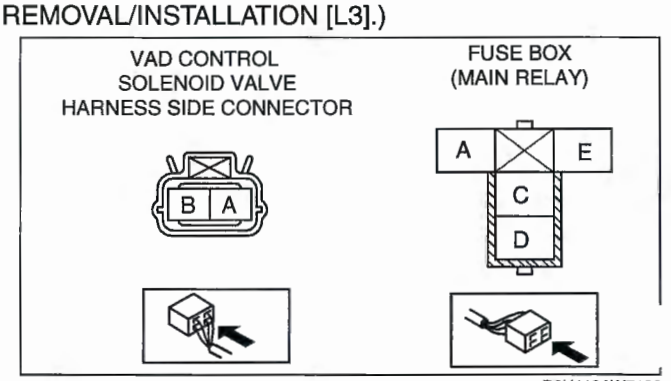
B6U0113W008



B6U0113W009

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harness for open or short circuit (continuity check).



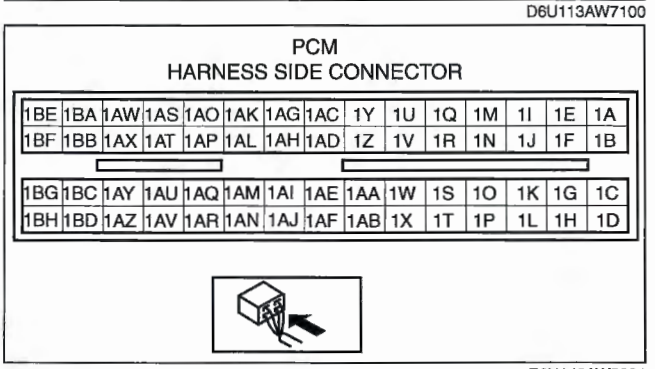
D6U113AW7100

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the harness.
  - — VAD control solenoid valve terminal B and PCM terminal 1K
  - — VAD control solenoid valve terminal A and main relay terminal C

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the harness.
  - — VAD control solenoid valve terminal B and body GND
  - — VAD control solenoid valve terminal A and power supply

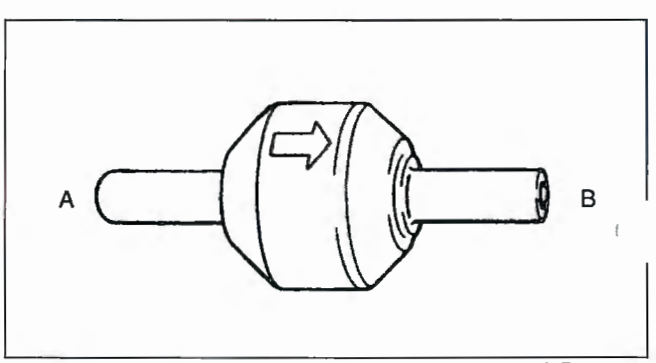


E6U140AW5991

VARIABLE AIR DUCT (VAD) CHECK VALVE (ONE-WAY) INSPECTION [L3]

E6U011342910W01

1. Remove the VAD check valve (one-way). (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].)
2. Blow through A and verify that air flows from B.
3. Blow through B and verify that air does not flow from A.
   - If not as specified, replace the VAD check valve (one-way).



A6E3910W039

THROTTLE ACTUATOR INSPECTION [L3]

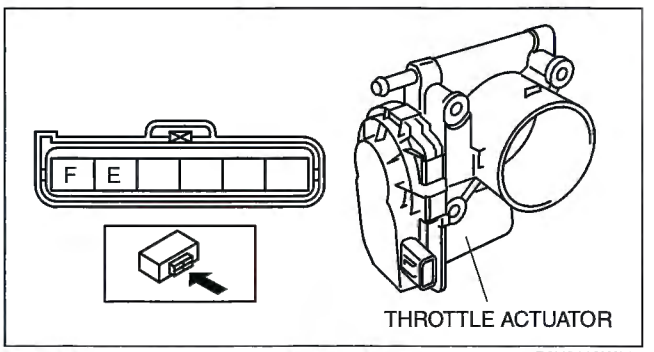
E6U011320663W01

Note
- Perform the following inspection only when directed.

Resistance Inspection
1. Disconnect the negative battery cable.
2. Disconnect the throttle body connector.
3. Measure the resistance between the throttle actuator terminals using an ohmmeter.
   - If not as specified, replace the throttle body. (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].)
   - If as specified, carry out the "Circuit Open/Short Inspection".

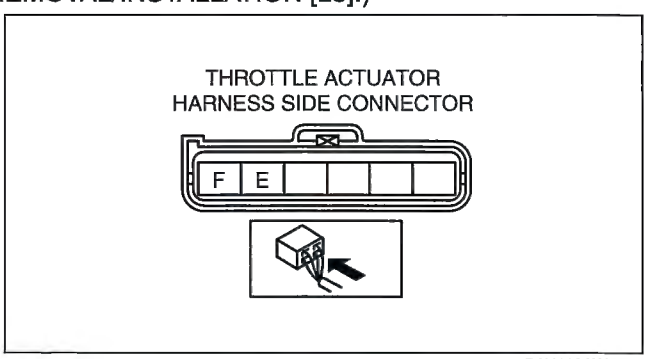
Specification

Ambient temperature (°C {°F})	Resistance (ohm)
Approx. 20 {68}	0.3—100

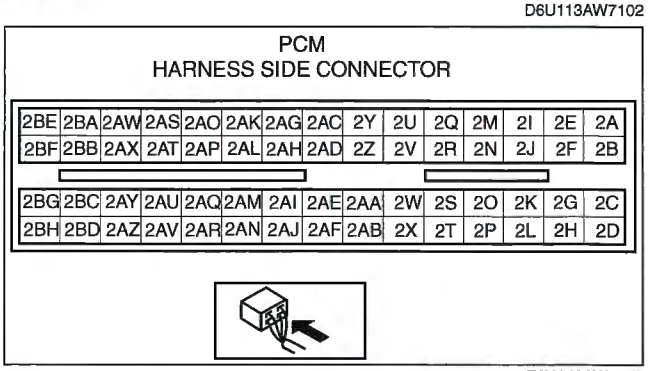


B6U0113W027

Circuit Open/Short Inspection
1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harnesses for open or short circuit (continuity check).



D6U113AW7102



E6U140AW5992

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the harness.
  - — Throttle actuator terminal F and PCM terminal 2A
  - — Throttle actuator terminal E and PCM terminal 2B

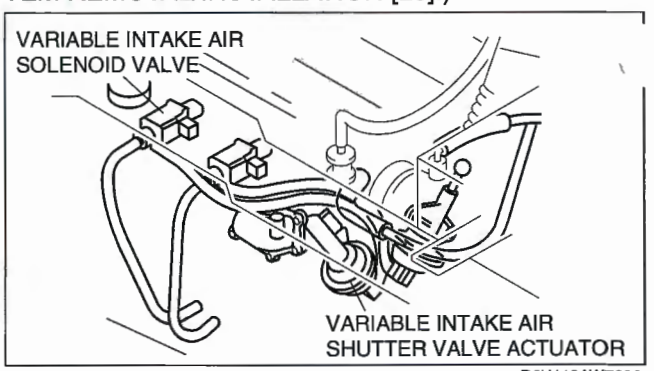
Short circuit
- If there is continuity, there is a short circuit. Repair or replace the harness.
  - — Throttle actuator terminal F and power supply
  - — Throttle actuator terminal F and GND
  - — Throttle actuator terminal E and power supply
  - — Throttle actuator terminal E and GND

VARIABLE INTAKE AIR SHUTTER VALVE ACTUATOR INSPECTION [L3]

E6U011320132W01

1. Remove the air hose. (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].)
2. Disconnect the vacuum hose from the Variable intake air solenoid valve.
3. Connect a vacuum pump to the Variable intake air shutter valve actuator.
4. Apply vacuum and verify that the rod moves.
   - If the rod does not move, replace the intake manifold.

Vacuum kPa {mmHg, inHg}	Rod movement
Below –2.7 {–20, –0.7}	Not move
Above –33.4 {–250, –9.9}	Fully pulled



D6U113AW7003

VARIABLE INTAKE AIR SOLENOID VALVE INSPECTION [L3]

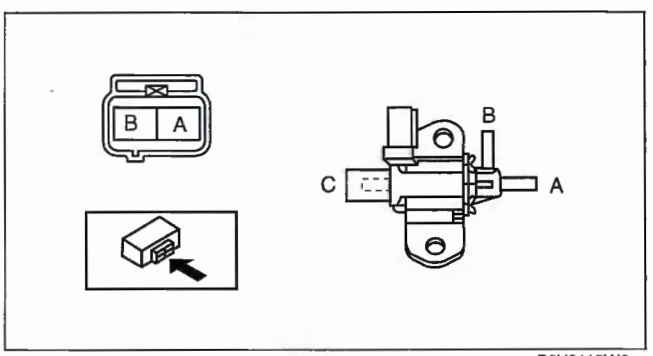
E6U011318740W01

1. Remove the Variable intake air solenoid valve. (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].)
2. Inspect airflow between the ports under the following conditions.
   - If not as specified, replace the Variable intake air solenoid valve.
   - If as specified, carry out the "Circuit Open/Short Inspection".

○—○ : Continuity ○═○ : Airflow

Step	Terminal		Port		
	A	B	A	B	C
1	○—○			○—○	
2	B+	GND	○—○		

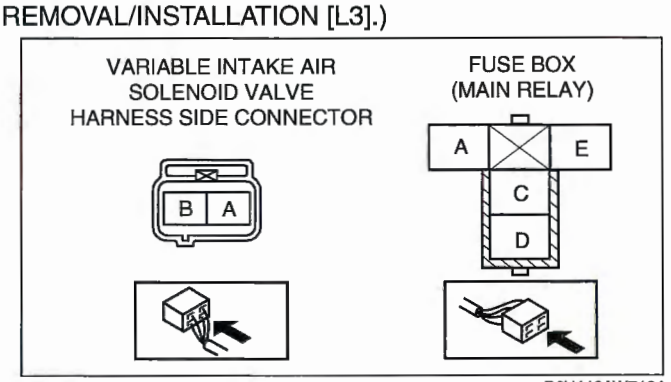
B6U0113W016



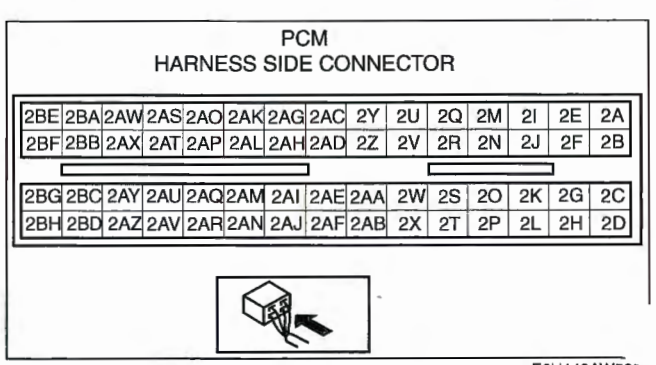
B6U0113W

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harness for open or short circuit (continuity check).



D6U113AW7104



E6U140AW599

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the harness.
  - — Variable intake air solenoid valve terminal B and PCM terminal 2J
  - — Variable intake air solenoid valve terminal A and main relay terminal C

Short circuit

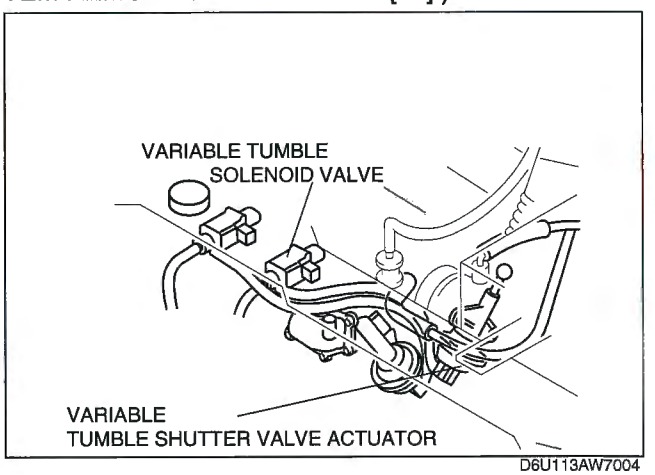
- If there is continuity, there is a short circuit. Repair or replace the harness.
  - — Variable intake air solenoid valve terminal B and body GND
  - — Variable intake air solenoid valve terminal A and power supply

VARIABLE TUMBLE SHUTTER VALVE ACTUATOR INSPECTION [L3]

E6U011320135W01

1. Remove the air hose. (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].)
2. Disconnect the vacuum hose from the variable tumble solenoid valve.
3. Connect a vacuum pump to the Variable tumble shutter valve actuator.
4. Apply vacuum and verify that the rod moves.
   - If the rod does not move, replace the intake manifold.

Vacuum kPa {mmHg, inHg}	Rod movement
Below –2.7 {–20, –0.7}	Not move
Above –33.4 {–250, –9.9}	Fully pulled

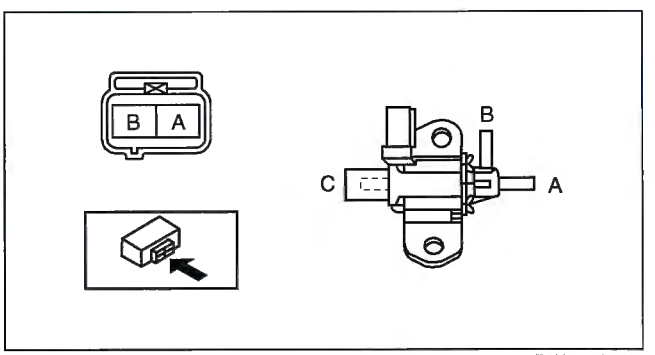


D6U113AW7004

VARIABLE TUMBLE SOLENOID VALVE INSPECTION [L3]

E6U011318745W01

1. Remove the variable tumble solenoid valve. (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].)
2. Inspect airflow between the ports under the following conditions.
   - If not as specified, replace the variable tumble solenoid valve.
   - If as specified, carry out the "Circuit Open/ Short Inspection".



B6U0113W025

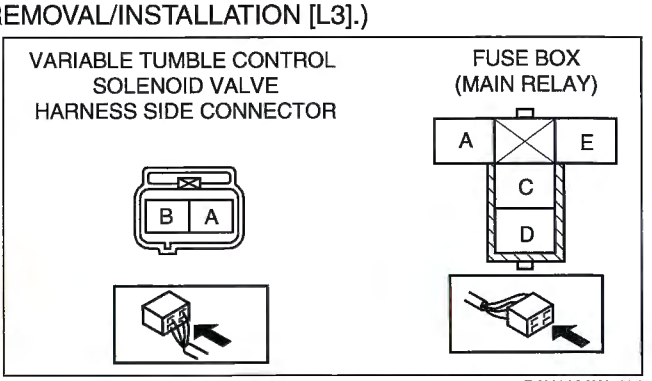
○—○ : Continuity ○═○ : Airflow

Step	Terminal		Port		
	A	B	A	B	C
1	○	○		○	○
2	B+	GND	○	○	

B6U0113W016

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harness for open or short circuit (continuity check).



D6U113AW7106

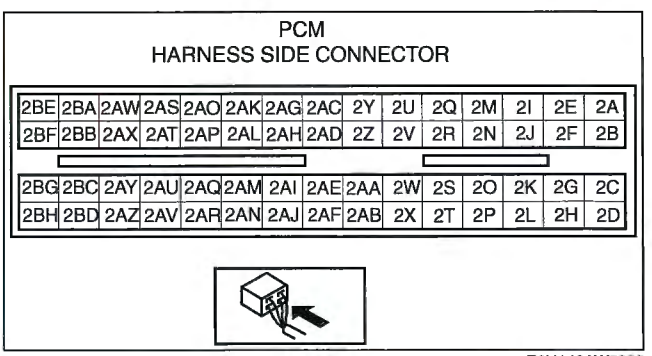
Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the harness.
  - — Variable tumble solenoid valve terminal B and PCM terminal 2I
  - — Variable tumble solenoid valve terminal A and main relay terminal C

Short circuit

If there is continuity, there is a short circuit. Repair or replace the harness.

- — Variable tumble solenoid valve terminal B and body GND
- — Variable tumble solenoid valve terminal A and power supply



E6U140AW5992

ACCELERATOR PEDAL REMOVAL/INSTALLATION [L3]

E6U011341600W02

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.

1	Connector
2	Accelerator pedal

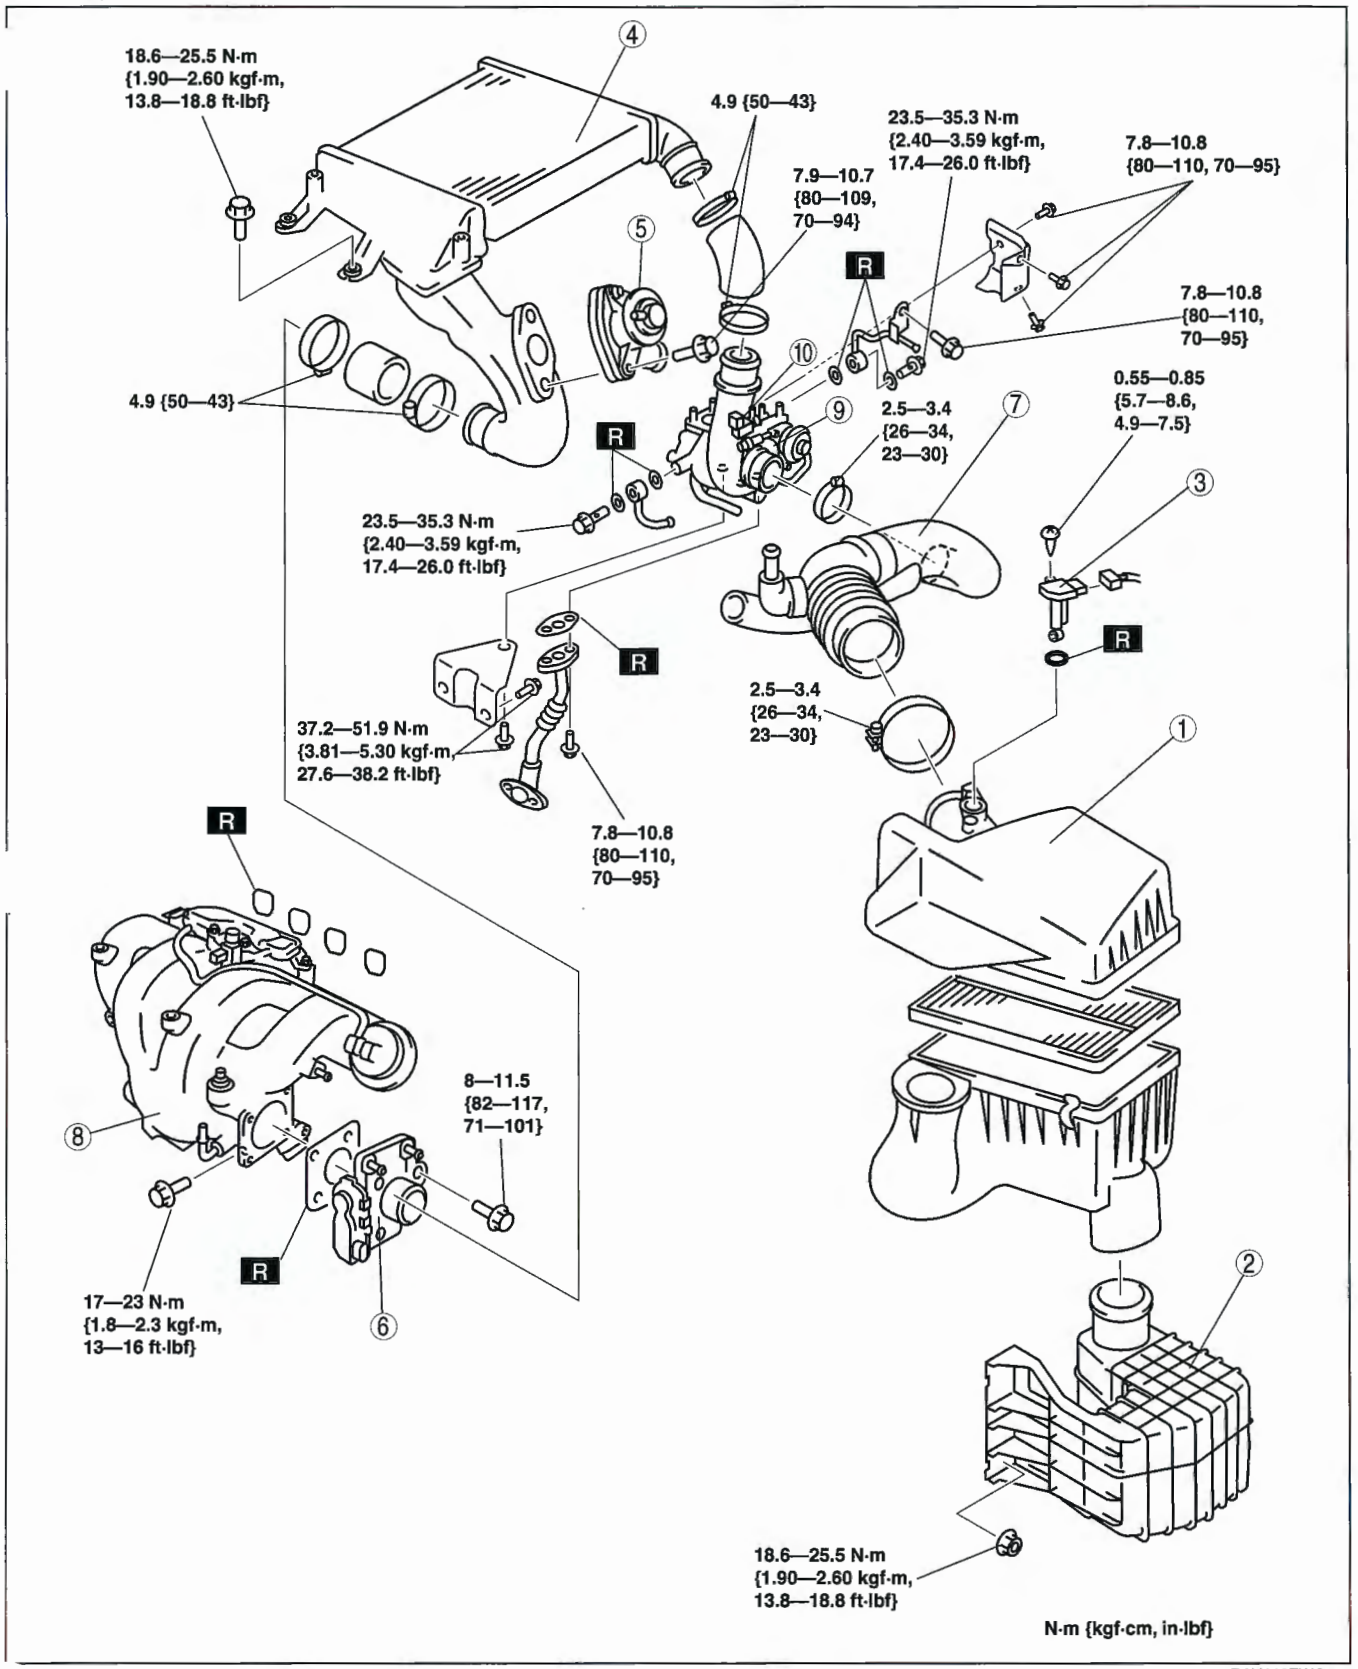
E6U011300000W16

Warning

- **A hot engine and intake air system can cause severe burns. Turn off the engine and wait until they are cool before removing the intake air system.**
- **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure". (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)**

1. Disconnect the negative battery cable.
2. Remove the charge air cooler cover.
3. Remove the battery and battery tray. (See 01–17B–2 BATTERY REMOVAL/INSTALLATION [L3 WITH TC].)
4. Remove in the order indicated in the table.
5. Install in the reverse order of removal.

6. Complete the "AFTER REPAIR PROCEDURE". (See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)



D6U113ZWC006

1	Air cleaner (See 01–13B–11 Air Cleaner Case Installation Note.)

2	Resonance chamber (See 01–13B–6 Resonance Chamber Removal Note.)
3	MAF/IAT sensor

4	Charge air cooler (See 01–13B–6 Charge Air Cooler Removal Note.) (See 01–13B–10 Charge Air Cooler Installation Note.)
5	Air bypass valve
6	Throttle body (See 01–13B–6 Throttle Body Removal Note.) (See 01–13B–10 Throttle Body Installation Note.)

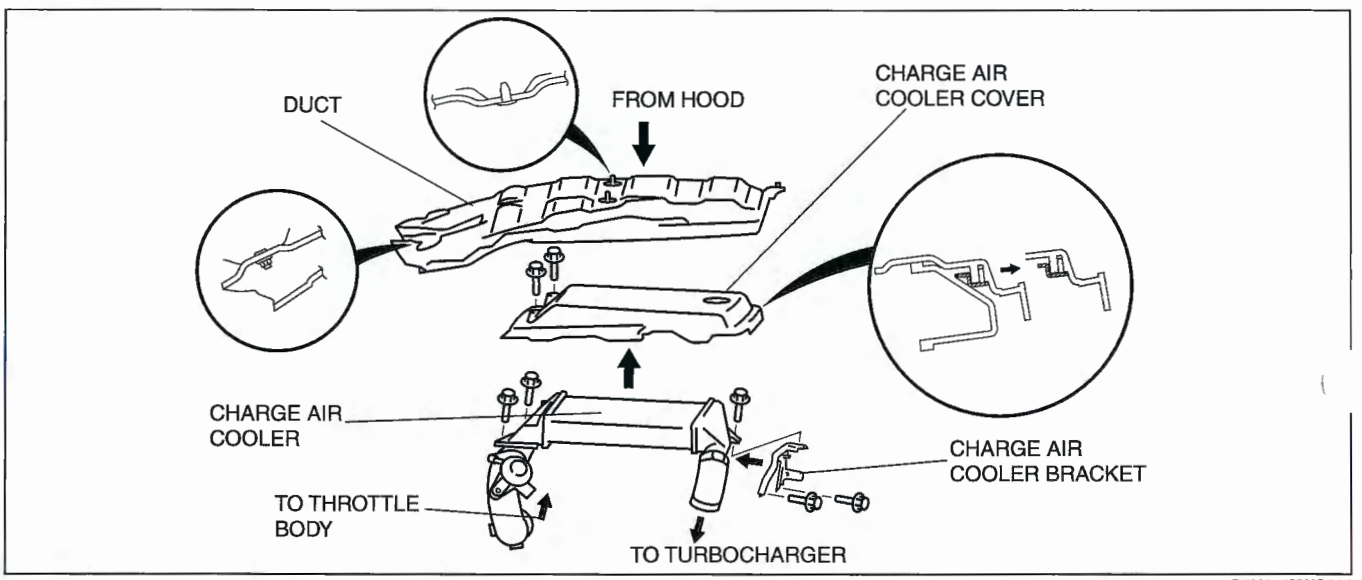
8	Intake manifold (See 01–13B–7 Intake Manifold Removal Note.) (See 01–13B–9 Intake Manifold Installation Note.)
9	Wastegate control solenoid valve (See 01–13B–9 Wastegate Control Solenoid Valve Installation Note.)
10	Turbocharger (See 01–13B–7 Turbocharger Removal Note.) (See 01–13B–8 Turbocharger Installation Note.)

Resonance Chamber Removal Note

1. Remove the front mudguard (LH) before removing the resonance chamber.

Charge Air Cooler Removal Note

1. Remove the duct.



D6U113ZWC014

2. Remove the charge air cooler cover.
3. Remove the charge air cooler.
4. Remove the charge air cooler bracket.

Throttle Body Removal Note

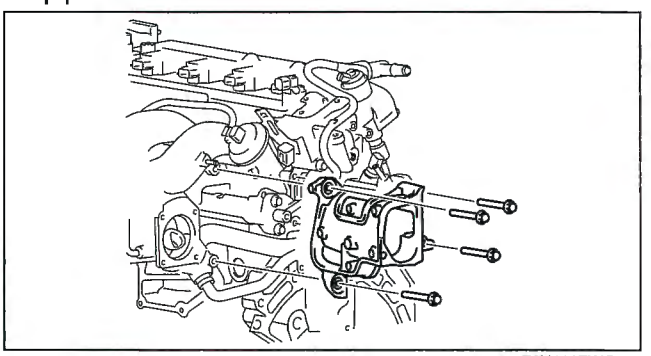
1. Drain the engine coolant before removing the water hose. (See 01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)
2. Remove the throttle body.

Air Hose Removal Note

1. Disconnect the EGR valve connector.
2. Remove the air hose.

Intake Manifold Removal Note

1. Remove the high pressure fuel pump bracket and the EGR pipe bracket.
2. Remove the fuel delivery pipe cover.
   Remove the oil level gauge pipe. (See 01–11B–5 OIL PAN REMOVAL/INSTALLATION [L3 WITH TC].)
4. Remove the drive belt. (See 01–10B–3 DRIVE BELT REPLACEMENT [L3 WITH TC].)
5. Set the power steering pump out of the way.
6. Remove the vacuum hose.
7. Remove the intake manifold.



E6U113ZWC005

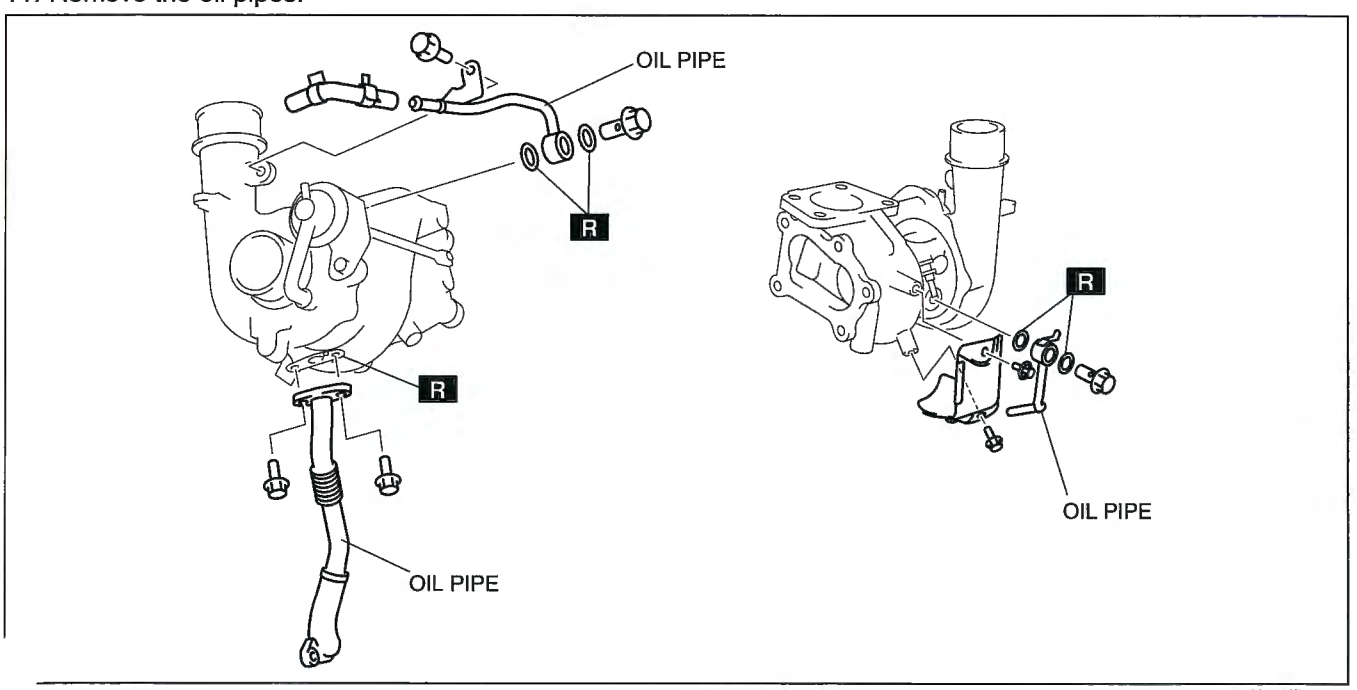
Turbocharger Removal Note

1. Remove the TWC. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Disconnect the rear HO2S connector.
3. Remove the front pipe. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)

Caution

- **When removing the cowl, a part or tool may hit the edge of the windshield and could damage it. Protect the windshield by covering it with a clean rag to prevent damage to the windshield.**

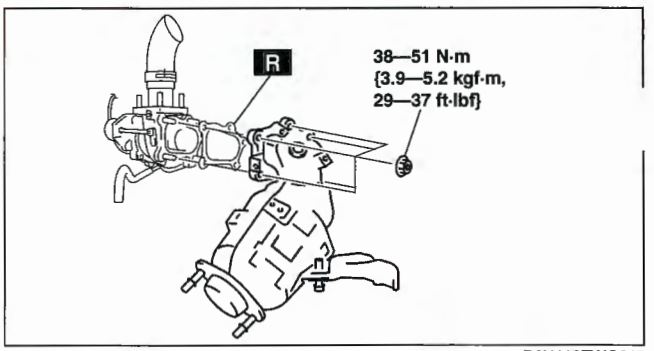
4. Remove the cowl and the insulator under the cowl. (See 09–16–4 COWL GRILLE REMOVAL/INSTALLATION [L3 WITH TC].)
5. Remove the insulator (Exhaust manifold upper side). (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
6. Set the generator out of the way. (See 01–17B–4 GENERATOR REMOVAL/INSTALLATION [L3 WITH TC].)
7. Remove the insulator (Exhaust manifold lower side). (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
8. Disconnect the front HO2S connector.
9. Remove the insulator (WU-TWC top side). (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
10. Remove the vacuum hose (Brake master back side).
11. Remove the oil pipes.



E6U113ZW6003

12. Remove the front HO2S. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
13. Remove the WU-TWC. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)

14. Remove the turbocharger.

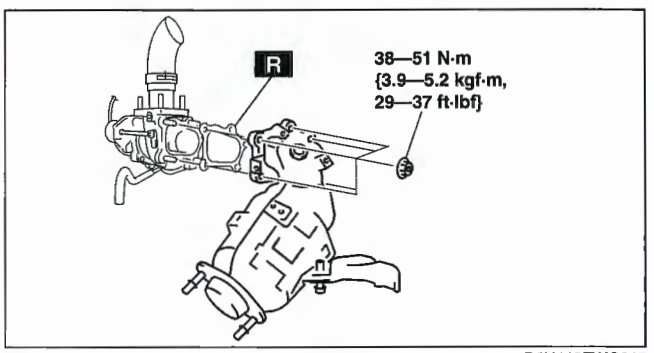


D6U113ZWC015

Turbocharger Installation Note

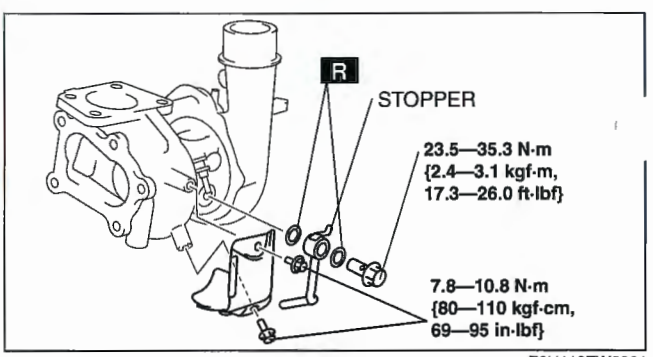
1. Install the turbocharger.

   Tightening torque
   38—51 N·m {3.9—5.2 kgf·m, 29—37 ft·lbf}



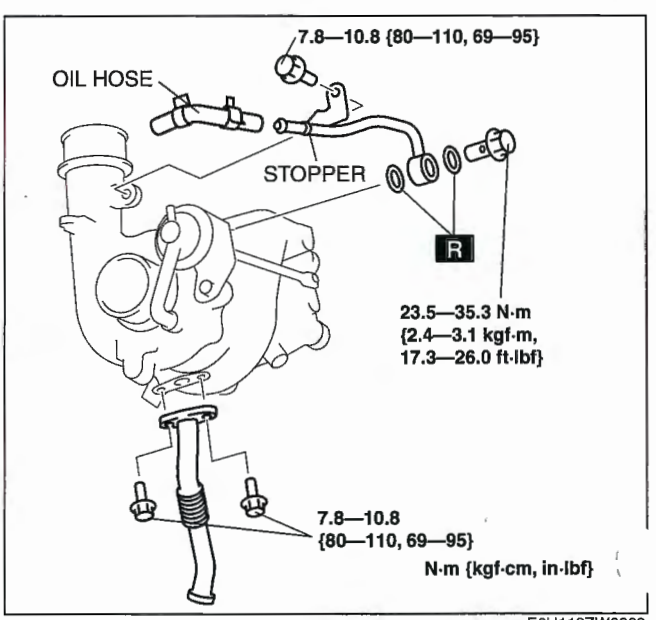
D6U113ZWC015

2. Install the WU-TWC. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
3. Install the front HO2S. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
4. Tight the oil pipe installation bolt while the stopper of the oil pipe is faced to the turbocharger.



E6U113ZW6001

5. Install the oil pipes and, insert the oil hose until it reaches the stopper.

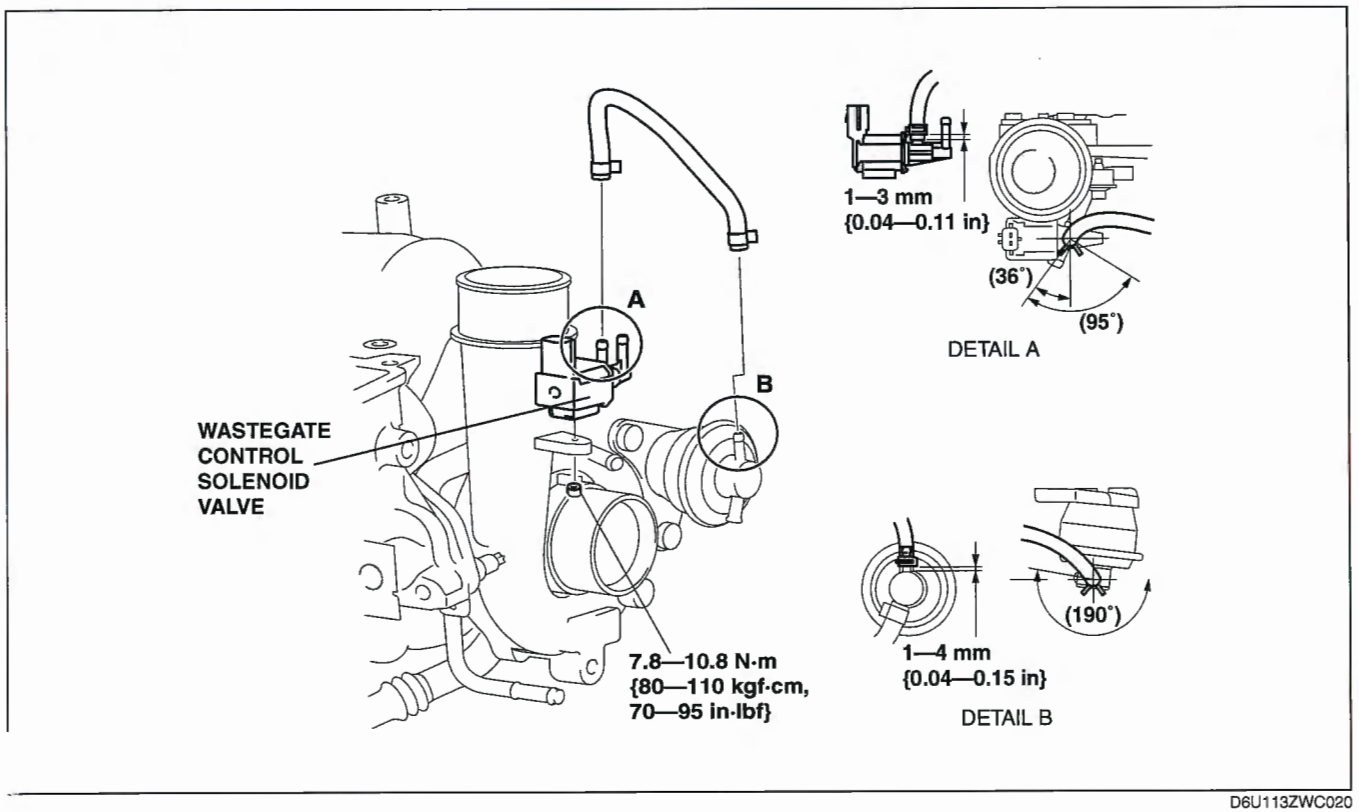


E6U113ZW6002

Wastegate Control Solenoid Valve Installation Note

1. Install the wastegate control solenoid valve.

Tightening torque
7.8—10.8 N·m {80—110 kgf·cm, 70—95 in·lbf}



D6U113ZWC020

2. Install the hose as shown in the figure.

Intake Manifold Installation Note

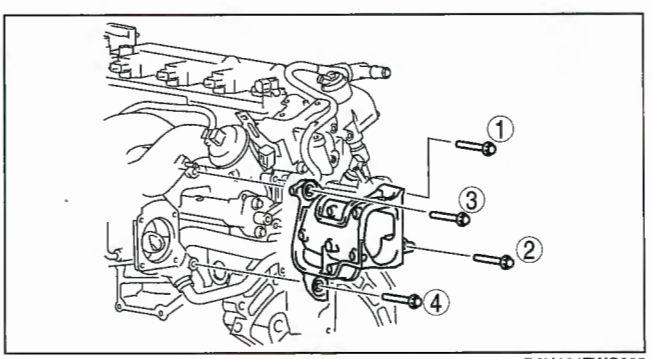
1. Install the intake manifold.

Tightening torque
17—23 N·m {1.8—2.3 kgf·m, 13—16 ft·lbf}

2. Install the vacuum hose.
3. Install the drive belt.
4. Install the oil level gauge pipe. (See 01–11B–5 OIL PAN REMOVAL/INSTALLATION [L3 WITH TC].)
5. Install the fuel delivery pipe cover in the order in the figure.

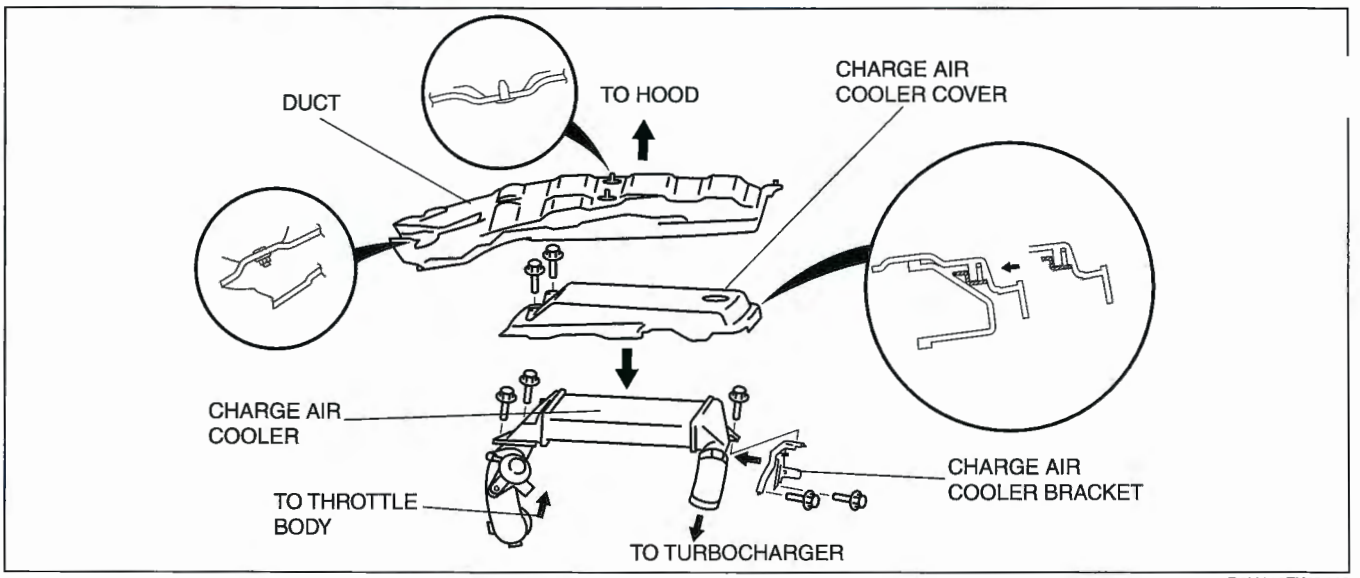
Tightening torque
17—23 N·m {1.8—2.3 kgf·m, 13—16 ft·lbf}

6. Install the high pressure fuel pump bracket and the EGR pipe bracket.



D6U114ZWC005

Charge Air Cooler Installation Note



D6U113ZWC013

1. Install the charge air cooler bracket.

   Tightening torque
   42—48 N·m {4.3—2.8 kgf·m, 31—35 ft·lbf}

2. Install the charge air cooler.

   Tightening torque
   18.6—25.5 N·m {1.90—2.60 kgf·m, 13.8—18.8 ft·lbf}

3. install the charge air cooler cover.

   Caution
   - **When installing the charge air cooler cover, be careful not to damage the charge air cooler cover clips.**

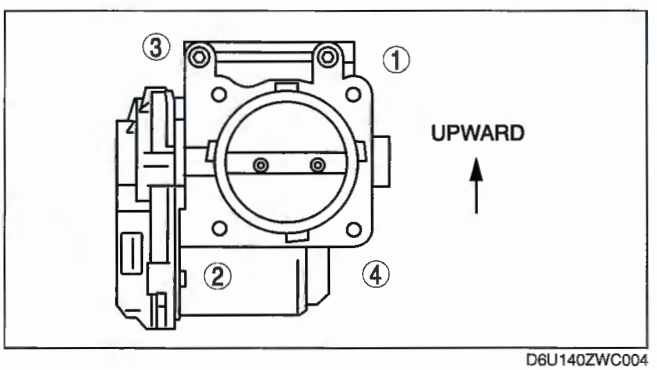
   Tightening torque
   7.9—10.7 N·m {81—109 kgf·cm, 70—94 in·lbf}

4. install the duct.

Throttle Body Installation Note

1. Tighten the throttle body installation bolts in the order shown in the figure.

   Tightening torque
   8—11.5 N·m {82—117 kgf·cm, 71—101 in·lbf}



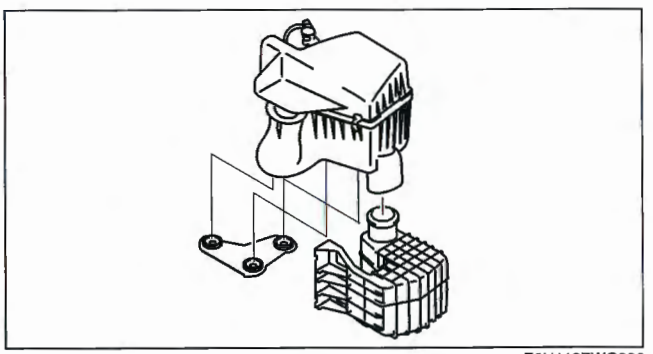
D6U140ZWC004

Air Cleaner Case Installation Note

Caution
- **Before assembling the air cleaner, verify that the rubber mounts have not fallen off from the air cleaner bracket (3 locations).**
- **Always install the air cleaner case using the following procedure.**

Note
- When inserting the rubber mounts into the air cleaner case, soapy water can be applied.

1. Verify that the rubber mounts are set in the air cleaner bracket (3 locations).
2. Install the projections on the frame side (2 locations).
3. Verify that the projections on the frame side are installed securely.
4. Install the projection on the engine side (remaining location).
5. Verify that the projection on the engine side installed securely.



E6U113ZWC006

AIR CLEANER ELEMENT INSPECTION [L3 WITH TC]

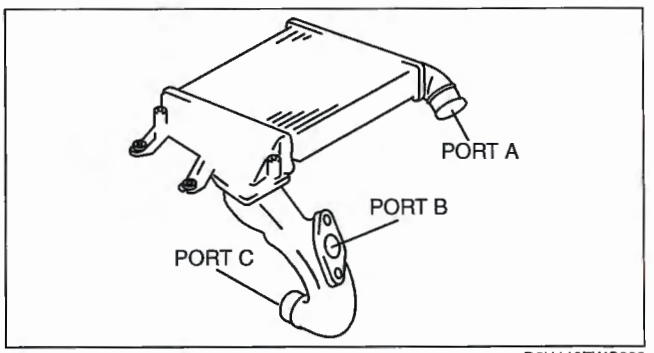
E6U011313300W02

1. Remove the air cleaner element. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Verify that the air cleaner element surface is free of dirt.
   - If there is dirt, use an air gun or similar tool to clean the element.
   - If the replacement time limit has passed, replace the element.

CHARGE AIR COOLER INSPECTION [L3 WITH TC]

E6U011313560W01

1. Remove the air bypass valve. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Plug ports A and B.
3. Verify that there is no air leakage when air is sent from port C.
   - If there is leakage, replace the charge air cooler.

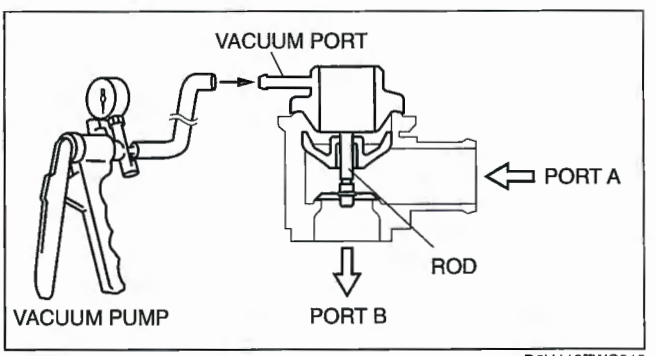


D6U113ZWC023

AIR BYPASS VALVE INSPECTION [L3 WITH TC]

E6U011300000W17

1. Remove the air bypass valve. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Connect the vacuum pump to the vacuum ports of the air bypass valve.

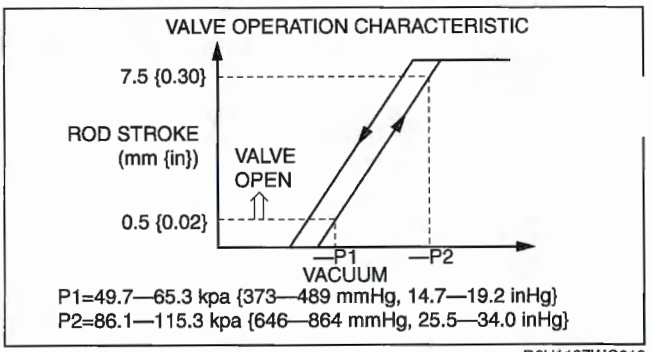


D6U113ZWC019

Approx value

3. Verify that the airflow is as indicated in the table.
   - If there is any malfunction, replace the air bypass valve.

Vacuum (kPa {mmHg, inHg})	Valve operation condition	Airflow between port A—B
–66 {–496, –20} or more	Open	Yes
–49 {–367, –14} or less	Closed	No



D6U113ZWC018

THROTTLE ACTUATOR INSPECTION [L3 WITH TC]

E6U011320663W02

Note

- Perform the following inspection only when directed.

Resistance Inspection

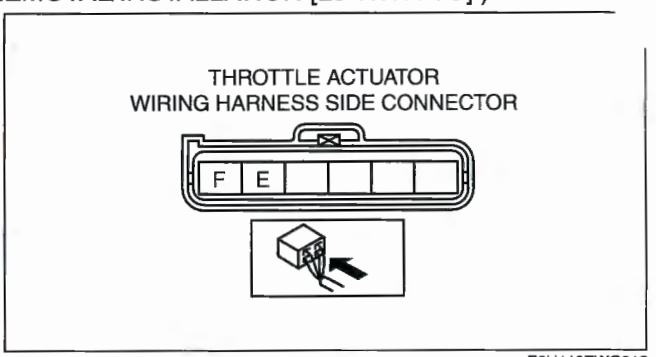
1. Disconnect the negative battery cable.
2. Disconnect the throttle body connector.
3. Measure the resistance between the throttle actuator terminals using a tester.
   - If not as specified, replace the throttle body. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
   - If as specified, carry out the "Circuit Open/Short Inspection".

Specification

Ambient temperature (°C {°F})	Resistance (ohm)
Approx. 20 {68}	0.3—100

Circuit Open/Short Inspection

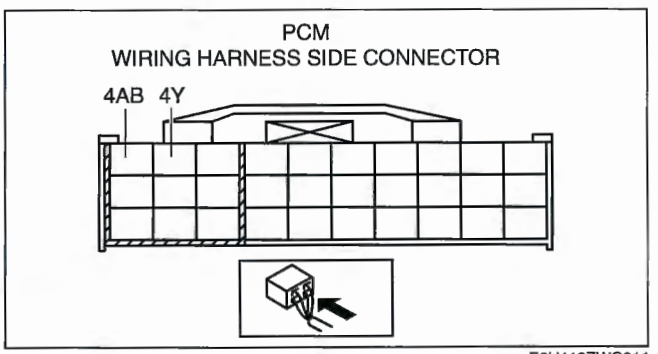
1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harnesses for an open or short circuit (continuity check).



E6U113ZWC012

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Throttle actuator terminal F and PCM terminal 4Y
  - — Throttle actuator terminal E and PCM terminal 4AB



E6U113ZWC011

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Throttle actuator terminal F and power supply
  - — Throttle actuator terminal F and ground
  - — Throttle actuator terminal E and power supply
  - — Throttle actuator terminal E and ground

VARIABLE SWIRL SHUTTER VALVE ACTUATOR INSPECTION [L3 WITH TC]

E6U011320135W02

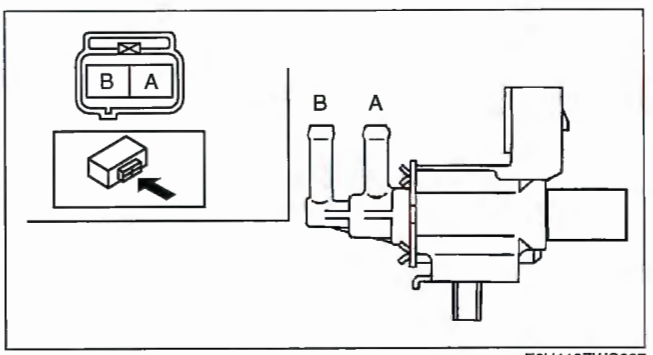
1. Remove the air hose. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Disconnect the vacuum hose from the variable swirl control solenoid valve.
   Connect a vacuum pump to the variable swirl shutter valve actuator.
3. Apply vacuum and verify that the rod moves.
   - If the rod does not move, replace the intake manifold. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)

Vacuum kPa {mmHg, inHg}	Rod movement
–2.7 {–20, –0.7} or less	Not move
–33.4 {–250, –9.9} or more	Fully pulled

VARIABLE SWIRL SOLENOID VALVE INSPECTION [L3 WITH TC]

E6U011318745W02

1. Remove the variable swirl solenoid valve. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the airflow between the ports under the following conditions.
   - If not as specified, replace the variable swirl control solenoid valve.
   - If as specified, carry out the "Circuit Open/Short Inspection".



E6U113ZWC007

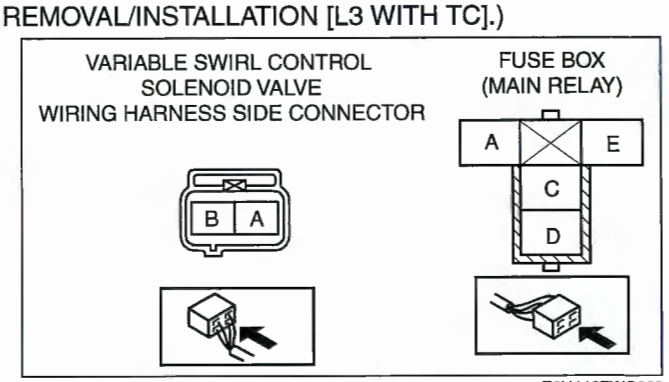
○—○ : Continuity ○═○ : Airflow

Step	Terminal		Port	
	A	B	A	B
1	○—○			
2	B+	GND	○═○	

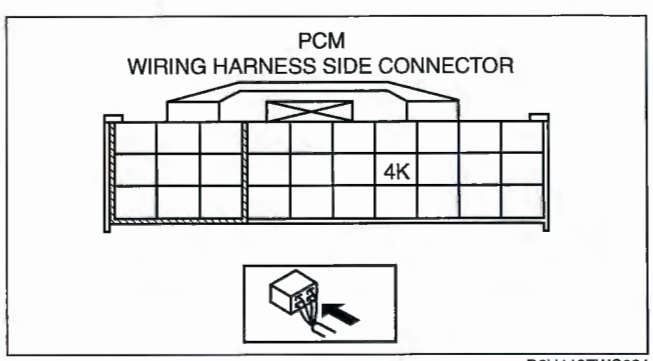
B6U0116W014

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harness for open or short circuit (continuity check).



E6U113ZWC003



D6U113ZWC024

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Variable swirl control solenoid valve terminal B and PCM terminal 4K
  - — Variable swirl control solenoid valve terminal A and main relay terminal C

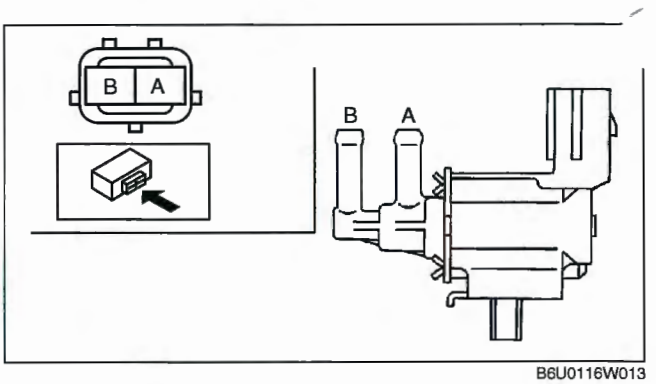
Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Variable swirl control solenoid valve terminal B and body ground
  - — Variable swirl control solenoid valve terminal A and power supply

WASTEGATE CONTROL SOLENOID VALVE INSPECTION [L3 WITH TC]

E6U011313240W01

1. Remove the wastegate control solenoid valve. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the airflow between the ports under the following conditions.
   - If not as specified, replace the wastegate control solenoid valve.
   - If as specified, carry out the "Circuit Open/Short Inspection".



B6U0116W013

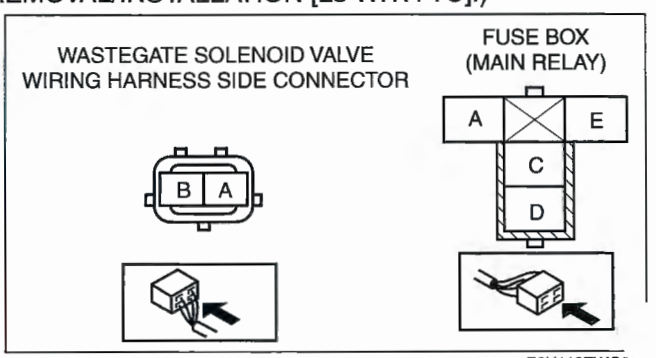
O—O : Continuity O═O : Airflow

Step	Terminal		Port	
	A	B	A	B
1	O—O			
2	B+	GND	O═O	

B6U0116W014

Circuit Open/Short Inspection

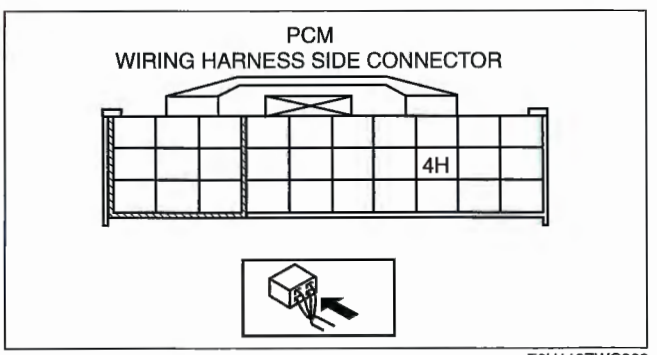
1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harness for an open or short circuit (continuity check).



E6U113ZWC00

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Variable swirl solenoid valve terminal B and PCM terminal 4H
  - — Variable swirl solenoid valve terminal A and main relay terminal C



E6U113ZWC002

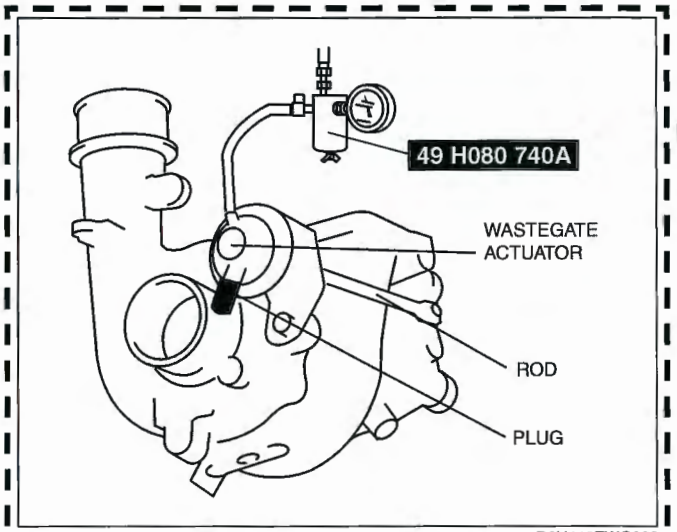
Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Variable swirl solenoid valve terminal B and body ground
  - — Variable swirl solenoid valve terminal A and power supply

WASTEGATE ACTUATOR INSPECTION [L3 WITH TC]

E6U011313240W02

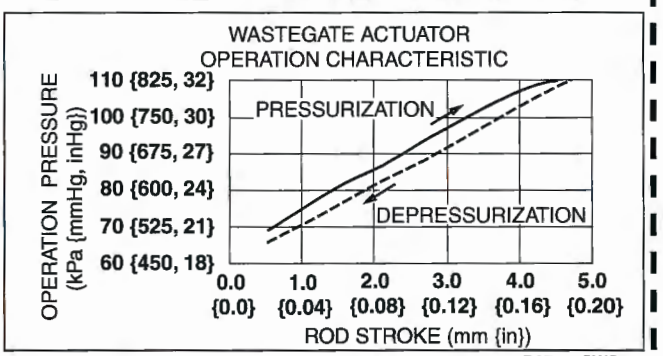
1. Remove the air hose. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Disconnect the hose from the wastegate actuator.
3. Plug the wastegate actuator as shown in the figure.
4. Connect the **SST** to the port.



D6U113ZWC026

5. Raise the pressure slowly and take a measurement of the pressure when the rod stroke is **1.5 mm {0.06 in}**.
   - If the rod does not move, replace the turbocharger.

Specification (rod stroke: 1.5 mm {0.06 in})
78.0—83.4 kPa {586—625 mmHg, 23.1—24.6 inHg}



D6E113CWS955

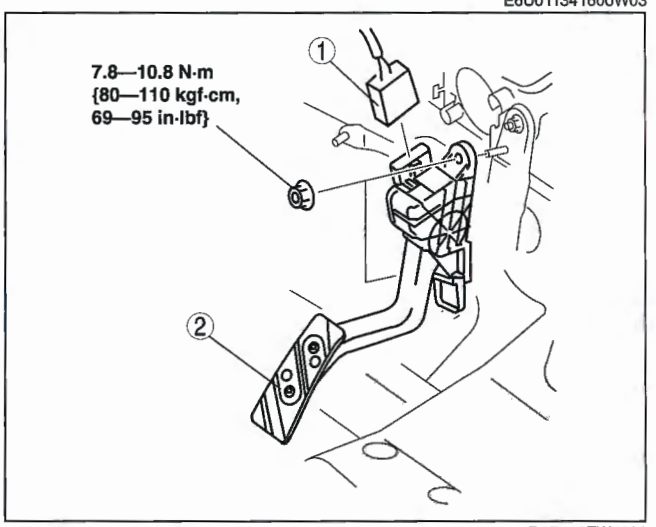
ACCELERATOR PEDAL REMOVAL/INSTALLATION [L3 WITH TC]

E6U011341600W03

1. Remove in the order indicated in the table.

1	Connector
2	Accelerator pedal

2. Install in the reverse order of removal.



D6E113ZW7301

TURBOCHARGER INSPECTION [L3 WITH TC]

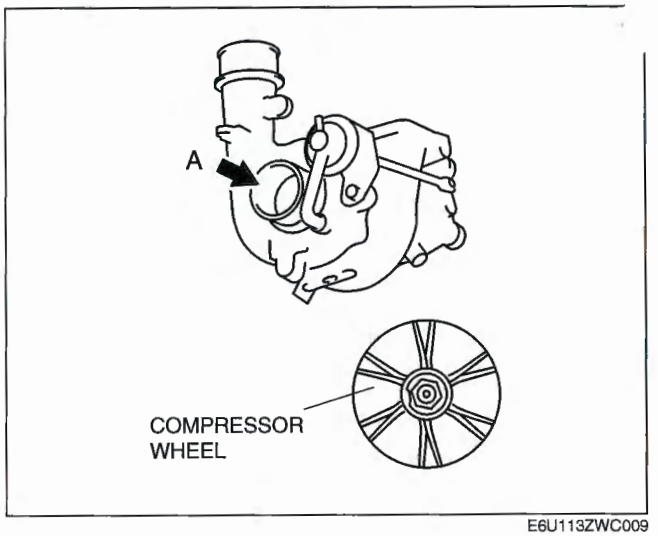
E6U011313700W01

Compressor Wheel Inspection

1. Remove the turbocharger. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Visually inspect the compressor wheel from view A for the cracks, damage, or bending on all the compressor wheel blades.
   - If there are any cracks or damage, replace the turbocharger.

Note

- If there is contact between the compressor wheel and compressor housing, there may be cracks, damage, or bending on the blade end area.
- If there are cracks, damage, or bending on the compressor wheel, verify the following after replacing the turbocharger.
  - — Intake air/exhaust system related components
  - — Oil pipe damage



E6U113ZWC009

Turbine wheel inspection

1. Remove the turbocharger. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Visually inspect the turbine wheel from view B for the cracks, damage, or bending on all the turbine wheel blades.
   - If there are cracks, damage, or bending on the turbine wheel, replace the turbocharger.

Note

- If there is contact between the turbine wheel and turbine housing, there may be cracks, damage, or bending on the blade end area.
- If there are cracks, damage, or bending on the turbine wheel, verify the following after replacing the turbocharger.
  - — Intake air/exhaust system related components
  - — Oil pipe damage

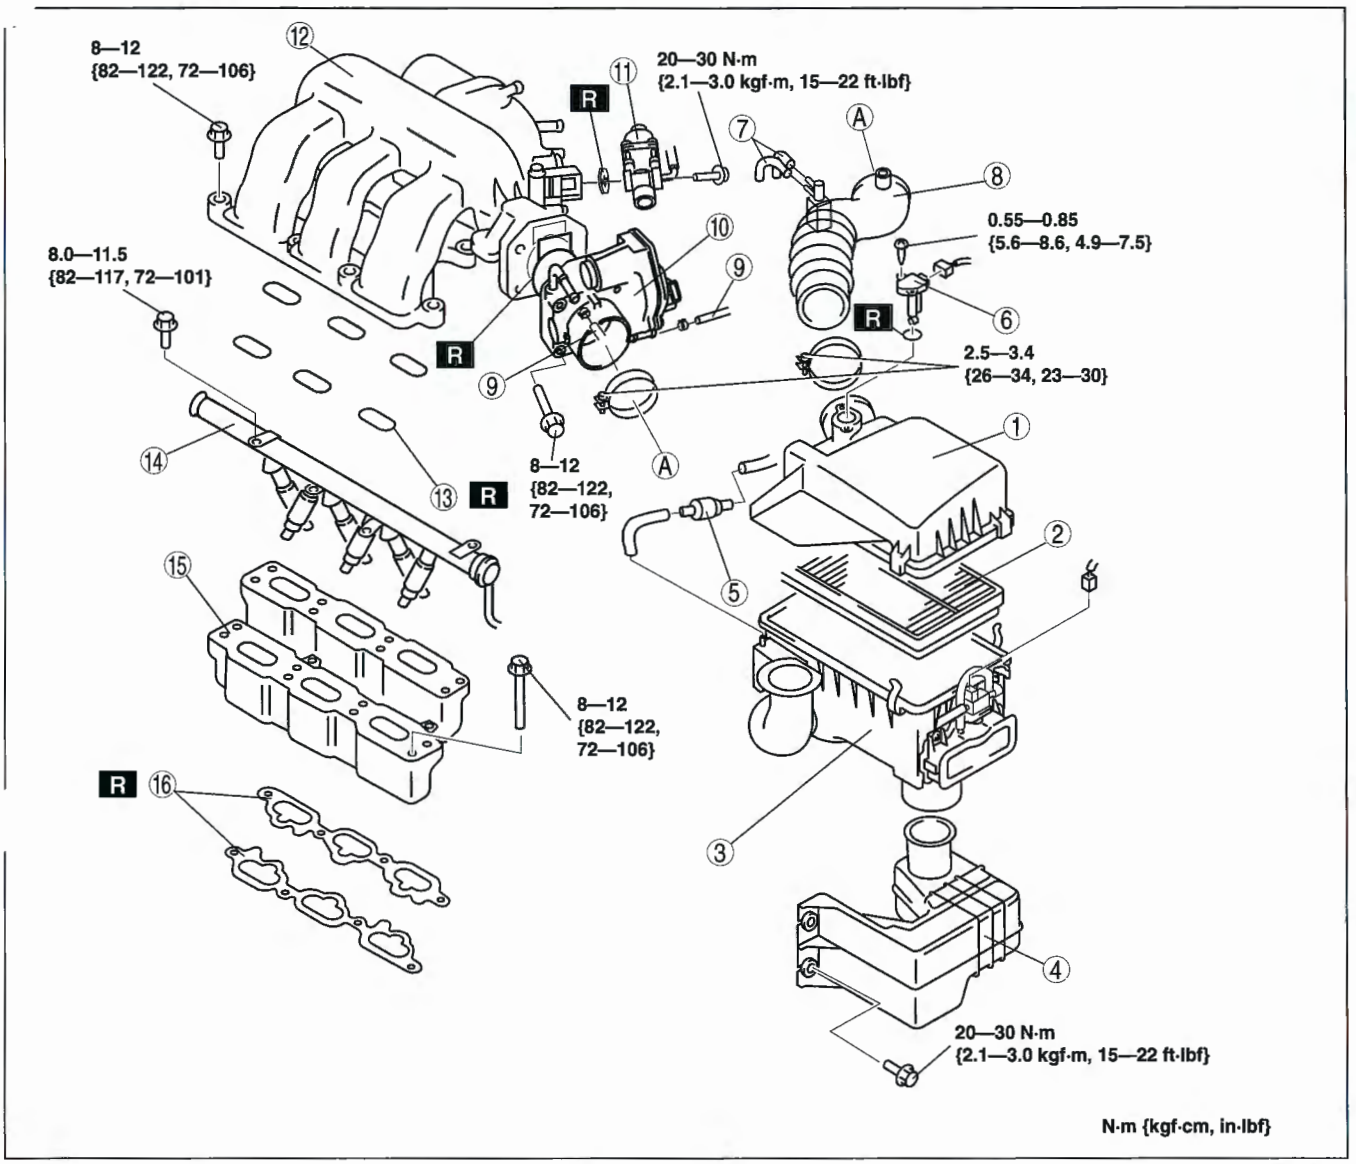
Warning

- **When the engine and intake air system are hot, they can badly burn. Turn off the engine and wait until they are cool before removing the intake air system.**
- **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure". (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)**

1. Disconnect the negative battery cable.
2. Drain the engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)
3. Remove in the order indicated in the table.
   Install in the reverse order of removal.



D6U113BW7002

1	Air cleaner cover
2	Air cleaner element
3	Air cleaner case
4	Resonance chamber (See 01–13C–4 Resonance Chamber Removal Note)
5	VAD check valve (one-way)
6	MAF/IAT sensor
7	Vacuum hose (purge solenoid valve)
8	Air hose
9	Water hose (See 01–13C–4 Water Hose Removal Note)
10	Throttle body

11	EGR valve (See 01–16A–17 EGR VALVE REMOVAL/ INSTALLATION [AJ])
12	Dynamic chamber (See 01–13C–4 Dynamic Chamber Installation Note)
13	Dynamic chamber gasket
14	Fuel distributor (See 01–14A–27 FUEL INJECTOR REMOVAL/ INSTALLATION [AJ])
15	Intake manifold (See 01–13C–4 Intake Manifold Installation Note)
16	Intake manifold gasket

Resonance Chamber Removal Note

1. Remove the front mudguard (LH) before removing the resonance chamber.

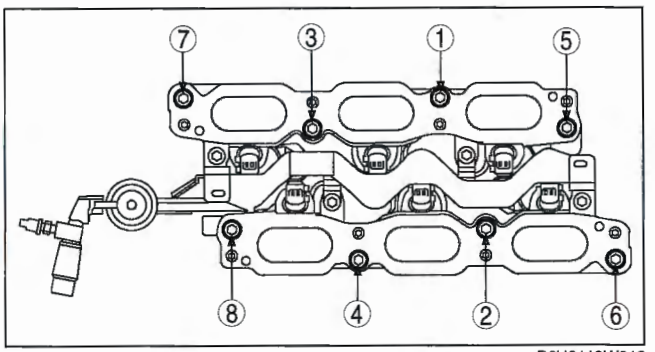
Water Hose Removal Note

1. Drain the engine coolant before removing the water hose. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)

Intake Manifold Installation Note

1. Tighten the intake manifold installation bolts in the order indicated.

   Tightening torque
   8—12 N·m {82—122 kgf·cm, 72—106 in·lbf}

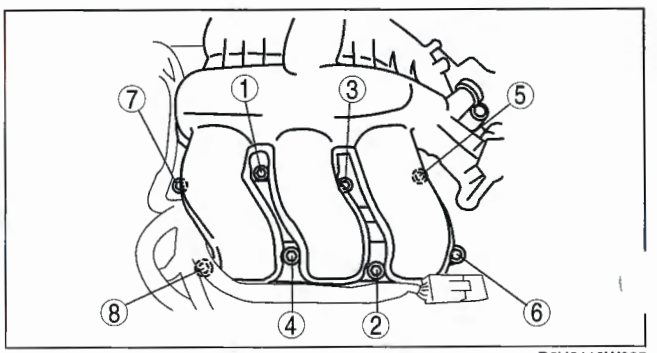


B6U0113W012

Dynamic Chamber Installation Note

1. Tighten the dynamic chamber installation bolts in the order indicated.

   Tightening torque
   8—12 N·m {82—122 kgf·cm, 72—106 in·lbf}



B6U0113W005

AIR CLEANER ELEMENT INSPECTION [AJ]

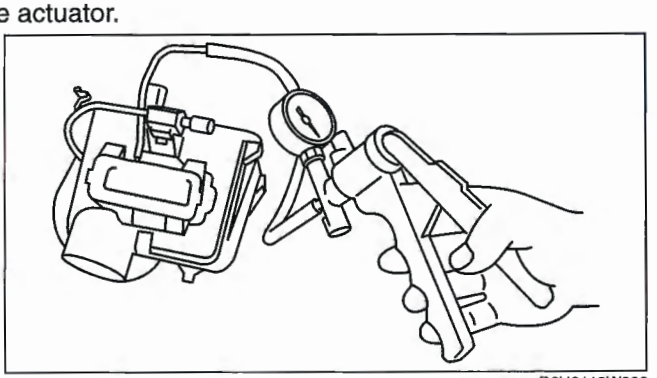
E6U011300000W05

1. Remove the air cleaner element. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
2. Verify that the air cleaner element surface is free of dirt.
   - If there is dirt present, use an air gun or similar tool to clean the element.
   - If the replacement time limit has passed, replace the element.

VARIABLE AIR DUCT (VAD) SHUTTER VALVE INSPECTION [AJ]

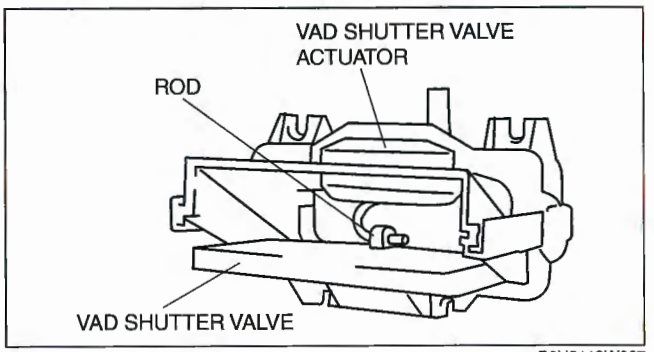
E6U011300000W06

1. Remove the air cleaner case. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
2. Disconnect the vacuum hose from the VAD shutter valve actuator.
3. Connect a vacuum pump to the VAD shutter valve actuator.
4. Apply vacuum and verify that the rod moves.
   - If the rod does not move, replace the air cleaner case.



B6U0113W006

Vacuum kPa {mmHg, inHg}	Rod movement
Below –10 {–75, –3.0}	Starts to move
Above –35 {–263, –10.4}	Fully pulled



B6U0113W007

VARIABLE AIR DUCT (VAD) CONTROL SOLENOID VALVE INSPECTION [AJ]

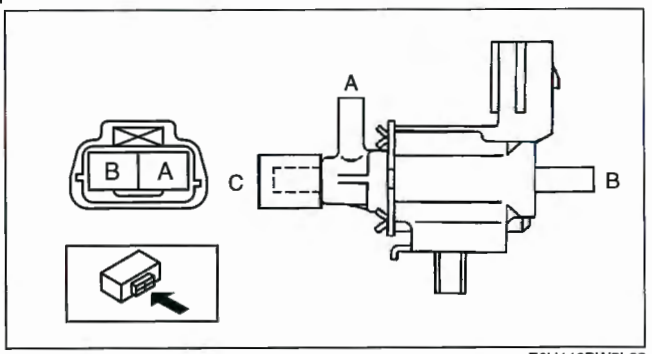
E6U011300000W07

1. Remove the VAD control solenoid valve. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
2. Inspect airflow between the ports under the following conditions.
   - If not as specified, replace the VAD control solenoid valve.
   - If as specified, carry out the "Circuit Open/Short Inspection".

○—○ : Continuity ○═○ : Airflow

Step	Terminal		Port		
	A	B	A	B	C
1	○—○		○═○		
2	B+	GND	○═══○		

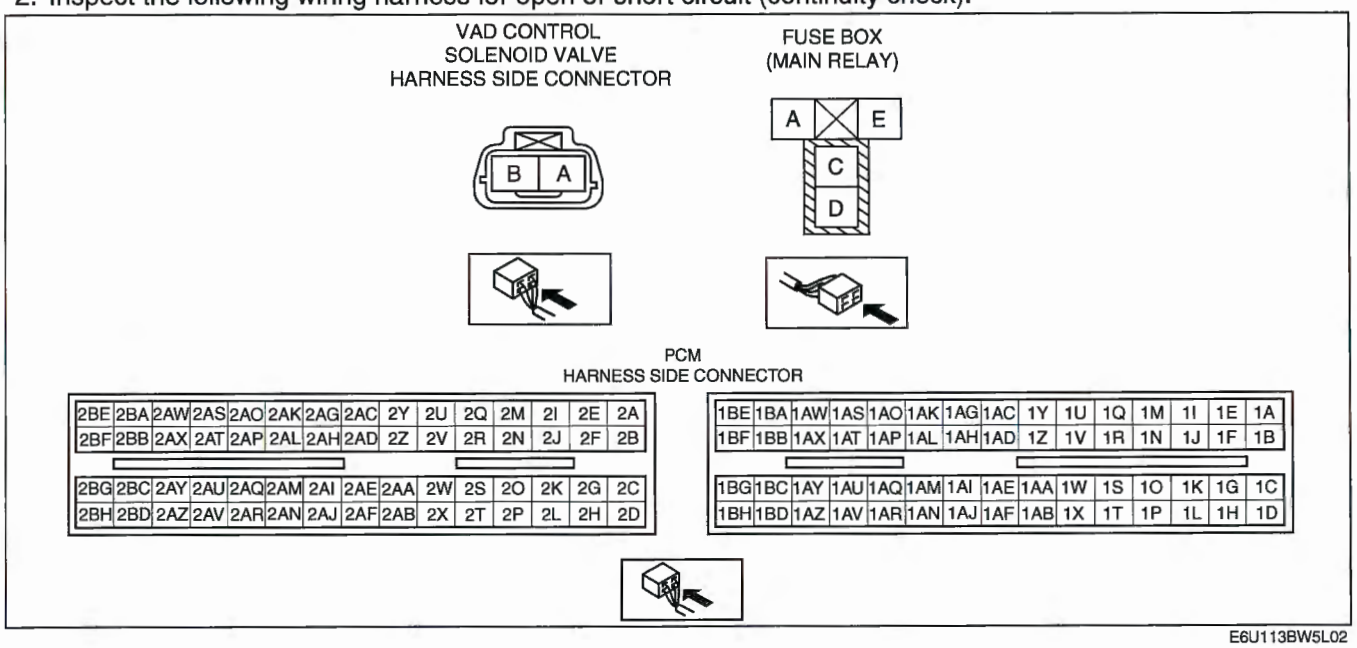
B6U0113W008



E6U113BW5L03

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following wiring harness for open or short circuit (continuity check).



E6U113BW5L02

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the harness.
  - — VAD control solenoid valve terminal B and PCM terminal 1BB
  - — VAD control solenoid valve terminal A and main relay terminal C

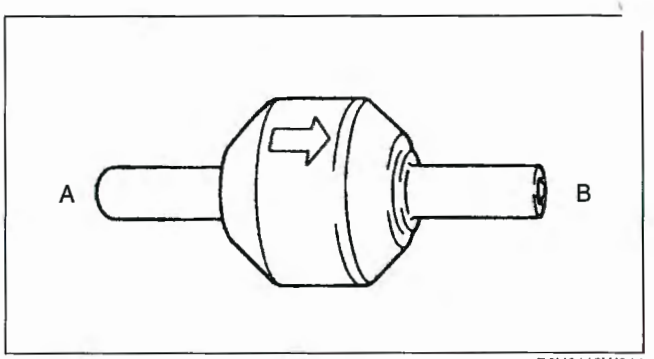
Short circuit

- If there is continuity, there is a short circuit. Repair or replace the harness.
  - — VAD control solenoid valve terminal B and body body ground
  - — VAD control solenoid valve terminal A and power supply

VARIABLE AIR DUCT (VAD) CHECK VALVE (ONE-WAY) INSPECTION [AJ]

E6U011300000W08

1. Remove the VAD check valve (one-way). (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
2. Blow through A and verify that air flows from B.
3. Blow through B and verify that air does not flow from A.
   - If not as specified, replace the VAD check valve (one-way).



B6U0113W011

THROTTLE ACTUATOR INSPECTION [AJ]

E6U011313640W01

Caution

- **When the ignition switch is turned to the ON position, the PCM operates the throttle actuator to adjust the throttle valve position. At this time, do not touch the valve to open or close it because your fingers could be pinched.**

Note

- Perform the following inspection only when directed.

Visual Inspection

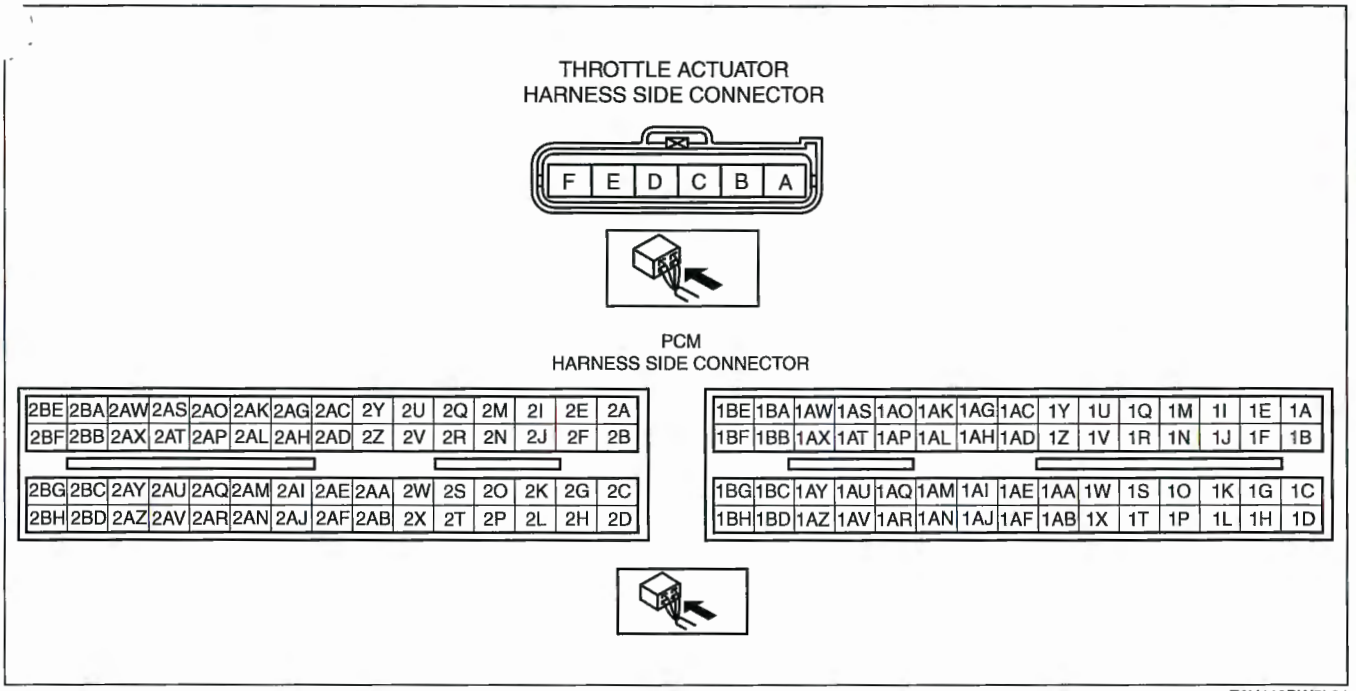
1. Verify that no DTCs related stored to the TP or APP sensors have been stored.
   - If any DTCs have been stored, perform the applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
2. Remove the air hose from the throttle body. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
3. Turn the ignition switch to the ON position.
4. Operate the accelerator pedal and verify that the throttle valve opens and closes in accordance with the pedal movement.
   - If it cannot be verified, perform the "Continuity Inspection".

Continuity Inspection

1. Disconnect the negative battery cable.
2. Disconnect the throttle actuator connector.
3. Inspect for continuity between the throttle actuator terminals A and B using an ohmmeter.
   - If not as specified, replace the throttle body. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
   - If as specified, perform the "Circuit Open/Short Inspection".

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following wiring harnesses for open or short circuit (continuity check).



E6U113BW5L01

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the harness.
  - — Throttle actuator terminal B and PCM terminal 2A
  - — Throttle actuator terminal A and PCM terminal 2B

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the harness.
  - — Throttle actuator terminal B and power supply
  - — Throttle actuator terminal B and body ground
  - — Throttle actuator terminal A and power supply
  - — Throttle actuator terminal A and body ground

ACCELERATOR PEDAL REMOVAL/INSTALLATION [AJ]

1. Remove in the order indicated in the table.

1	Connector
2	Accelerator pedal

2. Install in the reverse order of removal.

BEFORE REPAIR PROCEDURE [L3, AJ]

E6U011400000W03

Warning

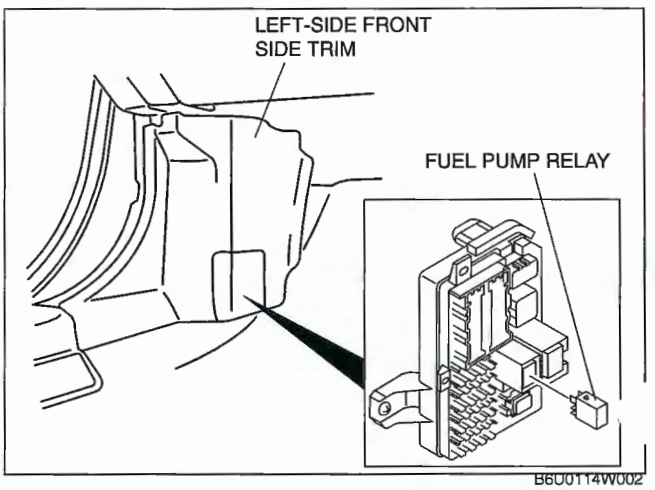
- **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the following "Fuel Line Safety Procedure".**
- **A person charged with static electricity could cause a fire or explosion, resulting in death or serious injury. Before performing work on the fuel system, discharge static electricity by touching the vehicle body.**

Fuel Line Safety Procedure

Note

- Fuel in the fuel system is under high pressure even when the engine is not running.

1. Remove the fuel-filler cap and release the pressure in the fuel tank.
2. Remove the fuel pump relay.
3. Start the engine.
4. After the engine stalls, crank the engine several times.
5. Turn the ignition switch to the LOCK position.
6. Install the fuel pump relay.



B6U0114W002

AFTER REPAIR PROCEDURE [L3, AJ]

E6U011400000W04

Warning

- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. When installing the fuel hose, perform "Fuel Leakage Inspection" described below.**

Fuel Leakage Inspection

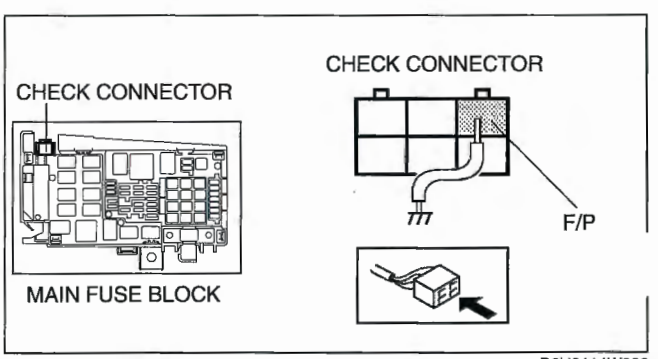
Warning

- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Always carry out the following procedure with the engine stopped.**

Caution

- **Connecting to the wrong check connector terminal may cause a malfunction. Carefully connect only to the specified terminal.**

1. Short the check connector terminal F/P to body GND using a jumper wire.
2. Turn the ignition switch to the ON position to operate the fuel pump.
3. Pressurize the system in this manner for **at least 5 min** to be sure there is no leakage.
   - If there is fuel leakage, inspect the fuel hoses, hose clamps, and fuel pipe sealing surface, and replace if necessary.
4. After repair, assemble the system and repeat Steps 1 to 3.



B6U0114W003

FUEL LINE PRESSURE INSPECTION [L3, AJ]

E6U011400000W05

Warning

- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death. Fuel can also irritate skin and eyes. To prevent this, always complete the "BEFORE REPAIR PROCEDURE". (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)**

Caution

- **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using cloth or soft brush, and make sure that it is free of foreign material.**

1. Complete the "BEFORE REPAIR PROCEDURE".
   (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ])
2. Disconnect the vacuum hose from the intake manifold that connecting to the brake booster.
3. Disconnect the negative battery cable.

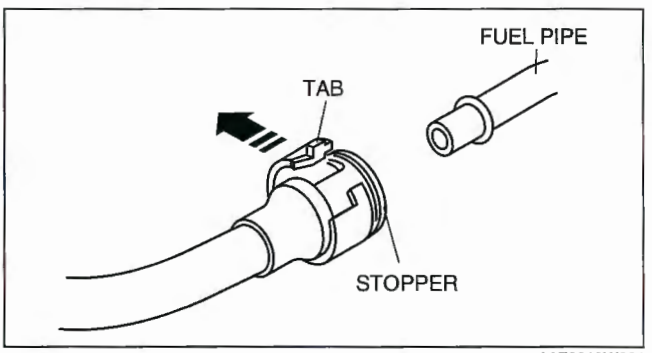
Caution

- **The quick release connector may be damaged if the tab is turned too far. Do not turn the tab over the stopper.**

4. Disconnect the quick release connector from the fuel tank as follows:
   (1) Push the tab on the locking coupler **90 degrees** until it stops.
   (2) Pull the fuel hose straight back.

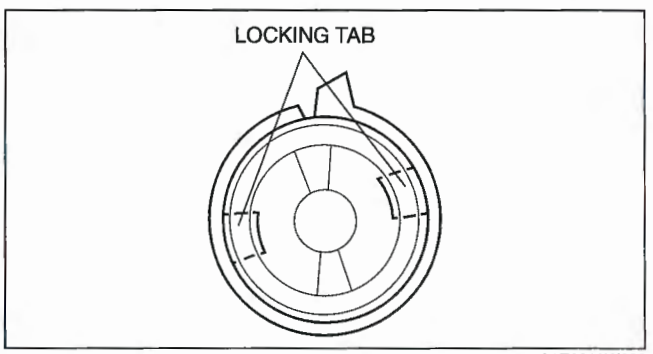
Note

- The stopper may be removed from the quick connector. Take care not to loose it. Reinstall it to the quick release connector before reconnecting the fuel line.



A6E3912W001

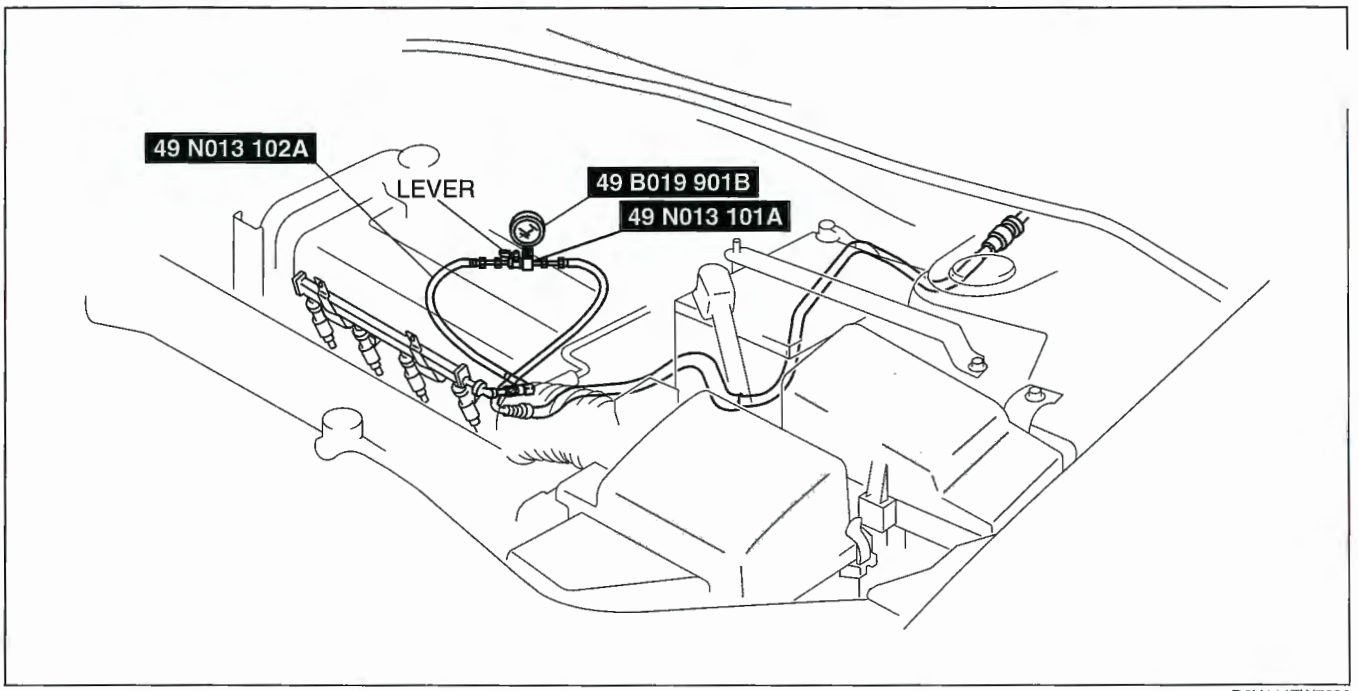
- The locking coupler has two internal locking tabs which distributor pipe. Be sure that the tab on the locking coupler is rotated until it stops to release two internal locking tabs.



A6E3912W002

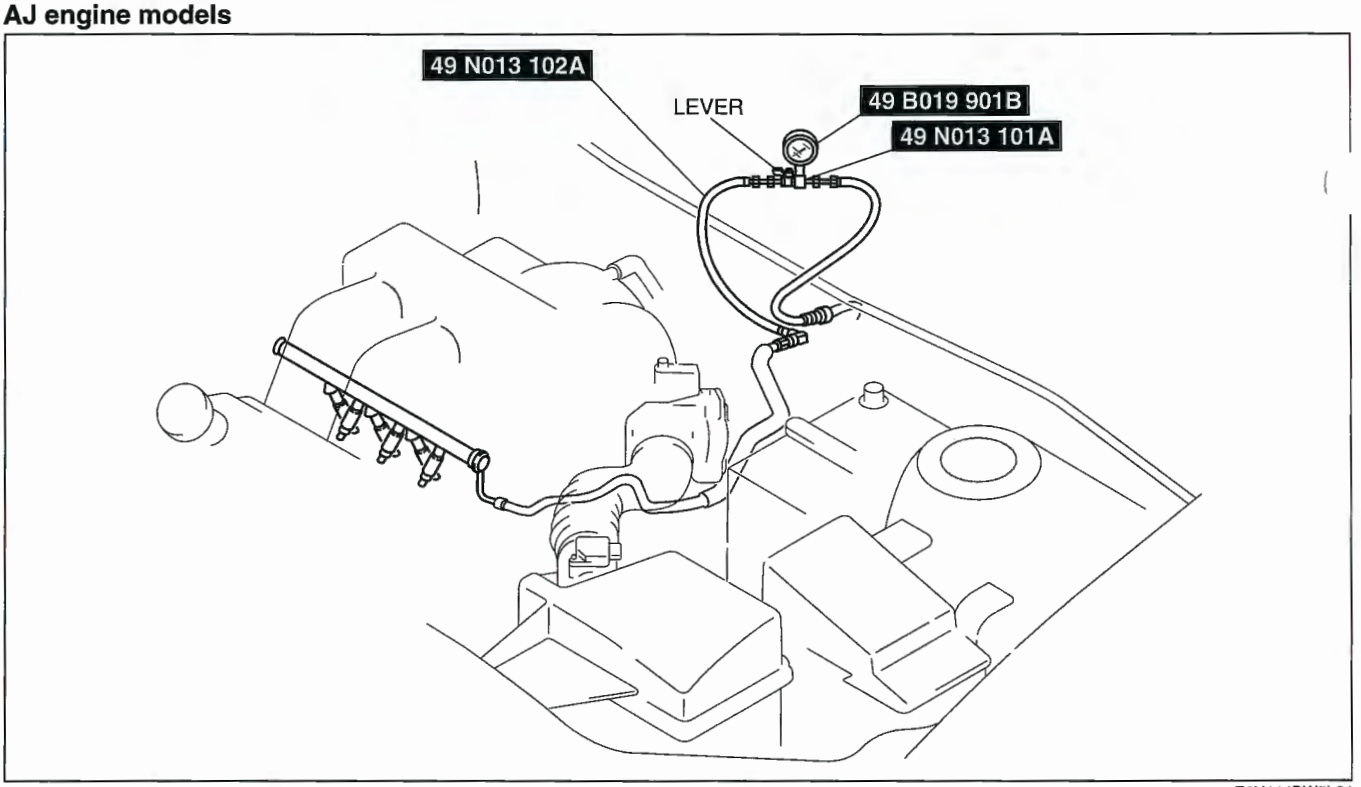
5. Push the **SST** quick release connector into the fuel pipe and plastic fuel hose into the **SST** until a click is heard.
6. Turn the lever parallel to the hose of the **SST** as shown.

L3 engine models



D6U114ZW7200

AJ engine models



E6U114BW5L21

7. Connect the vacuum hose from the intake manifold that connecting to the brake booster.
8. Connect the negative battery cable.
9. Verify that the vehicles for AT is at N position and MT is at neutral position.

10. Start the engine and let it idle. Measure the fuel line pressure.
    - If not as specified, inspect the following:

      Zero or low
      — FP circuit
      — FP
      — Fuel line (clogged)
      — Fuel leakage inside pressure regulator

      High
      — Pressure regulator for high pressure cause

Fuel line pressure
L3: 375—450 kPa {3.9—4.5 kgf/cm^2, 55—65 psi}
AJ: 430—510 kPa {4.4—5.2 kgf/cm^2, 63—73 psi}

11. Observe the fuel pressure gauge indicator during heavy acceleration.
12. Verify that the fuel pressure fluctuation is within the specification during the test.
    - If not as specified, inspect the following:
      — PCM
      — FP
      — Fuel line for improper routing, kinks or leakage

Fuel pressure fluctuation
L3: 365—450 kPa {3.8—4.5 kgf/cm^2, 53—65 psi}
AJ: 420—510 kPa {4.3—5.2 kgf/cm^2, 61—73 psi}

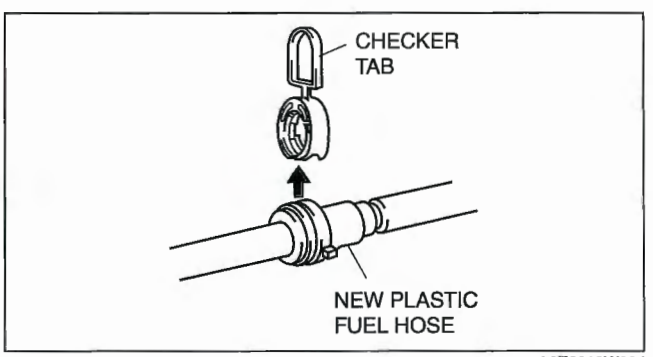
13. Turn the ignition switch to the LOCK position.
14. Measure the fuel hold pressure **after 5 min**.
    - If not as specified, inspect the following:
      — FP hold pressure
      — Fuel injector for leakage
      — Fuel line for improper routing, kinks or leakage

Fuel hold pressure
L3: More than 200 kPa {2.0 kgf/cm^2, 29 psi}
AJ: More than 250 kPa {2.5 kgf/cm^2, 36 psi}

15. Complete the "BEFORE REPAIR PROCEDURE".
    (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ])
16. Disconnect the vacuum hose from the intake manifold that connecting to the brake booster.
17. Disconnect the **SST**.

Note
- A checker tab is integrated with quick release connector for new plastic fuel hoses. The checker tab will be released from the quick release connector after it is completely engaged with the fuel pipe.

18. Inspect the plastic fuel hose and fuel pipe sealing surface for damage and deformation, and replace as necessary.
    - If the quick release connector O-ring is damaged or has slipped, replace the plastic fuel hose.
19. Apply a small amount of clean engine oil to the sealing surface of the fuel pipe.
20. Reconnect the fuel main hose to the fuel distributor until a click is heard.
21. Lightly pull and push the quick release connector a few times by hand and verify that it can move **2.0—3.0 mm {0.08—0.11 in}** and it is connected securely.
    - If quick release connector does not move at all, verify that O-ring is not damaged and slipped, and reconnect the quick release connector.



A6E3912W004

22. Connect the vacuum hose from the intake manifold that connecting to the brake booster.
23. Complete the "AFTER REPAIR PROCEDURE". (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)

FUEL TANK REMOVAL/INSTALLATION [L3, AJ]

E6U011442110W01

Warning

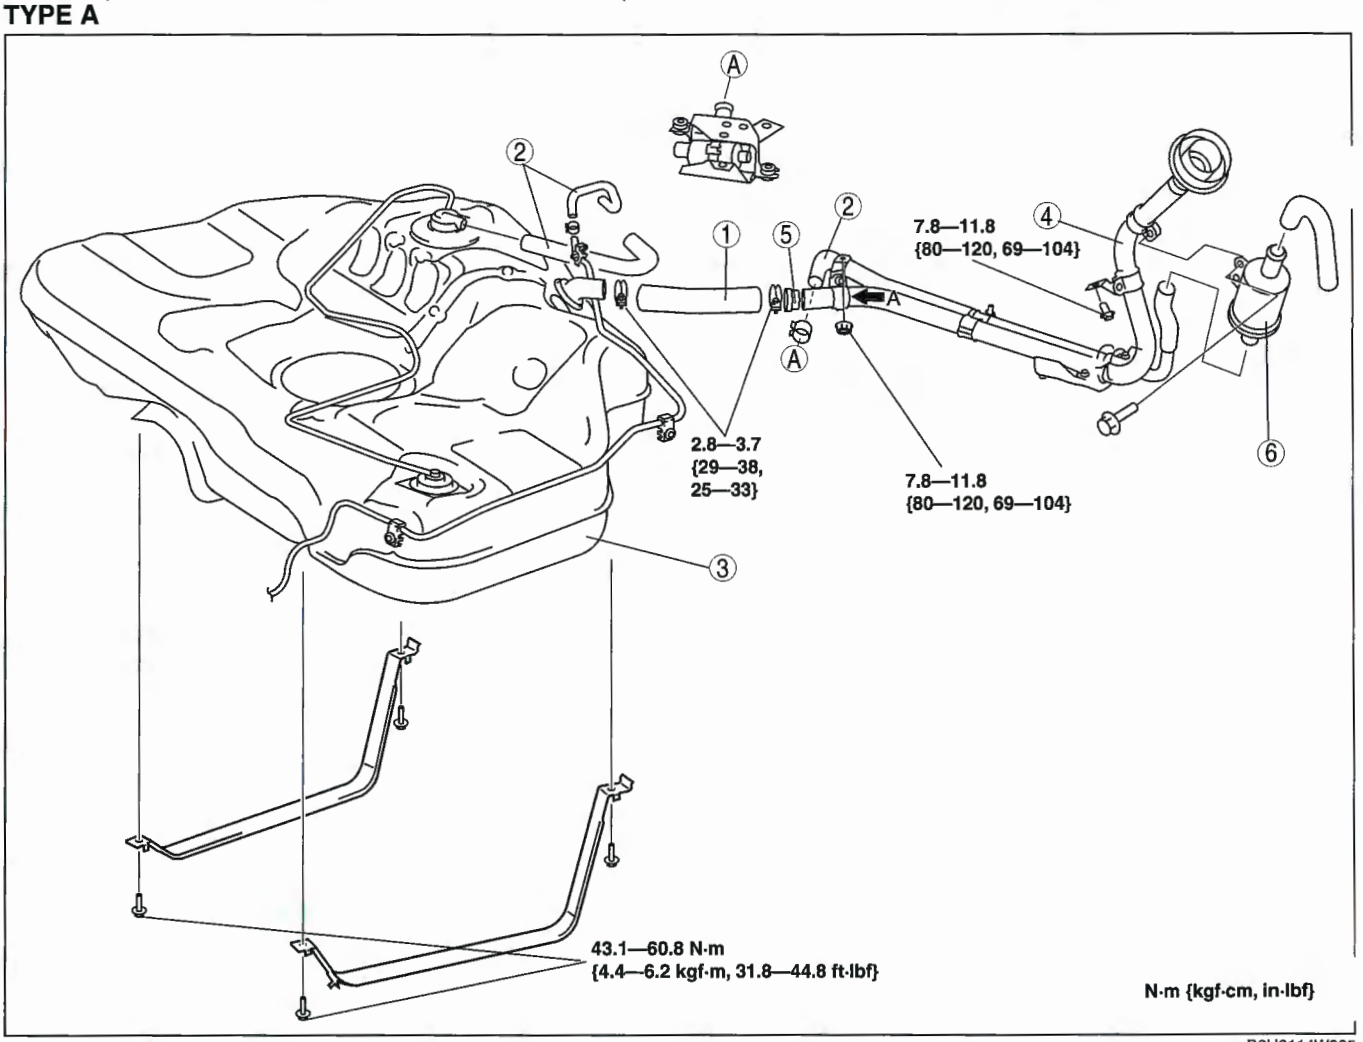
- **Repairing a fuel tank that has not been properly steam-cleaned can be dangerous. Explosion or fire may cause death or serious injury. Always properly steam clean a fuel tank before repairing it.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, do not damage the sealing surface of the fuel pump unit when removing or installing.**
- **A person charged with static electricity could cause a fire or explosion, resulting in death or serious injury. Before draining fuel, make sure to discharge static electricity by touching the vehicle body.**

Caution

- **Disconnecting/connecting the quick release connector without cleaning it may cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using a cloth or soft brush, and make sure that it is free of foreign material.**

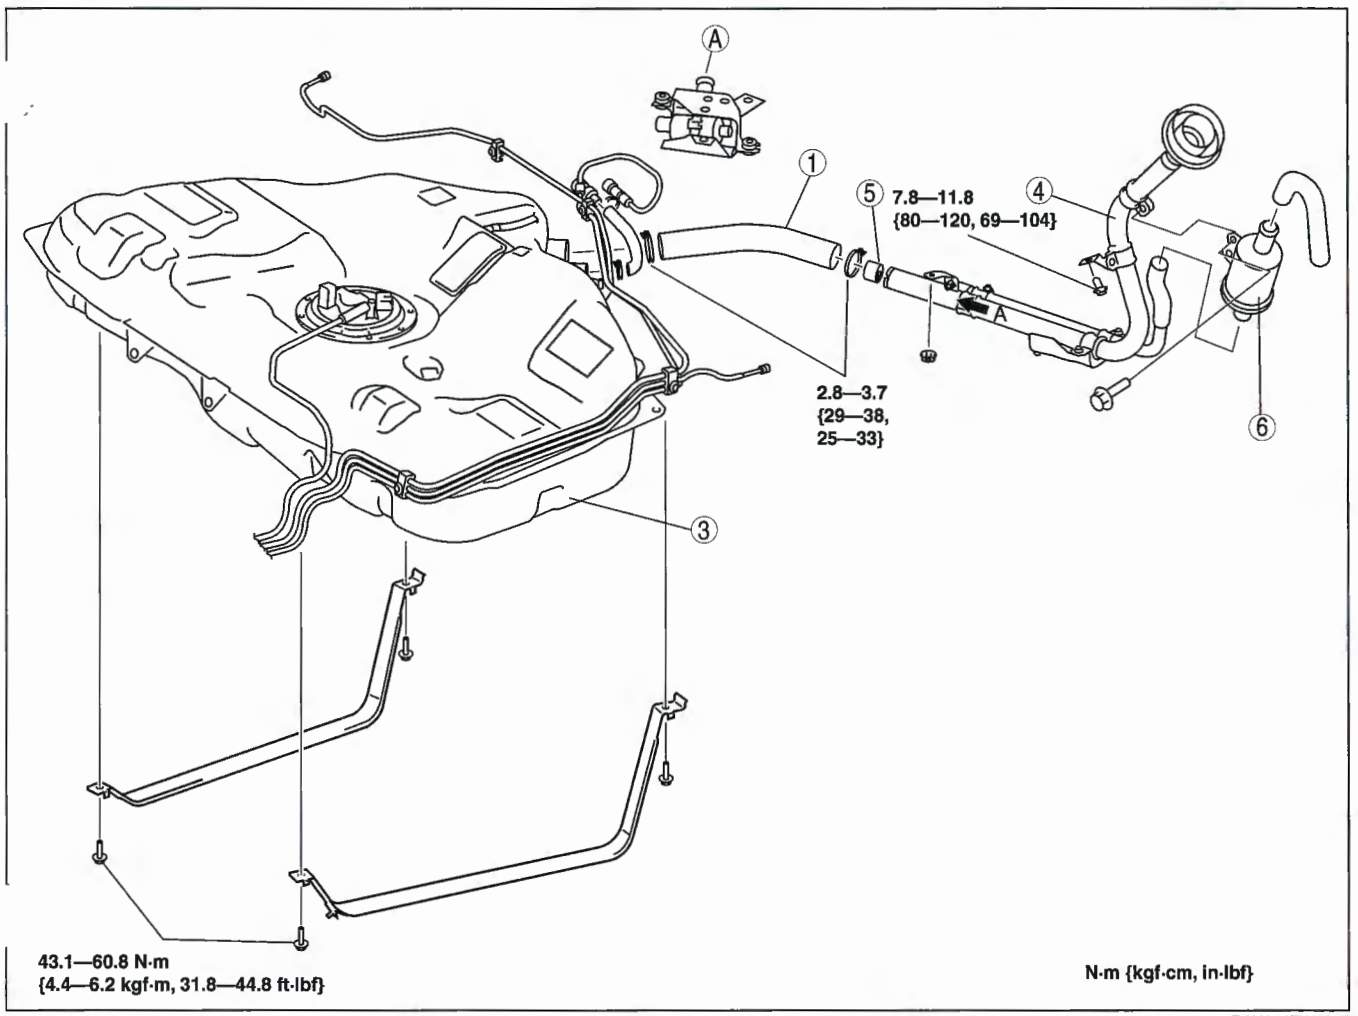
1. Level the vehicle.
2. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)
3. Disconnect the negative battery cable.
4. Remove the fuel pump unit. (See01–14A–13 FUEL PUMP UNIT REMOVAL/INSTALLATION [L3, AJ].)
5. Siphon the fuel from the fuel tank.
6. Remove in the order indicated in the table.
7. Install in the reverse order of removal.
8. Complete the "AFTER REPAIR PROCEDURE". (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)

TYPE A



B6U0114W005

TYPE B



D6U114ZW7007

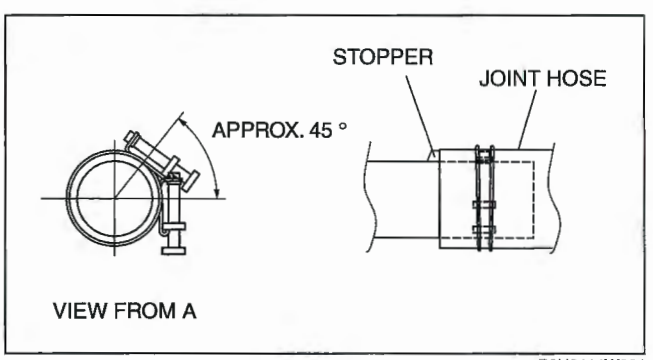
1	Joint hose (See 01–14A–11 Joint Hose Installation Note)
2	Evaporative hose (See 01–16A–7 Evaporative Hose Removal Note (Type A)) (See 01–16A–9 Evaporative Hose Installation Note)
3	Fuel tank

4	Fuel-filler pipe
5	Nonreturn valve
6	Air filter

TYPE A:The rollover valve is located on the external wall of the fuel tank.
TYPE B:The rollover valve is located inside the fuel tank.

Joint Hose Installation Note

1. Fit the joint hose onto the respective fittings, and install clamps as shown.



B6U0114W021

FUEL SHUT-OFF/ROLLOVER VALVE INSPECTION [L3, AJ]

E6U011442990W01

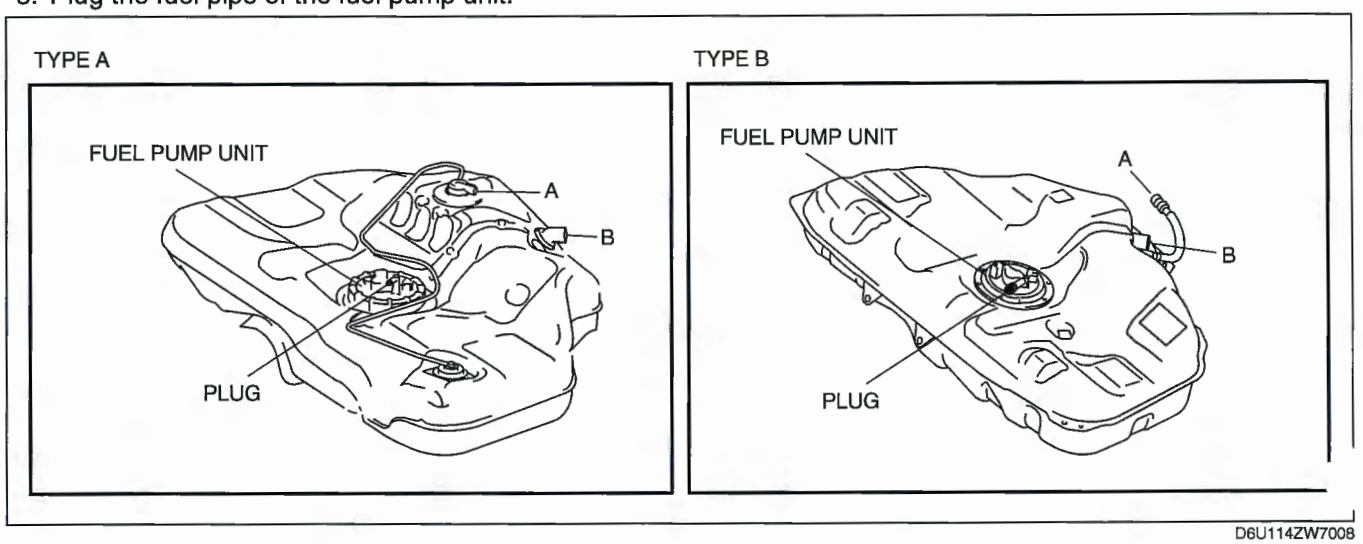
Caution

- **Disconnecting/connecting the quick release connector without cleaning it may cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using a cloth or soft brush, and make sure that it is free of foreign material.**

Note

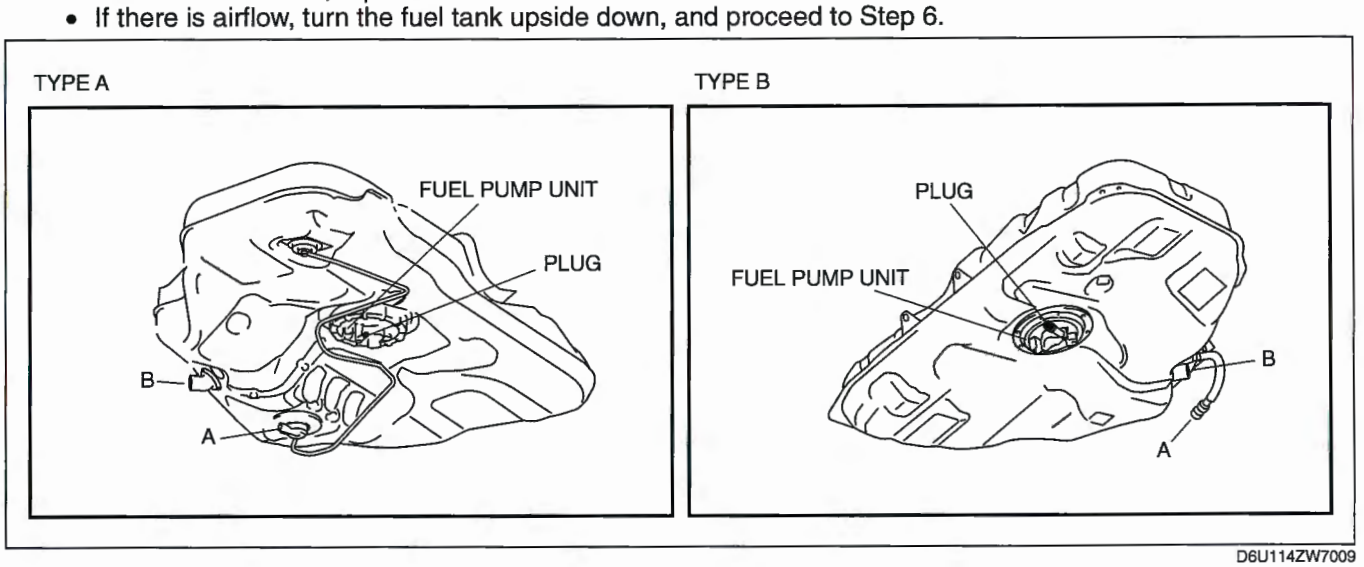
- This inspection is for fuel shut-off valve and two rollover valves integrated in the fuel tank.

1. Disconnect the plastic fuel hose and the fuel pump unit connector. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/INSTALLATION [L3, AJ].)
2. Remove the fuel tank with the fuel pump unit. (See 01–14A–10 FUEL TANK REMOVAL/INSTALLATION [L3, AJ].)
3. Plug the fuel pipe of the fuel pump unit.



D6U114ZW7008

4. Level the fuel tank.
5. Blow through port B and verify that there is airflow from port A.
   - If there is no airflow, replace the fuel tank.
   - If there is airflow, turn the fuel tank upside down, and proceed to Step 6.



D6U114ZW7009

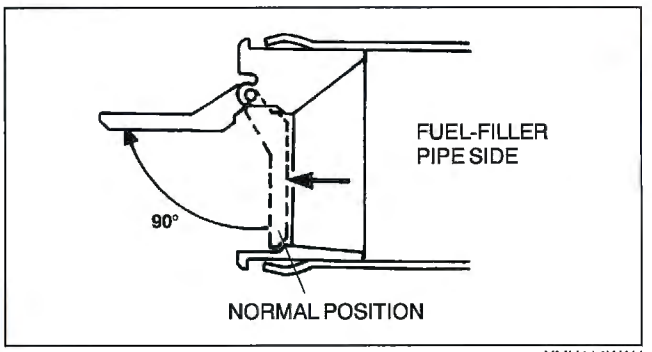
6. Blow through port B and verify that there is no airflow from port A.
   - If there is airflow, replace the fuel tank.

TYPE A:The rollover valve is located on the external wall of the fuel tank.
TYPE B:The rollover valve is located inside the fuel tank.

NONRETURN VALVE INSPECTION [L3, AJ]

E6U011442270W01

1. Remove the nonreturn valve. (See 01–14A–10 FUEL TANK REMOVAL/INSTALLATION [L3, AJ].)
2. Verify that the nonreturn valve opens up to **90°** when it is pushed from the fuel-filler pipe side, and it returns to the normal position by the spring force.
   - If the nonreturn valve does not open up to **90°** or does not return to the normal position, replace the nonreturn valve.



YMU114WAH

FUEL PUMP UNIT REMOVAL/INSTALLATION [L3, AJ]

E6U011413350W01

Warning

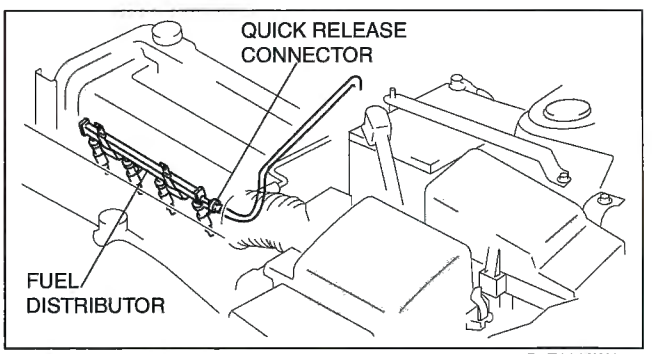
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure".**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, before performing the fuel pump unit removal/installation, always complete the "Fuel Leak Inspection After Fuel Pump Unit Installation".**
- **A person charged with static electricity could cause a fire or explosion, resulting in death or serious injury. Before draining fuel, make sure to discharge static electricity by touching the vehicle body.**

Caution

- **Because the fuel tank is constructed such that the fuel level is higher than the installation surface of the fuel pump, fuel leakage could occur. If the fuel gauge indicates a fuel level of half or more, perform the following Steps 1-6 to drain the fuel.**
- **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using a cloth or soft brush, and make sure that it is free of foreign material.**

Fuel Pump Cap-installed Type

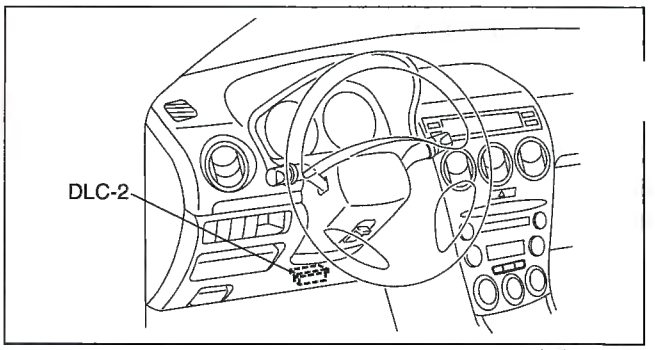
1. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)
2. Remove the plug hole plate.
3. Disconnect the quick release connector connected to the fuel distributor.
4. Connect a long hose to the disconnected quick release connector and drain the fuel into a container used for collecting gasoline.
5. Start the fuel pump using the following procedure.



D6E114AW4701

Using WDS or equivalent

1. Connect the WDS or equivalent to the DLC-2.
2. Using the simulation function "FP", start the fuel pump.



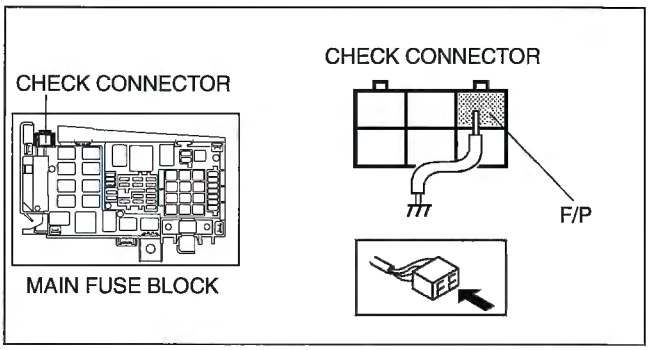
A6E3970W002

Without using WDS or equivalent

1. Short the check connector terminal F/P to body GND using a jumper wire.
2. Turn the ignition switch to ON position to operate the fuel pump.

Caution

- **The fuel pump could be damaged if it is operated (fuel pump idling) while there is no fuel in the fuel tank. Verify the amount of fuel being discharged from the hose and stop operation of the fuel pump when essentially no fuel is being discharged.**

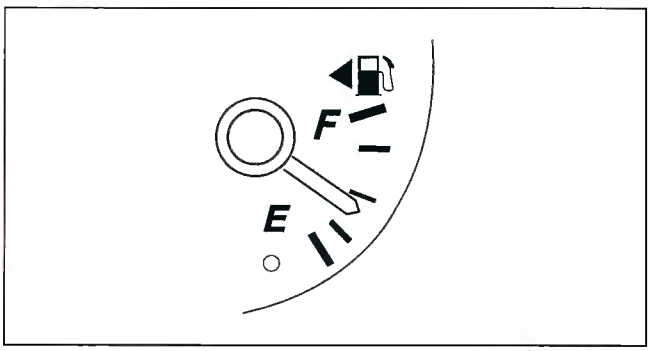


B6U0114W003

Note

- If the fuel tank is full, drain **approx. 35 L {9.2 US gal, 7.7 Imp gal}** of fuel until the fuel gauge indicates **approx. 3/8** of a tank.

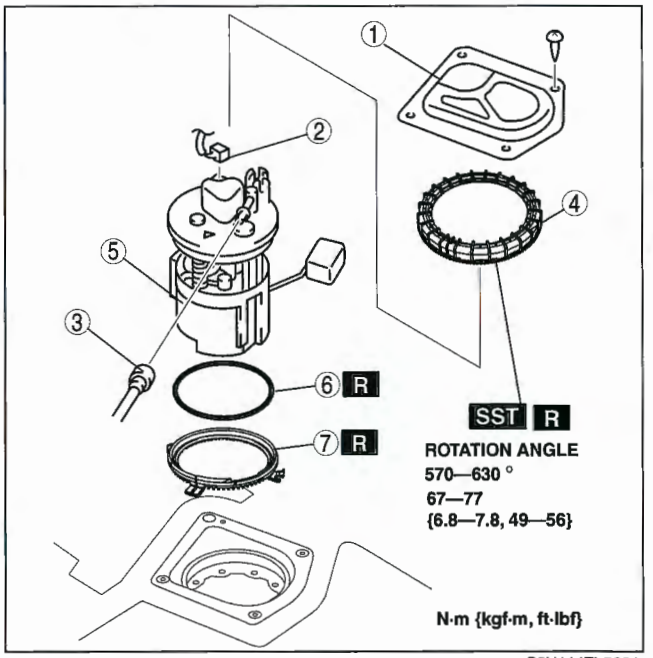
6. When essentially no fuel is being discharged, stop operation of the fuel pump.
7. Disconnect the negative battery cable.
8. Remove the rear seat cushion.
9. Remove in the order indicated in the table.
10. Install in the reverse order of removal.
11. Complete the "AFTER REPAIR PROCEDURE". (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)



D6E114AW4702

Fuel pump cap-installed type

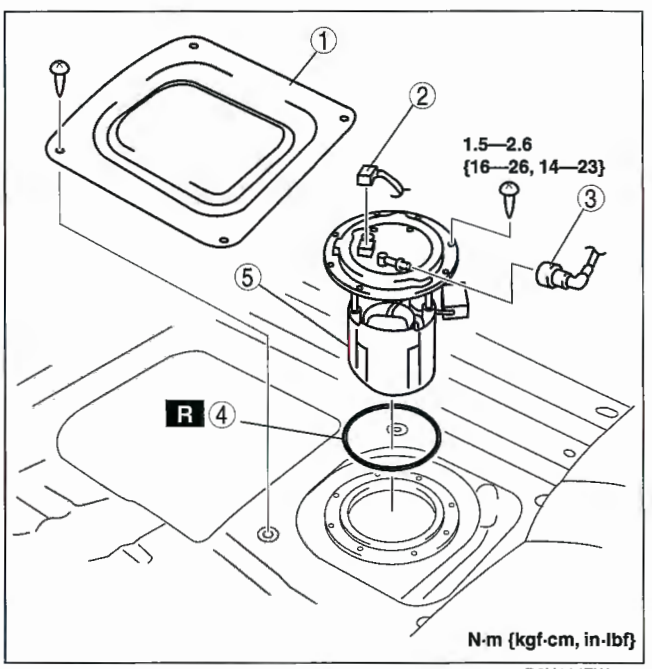
1	Service hole cover
2	Connector
3	Plastic fuel hose (See 01–14A–16 Plastic Fuel Hose Removal Note) (See 01–14A–20 Plastic Fuel Hose Installation Note)
4	Fuel pump cap (See 01–14A–16 Fuel Pump Cap Removal Note) (See 01–14A–17 Fuel Pump Cap Installation Note)
5	Fuel pump unit (See 01–14A–17 Fuel Pump Cap Installation Note)
6	Packing (See 01–14A–17 Fuel Pump Cap Installation Note)
7	Retainer (See 01–14A–17 Fuel Pump Cap Installation Note)



C6U114ZL5001

Screw-installed type

1	Service hole cover
2	Connector
3	Plastic fuel hose (See 01–14A–16 Plastic Fuel Hose Removal Note) (See 01–14A–20 Plastic Fuel Hose Installation Note)
4	Packing
5	Fuel pump unit



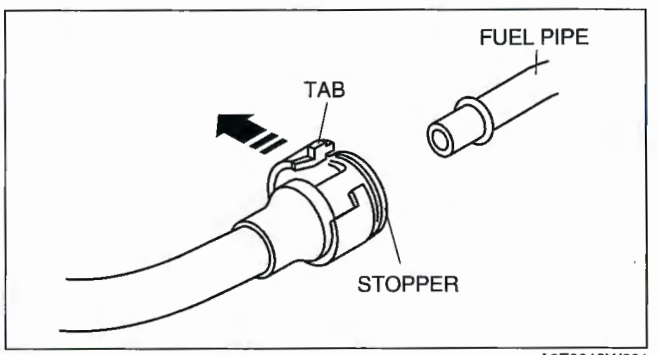
D6U114ZW8900

Plastic Fuel Hose Removal Note

Caution
- **The quick release connector may be damaged if the tab is bent excessively. Do not expand the tab over the stopper.**

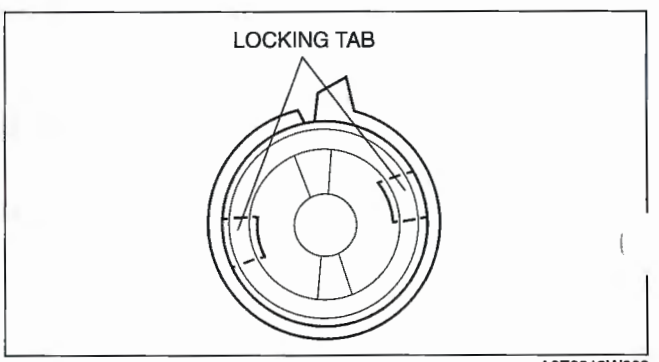
1. Disconnect the quick release connector.
   (1) Push the tab on the locking coupler **90** ° until it stops.
   (2) Pull the fuel hose straight back.

Note
- The stopper may be removed from the quick connector. Take care not to lose it. Reinstall it to the quick release connector before reconnecting the fuel line.



A6E3912W001

- The locking coupler has two internal locking tabs which retain the fuel pipe. Be sure that the tab on the locking coupler is rotated until it stops to release two internal locking tabs.



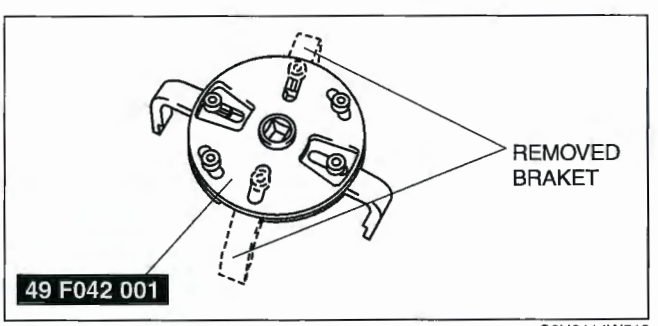
A6E3912W002

2. Cover the disconnected quick release connector and fuel pipe with vinyl sheets or the like to prevent them from being scratched or contaminated with foreign material.

Fuel Pump Cap Removal Note

Caution
- **The cap could be damaged if the SST is used with any play between the cap and the SST. Securely attach the SST so that there is no gap between the SST tabs and the side of the cap.**

1. Remove the fuel pump cap using the **SST** with two of the four brackets removed.



C6U0114W510

Fuel Pump Cap Installation Note

Warning
- **Make sure there is no foreign material on each of the parts. If there is foreign material on the parts, the fuel pump unit cannot be assembled correctly, which could result in fuel leakage.**

Note
- The fuel pump unit will rotate and cannot be secured in the specified position if there is any gasoline on the gasket. Thoroughly wipe away all gasoline from the gasket.

1. Replace the packing, fuel pump cap and the retainer with new parts.

Caution
- **New parts can deform depending on the temperature. If the parts deform, the fuel pump unit cannot be assembled correctly, which could result in fuel leakage. Therefore, keep new parts at room temperature for the specified period of time to stabilize the shape.**

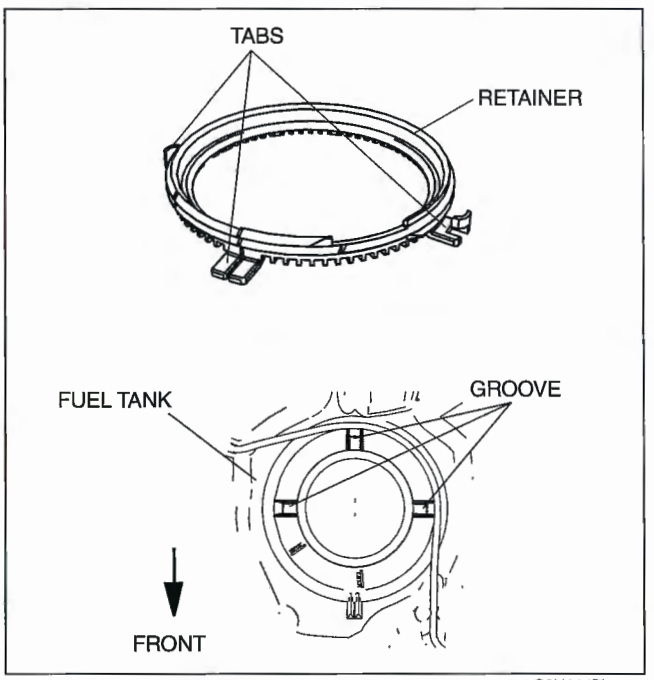
2. Leave new parts inside for the following period of time:

Stand-by time
12 h or more

3. Install a new retainer to the fuel tank.
   (1) Align the retainer tabs (3 locations) with the fuel tank grooves.
   (2) Verify that the tabs are inserted into the grooves and the retainer is installed correctly.
   (3) Verify the retainer is not damaged.
4. Install a new packing to the fuel tank.
   (1) Verify the packing groove is clean and free of foreign material.
   (2) Install the packing to the fuel tank so that it is inserted into the fuel tank grooves.

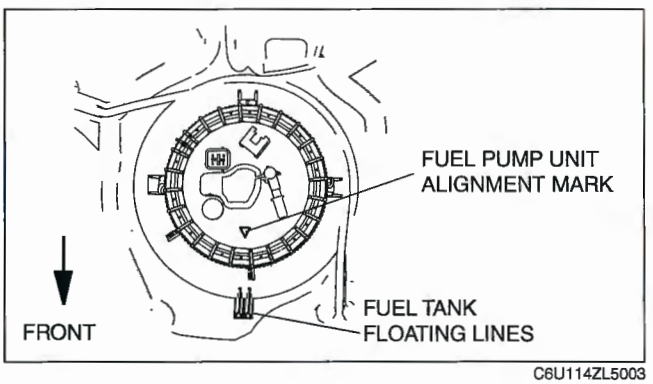
Caution
- **Install the fuel pump unit to the fuel tank being careful not to bend the fuel sender unit arm. If the arm is bent, the fuel sender unit will not operate correctly.**

5. Install the fuel pump unit to the fuel tank.



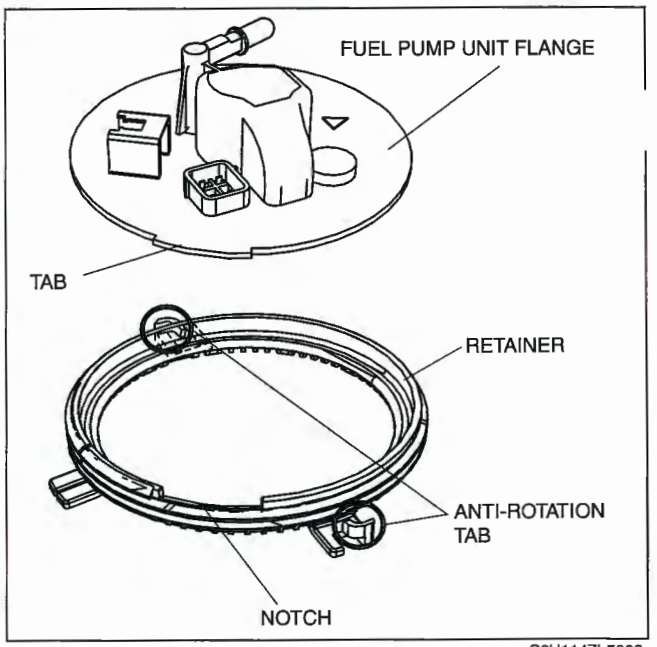
C6U114ZL5002

   (1) Align the fuel pump unit alignment mark and the floating lines on the fuel tank.



C6U114ZL5003

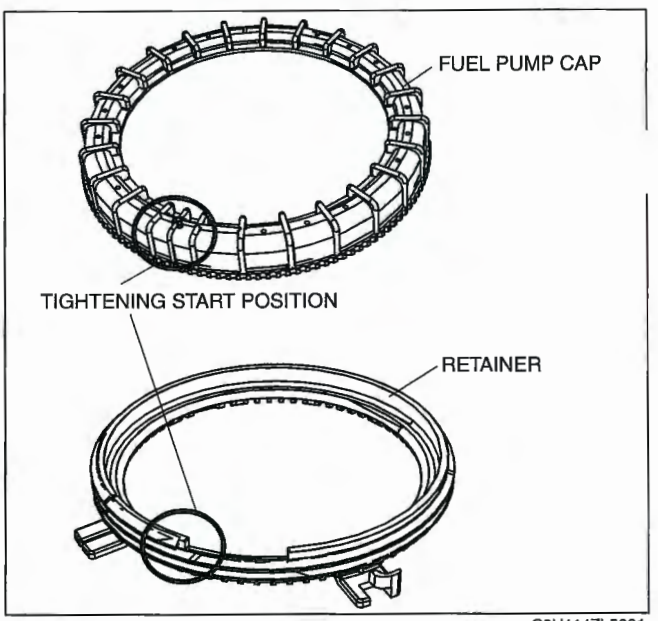
(2) Verify the tab on the fuel pump unit flange with the notch on the retainer.



C3U114ZL5003

6. Set on a new fuel pump cap.
   (1) Apply downward force (push down) on the center of the fuel pump unit flange.

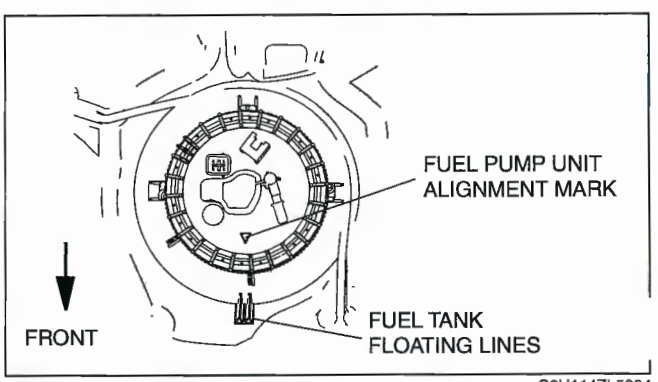
Note
- Align the fuel pump cap with the tightening start position of the retainer and tighten the fuel pump cap with the start position as **0** °.
- The fuel pump cap tightening start position is the position where the spaces between the ribs become narrow. The retainer tightening start position is the notch position.



C3U114ZL5001

(2) Align the tightening start position on the fuel pump cap and the tightening start point of the retainer.

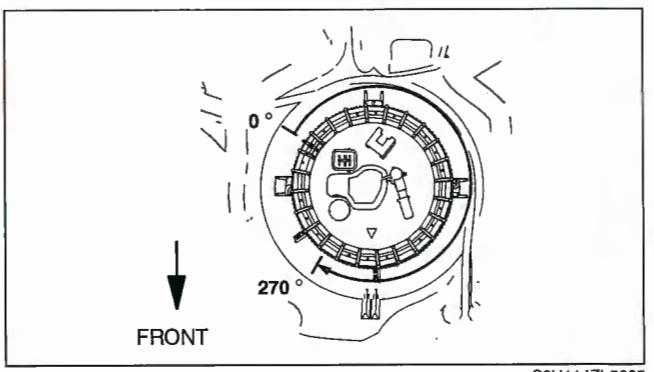
Warning
- **No grease or lubrication allowed on parts during installation. Parts could slide or they cannot be tightened to the specified torque. As a result, fuel leakage could occur.**
- **When tightening the fuel pump cap, be careful that the fuel pump unit alignment mark and the floating lines on the fuel tank have not deviated. If there is deviation, the fuel pump unit cannot be installed correctly, which could result in fuel leakage.**



C6U114ZL5004

7. Tighten the fuel pump cap.
   (1) Tighten the fuel pump cap by hand to the specified angle or more until the flange is fixed.

Fuel pump cap rotation angle
270 ° or more



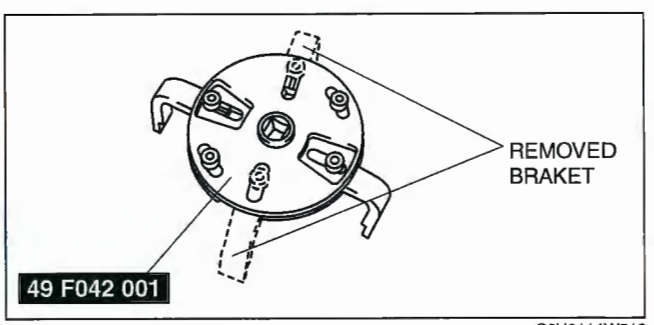
C6U114ZL5005

   (2) Verify that the fuel pump cap is tightened correctly.
      1) The gap between the bottom of the fuel pump cap and the tank surface is even all around.
         - If the fuel pump cap is not tightened uniformly, loosen it by hand and re-install it.

Caution
- **The cap could be damaged if the SST is used with any play between the cap and the SST. Securely attach the SST so that there is no gap between the SST tabs and the side of the cap.**

   (3) Install the **SST** with two of the four brackets removed.

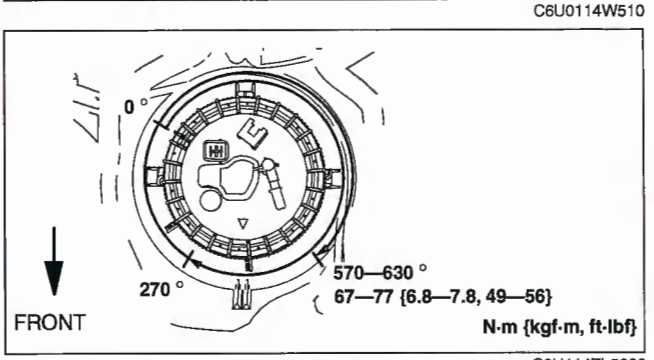
Note
- The fuel pump cap rotation angle is the angle from the **0 °** position. The angle tightened to using the **SST** includes the angle tightened by hand.



C6U0114W510

   (4) Tighten the fuel pump cap to the specified torque and to the specified angle or more.

Fuel pump cap rotation angle
570—630 °
Fuel pump cap tightening torque
67—77 N·m {6.8—7.8 kgf·m, 49—56 ft·lbf}

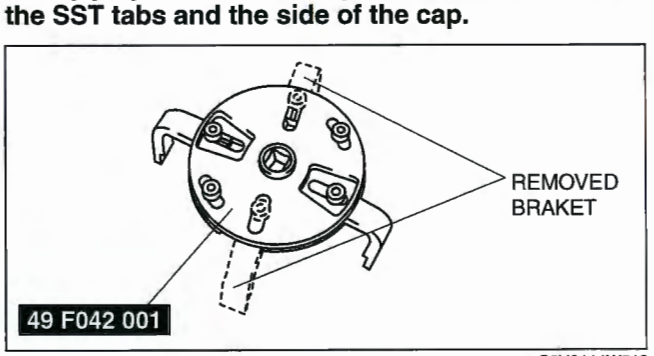


C6U114ZL5006

   (5) Verify that the fuel pump cap is tightened correctly.
      1) The gap between the top of the fuel pump unit flange and the fuel pump cap is even all around.
         - If it is not tightened uniformly, re-install it using the following procedure.
      2) The gap between the fuel pump unit and fuel tank is even all around.
         - If it is not tightened uniformly, re-install it using the following procedure.
      3) Verify that the fuel pump unit alignment mark and the floating lines on the fuel tank are aligned.
         - If they are not aligned, re-install it using the following procedure.

Caution
- **The cap could be damaged if the SST is used with any play between the cap and the SST. Securely attach the SST so that there is no gap between the SST tabs and the side of the cap.**

1. Install the **SST** with two of the four brackets removed.
2. Remove the fuel pump cap, fuel pump unit, packing, and retainer.
3. Verify that the retainer is not damaged.
   - If both of the retainer anti-rotation tabs are broken, replace it with new one.
4. Return to Step 2 and re-install.

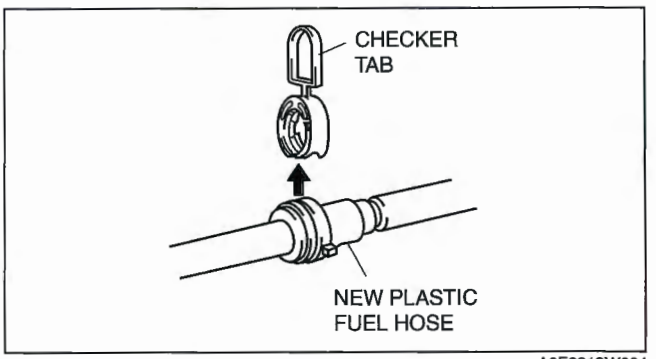


C6U0114W510

Plastic Fuel Hose Installation Note

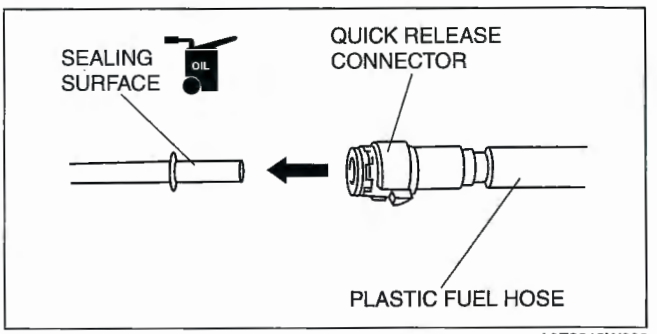
Note
- A checker tab is integrated with quick release connector for new plastic fuel hoses. The checker tab will b released from the quick release connector after it is completely engaged with the fuel pipe.

1. Inspect the fuel pump unit sealing surface for damage and deformation, and replace if necessary.
   - If the quick release connector O-ring is damaged, replace the plastic fuel hose.



A6E3912W004

2. Slightly apply clean engine oil to the sealing surface of the fuel pump unit.
3. Align the fuel pipe on the fuel pump unit and quick release connector so that the tabs of the retainer are correctly fitted into the quick release connector. Push the quick release connector straight into the retainer until a click is heard.
4. Lightly pull and push the quick release connector a few times by hand and verify that it can move **2.0—3.0 mm {0.08—0.11 in}** and it is connected securely.
   - If the quick release connector does not move at all, verify that O-ring is not damaged and slipped, and reconnect the quick release connector.



A6E3912W006

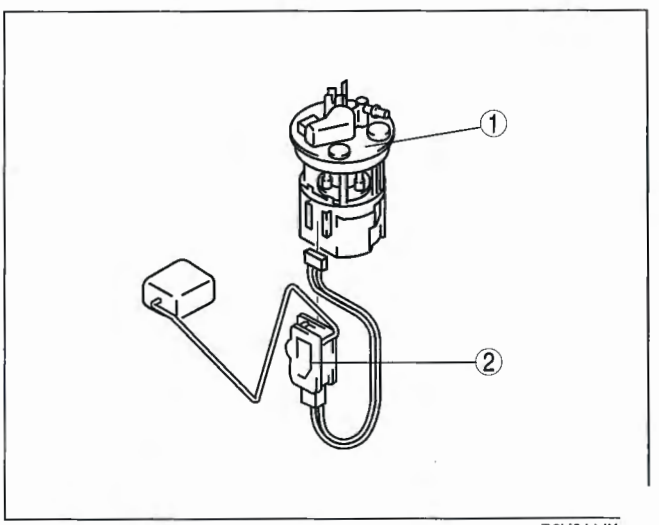
FUEL PUMP UNIT DISASSEMBLY/ASSEMBLY [L3, AJ]

E6U011413350W02

Warning
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, do not damage the sealing surface of the fuel pump unit when removing or installing.**

1. Disassemble in the order indicated in the table.
2. Assemble in the reverse order of disassembly.

1	Fuel pump unit
2	Fuel gauge sender unit



B6U0114W

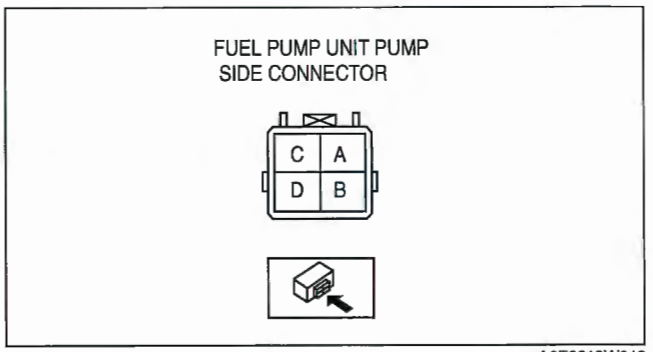
FUEL PUMP UNIT INSPECTION [L3, AJ]

E6U011413350W03

Continuity Inspection

Note
- Perform the following test only when directed.

1. Disconnect the negative battery cable.
2. Remove the service hole cover. (See 01–14A–13 FUEL PUMP UNIT REMOVAL/INSTALLATION [L3, AJ].)
3. Disconnect the fuel pump unit connector.
4. Inspect for continuity between fuel pump unit connector terminals B and D.
   - If there is no continuity, replace the fuel pump body.
   - If as specified, carry out the "Circuit Open/Short Inspection".



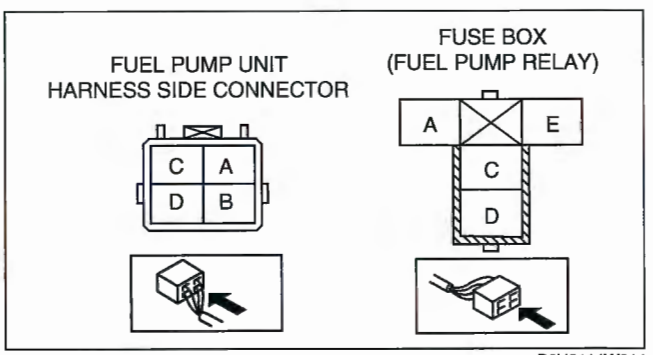
A6E3912W018

Circuit Open/Short Inspection

1. Inspect the following wiring harnesses as for open or short circuit (continuity check).

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Fuel pump unit terminal D and body GND
  - — Fuel pump unit terminal B and fuel pump relay terminal C

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Fuel pump unit terminal D and power supply
  - — Fuel pump unit terminal B and body GND



B6U0114W014

Fuel Pump Hold Pressure Inspection

Warning
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Always carry out the following procedure with the engine stopped.**

Caution
- **Disconnecting/connecting the quick release connector without cleaning it may cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using a cloth or soft brush, and make sure that it is free of foreign material.**

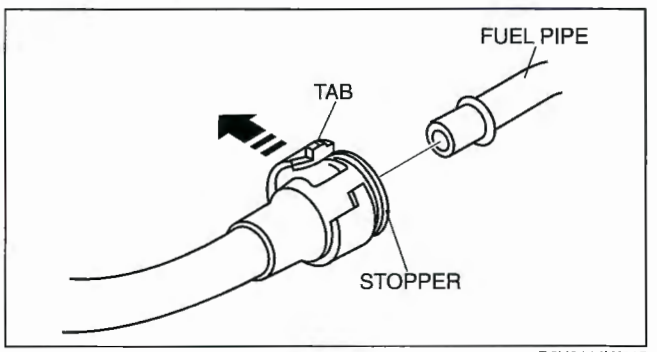
Note
- Perform the following test only when directed.

1. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)
2. Disconnect the negative battery cable.
3. Remove the battery and battery tray.

Caution
- **The quick release connector may be damaged if the tab is bent excessively. Do not expand the tab over the stopper.**

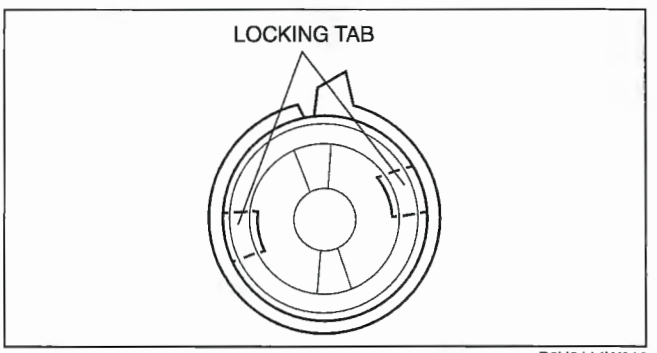
4. Disconnect the quick release connector from the fuel tank as follows:
   (1) Push the tab on the locking coupler **90°** until it stops.
   (2) Pull the fuel hose straight back.

Note
- The stopper may be removed from the quick connector. Take care not to lose it. Reinstall it to the quick release connector before reconnecting the fuel line.



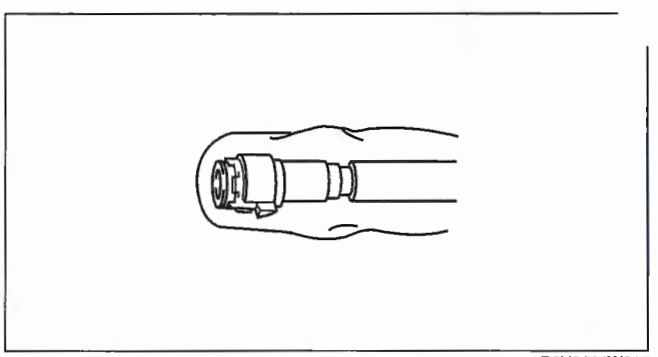
B6U0114W015

- The locking coupler has two internal locking tabs which distributor pipe. Be sure that the tab on the locking coupler is rotated until it stops to release two internal locking tabs.



B6U0114W016

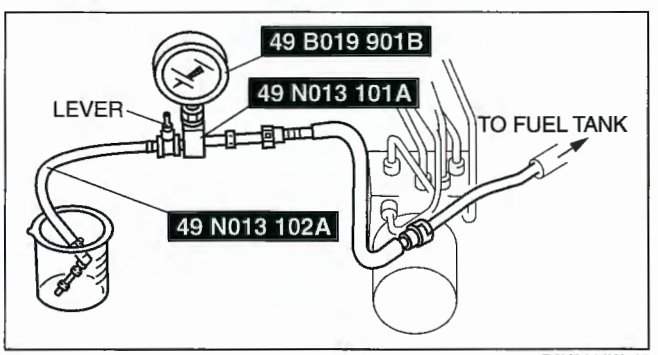
5. Cover the disconnected quick release connector with vinyl sheet or the like to prevent it from being scratched or contaminated with foreign material.



B6U0114W017

6. Turn the lever **90°** against the hose of the **SST** to plug the **SST** outlet.
7. Push the **SST** quick release connector into the fuel pipe until a click is heard.
8. Set the fuel hose into a container to avoid fuel spills.
9. Connect the negative battery cable.

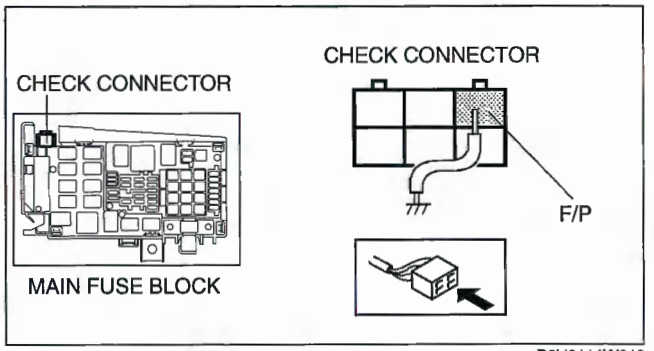
Caution
- **Connecting to the wrong check connector terminal may cause malfunction. Carefully connect only to the specified terminal.**



B6U0114W018

10. Short the check connector terminal F/P to body GND using a jumper wire.
11. Turn the ignition switch to the ON position to operate the fuel pump.
12. Turn the ignition switch to the LOCK position.
13. Measure the fuel pump hold pressure **after 5 min**.
    - If not as specified, replace the fuel pump after inspecting the following:
      — Fuel line for clogging or leakage

    Fuel pump hold pressure
    L3: More than 200 kPa {2.0 kgf/cm^2, 29 psi}
    AJ: More than 250 kPa {2.5 kgf/cm^2, 36 psi}

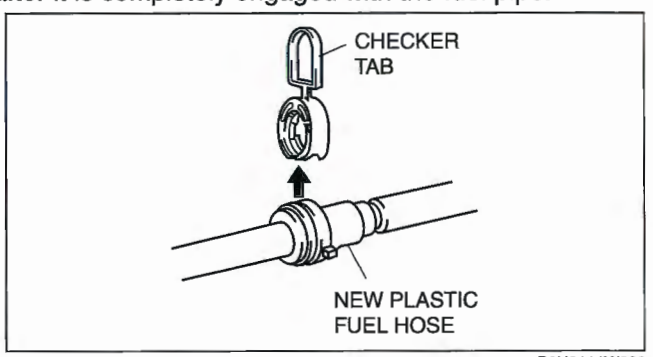


B6U0114W019

14. Disconnect the jumper wire.
15. Disconnect the **SST**.

Note
- A checker tab is integrated with the quick release connector for new plastic fuel hoses. The checker tab will be released from the quick release connector after it is completely engaged with the fuel pipe.

16. Inspect the plastic fuel hose and fuel pipe sealing surface for damage and deformation, and replace if necessary.
    - If the quick release connector O-ring is damaged or has slipped, replace the plastic fuel hose.
17. Apply a small amount of clean engine oil to the sealing surface of the fuel pipe.
18. Reconnect the plastic fuel hose straight to the fuel pipe until a click is heard.
19. Lightly pull and push the quick release connector a few times by hand and verify that it can move **2.0—3.0 mm {0.08—0.11 in}** and it is connected securely.
    - If quick release connector does not move at all, verify that O-ring is not damaged or slipped, and reconnect the quick release connector.



B6U0114W020

20. Complete the "AFTER REPAIR PROCEDURE". (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)

FUEL INJECTOR REMOVAL/INSTALLATION [L3]

E6U011413250W01

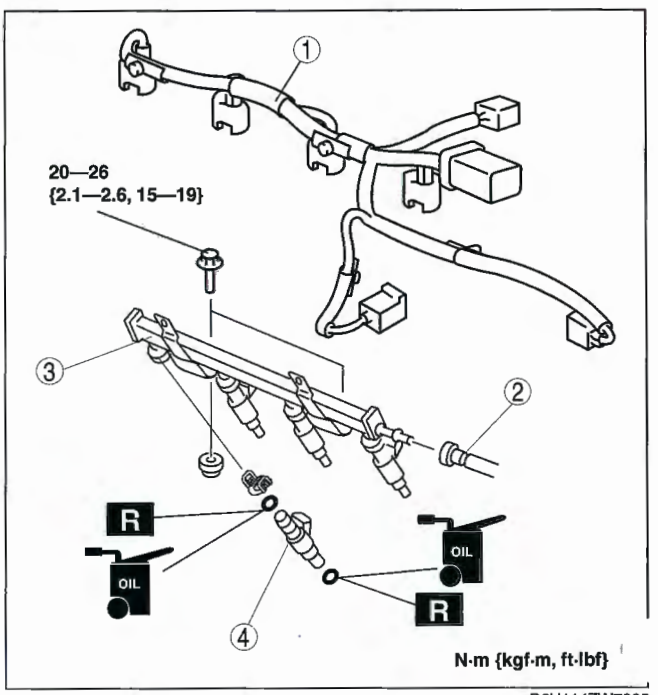
Caution

- **Disconnecting/connecting the quick release connector without cleaning it may cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using a cloth or soft brush, and make sure that it is free of foreign material.**

1. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)
2. Disconnect the negative battery cable.
3. Remove in the order indicated in the table.

1	Fuel injector connectors
2	Plastic fuel hose (See 01–14A–24 Plastic Fuel Hose Removal Note) (See 01–14A–26 Plastic Fuel Hose Installation Note)
3	Fuel distributor
4	Fuel injector (See 01–14A–25 Fuel Injector Removal Note) (See 01–14A–27 Fuel Injector Installation Note)

4. Install in the reverse order of removal.
5. Complete the "AFTER REPAIR PROCEDURE". (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)



D6U114ZW7005

Plastic Fuel Hose Removal Note

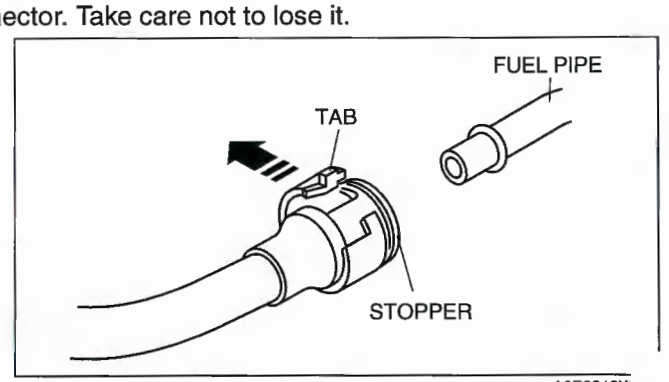
Caution

- **The quick release connector may be damaged if the tab is bent excessively. Do not expand the tab over the stopper.**

1. Disconnect the quick release connector.
   (1) Push the tab on the locking coupler **90°** until it stops.
   (2) Pull the fuel hose straight back.

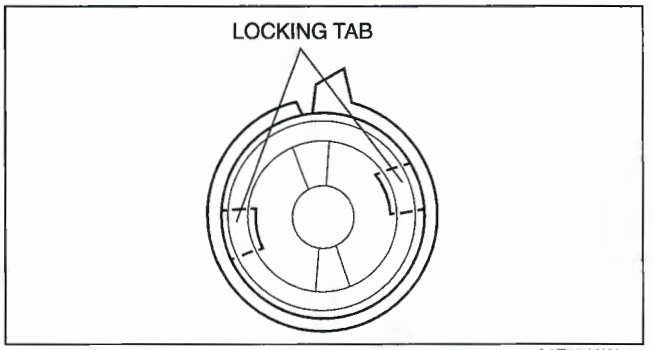
Note

- The stopper may be removed from the quick connector. Take care not to lose it. Reinstall it to the quick release connector before reconnecting the fuel line.



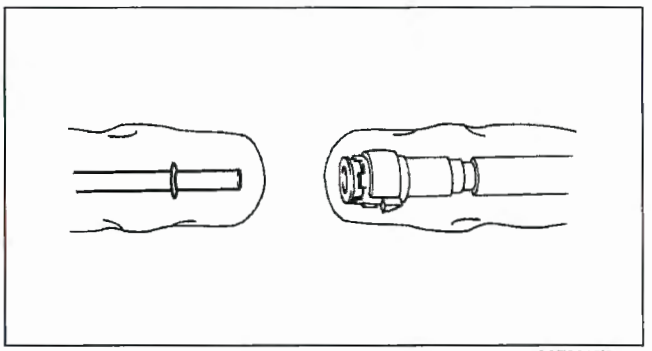
A6E3912W

- The locking coupler has two internal locking tabs which retain the fuel pipe. Be sure that the tab on the locking coupler is rotated until it stops to release two internal locking tabs.



A6E3912W002

2. Cover the disconnected quick release connector and fuel pipe with vinyl sheets or the like to prevent them from being scratched or contaminated with foreign material.



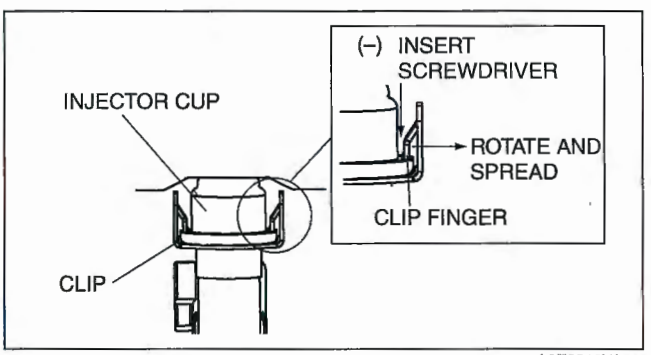
A6E3912W039

Fuel Injector Removal Note

Caution

- **Use of a deformed injector retaining clip will cause the injector to not engage correctly. Always use a new clip when reattaching the injector, otherwise it may cause the injector to rotate.**

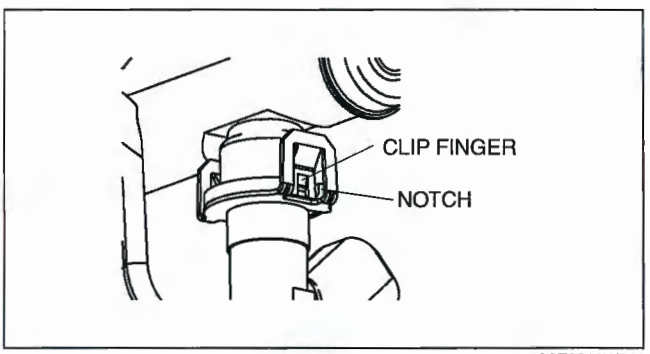
1. Insert a screwdriver between the injector cup and the clip fingers.



A6E3912W040

Note

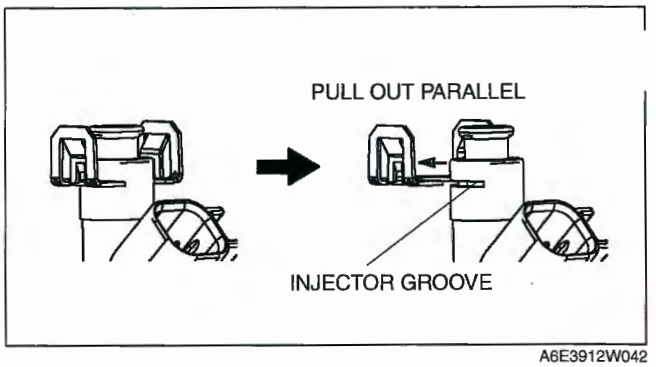
- When rotating the screwdriver to spread the clip fingers, bend them sufficiently to make sure they release from the notched edge of the injector cup.



A6E3912W041

2. Rotate the screwdriver to spread the clip fingers and remove them from the injector cup.
3. Pull the injector and clip out of the rail.

4. Remove the clip from the injector according to the following steps:
   (1) Grasp the clip with a pair of pliers.
   (2) Pull the clip parallel to the injector groove, and remove it from the injector.
   (3) Discard the clip.

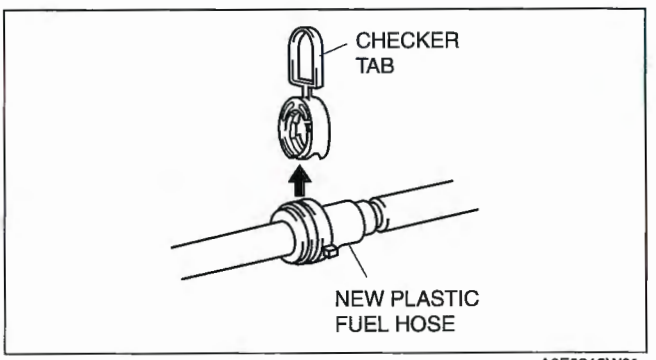


A6E3912W042

Plastic Fuel Hose Installation Note

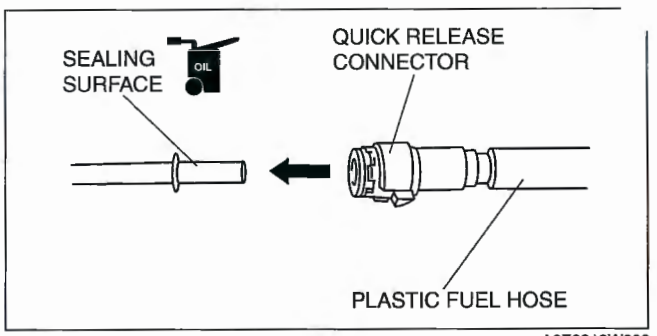
Note
- A checker tab is integrated with quick release connector for new plastic fuel hoses. The checker tab will be released from the quick release connector after it is completely engaged with the fuel pipe.

1. Inspect the fuel pump unit sealing surface for damage and deformation, and replace if necessary.
   - If the quick release connector O-ring is damaged, replace the plastic fuel hose.



A6E3912W0

2. Slightly apply clean engine oil to the sealing surface of the fuel pump unit.
3. Align the fuel pipe on the fuel pump unit and quick release connector so that the tabs of the retainer are correctly fitted into the quick release connector. Push the quick release connector straight into the retainer until a click is heard.
4. Lightly pull and push the quick release connector a few times by hand and verify that it can move **2.0—3.0 mm {0.08—0.11 in}** and it is connected securely.
   - If the quick release connector does not move at all, verify that O-ring is not damaged and slipped, and reconnect the quick release connector.



A6E3912W006

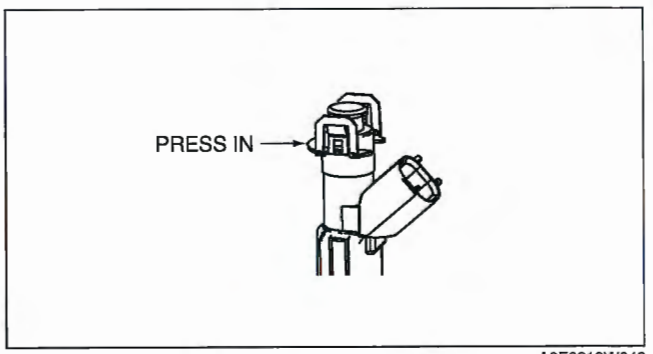
Fuel Injector Installation Note

1. Lightly lubricate the injector groove and O-ring.
2. Pre-attach a new clip in the injector groove.

Note

- When the clip is attached correctly, the central area of the injector and the clip finger positions are aligned.

3. Hold the injector firmly, and press the clip into the injector until the clip stops sliding.
4. Verify that the injector connector position is correct, and press the injector and clip into the injector cup. Continue pressing until the clip contacts the lower surface of the injector cup.
5. Verify that the injector and clip are correctly attached with the clip locked onto the injector cup notch.



A6E3912W043

FUEL INJECTOR REMOVAL/INSTALLATION [AJ]

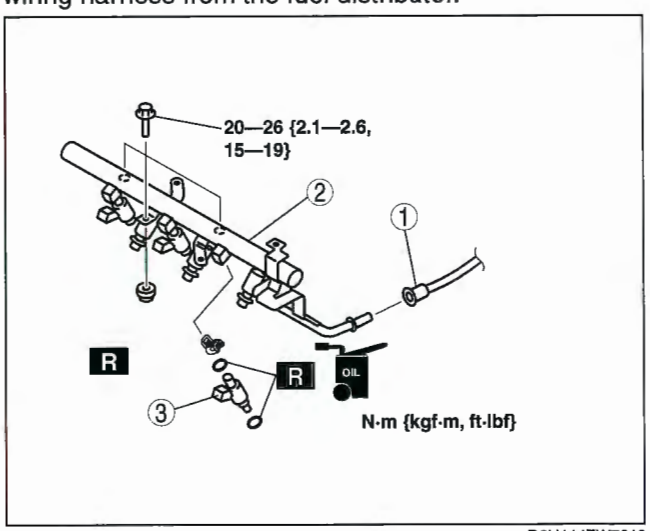
E6U011413250W02

1. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)
2. Disconnect the negative battery cable.
3. Remove the dynamic chamber. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
4. Disconnect the fuel injector connectors and remove the wiring harness from the fuel distributor.
5. Remove in the order indicated in the table.

1	Plastic fuel hose (See 01–14A–28 Plastic Fuel Hose Removal Note) (See 01–14A–29 Plastic Fuel Hose Installation Note)
2	Fuel distributor
3	Fuel injector (See 01–14A–29 Fuel Injector Installation Note)

Caution

- **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using a cloth or soft brush, and make sure that it is free of foreign material.**



D6U114ZW7010

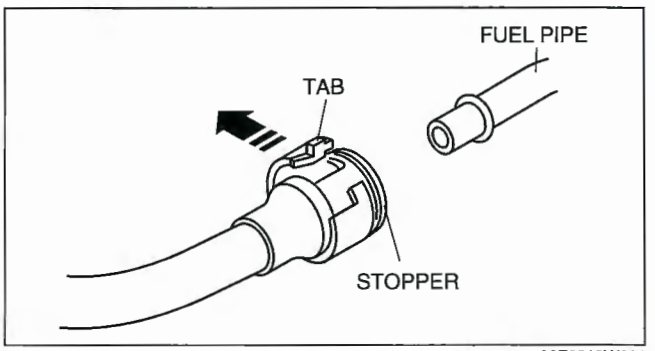
6. Install in the reverse order of removal.
7. Complete the "AFTER REPAIR PROCEDURE". (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)

Plastic Fuel Hose Removal Note

Caution
- **The quick release connector may be damaged if the tab is bent excessively. Do not expand the tab over the stopper.**

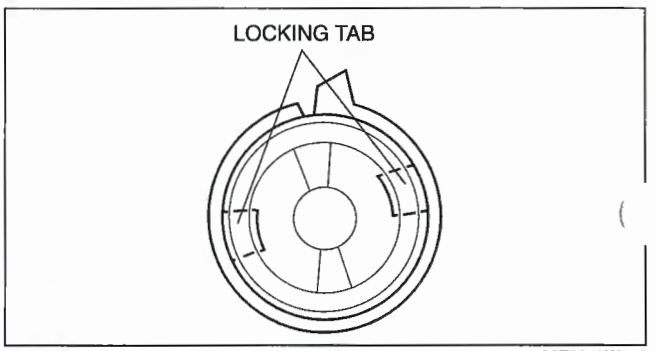
1. Disconnect the quick release connector.
   (1) Push the tab on the locking coupler **90°** until it stops.
   (2) Pull the fuel hose straight back.

Note
- The stopper may be removed from the quick connector. Take care not to lose it. Reinstall it to the quick release connector before reconnecting the fuel line.



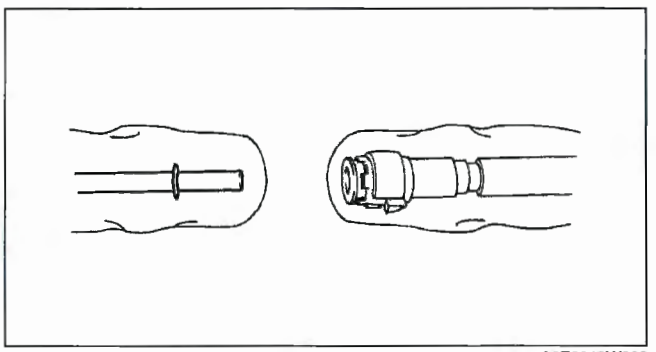
A6E3912W001

- The locking coupler has two internal locking tabs which retain the fuel pipe. Be sure that the tab on the locking coupler is rotated until it stops to release two internal locking tabs.



A6E3912W002

2. Cover the disconnected quick release connector and fuel pipe with vinyl sheets or the like to prevent them from being scratched or contaminated with foreign material.



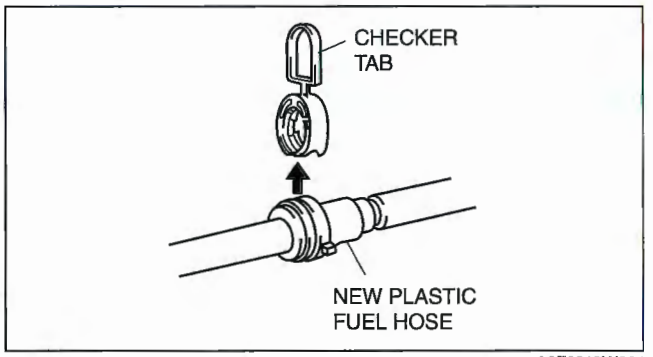
A6E3912W039

Plastic Fuel Hose Installation Note

Note

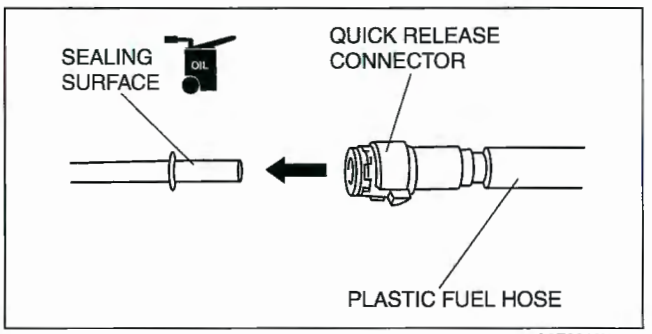
- A checker tab is integrated with quick release connector for new plastic fuel hoses. The checker tab will be released from the quick release connector after it is completely engaged with the fuel pipe.

1. Inspect the fuel pump unit sealing surface for damage and deformation, and replace if necessary.
   - If the quick release connector O-ring is damaged, replace the plastic fuel hose.



A6E3912W004

2. Slightly apply clean engine oil to the sealing surface of the fuel pump unit.
3. Align the fuel pipe on the fuel pump unit and quick release connector so that the tabs of the retainer are correctly fitted into the quick release connector. Push the quick release connector straight into the retainer until a click is heard.
4. Lightly pull and push the quick release connector a few times by hand and verify that it can move **2.0—3.0 mm {0.08—0.11 in}** and it is connected securely.
   - If the quick release connector does not move at all, verify that O-ring is not damaged and slipped, and reconnect the quick release connector.



A6E3912W006

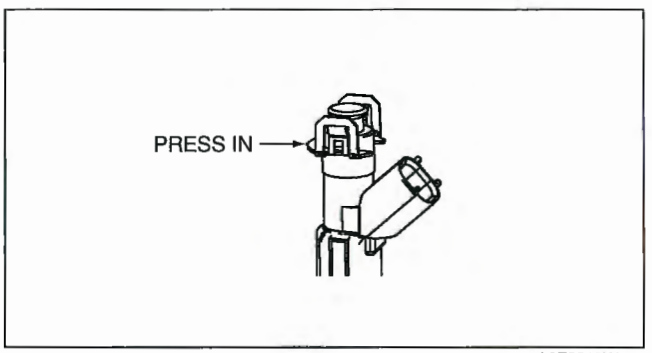
Fuel Injector Installation Note

1. Lightly lubricate the injector groove and O-ring.
2. Pre-attach a new clip in the injector groove.

Note

- When the clip is attached correctly, the central area of the injector and the clip finger positions are aligned.

3. Hold the injector firmly, and press the clip into the injector until the clip stops sliding.
4. Verify that the injector connector position is correct, and press the injector and clip into the injector cup. Continue pressing until the clip contacts the lower surface of the injector cup.
5. Verify that the injector and clip are correctly attached with the clip locked onto the injector cup notch.



A6E3912W043

FUEL INJECTOR INSPECTION [L3]

E6U011413250W03

Operation Test

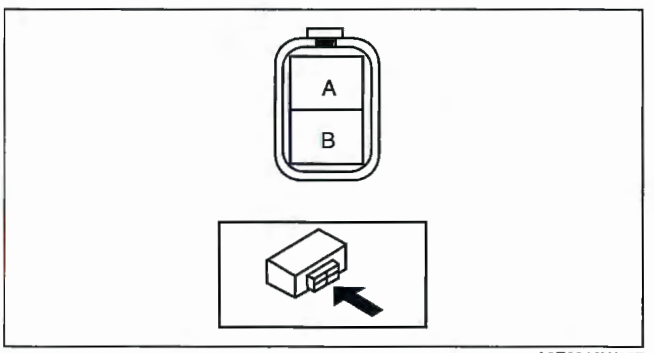
1. Carry out the "Fuel Injector Operation Inspection". (See 01–03A–68 Fuel Injector Operation Inspection.)
   - If not as specified, perform the further inspection for the fuel injectors.

Resistance Inspection

Note
- Perform the following procedure only when directed.

1. Turn the ignition switch to LOCK position.
2. Disconnect the negative battery cable.
3. Disconnect the fuel injector connectors.
4. Measure the resistance of the fuel injector using an ohmmeter.
   - If not as specified, replace the fuel injector. (See 01–14A–24 FUEL INJECTOR REMOVAL/INSTALLATION [L3].)
   - If as specified but "Operation Test" is failed, carry out the "Circuit Open/Short Inspection". Inspect for open or short circuit.

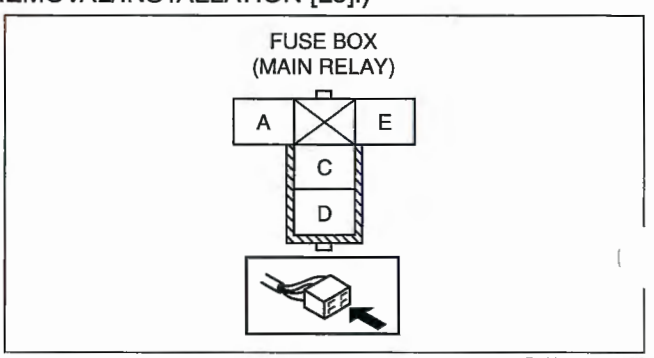
Fuel injector resistance
11.4—12.6 ohms [20 °C {68 °F}]



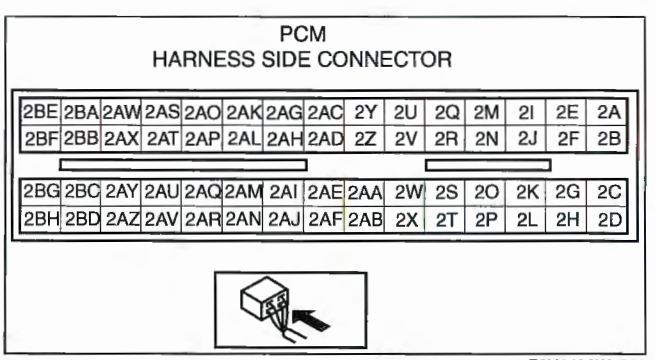
A6E3912W007

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harnesses for open or short circuit (continuity check).



D6U114ZW7100



E6U140AW5992

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring Except.
  - — No.1 cylinder fuel injector terminal B and PCM terminal 2BB
  - — No.2 cylinder fuel injector terminal B and PCM terminal 2BC
  - — No.3 cylinder fuel injector terminal B and PCM terminal 2BD
  - — No.4 cylinder fuel injector terminal B and PCM terminal 2AZ
  - — No.1 cylinder fuel injector terminal A and main relay terminal C through common connector
  - — No.2 cylinder fuel injector terminal A and main relay terminal C through common connector
  - — No.3 cylinder fuel injector terminal A and main relay terminal C through common connector
  - — No.4 cylinder fuel injector terminal A and main relay terminal C through common connector

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the harness.
  - — No.1 cylinder fuel injector terminal B and body GND
  - — No.2 cylinder fuel injector terminal B and body GND
  - — No.3 cylinder fuel injector terminal B and body GND
  - — No.4 cylinder fuel injector terminal B and body GND
  - — No.1 cylinder fuel injector terminal A and power supply
  - — No.2 cylinder fuel injector terminal A and power supply
  - — No.3 cylinder fuel injector terminal A and power supply
  - — No.4 cylinder fuel injector terminal A and power supply

Fuel Leakage Inspection

Warning

- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Always carry out the following procedure with the engine stopped.**

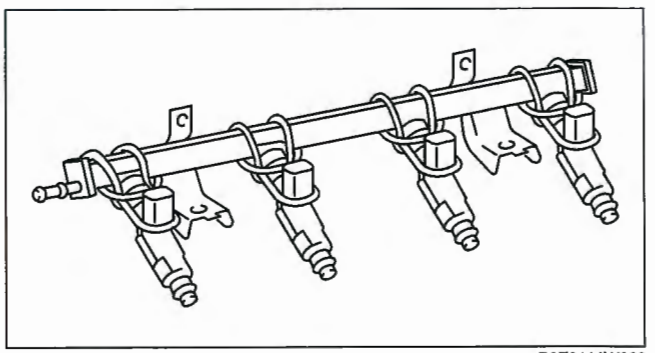
Note

- Perform the following procedure only when directed.

1. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)
2. Disconnect the negative battery cable.
3. Remove the fuel injectors together with the fuel distributor with the fuel hose connected. (See 01–14A–24 FUEL INJECTOR REMOVAL/INSTALLATION [L3].)
4. Fasten the fuel injectors firmly to the fuel distributor with wire.
5. Connect the negative battery cable.

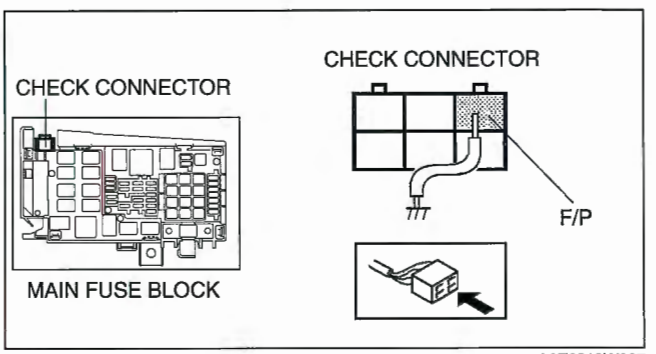
Caution

- **Connecting to the wrong check connector terminal may only to cause malfunction. Carefully connect the specified terminal.**



B3E0114W028

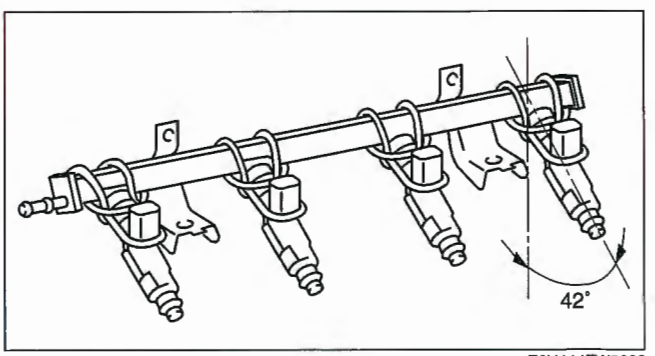
6. Short the check connector terminal F/P to body GND using a jumper wire.
7. Turn the ignition switch to ON position to operate the fuel pump.



A6E3912W037

8. Tilt the fuel injectors **approx. 42°.**
9. Verify that fuel leakage from the fuel injector nozzles is within the specification.
   - If not as specified, replace the fuel injector.

Fuel injector leakage amount
Less than 1 drop/2 min



E6U114ZW5200

10. Turn the ignition switch to LOCK position and remove the jumper wire.
11. Complete the "AFTER REPAIR PROCEDURE". (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)

Volume Inspection

Warning
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Always carry out the following procedure with the engine stopped.**

Note
- If there is an after market fuel injector tester, perform the following procedure.
- If there is no an aftermarket fuel injector tester, perform "Operation Test", "Resistance Inspection", and "Fuel Leakage Test" to verify the fuel injector is okay or not.

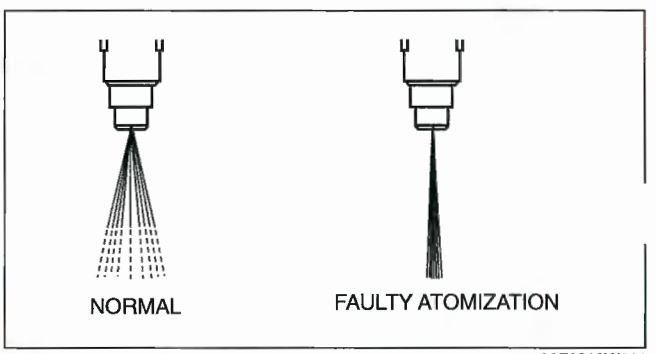
1. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)
2. Disconnect the negative battery cable.
3. Remove the fuel injectors. (See 01–14A–24 FUEL INJECTOR REMOVAL/INSTALLATION [L3].)
4. Connect the fuel injector to the fuel injector tester.
5. Measure the injection volume of each fuel injector using a graduated container.
   - If not as specified, replace the fuel injector.

Fuel injection volume
75—79 ml {75—79 cc, 2.54—2.67 fl oz}/15 s

6. Turn the ignition switch to the LOCK position and disconnect the jumper wire.
7. Complete the "AFTER REPAIR PROCEDURE". (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)

Atomization

1. Inspect atomization pattern.
   - If the atomization is faulty, replace the fuel injector.



A6E3912W011

FUEL INJECTOR INSPECTION [AJ]

E6U011413250W04

Operation Test

1. Carry out the "Fuel Injector Operation Inspection". (See 01–03C–67 Fuel Injector Operation Inspection.)
   - If not as specified, perform following inspections for the fuel injectors.

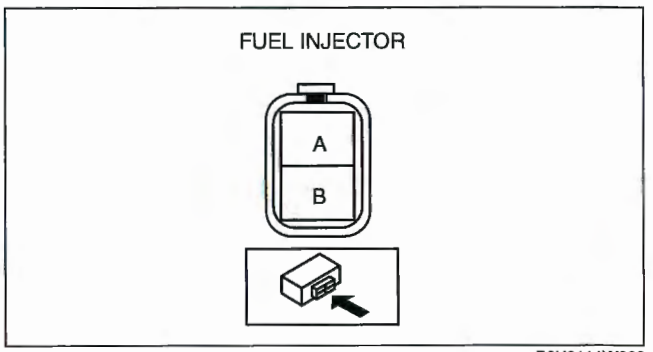
Resistance Inspection

Note
- Perform the following procedure only when directed.

1. Turn the ignition switch to the LOCK position.
2. Disconnect the negative battery cable.
3. Disconnect the fuel injector connectors.

4. Measure the resistance of the fuel injector using an ohmmeter.
   - If not as specified, replace the fuel injector. (See 01–14A–27 FUEL INJECTOR REMOVAL/INSTALLATION [AJ].)
   - If as specified but "Operation Test" is failed, carry out the "Circuit Open/Short Inspection". Inspect for open or short circuit.

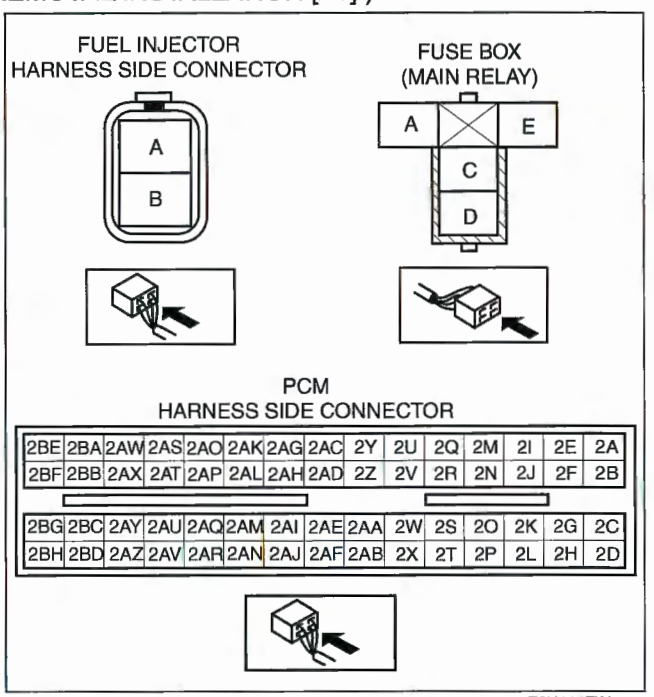
Fuel injector resistance
13.1—14.5 ohms [20 °C {68 °F}]



B6U0114W033

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following wiring harnesses for open or short circuit (continuity check).



E6U114ZW5201

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — No.1 cylinder fuel injector terminal 1 and PCM terminal 2I
  - — No.2 cylinder fuel injector terminal 1 and PCM terminal 2J
  - — No.3 cylinder fuel injector terminal 1 and PCM terminal 2K
  - — No.4 cylinder fuel injector terminal 1 and PCM terminal 2E
  - — No.5 cylinder fuel injector terminal 1 and PCM terminal 2F
  - — No.6 cylinder fuel injector terminal 1 and PCM terminal 2G
  - — No.1 cylinder fuel injector terminal 2 and main relay terminal C through common connector
  - — No.2 cylinder fuel injector terminal 2 and main relay terminal C through common connector
  - — No.3 cylinder fuel injector terminal 2 and main relay terminal C through common connector
  - — No.4 cylinder fuel injector terminal 2 and main relay terminal C through common connector
  - — No.5 cylinder fuel injector terminal 2 and main relay terminal C through common connector
  - — No.6 cylinder fuel injector terminal 2 and main relay terminal C through common connector

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — No.1 cylinder fuel injector terminal 1 and body GND
  - — No.2 cylinder fuel injector terminal 1 and body GND
  - — No.3 cylinder fuel injector terminal 1 and body GND
  - — No.4 cylinder fuel injector terminal 1 and body GND
  - — No.5 cylinder fuel injector terminal 1 and body GND
  - — No.6 cylinder fuel injector terminal 1 and body GND
  - — No.1 cylinder fuel injector terminal 2 and power supply
  - — No.2 cylinder fuel injector terminal 2 and power supply
  - — No.3 cylinder fuel injector terminal 2 and power supply
  - — No.4 cylinder fuel injector terminal 2 and power supply
  - — No.5 cylinder fuel injector terminal 2 and power supply
  - — No.6 cylinder fuel injector terminal 2 and power supply

. uel Leakage Test

Warning

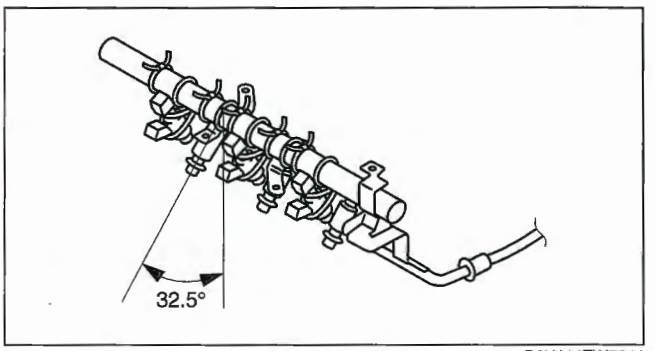
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and**

damage. Always carry out the following procedure with the engine stopped.

Note
- Perform the following test only when directed.

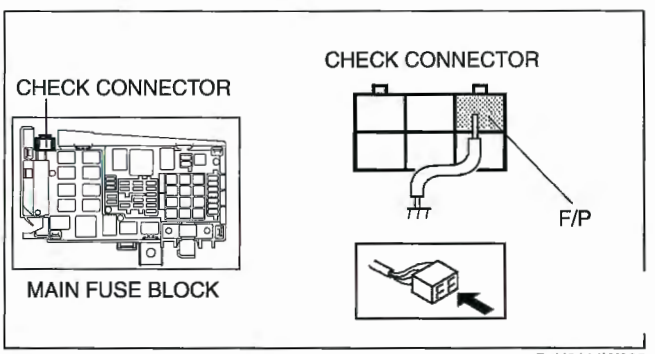
1. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)
2. Disconnect the negative battery cable.
3. Remove the fuel injectors together with the fuel distributor connected to fuel hose. (See 01–14A–27 FUEL INJECTOR REMOVAL/INSTALLATION [AJ].)
4. Fasten the fuel injectors firmly to the fuel distributor with wire.
5. Connect the negative battery cable.

Caution
- **Connecting to the wrong check connector terminal may cause a malfunction. Carefully connect only to the specified terminal.**



D6U114ZW7011

6. Short the check connector terminal F/P to body GND using a jumper wire.
7. Turn the ignition switch to the ON position to operate the fuel pump.

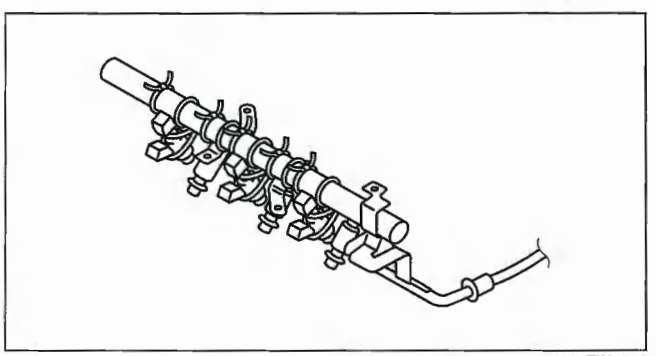


B6U0114W035

8. Tilt the fuel injectors **approx. 32.5°.**
9. Verify that fuel leakage from the fuel injector nozzles is within the specification.
   - If not as specified, replace the fuel injector.

Fuel injector leakage amount
Less than 1 drop/2 min

10. Turn the ignition switch to the LOCK position and remove the jumper wire.
11. Complete the "AFTER REPAIR PROCEDURE". (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)



D6U114ZW7012

Volume Test

Warning
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Always carry out the following procedure with the engine stopped.**

Note
- If there is an after market fuel injector tester, perform the following procedure.
- If there is no an aftermarket fuel injector tester, perform "Operation Test", "Resistance Inspection", and "Fuel Leakage Test" to verify the fuel injector is okay or not.

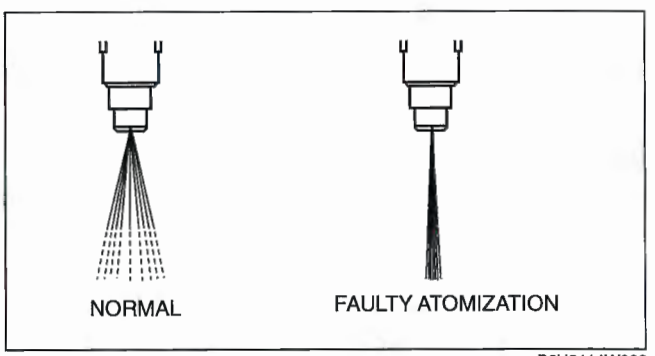
1. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14A–6 BEFORE REPAIR PROCEDURE [L3, AJ].)
2. Disconnect the negative battery cable.
3. Remove the fuel injectors. (See 01–14A–27 FUEL INJECTOR REMOVAL/INSTALLATION [AJ].)
4. Connect the fuel injector to the fuel injector tester.
5. Measure the injection volume of each fuel injector using a graduated container.
   - If not as specified, replace the fuel injector.

Fuel injection volume
44—58 ml {44—58 cc, 1.5—1.9 fl oz.}/15 s

6. Turn the ignition switch to the LOCK position and disconnect the jumper wire.
7. Complete the "AFTER REPAIR PROCEDURE". (See 01–14A–6 AFTER REPAIR PROCEDURE [L3, AJ].)

Atomization

1. Inspect atomization pattern.
   - If the atomization is faulty, replace the fuel injector.



B6U0114W036

PRESSURE REGULATOR INSPECTION [L3, AJ]

E6U011413280W01

Note
- Due to the adoption of the mechanical returnless fuel system, the pressure regulator cannot be inspected separately.

1. Perform "FUEL LINE PRESSURE INSPECTION". (See 01–14A–7 FUEL LINE PRESSURE INSPECTION [L3, AJ].)

01–14B FUEL SYSTEM [L3 WITH TC]

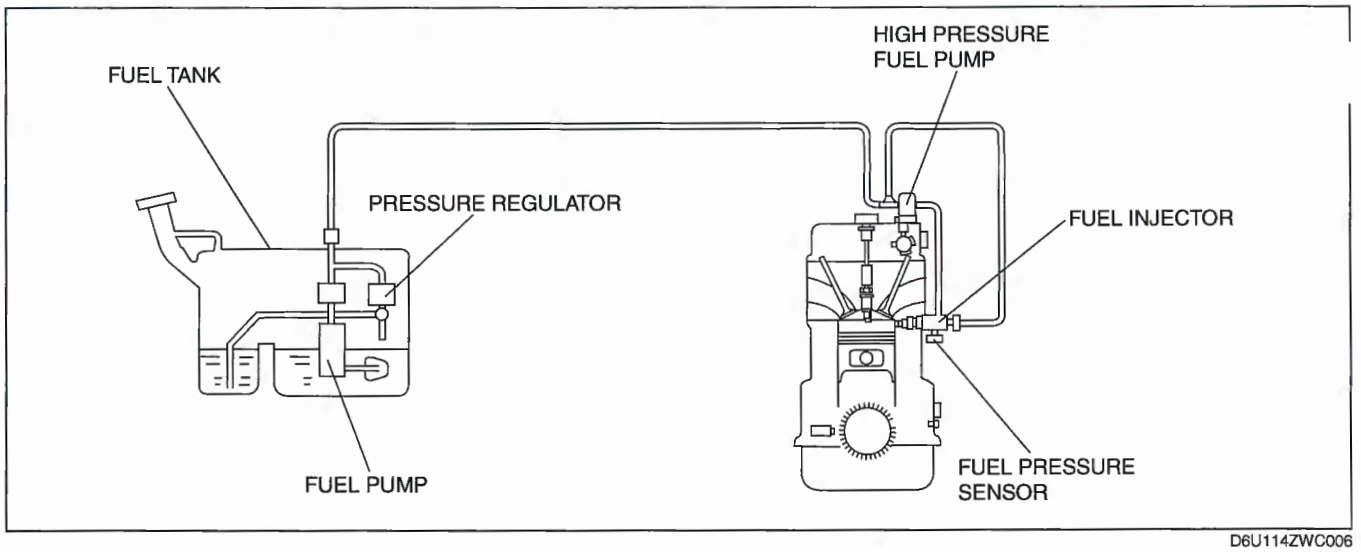
FUEL SYSTEM DIAGRAM [L3 WITH TC]

E6U011400000W07



D6U114ZWC006

BEFORE REPAIR PROCEDURE [L3 WITH TC]

E6U011400000W08

Warning

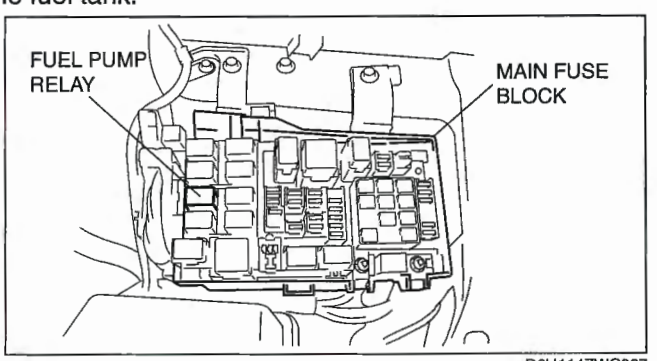
- **Fuel vapor is hazardous. It can easily ignite, causing serious injury and damage. Always keep sparks and flames away from fuel.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the following "Fuel Line Safety Procedure".**
- **A person charged with static electricity could cause a fire or explosion, resulting in death or serious injury. Before performing work on the fuel system, discharge static electricity by touchin the vehicle body.**

Fuel Line Safety Procedure

Note

- Fuel in the fuel system is under high pressure even when the engine is not running.

1. Remove the fuel-filler cap and release the pressure in the fuel tank.
2. Remove the fuel pump relay.
3. Start the engine.
4. After the engine stalls, crank the engine several times.
5. Turn the ignition switch to the LOCK position.
6. Install the fuel pump relay.



D6U114ZWC007

AFTER REPAIR PROCEDURE [L3 WITH TC]

E6U011400000W09

Warning

- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. When installing the fuel hose, perform "Fuel Leakage Inspection" described below.**

Fuel Leakage Inspection

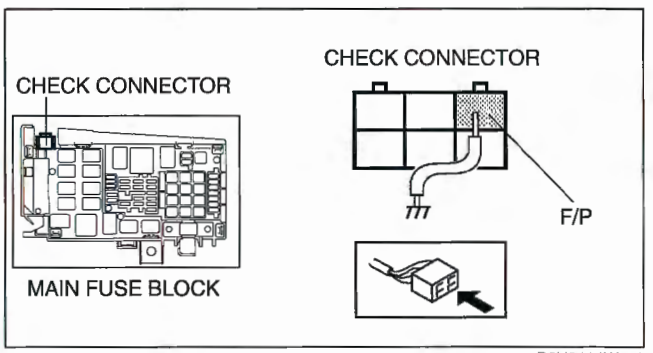
Warning

- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Always carry out the following procedure with the engine stopped.**

Caution

- **Connecting to the wrong check connector terminal may cause a malfunction. Carefully connect only to the specified terminal.**

1. Short the check connector terminal F/P to body ground using a jumper wire.
2. Turn the ignition switch to the ON position to operate the fuel pump.
3. Pressurize the system in this manner for **at least 5 min** to be sure there is no leakage.
   - If there is fuel leakage, inspect the fuel hoses, hose clamps, and fuel pipe sealing surface, and replace if necessary.
4. After repair, assemble the system and repeat Steps 1 to 3.



B6U0114W003

FUEL LINE PRESSURE INSPECTION [L3 WITH TC]

E6U011400000W10

Low Pressure Line (From the Fuel Tank to the High Pressure Fuel Pump)

Warning

- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death. Fuel can also irritate skin and eyes. To prevent this, always complete the "BEFORE REPAIR PROCEDURE". (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)**

Caution

- **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using cloth or soft brush, and make sure that it is free of foreign material.**

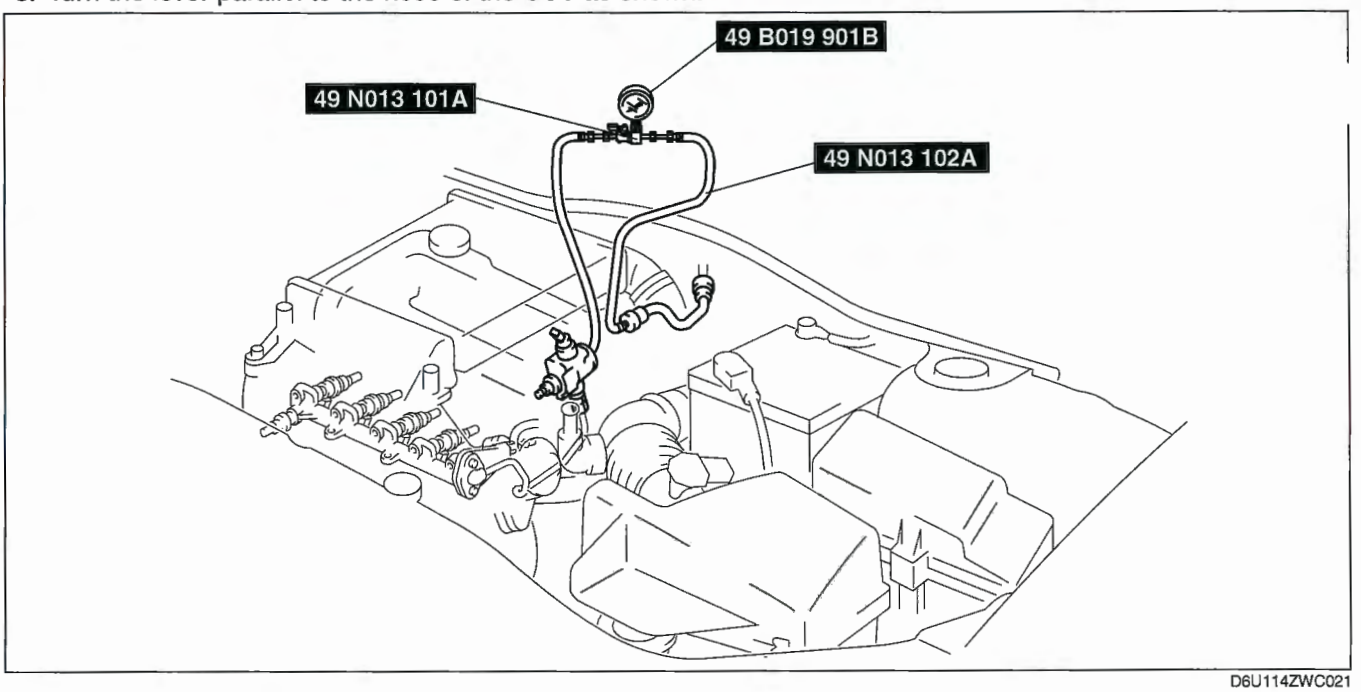
1. Complete the "BEFORE REPAIR PROCEDURE".
   (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC])
2. Disconnect the vacuum hose from the intake manifold that connecting to the brake booster.
3. Disconnect the negative battery cable.

Caution

- **The quick release connector may be damaged if the tab is turned too far. Do not turn the tab over the stopper.**

4. Disconnect the quick release connector from the fuel tank. (See 01–14B–21 QUICK RELEASE CONNECTOR REMOVAL/INSTALLATION [L3 WITH TC].)
5. Push the **SST** quick release connector into the fuel pipe and plastic fuel hose into the **SST** until a click is heard.

6. Turn the lever parallel to the hose of the **SST** as shown.



D6U114ZWC021

7. Connect the vacuum hose to the intake manifold that connecting to the brake booster.
8. Connect the negative battery cable.
9. Verify the vehicle's MTX is in neutral position.
10. Start the engine and let it idle. Measure the fuel line pressure.
    - If not as specified, inspect the following:

    Zero or low
    — FP circuit
    — FP
    — Fuel line (clogged)
    — Fuel leakage inside pressure regulator

    High
    — Pressure regulator for high pressure cause

Fuel line pressure
410—490 kPa {4.2—4.9 kgf/cm^2, 60—71 psi}

11. Turn the ignition switch to the LOCK position.
12. Measure the fuel hold pressure **after 5 min**.
    - If not as specified, inspect the following:
      — FP hold pressure
      — Fuel injector for leakage
      — Fuel line for improper routing, kinks or leakage

Fuel hold pressure
More than 230 kPa {2.3 kgf/cm^2, 33 psi}

13. Complete the "BEFORE REPAIR PROCEDURE".
    (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC])
14. Disconnect the vacuum hose from the intake manifold that connecting to the brake booster.
15. Disconnect the **SST**.
16. Connect the quick release connector. (See 01–14B–21 QUICK RELEASE CONNECTOR REMOVAL/INSTALLATION [L3 WITH TC].)

High Pressure Line (From the High Pressure Fuel Pump to the Fuel Injector)

1. Inspect the fuel pressure sensor. (See 01–40B–34 FUEL PRESSURE SENSOR REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the high pressure fuel pump. (See 01–14B–18 HIGH PRESSURE FUEL PUMP REMOVAL/INSTALLATION [L3 WITH TC].)

FUEL TANK REMOVAL/INSTALLATION [L3 WITH TC]

E6U011442110W02

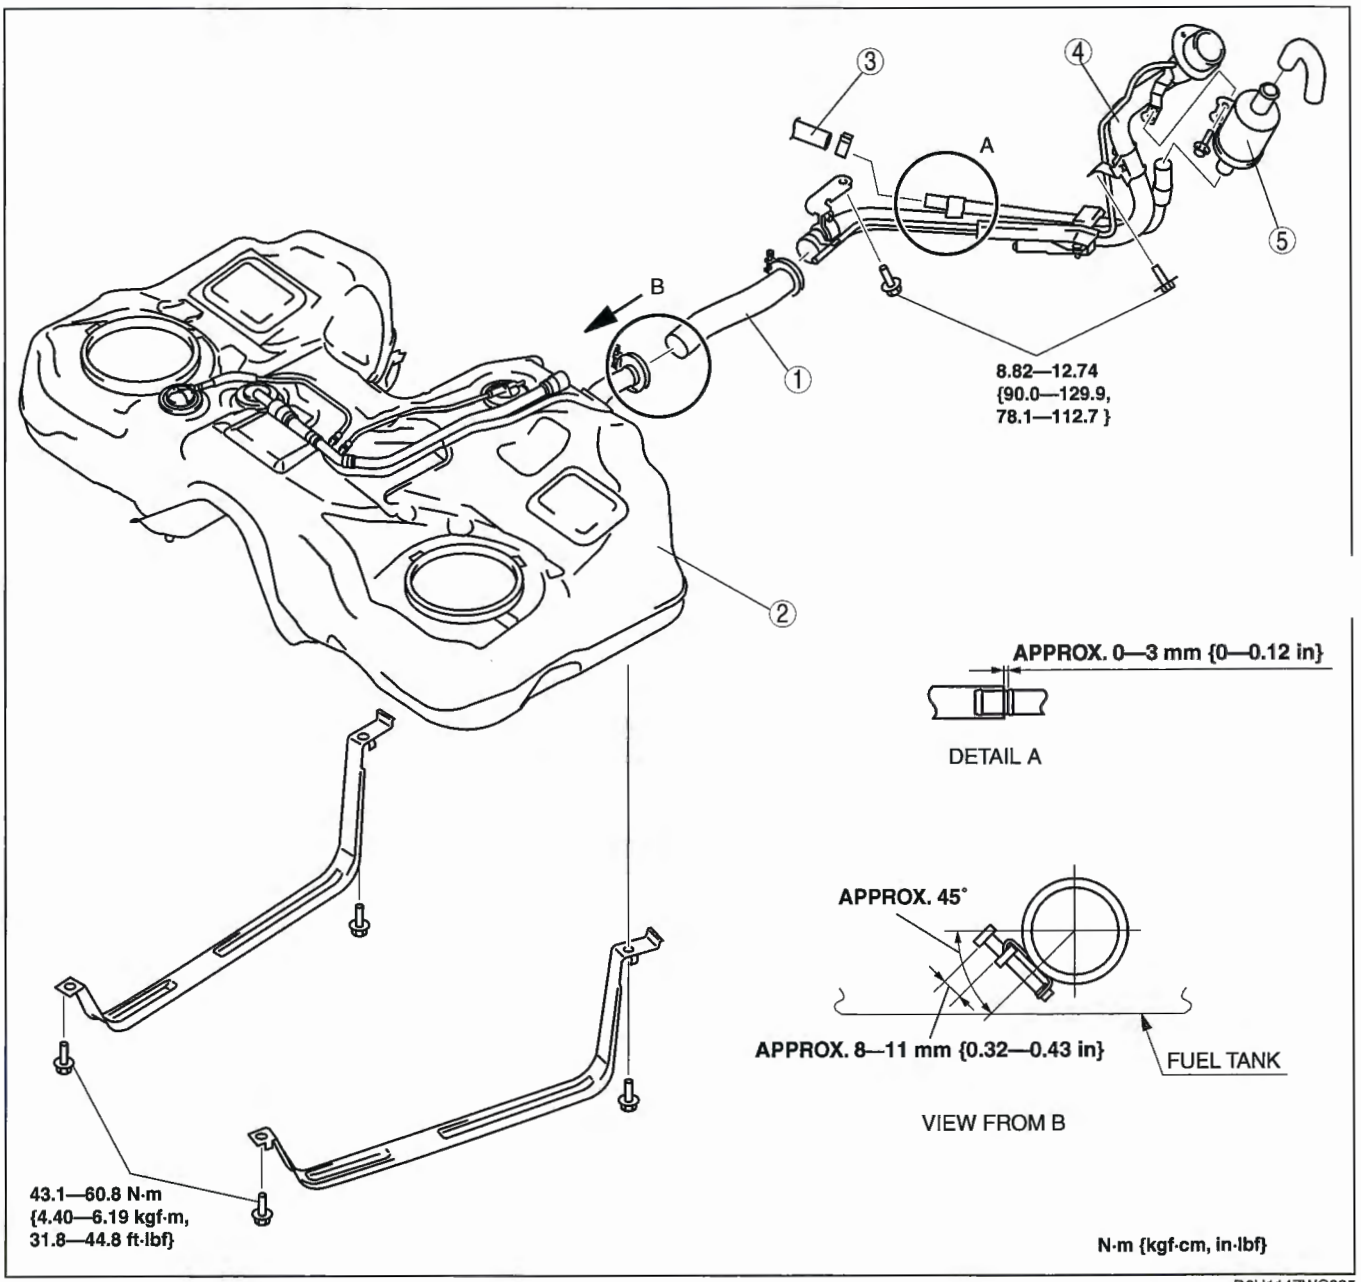
Warning

- **Repairing a fuel tank that has not been properly steam-cleaned can be dangerous. Explosion or fire may cause death or serious injury. Always properly steam clean a fuel tank before repairing it.**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, do not damage the sealing surface of the fuel pump unit when removing or installing.**
- **A person charged with static electricity could cause a fire or explosion, resulting in death or serious injury. Before draining fuel, make sure to discharge static electricity by touching the vehicle body.**

Caution

- **Disconnecting/connecting the quick release connector without cleaning it may cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using a cloth or soft brush, and make sure that it is free of foreign material.**

1. Level the vehicle.
2. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)
3. Remove the propeller shaft. (See 03–15–4 PROPELLER SHAFT REMOVAL/INSTALLATION.)
4. Remove the middle pipe. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
5. Disconnect the negative battery cable.
6. Remove the fuel pump unit. (See01–14B–9 FUEL PUMP UNIT REMOVAL/INSTALLATION [L3 WITH TC].)
7. Siphon the fuel from the fuel tank.
8. Remove in the order indicated in the table.
9. Install in the reverse order of removal.
10. Complete the "AFTER REPAIR PROCEDURE". (See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)



D6U114ZWC025

1	Joint hose
2	Fuel tank
3	Evaporative hose

4	Fuel-filler pipe
5	Air filter

FUEL SHUT-OFF/ROLLOVER VALVE INSPECTION [L3 WITH TC]

E6U011442990W02

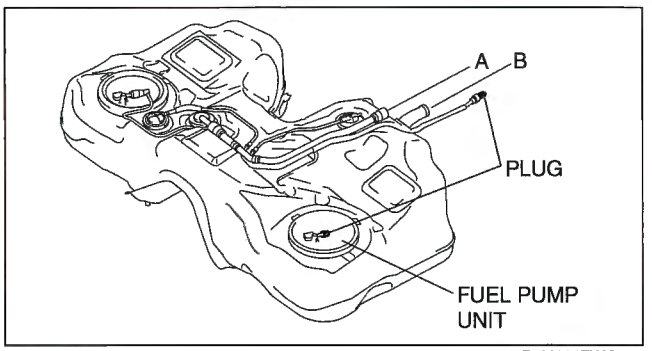
Caution

- **Disconnecting/connecting the quick release connector without cleaning it may cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using a cloth or soft brush, and make sure that it is free of foreign material.**

Note

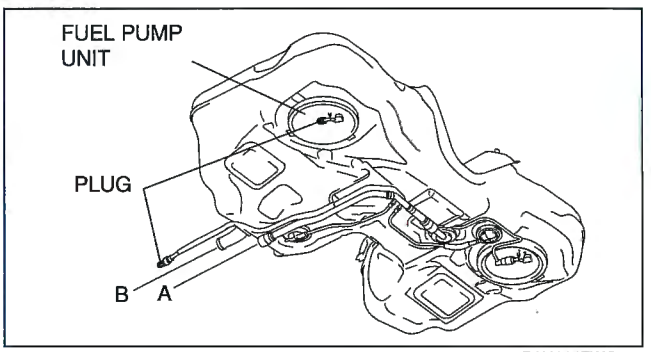
- This inspection is for fuel shut-off valve and two rollover valves integrated in the fuel tank.

1. Disconnect the plastic fuel hose and the fuel pump unit connector. (See 01–14B–9 FUEL PUMP UNIT REMOVAL/INSTALLATION [L3 WITH TC].)
2. Remove the fuel tank with the fuel pump unit. (See 01–14B–7 FUEL TANK REMOVAL/INSTALLATION [L3 WITH TC].)
3. Plug the port as shown in the figure.
4. Level the fuel tank.



D6U114ZWC026

5. Blow through port B and verify that there is airflow from port A.
   - If there is no airflow, replace the fuel tank.
   - If there is airflow, turn the fuel tank upside down, and proceed to Step 6.
6. Blow through port B and verify that there is no airflow from port A.
   - If there is airflow, replace the fuel tank.



D6U114ZWC027

FUEL PUMP UNIT REMOVAL/INSTALLATION [L3 WITH TC]

E6U011413350W04

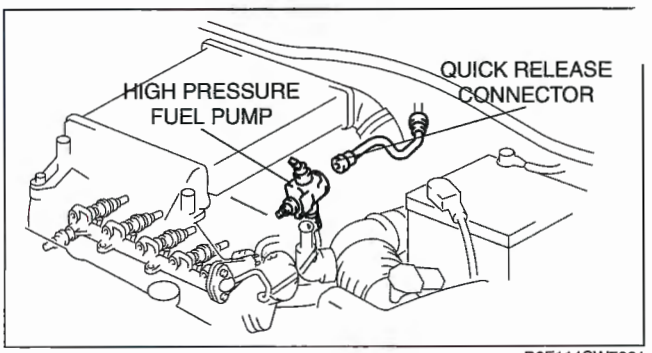
Warning

- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure".**
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, before performing the fuel pump unit removal/installation, always complete the "Fuel Leak Inspection After Fuel Pump Unit Installation".**
- **A person charged with static electricity could cause a fire or explosion, resulting in death or serious injury. Before draining fuel, make sure to discharge static electricity by touching the vehicle body.**

Caution

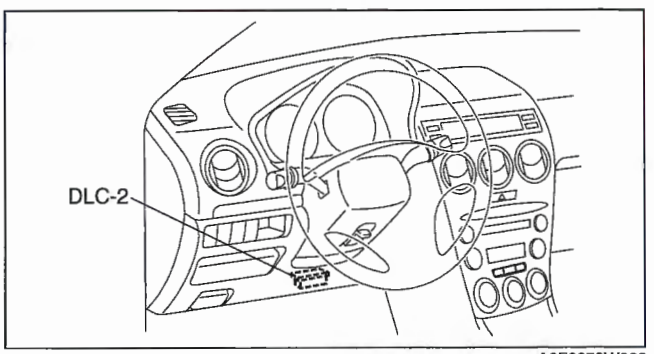
- **Because the fuel tank is constructed such that the fuel level is higher than the installation surface of the fuel pump, fuel leakage could occur. If the fuel gauge indicates a fuel level of half or more, perform the following Steps 1-6 to drain the fuel.**
- **Disconnecting/connecting the quick release connector without cleaning it may possibly cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using a cloth or soft brush, and make sure that it is free of foreign material.**
- **To prevent the SST from coming off the fuel pump cap while performing the work, always perform the removal/installation procedure with 2 people. One person presses the SST against cap from directly above, while the other person rotates the SST.**

1. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)
2. Remove the plug hole plate.
3. Disconnect the quick release connector connected to the high pressure fuel pump.
4. Connect a long hose to the disconnected quick release connector and drain the fuel into a container used for collecting gasoline.



D6E114CW7001

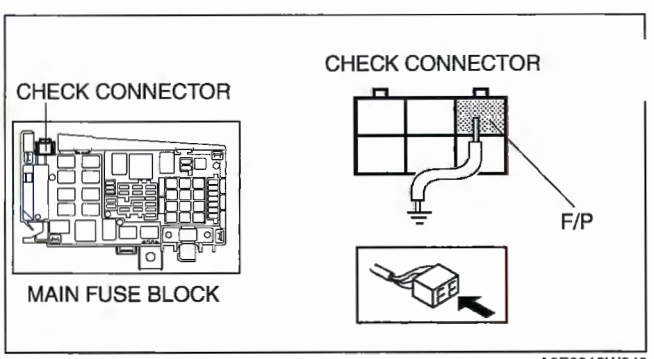
5. Start the fuel pump using the following procedure.
   Using WDS or equivalent
   1. Connect the WDS or equivalent to the DLC-2.
   2. Using the simulation function "FP", start the fuel pump.



A6E3970W002

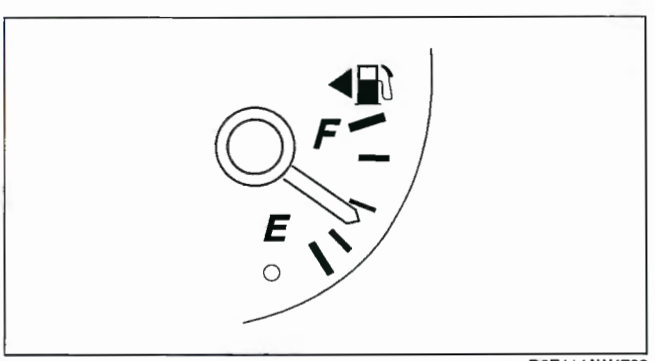
   Without using WDS or equivalent
   1. Short the check connector terminal F/P to body GND using a jumper wire.
   2. Turn the ignition switch to ON position to operate the fuel pump.

   Caution
   - **The fuel pump could be damaged if it is operated (fuel pump idling) while there is no fuel in the fuel tank. Verify the amount of fuel being discharged from the hose and stop operation of the fuel pump when essentially no fuel is being discharged.**



A6E3912W049

   Note
   - If the fuel tank is full, drain **approx. 40 L {10.6 US gal, 8.8 Imp gal}** of fuel until the fuel gauge indicates **approx. 3/8** of a tank.



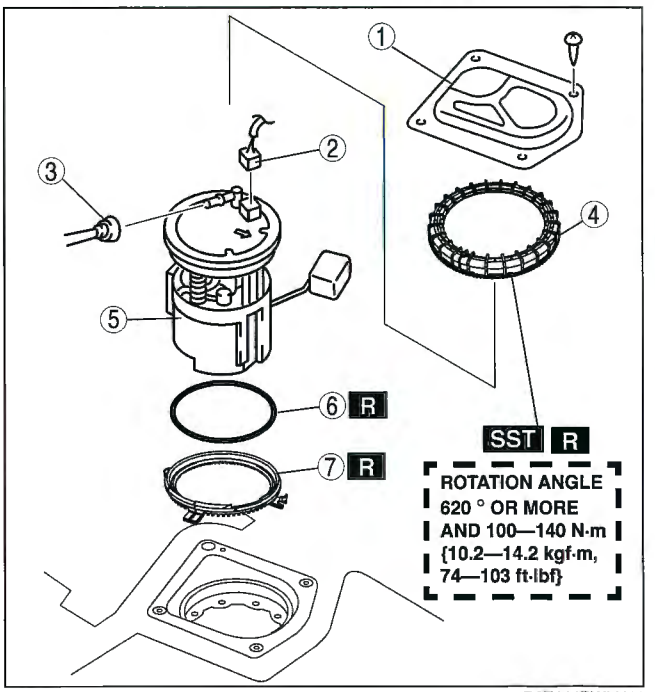
D6E114AW4702

6. When essentially no fuel is being discharged, stop the fuel pump.
   Using WDS or equivalent
   1. Using the simulation function "FP", stop the fuel pump.
   Without using WDS or equivalent
   1. Turn the ignition switch to LOCK position to stop the fuel pump.
   2. Disconnect the jumper wire from the check connector.
7. Disconnect the negative battery cable.
8. Complete the following in order to the work area.
   (1) Loosen the bolt of the fuel tank strap.
   (2) Lower the fuel tank to a position where the **SST** can be attached from the service hole cover.
9. Remove the rear seat cushion.

10. Remove in the order indicated in the table.

1	Service hole cover
2	Connector
3	Plastic fuel hose (See 01–14B–21 QUICK RELEASE CONNECTOR REMOVAL/INSTALLATION [L3 WITH TC])
4	Fuel pump cap (See 01–14B–11 Fuel Pump Cap Removal Note) (See 01–14B–12 Fuel Pump Cap Installation Note)
5	Fuel pump unit
6	Packing
7	Retainer (See 01–14B–12 Fuel Pump Cap Installation Note)

11. Install in the reverse order of removal.
12. Complete the "AFTER REPAIR PROCEDURE". (See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)



D6E114BWLH01

Plastic Fuel Hose Removal Note

Caution
- **The quick release connector may be damaged if the tab is bent excessively. Do not expand the tab over the stopper.**

1. Disconnect the quick release connector. (See 01–14B–21 QUICK RELEASE CONNECTOR REMOVAL/INSTALLATION [L3 WITH TC].)
2. Cover the disconnected quick release connector and fuel pipe with vinyl sheets or the like to prevent them from being scratched or contaminated with foreign material.

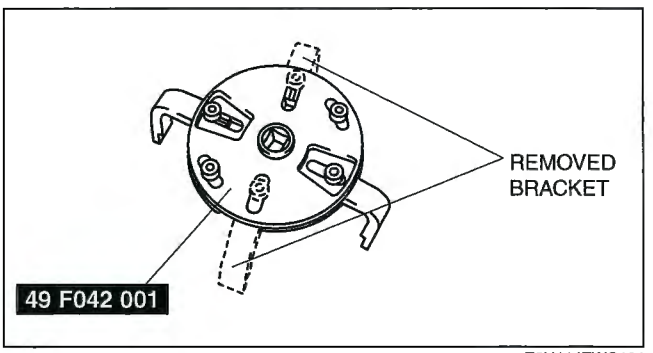
Fuel Pump Cap Removal Note

Note
- Do not remove the fuel tank strap.

1. Loosen the fuel tank strap installation bolts and lower the fuel tank so that the **SST** can be set.

Caution
- **The cap could be damaged if the SST is used with any play between the cap and the SST. Securely attach the SST so that there is no gap between the SST tabs and the side of the cap.**

2. Remove the fuel pump cap using the **SST** with two of the four brackets removed.



E6U114ZWC101

Fuel Pump Cap Installation Note

Warning
- **Make sure there is no foreign material on each of the parts. If there is foreign material on the parts the fuel pump unit cannot be assembled correctly, which could result in fuel leakage.**

Note
- The fuel pump unit will rotate and cannot be secured in the specified position if there is any gasoline on the gasket. Thoroughly wipe away all gasoline from the gasket.

1. Replace the packing, fuel pump cap and the retainer with new parts.

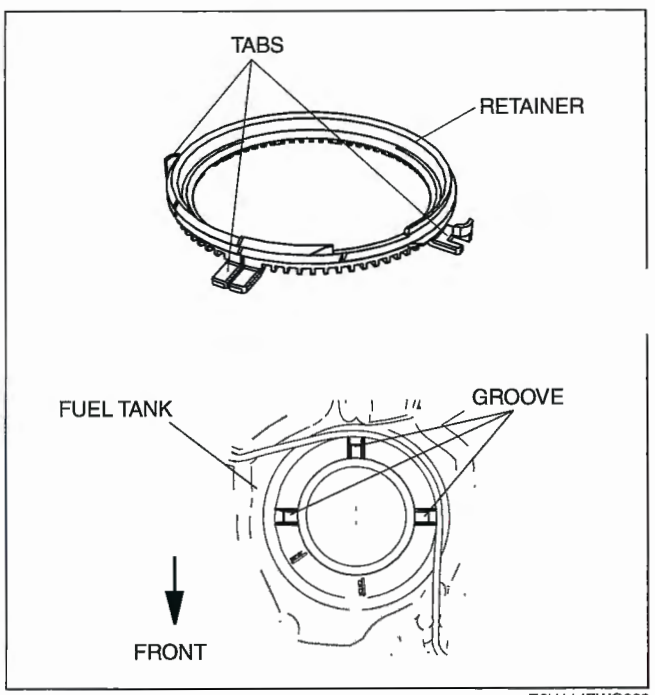
Caution
- **New parts can deform depending on the temperature. If the parts deform, the fuel pump unit cannot be assembled correctly, which could result in fuel leakage. Therefore, keep new parts at room temperature for the specified period of time to stabilize the shape.**

2. Leave new parts inside for the following period of time:

Stand-by time
12 h or more

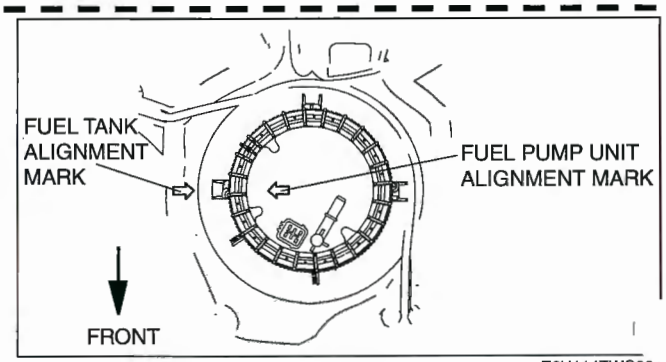
3. Install a new retainer to the fuel tank.
   (1) Align the retainer tabs (3 locations) with the fuel tank grooves.
   (2) Verify that the tabs are inserted into the grooves and the retainer is installed correctly.
   (3) Verify the retainer is not damaged.
4. Install a new packing to the fuel tank.
   (1) Verify the packing groove is clean and free of foreign material.
   (2) Install the packing to the fuel tank so that it is inserted into the fuel tank grooves.

Caution
- **Install the fuel pump unit to the fuel tank being careful not to bend the fuel sender unit arm. If the arm is bent, the fuel sender unit will not operate correctly.**



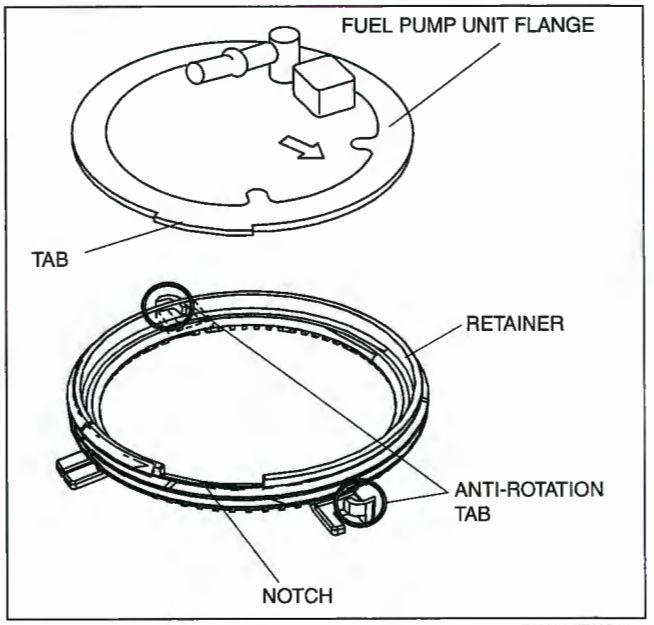
E6U114ZWC003

5. Install the fuel pump unit to the fuel tank.
   (1) Align the fuel tank and fuel pump unit alignment marks as shown in the figure.



E6U114ZWC004

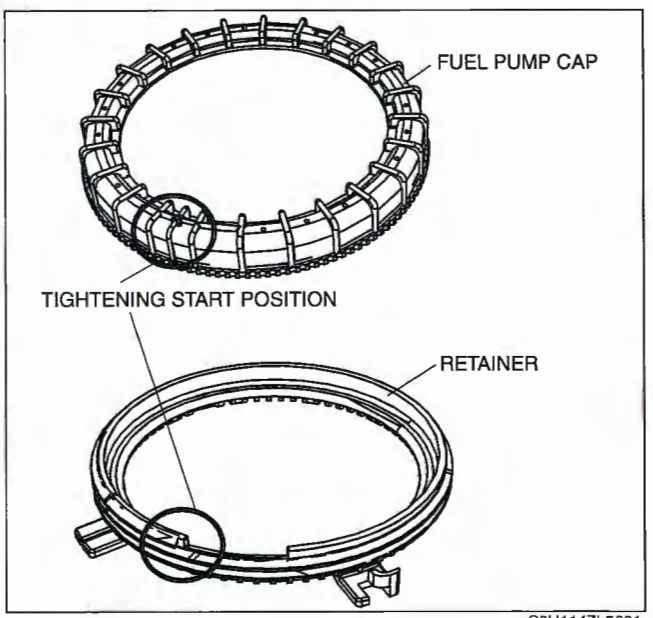
(2) Verify the tab on the fuel pump unit flange with the notch on the retainer.



E6U114ZWC005

6. Set on a new fuel pump cap.
(1) Apply downward force (push down) on the center of the fuel pump unit flange.

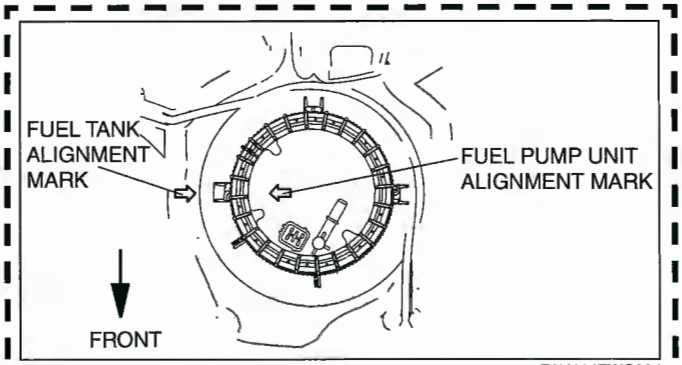
Note
- Align the fuel pump cap with the tightening start position of the retainer and tighten the fuel pump cap with the start position as **0** °.
- The fuel pump cap tightening start position is the position where the spaces between the ribs become narrow. The retainer tightening start position is the notch position.



C3U114ZL5001

(2) Align the tightening start position on the fuel pump cap and the tightening start point of the retainer.

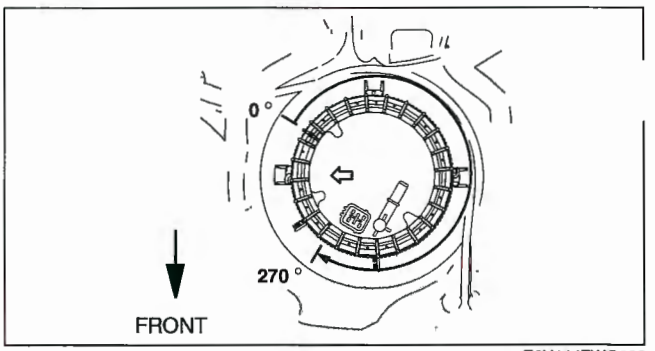
Warning
- **No grease or lubrication allowed on parts during installation. Parts could slide or they cannot be tightened to the specified torque. As a result, fuel leakage could occur.**
- **When tightening the fuel pump cap, be careful that the fuel tank and fuel pump unit alignment marks have not deviated. If there is deviation, the fuel pump unit cannot be installed correctly, which could result in fuel leakage.**



E6U114ZWC004

7. Tighten the fuel pump cap.
   (1) Tighten the fuel pump cap by hand to the specified angle or more until the flange is fixed.

Fuel pump cap rotation angle
270 ° or more



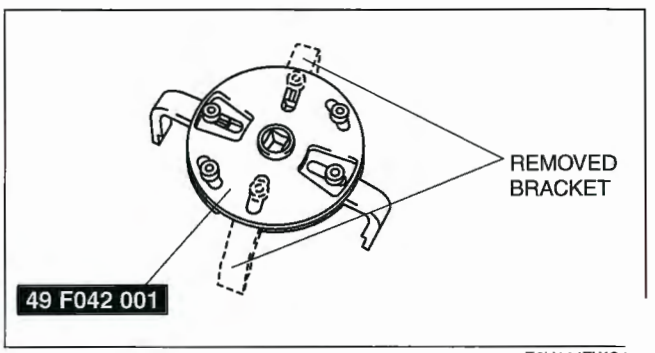
E6U114ZWC006

   (2) Verify that the fuel pump cap is tightened correctly.
      1) The gap between the bottom of the fuel pump cap and the tank surface is even all around.
         - If the fuel pump cap is not tightened uniformly, loosen it by hand and re-install it.

Caution
- **The cap could be damaged if the SST is used with any play between the cap and the SST. Securely attach the SST so that there is no gap between the SST tabs and the side of the cap.**

   (3) Install the **SST** with two of the four brackets removed.

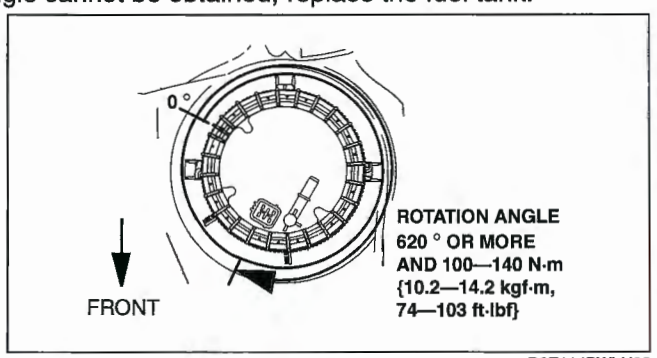
Note
- The fuel pump cap rotation angle is the angle from the **0** ° position. The angle tightened to using the **SST** includes the angle tightened by hand.



E6U114ZWC10

   (4) Tighten the fuel pump cap to the specified torque and to the specified angle or more.
      - If the specified tightening torque and rotation angle cannot be obtained, replace the fuel tank.

Fuel pump cap rotation angle
620 ° or more
Fuel pump cap tightening torque
100—140 N·m {10.2—14.2 kgf·m, 74—103 ft·lbf}



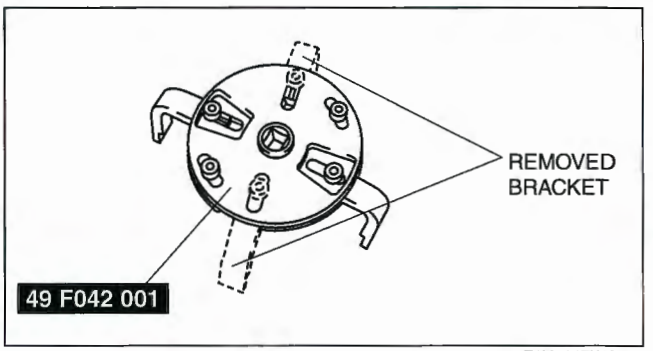
D6E114BWLH02

   (5) Verify that the fuel pump cap is tightened correctly.
      1) The gap between the top of the fuel pump unit flange and the fuel pump cap is even all around.
         - If it is not tightened uniformly, re-install it using the following procedure.
      2) The gap between the fuel pump unit and fuel tank is even all around.
         - If it is not tightened uniformly, re-install it using the following procedure.
      3) Verify that the fuel tank and fuel pump unit alignment marks are aligned.
         - If they are not aligned, re-install it using the following procedure.

Caution
- **The cap could be damaged if the SST is used with any play between the cap and the SST. Securely attach the SST so that there is no gap between the SST tabs and the side of the cap.**

8. Install the **SST** with two of the four brackets removed.
9. Remove the fuel pump cap, fuel pump unit, packing, and retainer.
10. Verify that the retainer is not damaged.
    - If both of the retainer anti-rotation tabs are broken, replace it with new one.
11. Return to Step 2 and re-install.
12. Tighten the fuel tank strap bolts.

Tightening torque
43.1—60.8 N·m {4.40—6.19 kgf·m, 31.8—44.8 ft·lbf}



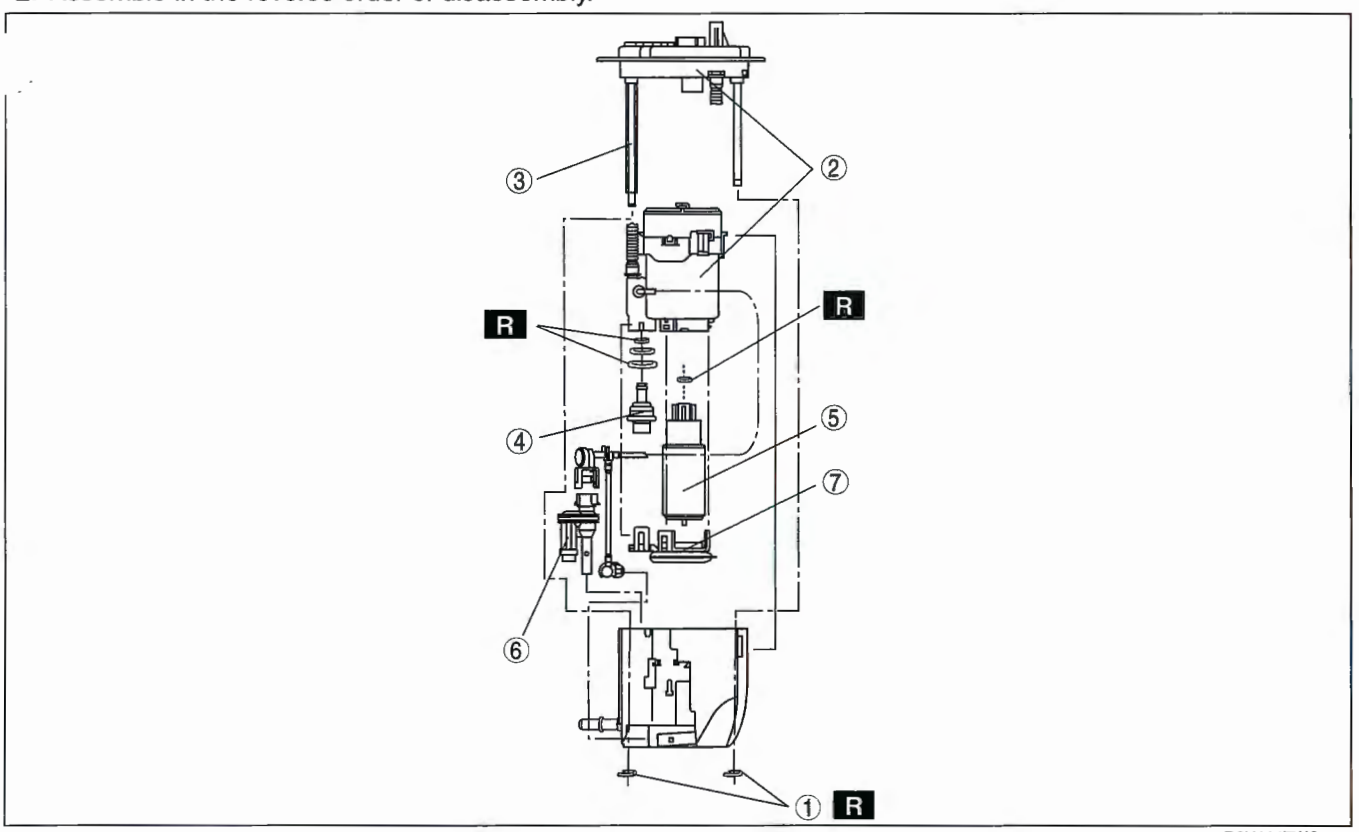
E6U114ZWC101

FUEL PUMP UNIT DISASSEMBLY/ASSEMBLY [L3 WITH TC]

E6U011413350W05

Warning
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Fuel can also irritate skin and eyes. To prevent this, do not damage the sealing surface of the fuel pump unit when removing or installing.**

1. Disassemble in the order indicated in the table.
2. Assemble in the reverse order of disassembly.



D6U114ZWC100

1	E-ring
2	Fuel filter body
3	Spring
4	Fuel pressure regulator

5	Fuel pump
6	Transfer
7	Filter

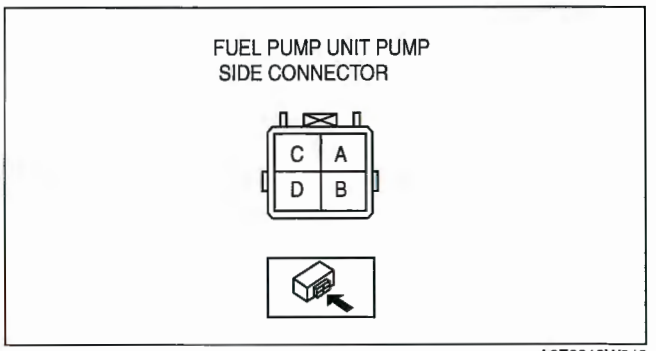
FUEL PUMP UNIT INSPECTION [L3 WITH TC]

E6U011413350W06

Continuity Inspection

Note
- Perform the following test only when directed.

1. Disconnect the negative battery cable.
2. Remove the service hole cover. (See 01–14B–9 FUEL PUMP UNIT REMOVAL/INSTALLATION [L3 WITH TC].)
3. Disconnect the fuel pump unit connector.
4. Inspect for continuity between fuel pump unit connector terminals B and D.
   - If there is no continuity, replace the fuel pump body.
   - If as specified, carry out the "Circuit Open/Short Inspection".



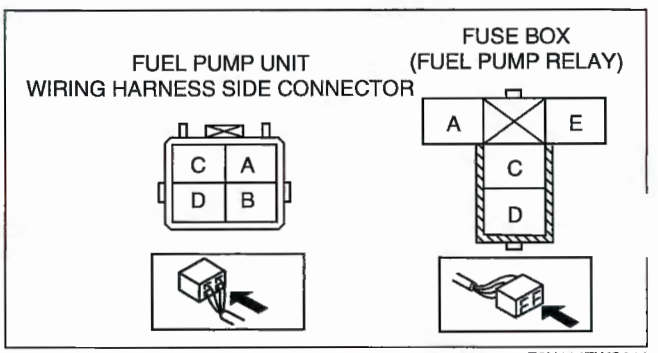
A6E3912W018

Circuit Open/Short Inspection

1. Inspect the following wiring harnesses as for open or short circuit (continuity check).

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Fuel pump unit terminal D and body ground
  - — Fuel pump unit terminal B and fuel pump relay terminal C

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Fuel pump unit terminal D and power supply
  - — Fuel pump unit terminal B and body ground



E6U114ZWC011

Fuel Pump Hold Pressure Inspection

Warning
- **Fuel line spills and leakage are dangerous. Fuel can ignite and cause serious injuries or death and damage. Always carry out the following procedure with the engine stopped.**

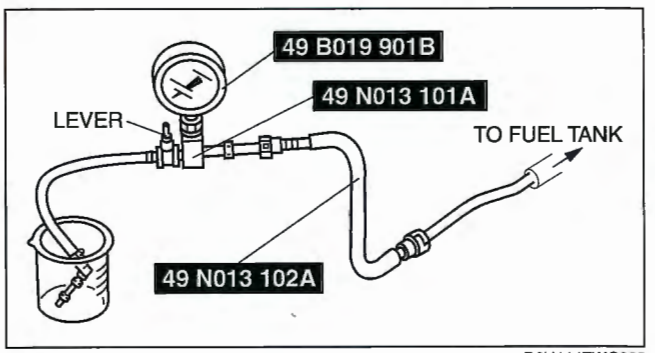
Caution
- **Disconnecting/connecting the quick release connector without cleaning it may cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using a cloth or soft brush, and make sure that it is free of foreign material.**

Note
- Perform the following test only when directed.

1. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)
2. Disconnect the negative battery cable.
3. Remove the battery and battery tray.

Caution
- **The quick release connector may be damaged if the tab is bent excessively. Do not expand the tab over the stopper.**

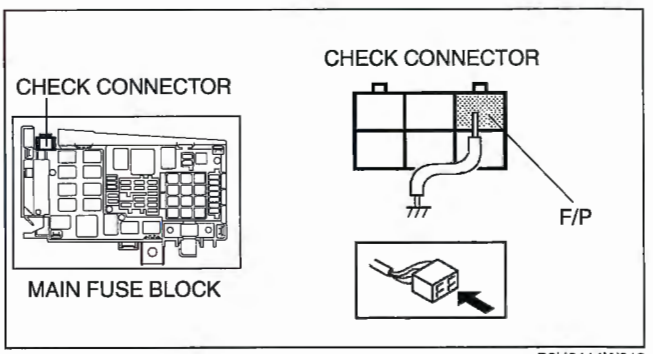
4. Disconnect the quick release connector from the fuel tank. (See 01–14B–21 QUICK RELEASE CONNECTOR REMOVAL/INSTALLATION [L3 WITH TC].)
5. Turn the lever **90°** against the hose of the **SST** to plug the **SST** outlet.
6. Push the **SST** quick release connector into the fuel pipe until a click is heard.
7. Set the fuel hose into a container to avoid fuel spills.
8. Connect the negative battery cable.



D6U114ZWC028

Caution
- **Connecting to the wrong check connector terminal may cause malfunction. Carefully connect only to the specified terminal.**

9. Short the check connector terminal F/P to body ground using a jumper wire.
10. Turn the ignition switch to the ON position to operate the fuel pump.
11. Turn the ignition switch to the LOCK position.
12. Measure the fuel pump hold pressure **after 5 min.**
    - If not as specified, replace the fuel pump after inspecting the following:
      — Fuel line for clogging or leakage



B6U0114W019

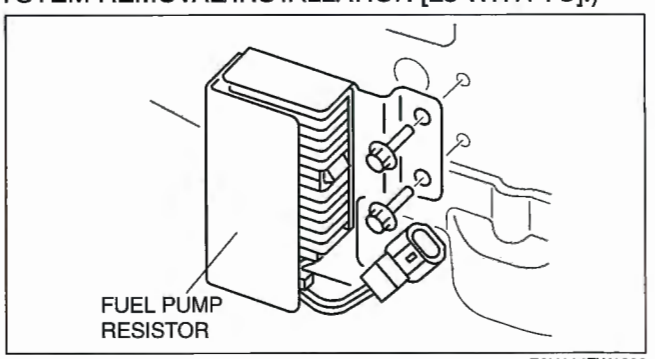
Fuel pump hold pressure
More than 230 kPa {2.3 kgf/cm^2, 33 psi}

13. Disconnect the jumper wire.
14. Disconnect the **SST**.
15. Connect the quick release connector. (See 01–14B–21 QUICK RELEASE CONNECTOR REMOVAL/INSTALLATION [L3 WITH TC].)

FUEL PUMP RESISTOR REMOVAL/INSTALLATION [L3 WITH TC]

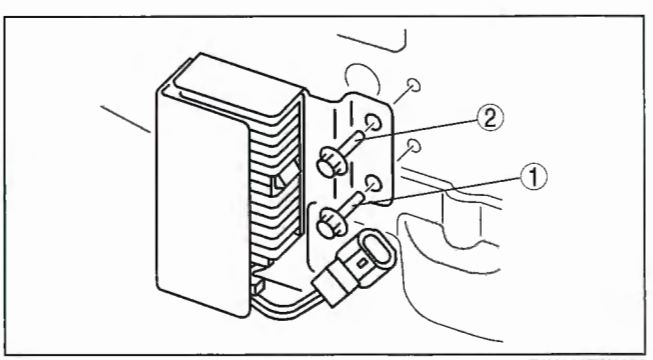
E6U011413350W07

1. Disconnect the negative battery cable. (See 01–17B–2 BATTERY REMOVAL/INSTALLATION [L3 WITH TC].)
2. Remove the air cleaner. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
3. Disconnect the fuel pump resistor connector.
4. Remove in the fuel pump resistor.



E6U114ZW1003

5. Install in the order as shown in the figure.



E6U114ZW1002

Tightening torque
4.2—6.2 N·m {43—63 kgf·cm, 38—54 in·lbf}

6. Connect the fuel pump resistor connector.

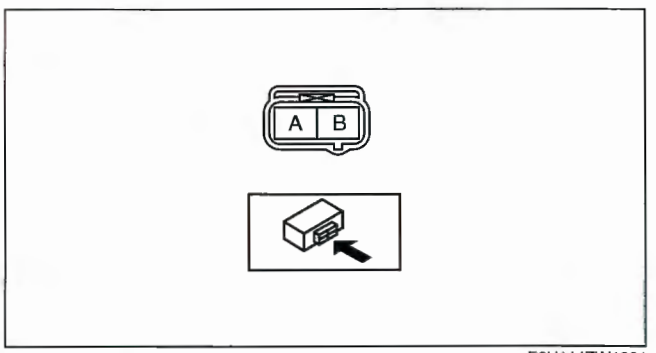
FUEL PUMP RESISTOR INSPECTION [L3 WITH TC]

E6U011413350W08

Resistance Inspection

1. Disconnect the negative battery cable. (See 01–17B–2 BATTERY REMOVAL/INSTALLATION [L3 WITH TC].)
2. Remove the fuel pump resister. (See 01–14B–17 FUEL PUMP RESISTOR REMOVAL/INSTALLATION [L3 WITH TC].)
3. Verify that the continuity between the fuel pump resister terminal A and B is within the specification.
   - If not within the specification, replace the fuel resistor.

Fuel pump resistor continuity
0.304—0.336 ohms (20 °C {68 °F})



E6U114ZW1001

HIGH PRESSURE FUEL PUMP REMOVAL/INSTALLATION [L3 WITH TC]

E6U011413350W09

Caution

- **Do not disassemble the high pressure fuel pump.**
- **Do not scratch or damage the fuel sealing surface of the high and low fuel ports.**
- **When removing the high pressure fuel pipe, secure the joint (pump side) so that it dose not rotate, and loosen the screw (pipe side).**

Note

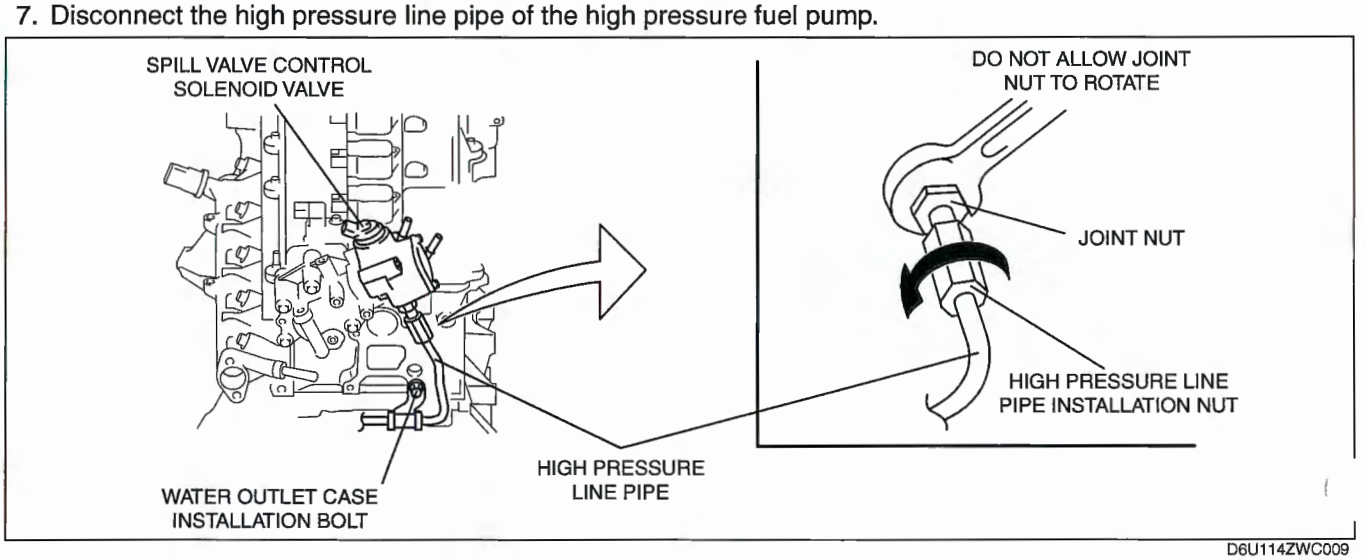
- If the high pressure fuel pump is removed, replace the O-ring with a new one.

1. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)
2. Disconnect the negative battery cable.
3. Remove the charge air cooler cover.
4. Disconnect the spill valve control solenoid valve connector.
5. Disconnect the quick release connector on the high pressure fuel pump. (See 01–14B–21 QUICK RELEASE CONNECTOR REMOVAL/INSTALLATION [L3 WITH TC].)
6. Remove the battery and battery tray. (See 01–17B–2 BATTERY REMOVAL/INSTALLATION [L3 WITH TC].)

Warning

- **If the high pressure fuel pump joint nut is loosened, fuel leakage may occur resulting in death or serious injury, or damage to the equipment or the vehicle. Fuel can also irritate the skin and eyes. When removing the high pressure line pipe, always tighten the high pressure line pipe installation nut while fixing the high pressure fuel pump joint nut with a wrench. If the high pressure fuel pump joint nut has rotated, replace the high pressure fuel pump with a new one.**

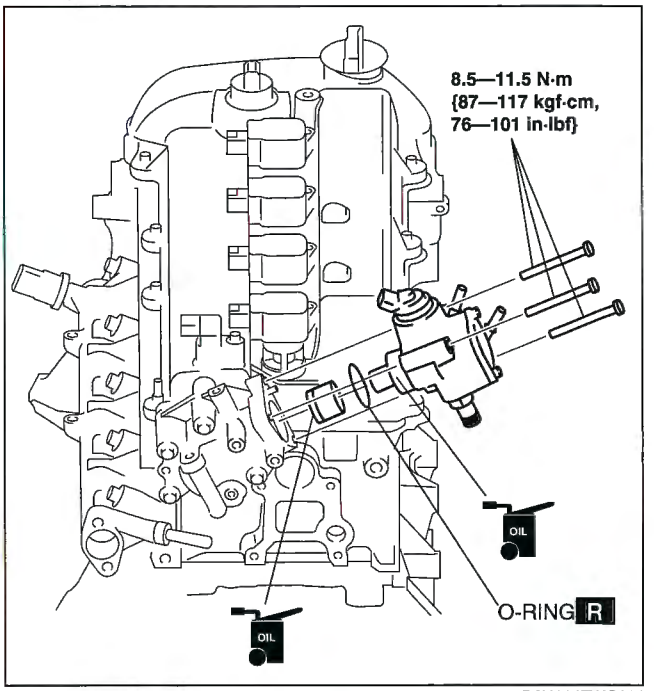
7. Disconnect the high pressure line pipe of the high pressure fuel pump.



D6U114ZWC009

(1) Fix the joint nut with a wrench on the high pressure fuel pump side as shown in the figure.
(2) Loosen the high pressure line pipe installation nut.

8. Drain engine coolant. (See 01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)
9. Loosen the water outlet case installation bolts securing the high pressure line pipe.
10. Remove the high pressure fuel pump.

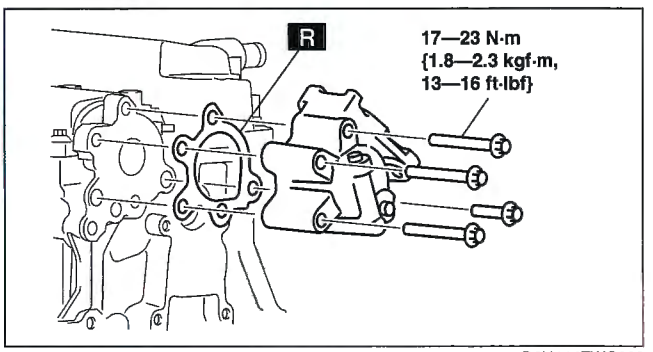


D6U114ZWC004

11. Remove the high pressure fuel pump cover.
12. Tighten the bolts on the high pressure fuel pump cover.

Tightening torque
17—23 N·m {1.8—2.3 kgf·m, 13—16 ft·lbf}

Caution
- **If the high pressure fuel pump installation bolts are tightened with the high pressure fuel pump tilted, the high pressure fuel pump may not operate correctly. Tighten the high pressure fuel pump installation bolts in a few passes with equal torque.**



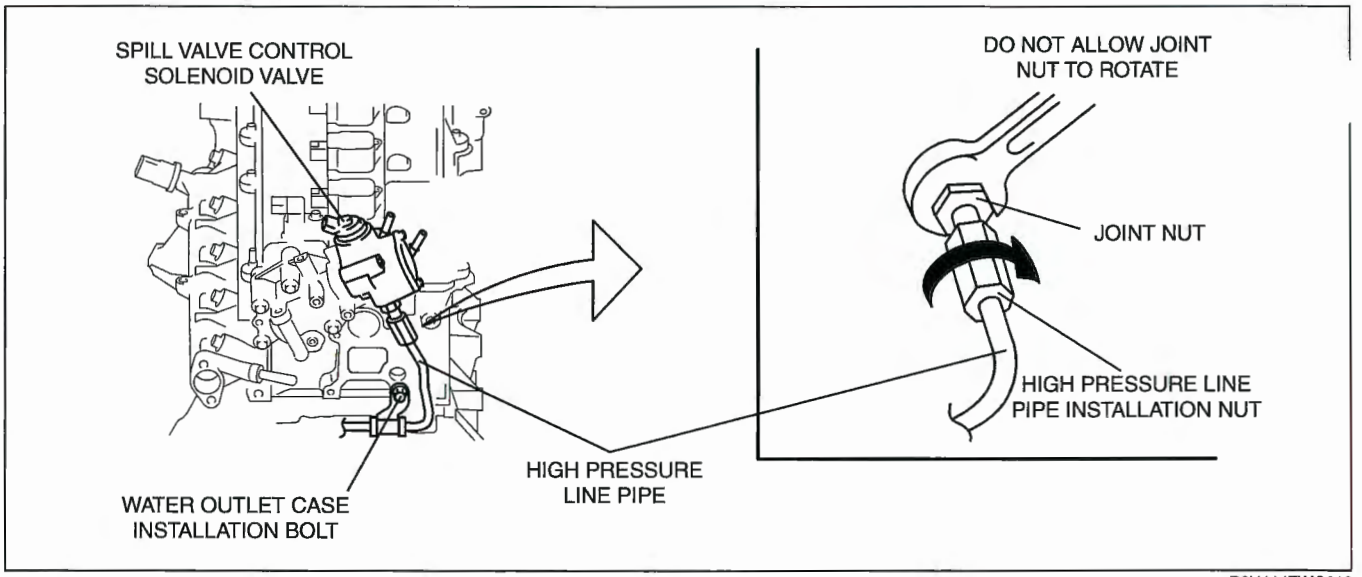
D6U114ZWC022

13. Tighten the bolts on the high pressure fuel pump.

Tightening torque
8.5—11.5 N·m {87—117 kgf·m, 76—101 ft·lbf}

Warning
- **If the high pressure fuel pump joint nut is loosened, fuel leakage may occur resulting in death or serious injury, or damage to the equipment or the vehicle. Fuel can also irritate the skin and eyes. When installing the high pressure line pipe, always tighten the high pressure line pipe installation nut while fixing the high pressure fuel pump joint nut with a wrench. If the high pressure fuel pump joint nut has rotated, replace the high pressure fuel pump with a new one.**

14. Assemble the high pressure line pipe.



D6U114ZWC010

(1) Fix the joint nut with a wrench on the high pressure fuel pump side as shown in the figure.
(2) Tighten the high pressure line pipe installation nut.

Tightening torque
23.5—35.5 N·m {2.40—3.61 kgf·m, 17.4—26.1 ft·lbf}

15. Tighten the water outlet case installation bolts.

Tightening torque
8—11.5 N·m {82—117 kgf·cm, 71—101 in·lbf}

16. Install the quick release connector. (See 01–14B–21 QUICK RELEASE CONNECTOR REMOVAL/ INSTALLATION [L3 WITH TC].)

Fuel Leakage Inspection After High Pressure Fuel Pump Installation
1. Verify that the high pressure fuel pump is assembled securely.
2. Drive the vehicle starting from a standstill and brake suddenly **five to six times** at a low speed.
3. Stop the vehicle and verify from outside the vehicle that there is no fuel leakage around the high pressure fuel pump.

HIGH PRESSURE FUEL PUMP INSPECTION [L3 WITH TC]

E6U011413350W10

Note
- Perform the following inspection only when directed.
- The following vacuum values are indicated by relative pressure from the fuel pressure sensor.

1. Verify that the fuel pressure sensor is normal. (See 01–40B–34 FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC].)
2. Connect the WDS or equivalent to the DLC-2.
3. Turn the ignition switch to the ON position (Engine off).
4. Select the FUEL_PRES, and LOAD, RPM PIDs on the WDS or equivalent.

Caution
- **If the engine is run at a high speed, it could be damaged. When racing the engine, do not race it up to 6,700 rpm or more.**

5. After the LOAD PID is **60% or more** while the engine is raced with the accelerator pedal fully depressed, verify that the FUEL_PRES PID is **approx. 11.5 Mpa**.
   — If not as verified, replace the high pressure fuel pump.

QUICK RELEASE CONNECTOR REMOVAL/INSTALLATION [L3 WITH TC]

E6U011442692W01

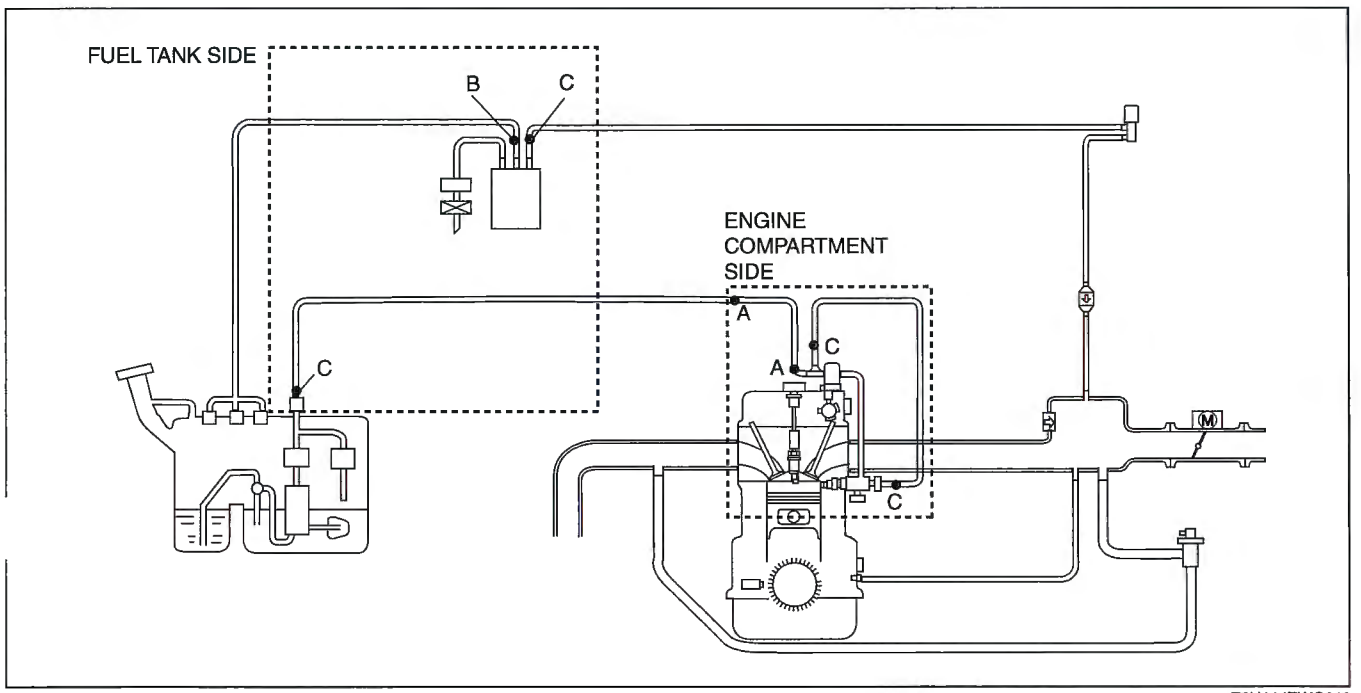
Warning

- **Fuel is very flammable liquid. If fuel spills or leaks from the pressurized fuel system, it will cause serious injury or death and facility breakage. Fuel can also irritate skin and eyes. To prevent this, always complete the "Fuel Line Safety Procedure", while referring to the "BEFORE SERVICE PRECAUTION".**

Quick Release Connector Type

Caution

- **There are four types of quick release connectors. Verify the type and location, and install/remove properly.**



E6U114ZWC010

Type A Removal

1. Follow "BEFORE REPAIR PROCEDURE" before performing any work operations to prevent fuel from spilling from the fuel system. (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)

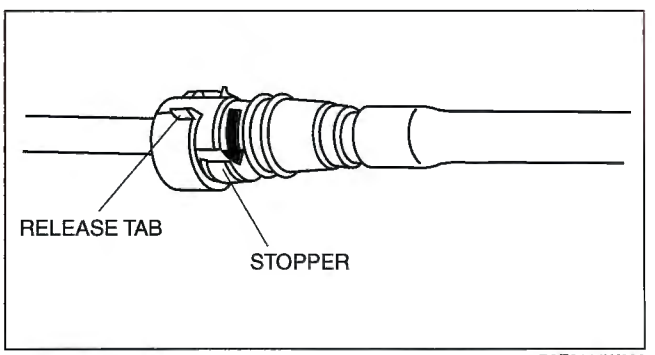
Caution

- **The quick release connector may be damaged if the release tab is bent excessively. Do not expand the release tab over the stopper.**

Note

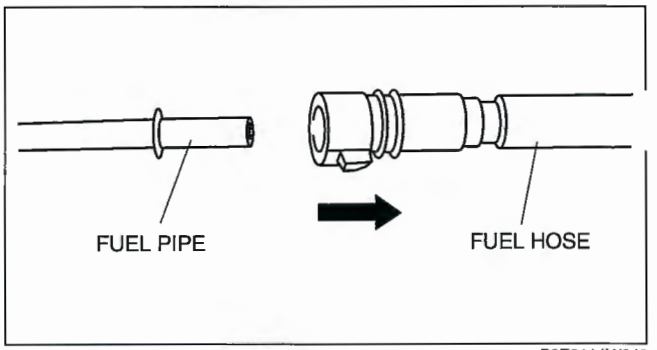
- The fuel hose can be removed by pushing it to the pipe side to release the lock.

2. Rotate the release tab on the quick release connector to the stopper position.



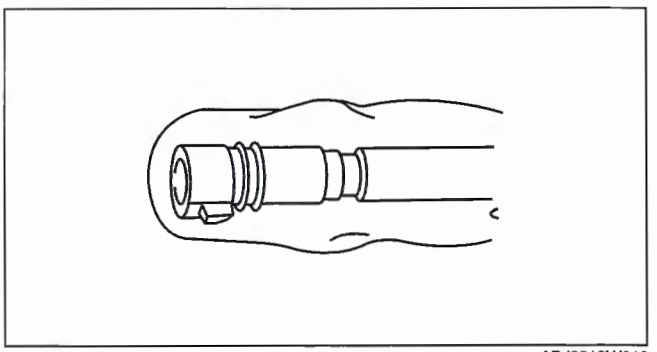
B3E0114W039

3. Pull out the fuel hose straight from the fuel pipe and disconnect it.



B3E0114W040

4. Cover the disconnected quick release connector and fuel pipe with vinyl sheeting or a similar material to prevent it from scratches or dirt.



ADJ3912W019

Type B Removal

Caution
- **When releasing the retainer locks, take extreme care not to damage the charcoal canister and pipe.**
- **Be careful not to damage the pipe when unlocking the retainer.**

Note
- If the quick release connector is removed, replace the retainer with a new one.

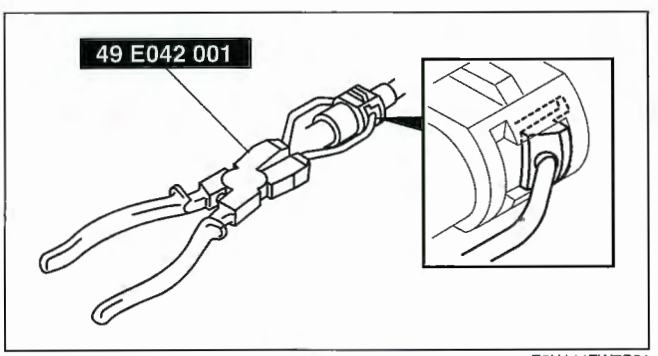
1. Follow "BEFORE SERVICE PRECAUTION" and remove dirt from the connecting surfaces before performing any work operations. (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)

Note
- The retainer is attached to the pipe even after the connector is disconnected.

2. Set the **SST** parallel to the quick release connector.

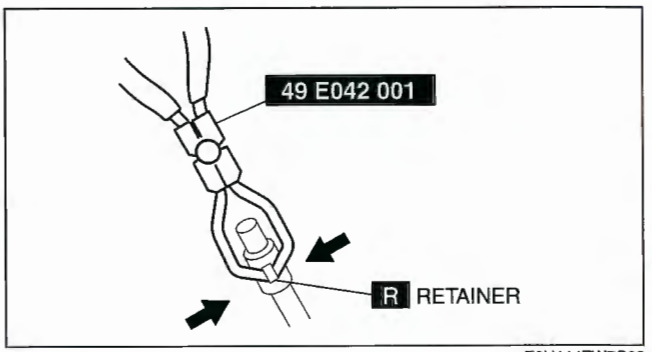
Note
- The quick release connector can be removed by pushing the center of the retainer tabs.

3. Hold the center of the retainer tabs with the **SST** ends and press the retainer.
4. Pull the connector side and disconnect the quick release connector.



E6U114ZW7S81

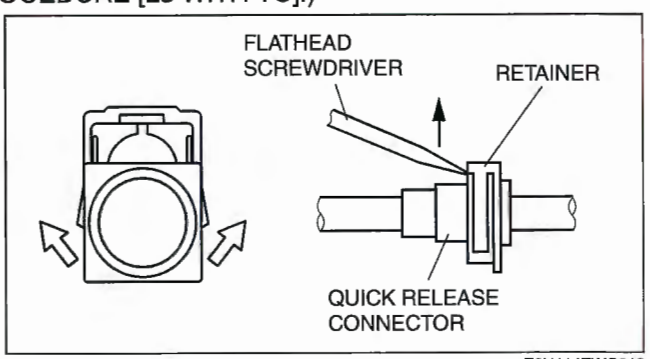
5. Raise a retainer tab using the **SST** and remove the retainer.
6. Cover the disconnected quick release connector and evaporative hose with vinyl sheeting or a similar material to prevent it from scratches or dirt.



E6U114ZW7S82

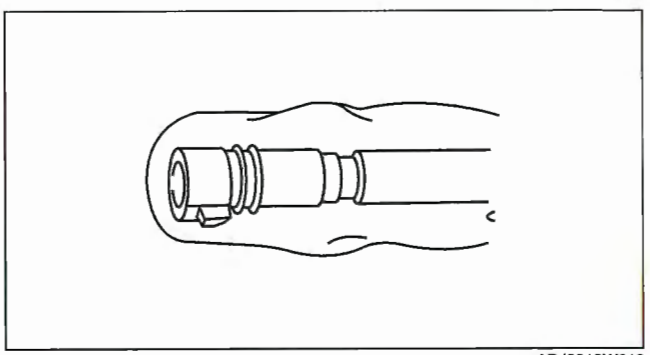
Type C Removal

1. Follow "BEFORE REPAIR PROCEDURE" and remove dirt from the connecting surfaces before performing any work operations. (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)
2. Move the retainer upward using a small flathead screwdriver or a similar tool.
3. Pull out the fuel hose straight from the fuel pipe and disconnect it.



E6U114ZWC013

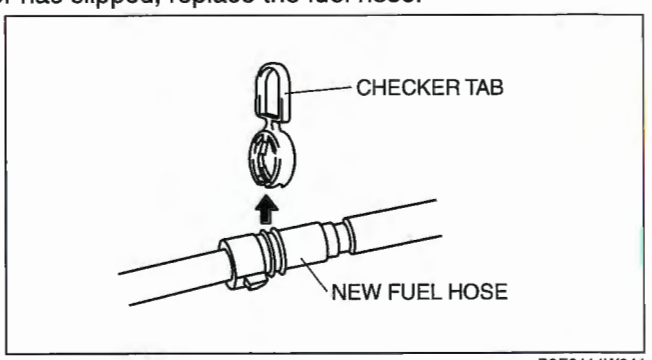
4. Cover the disconnected quick release connector and fuel pipe with vinyl sheeting or a similar material to prevent it from scratches or dirt.



ADJ3912W019

Type A Installation

Note
- If the quick release connector O-ring is damaged or has slipped, replace the fuel hose.
- A checker tab is integrated with the quick release connector for new fuel hoses and evaporative hoses. Remove the checker tab from the quick release connector after the connector is completely engaged with the fuel pipe.



B3E0114W041

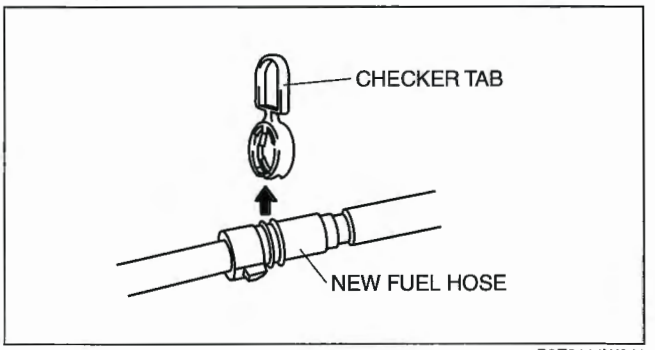
1. Inspect the fuel hose and fuel pipe sealing surface for damage and deformation.
   - If there is any malfunction, replace it with a new one.
2. Apply a small amount of clean engine oil to the sealing surface of the fuel pipe.
3. Reconnect the fuel hose straight to the fuel pipe until a click is heard.

Note
- If the quick release connector does not move at all, disconnect it, verify that the O-ring is not damaged or has not slipped, and then reconnect the quick release connector.

4. Lightly pull and push the quick release connector a few times by hand, and then verify that it can move **2.0—3.0 mm {0.08—0.12 in}** and is connected securely.
5. Inspect all related parts by performing "AFTER REPAIR PROCEDURE". (See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)

Type B Installation

Note
- If the quick release connector O-ring is damaged or has slipped, replace the fuel hose.
- A checker tab is integrated with the quick release connector for new fuel hoses and evaporative hoses. Remove the checker tab from the quick release connector after the connector is completely engaged with the fuel pipe.



B3E0114W041

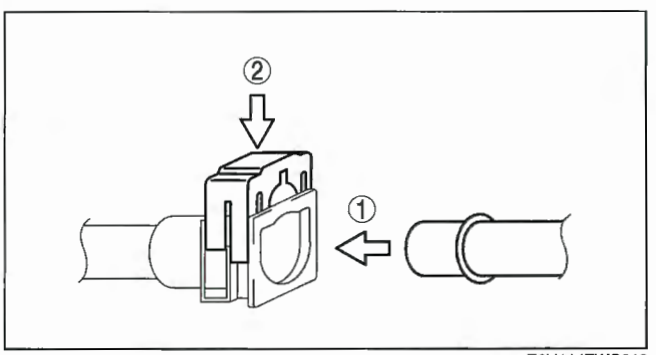
Caution
- **Be sure to replace the retainer with a new one to prevent gas leakage.**
- **To prevent evaporative gas leakage, be sure not to damage the connecting part between the charcoal canister and pipe, and the locks between the quick release connector and retainer. If any of them are damaged, replace the charcoal canister or hose with a new one.**

1. Remove the retainer remaining on the charcoal canister pipe.
2. Install a new retainer to the quick release connector.
3. Reconnect the hose straight to the pipe until a click is heard.
4. Lightly pull and push the quick release connector a few times by hand, and then verify that it is connected securely.
5. Inspect all related parts by performing "AFTER REPAIR PROCEDURE". (See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)

Type C Installation

Note
- If the quick release connector O-ring is damaged or has slipped, replace the fuel hose.

1. Inspect the fuel hose and fuel pipe sealing surface for damage and deformation.
   - If there is any malfunction, replace it with a new one.
2. Install the quick release connector.
   - Insert the fuel pipe straight to the end of the quick release connector.
   - Push down the retainer using a finger.
     - — If the retainer cannot be pushed down, push the fuel pipe further to the quick release connector.
3. Lightly pull and push the quick release connector a few times by hand, and then verify that it is connected securely.
4. Inspect all related parts by performing "AFTER REPAIR PROCEDURE". (See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)



E6U114ZWC012

FUEL INJECTOR REMOVAL/INSTALLATION [L3 WITH TC]

E6U011413250W05

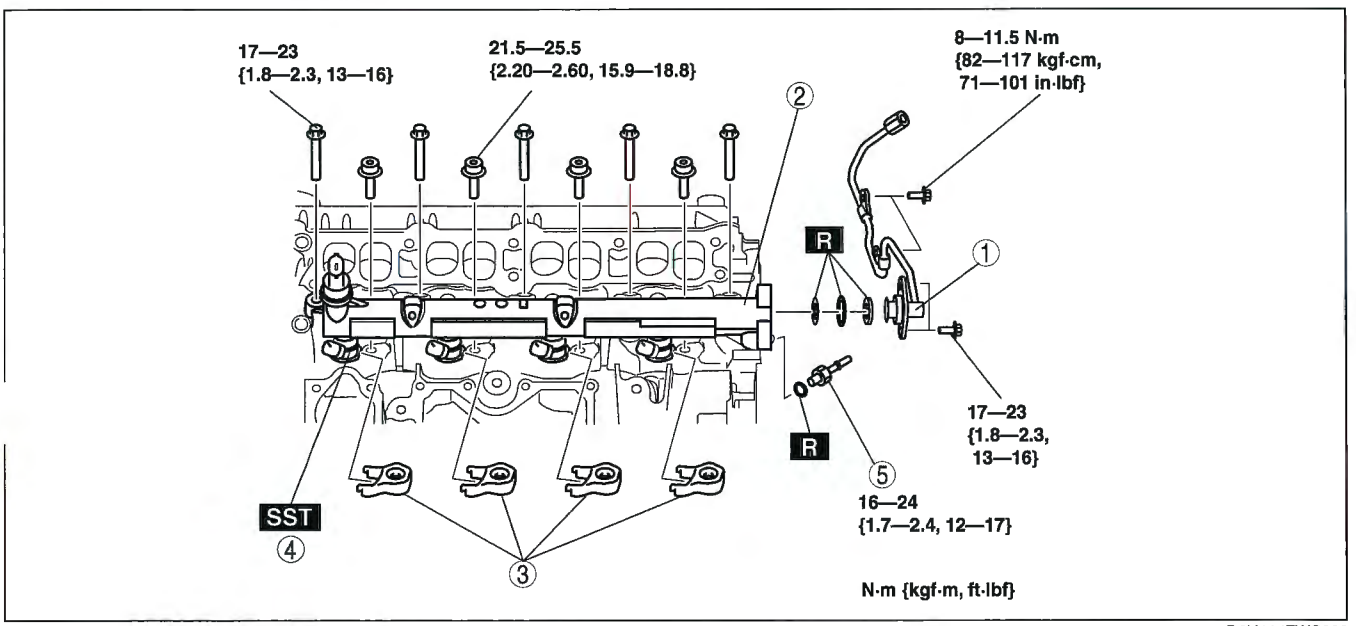
Caution

- **Disconnecting/connecting the quick release connector without cleaning it may cause damage to the fuel pipe and quick release connector. Always clean the quick release connector joint area before disconnecting/connecting using a cloth or soft brush, and make sure that it is free of foreign material.**

Note

- When the fuel pressure sensor replaces, replace a new fuel delivery pipe with a new fuel pressure sensor. 01–14B–25 FUEL INJECTOR REMOVAL/INSTALLATION [L3 WITH TC]

1. Complete the "BEFORE REPAIR PROCEDURE". (See 01–14B–4 BEFORE REPAIR PROCEDURE [L3 WITH TC].)
2. Disconnect the negative battery cable.
3. Remove the intake manifold. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
4. Remove in the order indicated in the table.



D6U114ZWC023

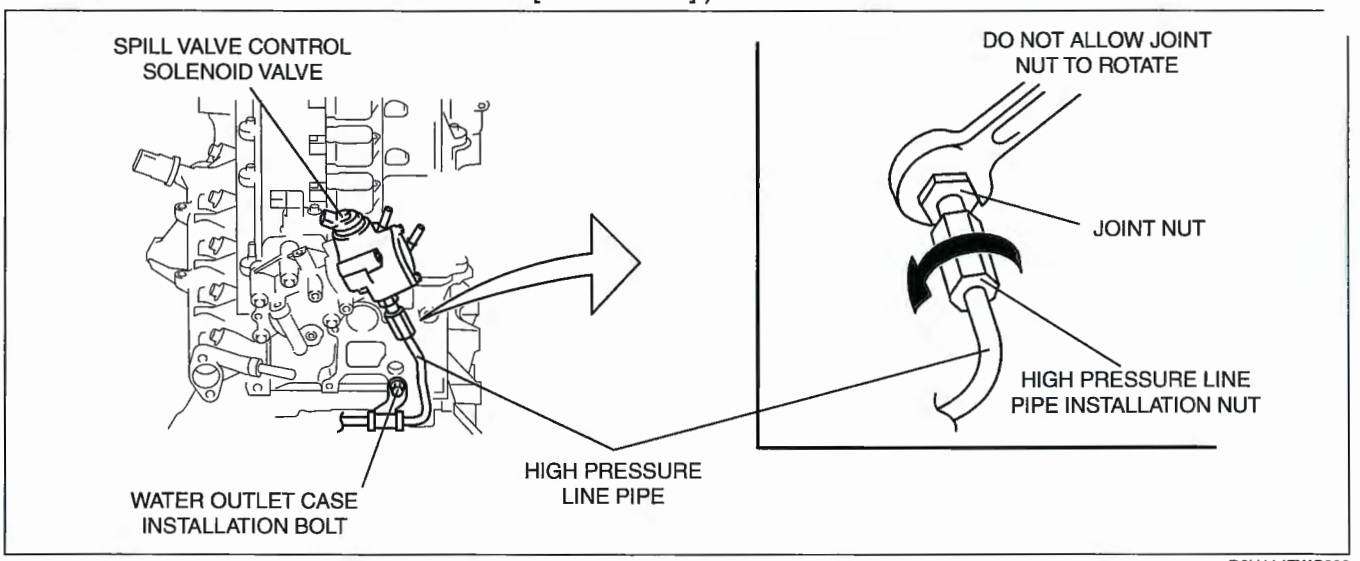
1	High pressure line pipe (See 01–14B–26 High Pressure Line Pipe Removal Note.) (See 01–14B–28 High Pressure Line Pipe Installation Note.)

2	Fuel delivery pipe (See 01–14B–27 Fuel Delivery Pipe Installation Note.)
3	Fuel injector bracket
4	Fuel injector (See 01–14B–26 Fuel Injector Removal Note.)
5	Relief valve

5. Install in the reverse order of removal.
6. Complete the "AFTER REPAIR PROCEDURE". (See 01–14B–5 AFTER REPAIR PROCEDURE [L3 WITH TC].)

High Pressure Line Pipe Removal Note

1. Drain engine coolant. (See 01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)
2. Disconnect the high pressure line pipe of the high pressure fuel pump. (See 01–14B–18 HIGH PRESSURE FUEL PUMP REMOVAL/INSTALLATION [L3 WITH TC].)



D6U114ZWC009

   (1) Fix the joint nut with a wrench on the high pressure fuel pump side as shown in the figure.
   (2) Loosen the high pressure line pipe installation nut.
3. Remove the high pressure line pipe.

Fuel Injector Removal Note

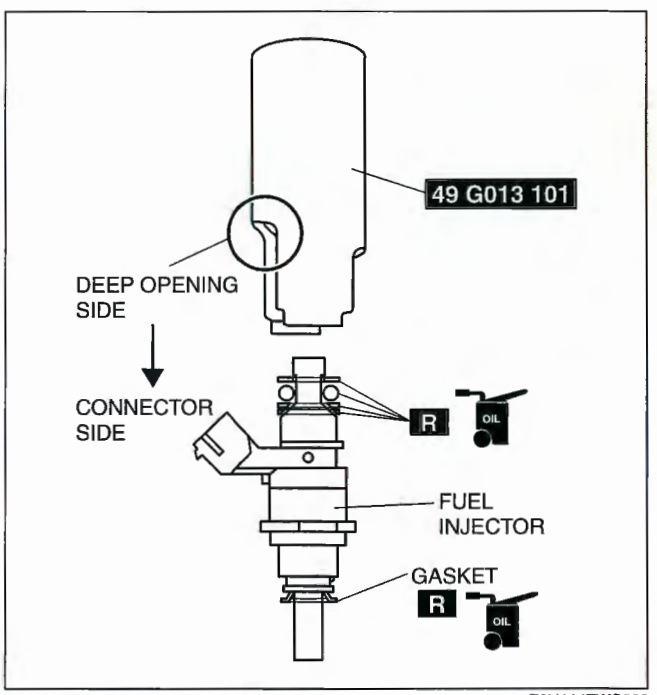
Note

- Depending on the driving conditions, carbon may accumulate on the inserted part of the fuel injector, causing the fuel injector to stick. Remove the fuel injector using the following procedure.

1. Install the **SST** to the fuel injector confirming that the **SST** faces the correct direction as shown in the figure.

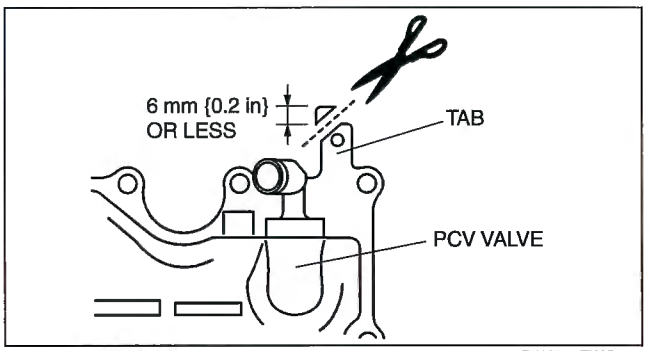
Caution

- **If the SST slips while ratcheting up the fuel injector, the fuel injector or surrounding parts could be damaged. Press fit the SST to the fuel injector firmly and operate carefully.**
- **When ratcheting up the fuel injector, the fuel injector connector may contact the cylinder head and damage the fuel injector. Ratchet up the fuel injector so that the fuel injector connector does not contact the cylinder head.**



E6U114ZWC008

Note
- If fuel injector No.3 contacts the oil separator, cut the tab on the oil separator as shown in the figure. Carefully cut the tab so that the oil separator is not deformed or damaged, with no clearance on the mating surfaces of the oil separator and engine.



D6U114ZWC101

2. Keep ratcheting the **SST** so that the fuel injector becomes free enough to ratchet up without using the **SST**.

Caution
- **Do not apply excessive force to the fuel injector connector because the fuel injector could be damaged.**

3. Pull out the fuel injector by ratcheting it upright.
4. Verify that there are no gasket in the cylinder heads after removing the fuel injectors.

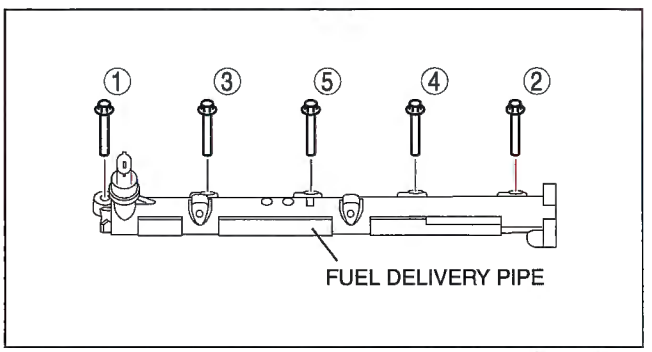
Warning
- **If foreign material such as metal shavings penetrates the fuel injector installation hole on the cylinder block, the engine could be damaged. Remove all foreign material and cap the fuel injector installation hole after removing the fuel injector.**

5. Clean the fuel injector and around the insertion hole using a vacuum cleaner.

Fuel Delivery Pipe Installation Note

Tighten the bolts in the order shown in the figure.

Tightening torque
17—23 N·m {1.8—2.3 kgf·m, 13—16 ft·lbf}

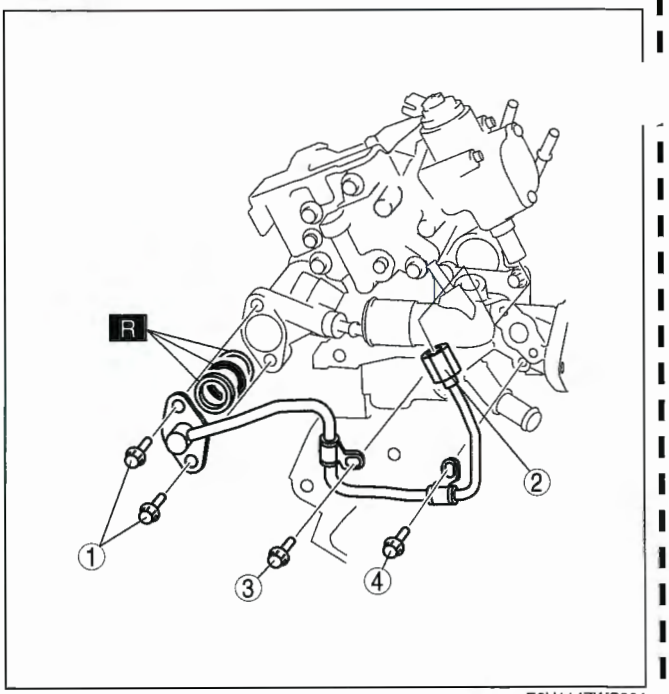


D6U114ZWC024

High Pressure Line Pipe Installation Note

1. Temporarily tighten the bolts and nut in the order shown in the figure.

1	High pressure line pipe installation bolt
2	High pressure line pipe installation nut
3	Water outlet case installation bolt
4	Water outlet case installation bolt



E6U114ZWS301

2. Tighten the high pressure line pipe installation bolts.

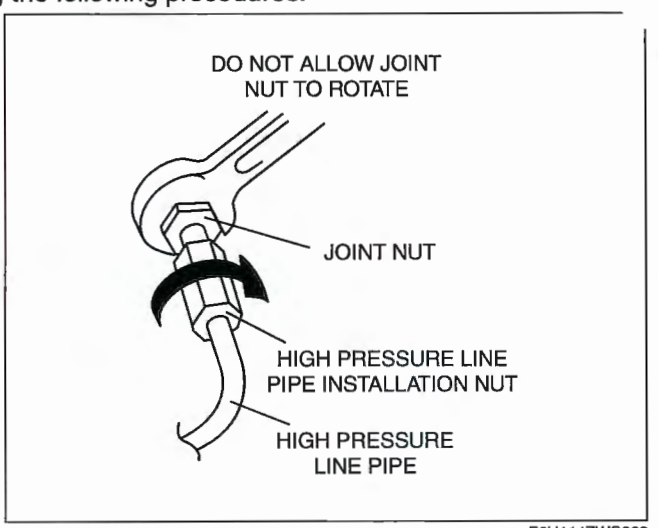
Tightening torque
17—23 N·m {1.8—2.3 kgf·m, 13—16 ft·lbf}

3. Tighten the high pressure line pipe installation nut using the following procedures.
   (1) Fix the joint nut with a wrench on the high pressure fuel pump side as shown in the figure.
   (2) Tighten the high pressure line pipe installation nut.

Tightening torque
23.5—35.5 N·m {2.40—3.61 kgf·m, 17.4—26.1 ft·lbf}

4. Tighten the water outlet case installation bolts.

Tightening torque
8—11.5 N·m {82—117 kgf·cm, 71—101 in·lbf}



E6U114ZWS302

FUEL INJECTOR INSPECTION [L3 WITH TC]

E6U011413250W06

Operation Test

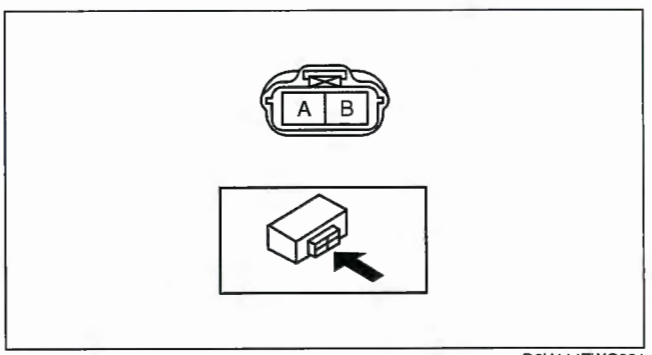
1. Carry out the "Fuel Injector Operation Inspection". (See 01–03A–68 Fuel Injector Operation Inspection.)
   - If not as specified, perform the further inspection for the fuel injectors.

Resistance Inspection

Note
- Perform the following procedure only when directed.

1. Turn the ignition switch to the LOCK position.
2. Disconnect the negative battery cable.
3. Remove the fuel delivery pipe. (See 01–14B–25 FUEL INJECTOR REMOVAL/INSTALLATION [L3 WITH TC].)
4. Disconnect the fuel injector connectors.
5. Measure the resistance of the fuel injector using a tester.
   - If not as specified, replace the fuel injector. (See 01–14B–25 FUEL INJECTOR REMOVAL/INSTALLATION [L3 WITH TC].)
   - If as specified but "Operation Test" is failed, carry out the "Circuit Open/Short Inspection". Inspect for open or short circuit.

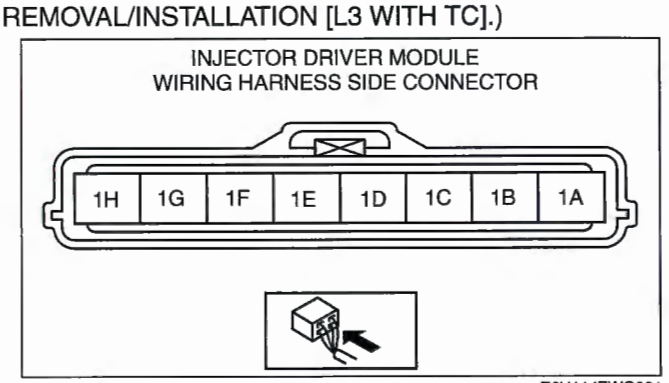
Fuel injector resistance
1.0—1.2 ohms [20 °C {68 °F}]



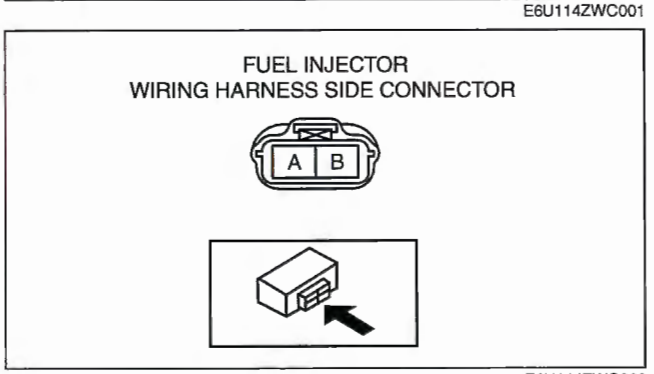
D6U114ZWC031

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harnesses for an open or short circuit (continuity check).



E6U114ZWC001



E6U114ZWC009

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — No.1 cylinder fuel injector terminal B and injector driver module terminal 1F
  - — No.2 cylinder fuel injector terminal B and injector driver module terminal 1A
  - — No.3 cylinder fuel injector terminal B and injector driver module terminal 1A
  - — No.4 cylinder fuel injector terminal B and injector driver module terminal 1F
  - — No.1 cylinder fuel injector terminal A and injector driver module terminal 1E
  - — No.2 cylinder fuel injector terminal A and injector driver module terminal 1B
  - — No.3 cylinder fuel injector terminal A and injector driver module terminal 1C
  - — No.4 cylinder fuel injector terminal A and injector driver module terminal 1D

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — No.1 cylinder fuel injector terminal B and body Ground
  - — No.2 cylinder fuel injector terminal B and body Ground
  - — No.3 cylinder fuel injector terminal B and body Ground
  - — No.4 cylinder fuel injector terminal B and body Ground
  - — No.1 cylinder fuel injector terminal A and power supply or body Ground
  - — No.2 cylinder fuel injector terminal A and power supply or body Ground
  - — No.3 cylinder fuel injector terminal A and power supply or body Ground
  - — No.4 cylinder fuel injector terminal A and power supply or body Ground

PRESSURE REGULATOR INSPECTION [L3 WITH TC]

E6U011413280W02

Note

- Due to the adoption of the mechanical returnless fuel system, the pressure regulator cannot be inspecte separately.

1. Perform "FUEL LINE PRESSURE INSPECTION". (See 01–14B–5 FUEL LINE PRESSURE INSPECTION [L3 WITH TC].)

01–15A EXHAUST SYSTEM [L3]

EXHAUST SYSTEM INSPECTION [L3] 01–15A–1

Exhaust Manifold Insulator (Upper) Installation Note 01–15A–7

EXHAUST SYSTEM INSPECTION [L3]

E6U011500000W03

1. Start the engine and inspect each exhaust system component for exhaust gas leakage.
   - If there is leakage, repair or replace if necessary.

EXHAUST SYSTEM REMOVAL/INSTALLATION [L3]

E6U011500000W04

Warning

- **A hot engine and exhaust system can cause severe burns. Turn off the engine and wait until they are cool before removing the exhaust system.**

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.

California emission regulation applicable ATX model

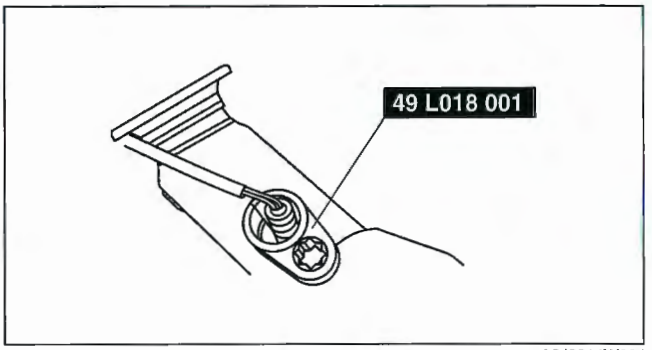
E6U115AW5001

1	Main silencer
2	Presilencer
3	TWC
4	Exhaust manifold insulator (upper) (See 01–15A–7 Exhaust Manifold Insulator (Upper) Installation Note)
5	Bracket (See 01–15A–6 Bracket Installation Note (Except for California Emission Regulation Applicable ATX Model))
6	Exhaust manifold (See 01–15A–6 Exhaust Manifold Installation Note)
7	Gasket
8	Exhaust manifold insulator (lower) (See 01–15A–5 Exhaust Manifold Insulator (Lower) Installation Note)
9	HO2S (front) (See 01–15A–5 HO2S Removal Note)
10	HO2S (rear) (See 01–15A–5 HO2S Removal Note)

HO2S Removal Note

1. Remove the HO2S using the **SST** before removing the exhaust manifold.

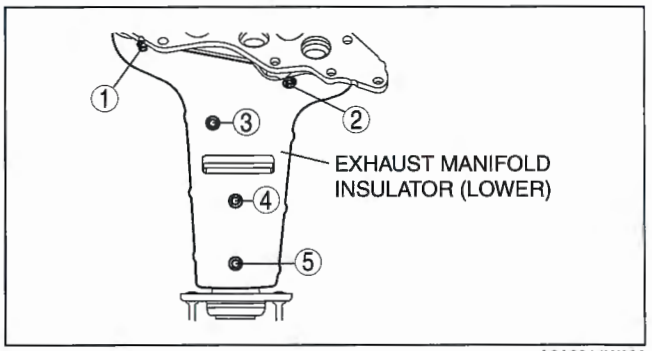


A6J3914W004

Exhaust Manifold Insulator (Lower) Installation Note

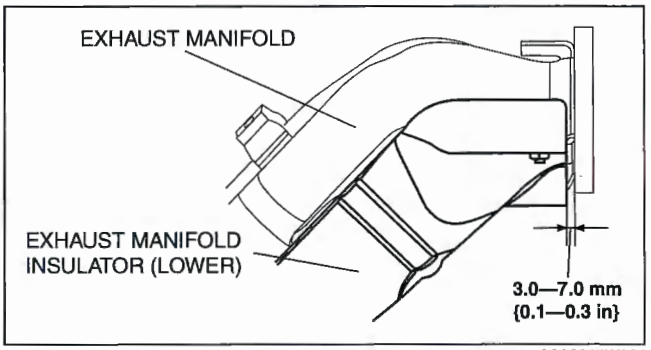
1. Tighten the exhaust manifold insulator (lower) installation bolts in the order shown.

   Tightening torque
   7.8—10.8 N·m {80—110 kgf·cm, 70—95 in·lbf}



A6A3914W003

2. Verify that the insulator is installed as shown.

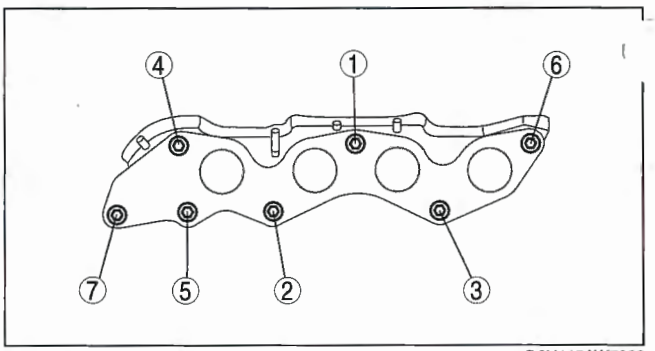


A6A3914W004

Exhaust Manifold Installation Note

1. Tighten the exhaust manifold installation nuts in the order shown.

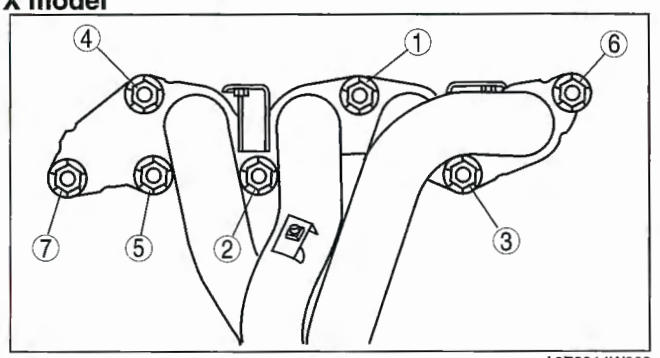
California emission regulation applicable ATX model



D6U115AW7003

Except for California emission regulation applicable ATX model

Tightening torque
43—64 N·m {4.4—6.5 kgf·m, 32—47 ft·lbf}



A6E3914W003

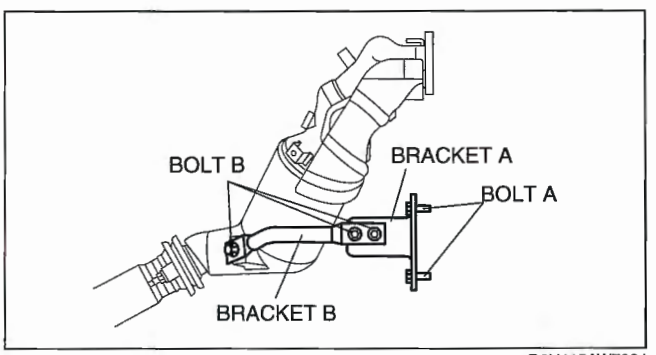
Bracket Installation Note (California Emission Regulation Applicable ATX Model)

1. Install bracket A using bolts A and tighten to the Specified torque.

Tightening torque
38—51 N·m {3.9—5.2 kgf·m, 29—37 ft·lbf}

2. Temporarily install bracket B using bolts B.
3. Tighten bolts B to the Specified torque.

Tightening torque
38—51 N·m {3.9—5.2 kgf·m, 29—37 ft·lbf}



D6U115AW7004

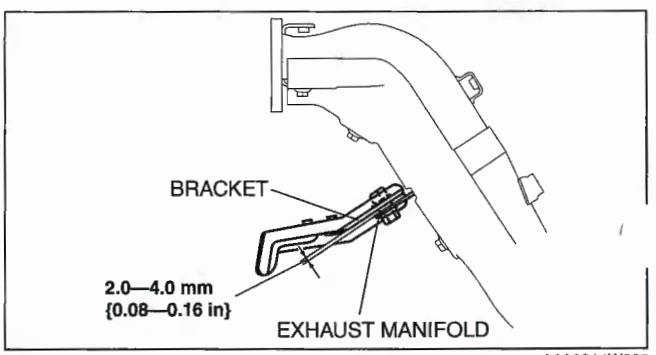
Bracket Installation Note (Except for California Emission Regulation Applicable ATX Model)

1. Temporarily tighten the exhaust manifold side bolts.
2. Verify that the gap between the exhaust manifold and the bracket is **2.0—4.0 mm {0.08—0.16 in}**.
3. Fully tighten the cylinder block side bolt.

Tightening torque
38—51 N·m {3.9—5.2 kgf·m, 29—37 ft·lbf}

4. Fully tighten the exhaust manifold side bolts.

Tightening torque
40—55 N·m {4.1—5.6 kgf·m, 29.5—40.5 ft·lbf}

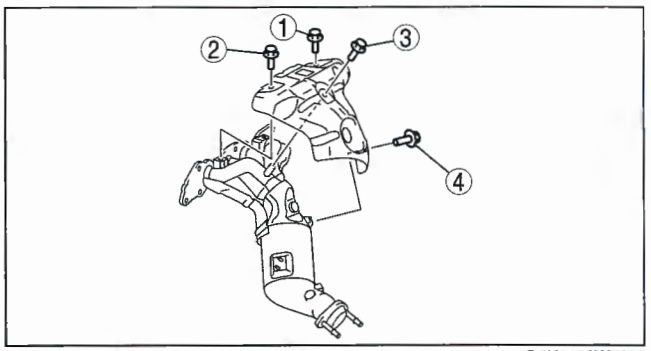


A6A3914W005

Exhaust Manifold Insulator (Upper) Installation Note

1. Tighten the exhaust manifold insulator (upper) installation bolts in the order shown.

California emission regulation applicable ATX model



D6U115AW7002

Except for California emission regulation applicable ATX model

Tightening torque
7.8—10.8 N·m {80—110 kgf·cm, 70—95 in·lbf}

WU-TWC Installation Note **01–15B–4**
Middle Pipe and Main Silencer Installation Note **01–15B–4**

EXHAUST SYSTEM INSPECTION [L3 WITH TC]

E6U011500000W05

1. Start the engine and inspect each exhaust system component for exhaust gas leakage.
   - If there is leakage, repair or replace if necessary.

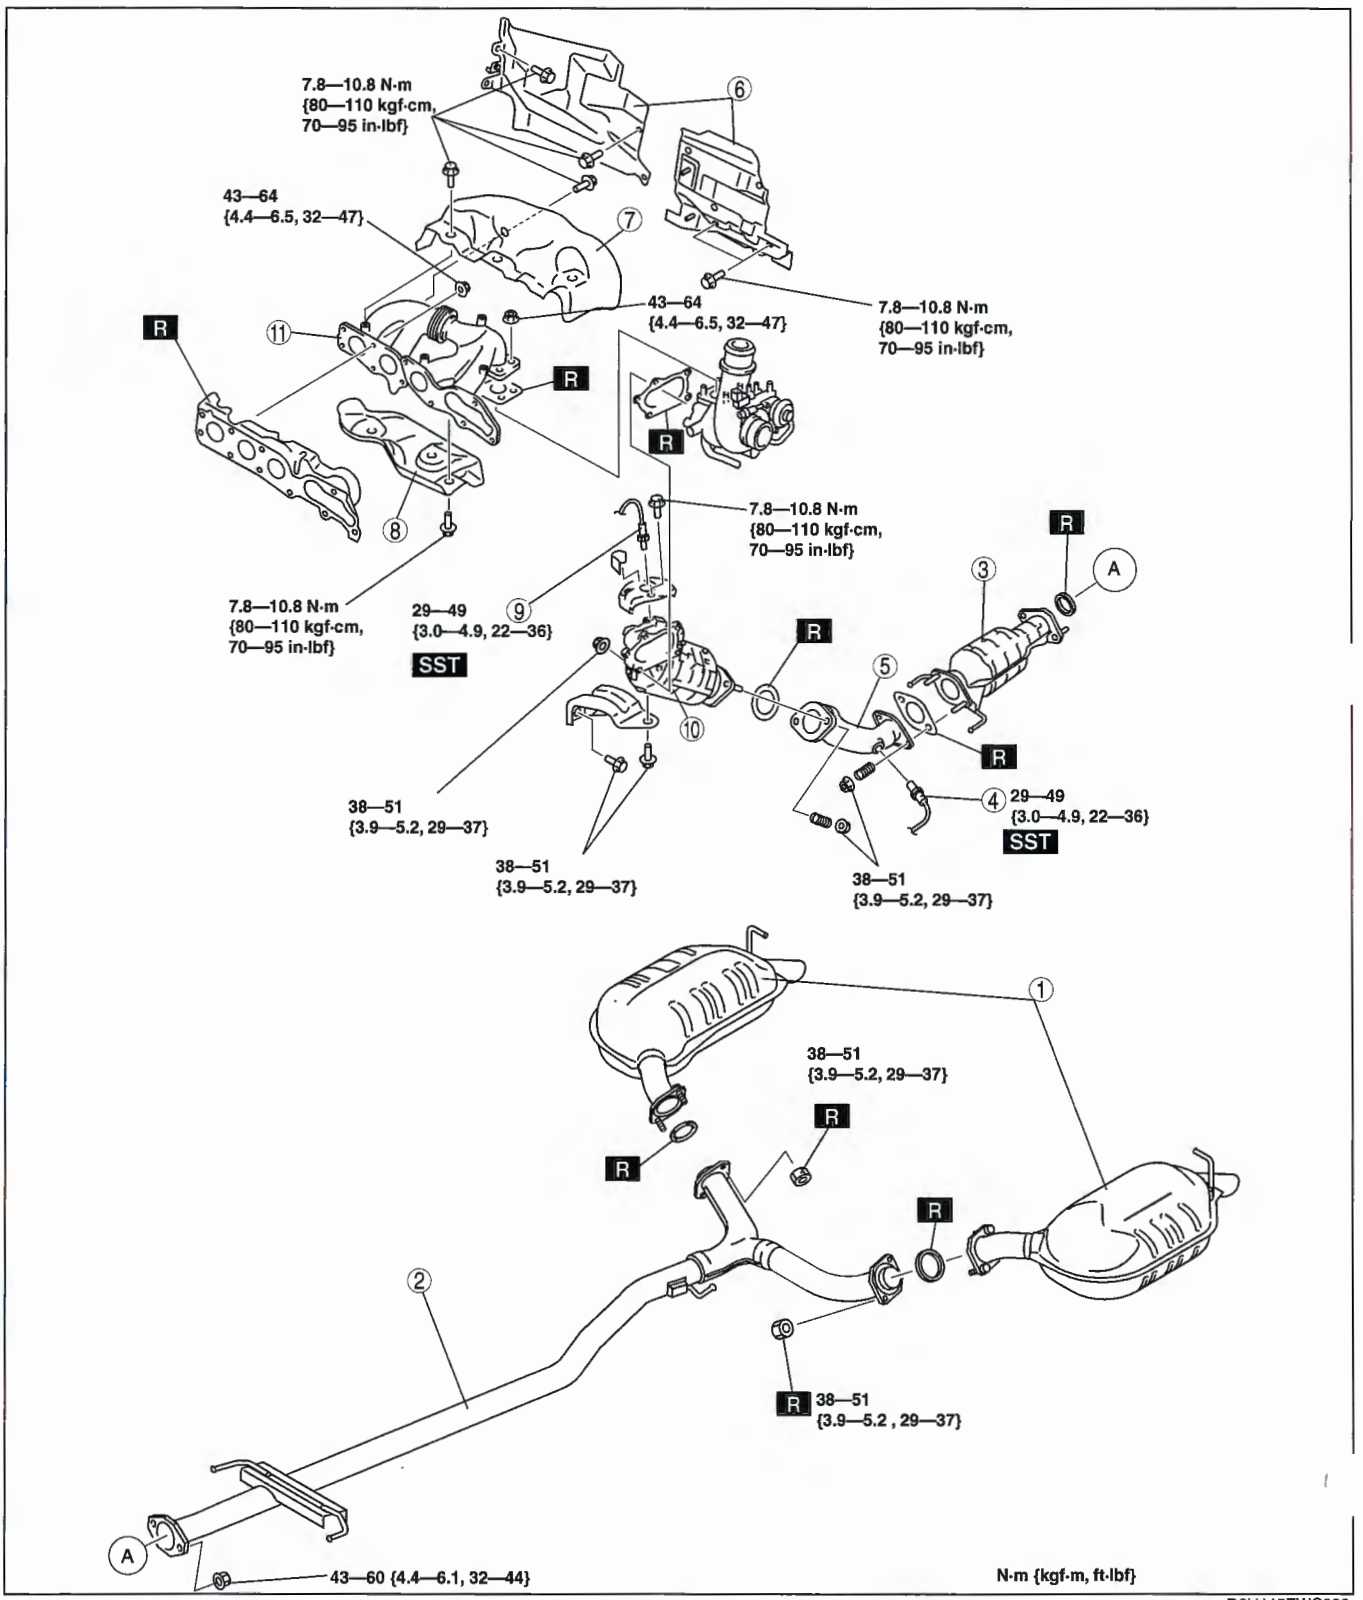
EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC]

E6U011500000W06

Warning

- **A hot engine and exhaust system can cause severe burns. Turn off the engine and wait until they are cool before removing the exhaust system.**

1. Remove the negative battery cable.
2. Remove in the order indicated in the table.
3. Install in the reverse order of removal.



D6U115ZWC003

1	Main silencer
2	Middle pipe (See 01–15B–4 Middle Pipe and Main Silencer Installation Note.)
3	TWC
4	HO2S (rear) (See 01–15B–3 HO2S Removal Note.)
5	Front pipe
6	Insulator (See 01–15B–3 Insulator Removal Note.)

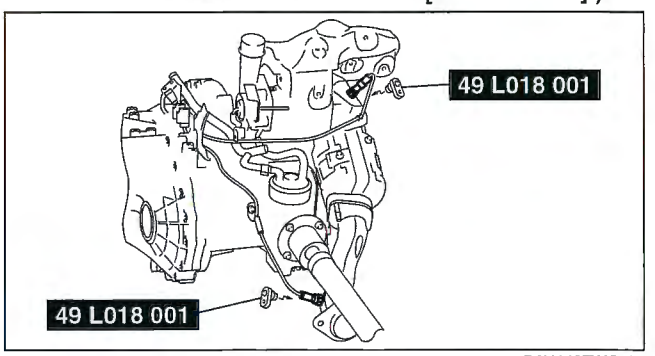
11	Exhaust manifold (See 01–15B–3 Exhaust Manifold Installation Note.)

HO2S Removal Note

1. Remove the insulator (WU-TWC top side). (Front HO2S)
2. Remove the battery and battery tray. (See 01–17B–2 BATTERY REMOVAL/INSTALLATION [L3 WITH TC].)
3. Remove the HO2S using the **SST** before removing the exhaust manifold.



D6U140ZWC009

Insulator Removal Note

1. Remove the charge air cooler and the charge air cooler bracket. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)

Caution

- **When removing the cowl, a part or tool may hit the edge of the windshield and could damage it. Protect the windshield by covering it with a clean rag to prevent damage to the windshield.**

2. Remove the cowl grille. (See 09–16–4 COWL GRILLE REMOVAL/INSTALLATION [L3 WITH TC].)
3. Remove the insulators.

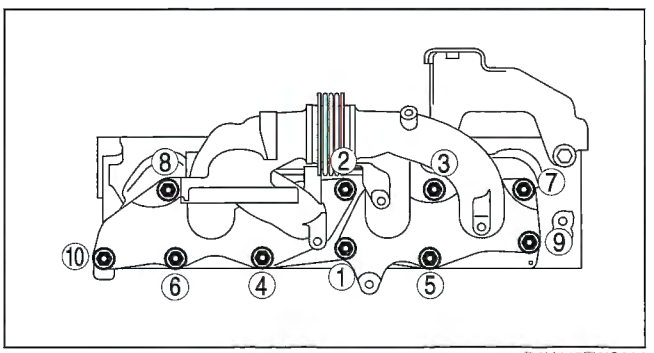
WU-TWC Removal Note

1. Set the generator out of the way.
2. Disconnect the vacuum hose (Master cylinder side).
3. Remove the WU-TWC.

Exhaust Manifold Installation Note

1. Tighten the exhaust manifold installation nuts in the order shown.

Tightening torque
43—64 N·m {4.4—6.5 kgf·m, 32—47 ft·lbf}



D6U115ZWC004

WU-TWC Installation Note

1. Temporarily tighten No.1 shown in the figure.
2. Temporarily tighten No.2 shown in the figure.
3. Temporarily tighten No.3 shown in the figure.
4. Completely tighten No.1 shown in the figure.

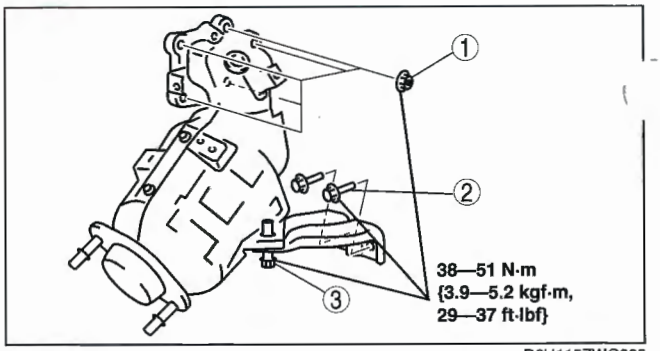
   Tightening torque
   38—51 N·m {3.9—5.2 kgf·m, 29—37 ft·lbf}

5. Completely tighten No.2 shown in the figure.

   Tightening torque
   38—51 N·m {3.9—5.2 kgf·m, 29—37 ft·lbf}

6. Completely tighten No.3 shown in the figure.

   Tightening torque
   38—51 N·m {3.9—5.2 kgf·m, 29—37 ft·lbf}



D6U115ZWC005

Middle Pipe and Main Silencer Installation Note

Note
- If any the following parts are removed, loosen all the nuts installed between these parts and perform the following procedure: catalytic converter, middle pipe, main silencer.

1. Set the middle pipe mount, and temporarily tighten to the catalytic converter.
2. Set the left and right main silencer mounts, and temporarily tighten to the middle pipe.
3. Completely tighten the installation nuts between the catalytic converter and middle pipe.

   Tightening torque
   43—60 N·m {4.4—6.1 kgf·m, 32—44 ft·lbf}

4. Completely tighten the installation nuts between main silencer and middle pipe in the order of left side, then right side.

   Tightening torque
   38—51 N·m {3.9—5.2 kgf·m, 29—37 ft·lbf}

Exhaust Manifold (RH) Installation Note 01–15C–3

EXHAUST SYSTEM INSPECTION [AJ]

E6U011500000W01

1. Start the engine and inspect each exhaust system component for exhaust gas leakage.
   - If there is leakage, repair or replace if necessary.

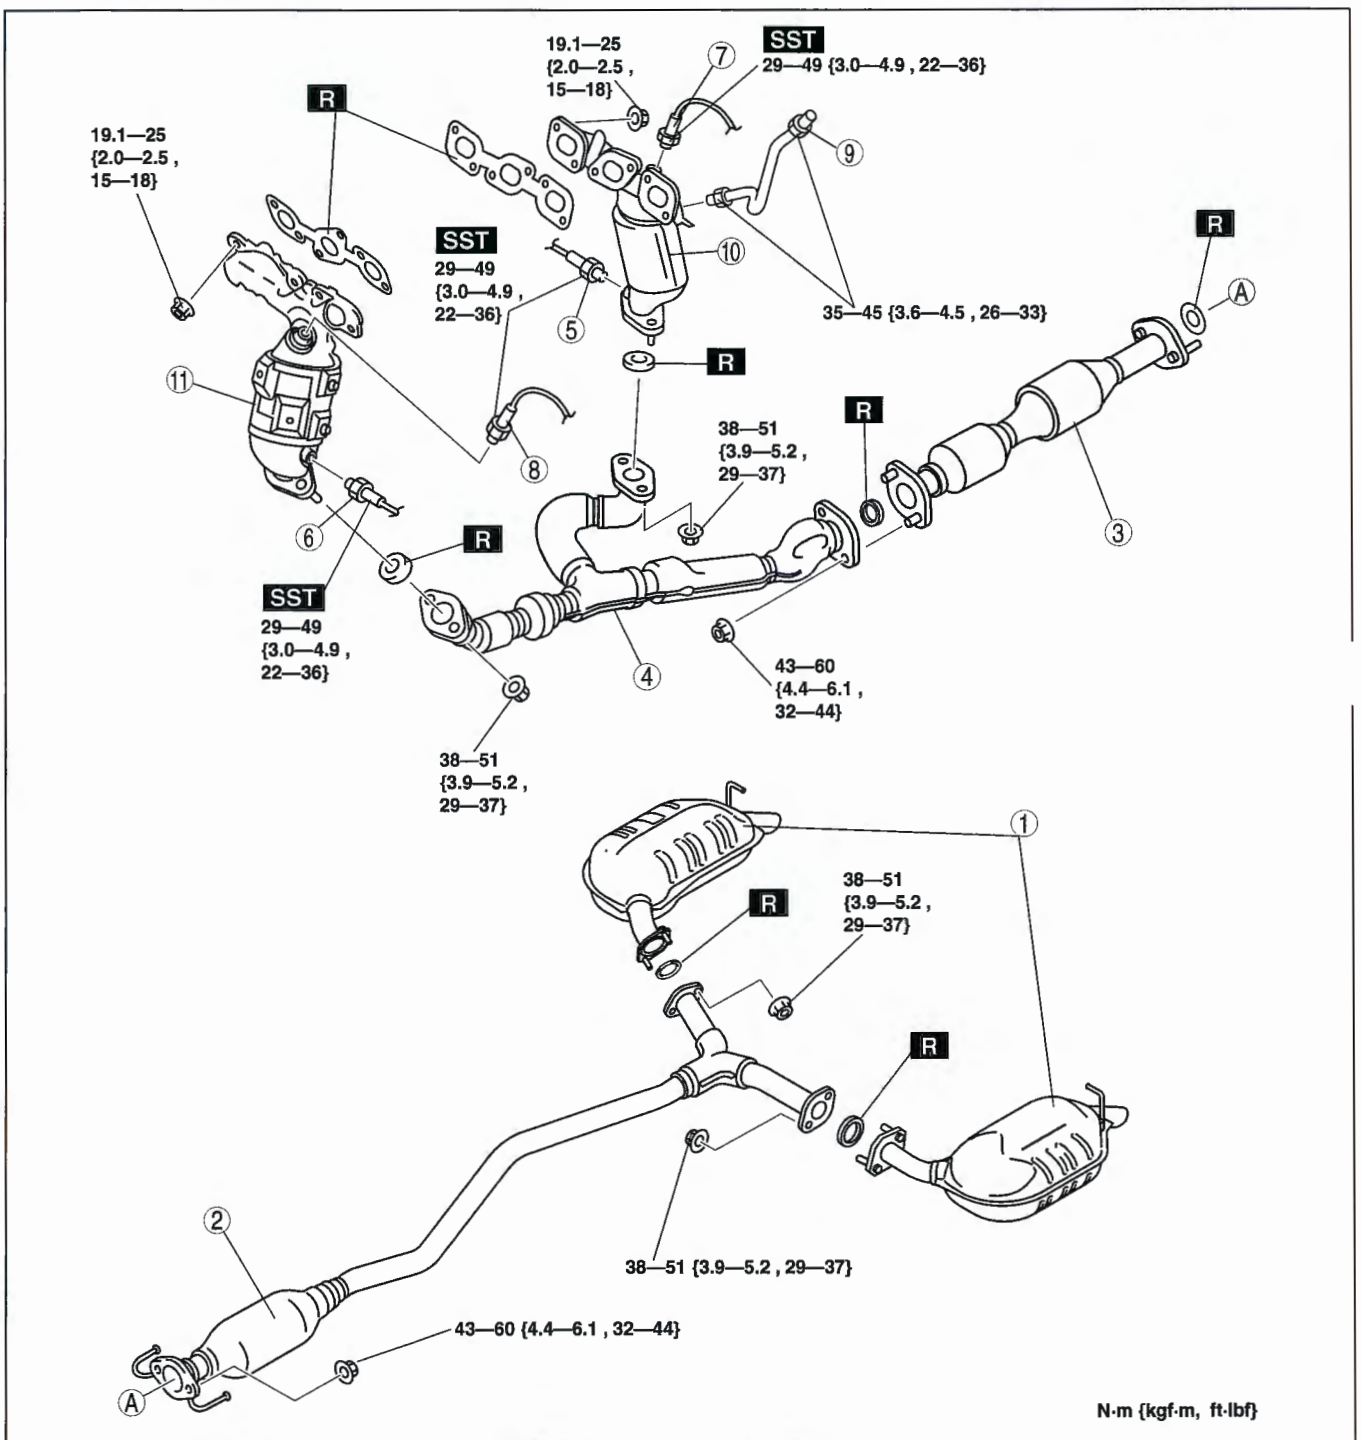
EXHAUST SYSTEM REMOVAL/INSTALLATION [AJ]

E6U011500000W02

Warning

- **When the engine and exhaust system are hot, they can badly burn. Turn off the engine and wait until they are cool before removing the exhaust system.**

1. Disconnect the negative battery cable.
2. Remove in the order indicated in the table.
3. Install in the reverse order of removal.



E6U115BW5L0

1	Main silencer
2	Presilencer
3	TWC
4	Front pipe

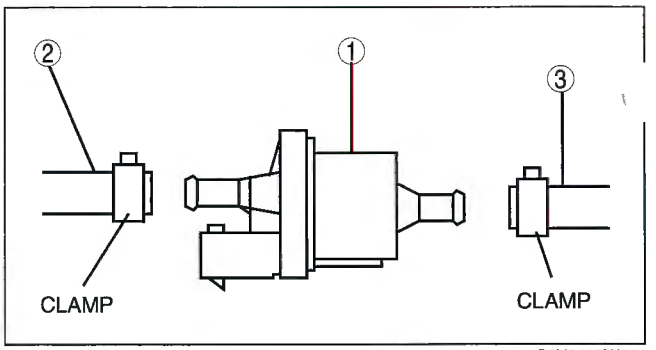
1	Purge solenoid valve (See 01–16A–6 Purge Solenoid Valve Installation Note)

Purge Solenoid Valve Installation Note

1. Install in the order indicated in the table.

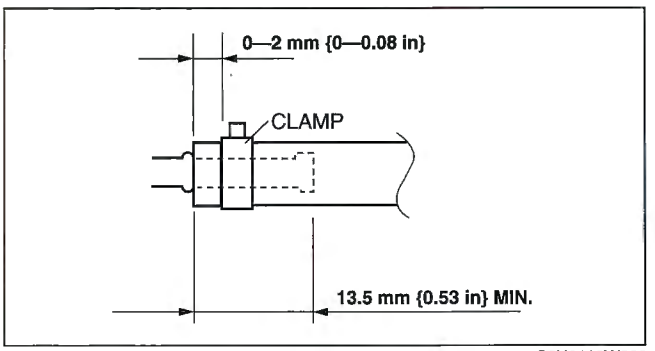
1	Purge solenoid valve
2	Vacuum hose (See 01–16A–6 Hose (purge solenoid valve) installation note)
3	Evaporative hose (See 01–16A–6 Hose (purge solenoid valve) installation note)



C6U0116W911

Hose (purge solenoid valve) installation note

1. Fit the vacuum hose (purge solenoid valve) onto the respective fittings, and install clamps as shown.

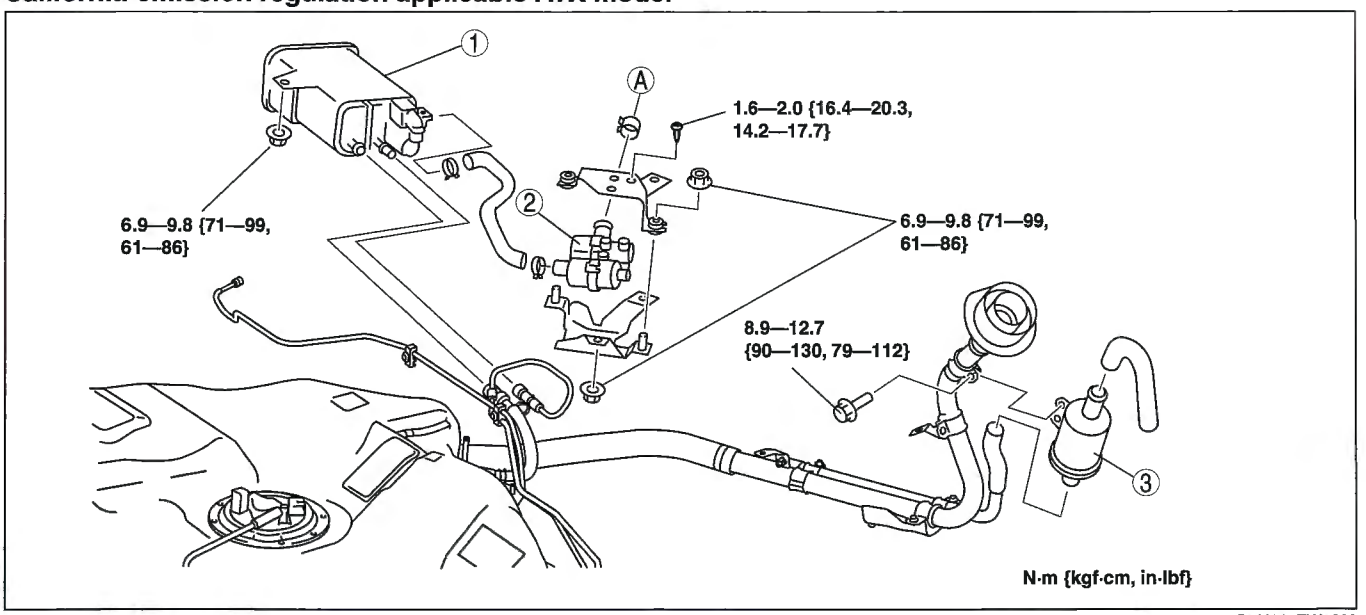


C6U0116W902

Fuel Tank Side

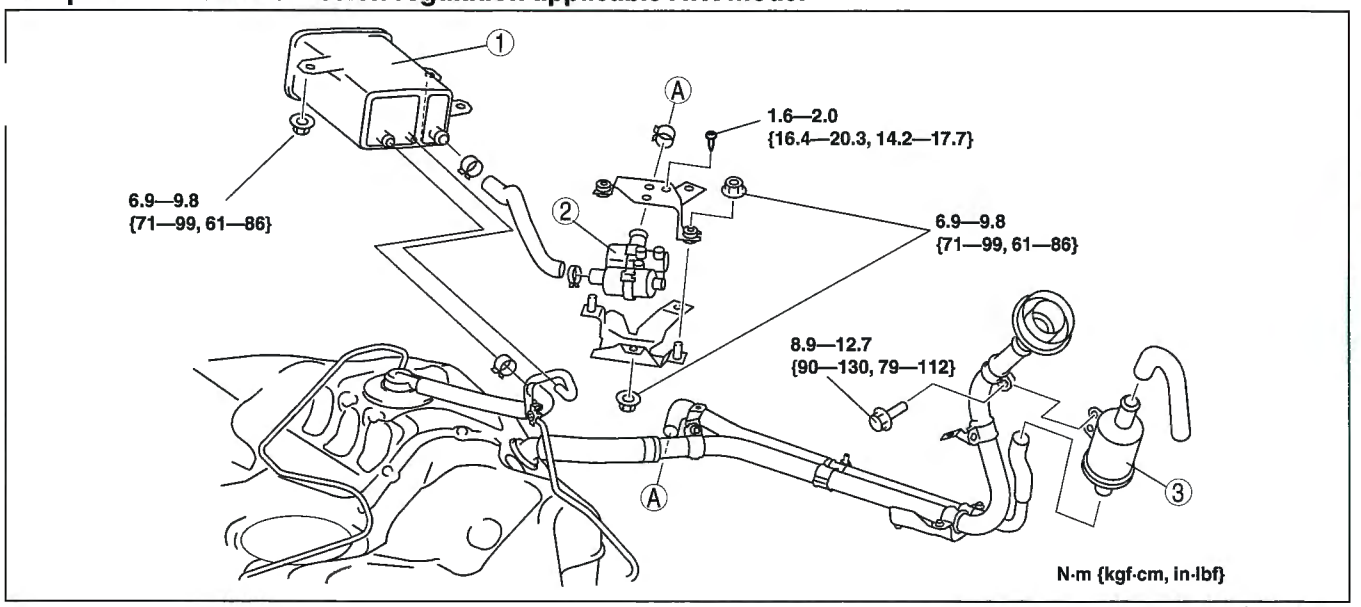
1. Raise the rear of the vehicle and support it with safety stands.
2. Remove in the order indicated in the table.
3. Install in the reverse order of removal.

California emission regulation applicable ATX model



D6U116ZW7009

Except for California emission regulation applicable ATX model



C6U0116W800

1	Charcoal canister (See 01–16A–7 Charcoal Canister Removal Note) (See 01–16A–7 Charcoal Canister Installation Note)
2	EVAP system leak detection pump
3	Air filter

Charcoal Canister Removal Note

- Refer to the "Evaporative Hose Removal Note" to disconnect the evaporative hose (to the purge solenoid valve) from the charcoal canister. (See 01–16A–7 Evaporative Hose Removal Note (Type A).)
  For California emission regulation applicable model, refer to the "Evaporative Hose Removal Note" to disconnect evaporative hose (to the fuel tank) from the charcoal canister. (See 01–16A–8 Evaporative Hose Removal Note (Type B).)

Charcoal Canister Installation Note

- Refer to the "Evaporative Hose Installation Note" to connect the evaporative hose from the charcoal canister. (See 01–16A–9 Evaporative Hose Installation Note.)

Evaporative Hose Removal Note (Type A)

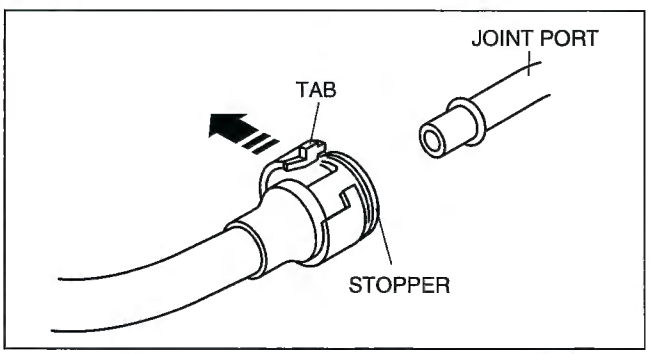
Caution

- **The quick release connector may be damaged if the tab is bent excessively. Do not expand the tab over the stopper.**

1. Disconnect the quick release connector.
   (1) Push the tab on the locking coupler **90** ° until it stops.
   (2) Pull the evaporative hose straight back.

Note

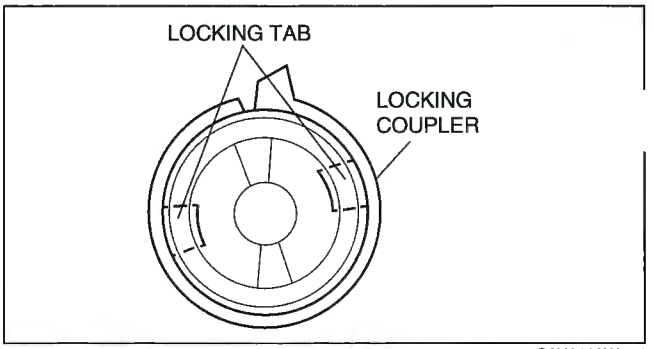
- The stopper may be removed from the quick connector. Take care not to lose it. Reinstall it to the quick release connector before reconnecting the joint port.



C6U0116W903

- The locking coupler has two internal locking tabs which retain the joint port. Be sure that the tab on the locking coupler is rotated until it stops to release two internal locking tabs.

2. Cover the disconnected quick release connector and joint port with vinyl sheets or the like to prevent them from being scratched or contaminated with foreign material.

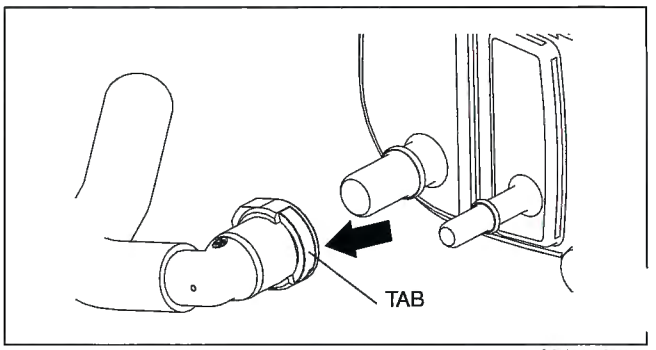


C6U0116W904

Evaporative Hose Removal Note (Type B)

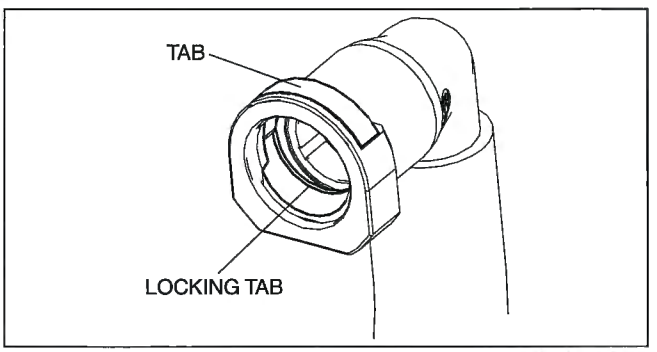
Caution
- **The quick release connector may be damaged if the tab is bent excessively. Do not expand the tab over the stopper.**

1. Disconnect the quick release connector.
   (1) Push the tab on the locking coupler until it stops.
   (2) Pull the evaporative hose straight back.



C6U0116W801

Note
- The locking coupler has the internal locking tab which retain the joint port. Be sure that the tab on the locking coupler is pushed until it stops to release the internal locking tab.

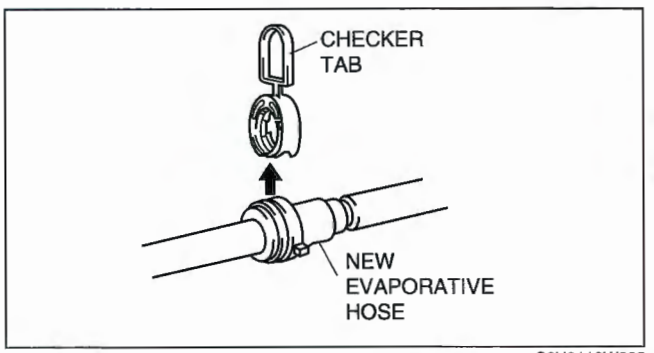


C6U0116W802

2. Cover the disconnected quick release connector and joint port with vinyl sheets or the like to prevent them from being scratched or contaminated with foreign material.

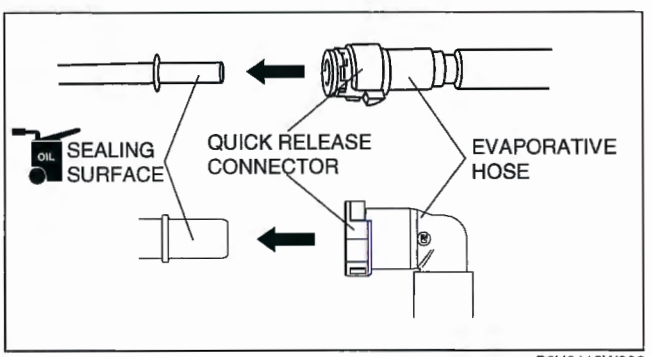
Evaporative Hose Installation Note

Note
- For type A, a checker tab is integrated with the quick release connector for new evaporative hoses. The checker tab will be released from the quick release connector after it is completely engaged with the joint port.



C6U0116W905

1. Inspect the joint port sealing surface for damage and deformation, and replace if necessary.
   - If the quick release connector O-ring is damaged, replace the evaporative hose.
2. Slightly apply clean engine oil to the sealing surface of the joint port.
3. Align the joint port with quick release connector so that the tabs of the retainer are correctly fitted into the quick release connector. Push the quick release connector straight into the joint port until a click is heard.
4. Lightly pull and push the quick release connector a few times by hand and verify that it can move **2.0—3.0 mm {0.08—0.11 in}** and it is connected securely.
   - If the quick release connector does not move at all, verify that O-ring is not damaged and slipped, and reconnect the quick release connector.



C6U0116W906

JEL-FILLER CAP INSPECTION [L3, AJ]

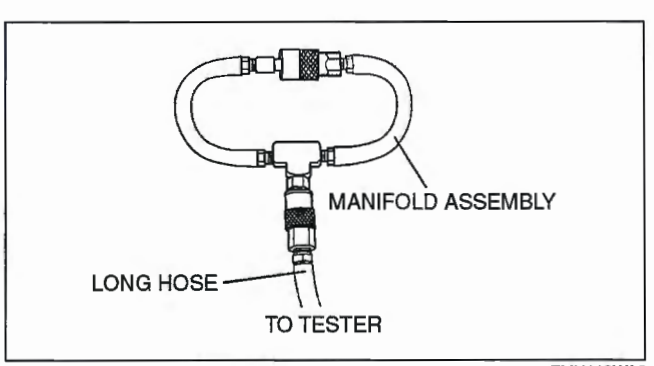
E6U011642250W01

Leakage Inspection

1. Perform the following **SST** (Evaporative Emission System Tester 134-01049) self-test:

Note
- If the tester does not work correctly during self-test, refer to the tester operators manual for more detailed procedures.

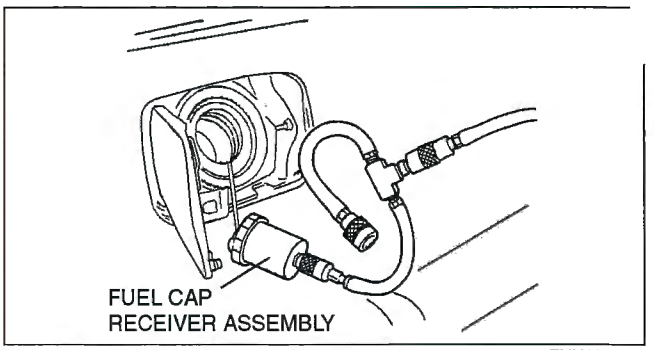
(1) Verify the gas cylinder valve is closed and the control valve located on the tester is in the TEST position. All tester display should be off at this time.
(2) Connect the long hose (part of **SST**) to the tester.
(3) Connect the manifold assembly (part of **SST**) to the long hose as shown.
(4) Open the gas cylinder valve and verify the gas cylinder regulator left gauge reads **10 to 12 psi** (preset at factory).
   - If not, refer to the tester operators manual to contact tester manufacturer.
(5) Press the ON/OFF switch to turn on the **SST** and make sure the left display reads **0.0**.
(6) Turn the control valve on the tester to the FILL position.
(7) Verify the left display reading is **within 13.9 to 14.0 in of water.**
   - If not, adjust the pressure using the regulator knob located on the right side of the tester.
(8) Turn the control valve to TEST position and press the START switch.
(9) After the **2-min** countdown (left display) is completed, the right display shows the total pressure loss for that period. A **0.5 in** of water loss is acceptable on the self-test.
   - If the loss is **more than 0.5 in** of water, do one or more self-test. If the failed test repeats, check for leak using the ultrasonic leak detector (part of **SST**).



ZMU116WA6

2. Press the RESET switch to set the left display reading to **0.0**.

3. Connect the fuel cap receiver assembly (part of **SST**) to the manifold assembly and fuel-filler cap from the vehicle.
   - If the fuel-filler cap is not a genuine part, replace it.
4. Turn the control valve to the FILL position.
5. Wait (**maximum 20 s**) until the left display reads **13.9 to 14 in of water.**
   - If the reading is slightly below the specification, adjust it using the regulator knob.
   - If the reading is far below, the fuel-filler cap has leak. Replace it.
6. Turn the control valve to the TEST position and press the START switch.
7. After the **2-min** countdown (left display) is completed, check the test result (the failed/passed light on the tester).
   - If the green light turns on, the fuel-filler cap is OK.
   - If the red light turns on, the fuel-filler cap has leakage. Replace it.
8. Close the gas cylinder valve.
9. Turn the control valve to the FILL position.
10. Press the ON/OFF switch to turn off the tester.

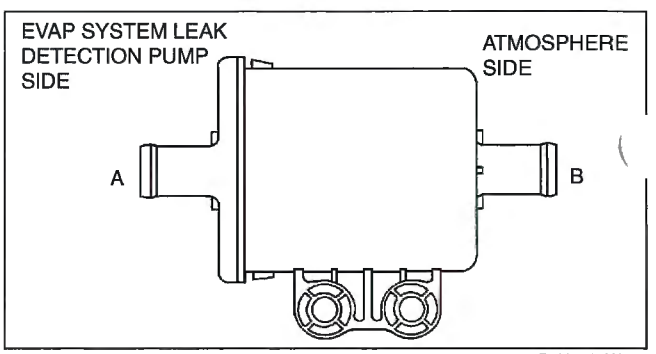


ZMU116WA7

AIR FILTER INSPECTION [L3, AJ]

E6U011613988W01

1. Remove the air filter.
2. Blow from port A and verify that there is airflow from port B.
   - If not as specified, replace the air filter.
3. Blow from port B and verify that there is airflow from port A.
   - If not as specified, replace the air filter.



B6U0116W004

CHARCOAL CANISTER INSPECTION [L3, AJ]

E6U011613970W01

1. Remove the charcoal canister. (See 01–16A–5 EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM COMPONENT REMOVAL/INSTALLATION [L3, AJ].)
2. Plug ports A and C, then blow air into port B.

Caution
- **Do not apply the pressure more than 20 kPa {0.2 kgf/cm^2, 2.8 psi} to the charcoal canister. Doing so will damage the charcoal canister.**

3. Verify that there is no air leakage from the case.
   - If not as specified, replace the charcoal canister.

California emission regulation applicable ATX model

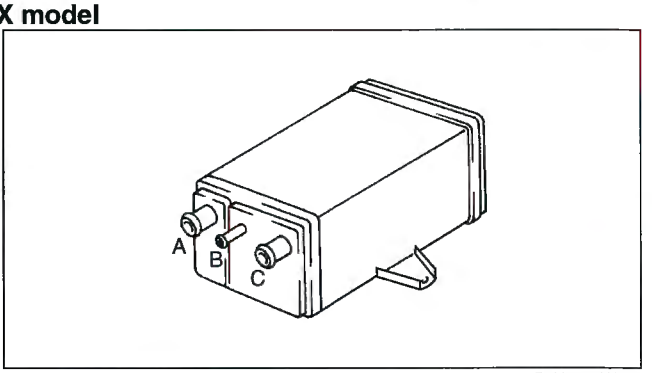
Except for California emission regulation applicable ATX model



B6U0116W005

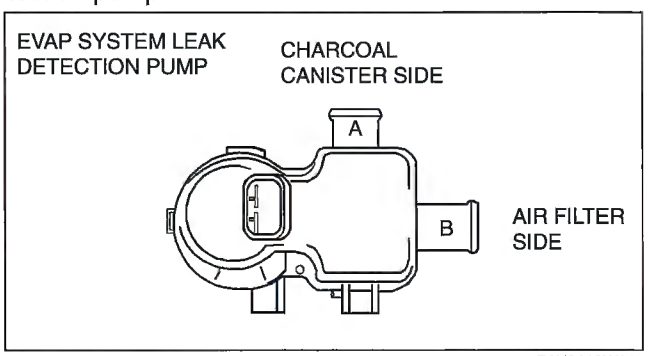
EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTION PUMP INSPECTION [L3, AJ]

E6U011618581W01

Airflow Inspection

Note
- Perform the following test only when directed.

1. Disconnect the negative battery cable.
2. Remove the EVAP system leak detection pump. (See 01–16A–5 EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM COMPONENT REMOVAL/INSTALLATION [L3, AJ].)
3. Blow air into port A and verify that there is airflow from port B.
   - If not as specified, replace the EVAP system leak detection pump.
4. Blow air into port B and verify that there is airflow from port A.
   - If not as specified, replace the EVAP system leak detection pump.
   - If as specified, perform the following "Resistance Inspection".



B6U0116W006

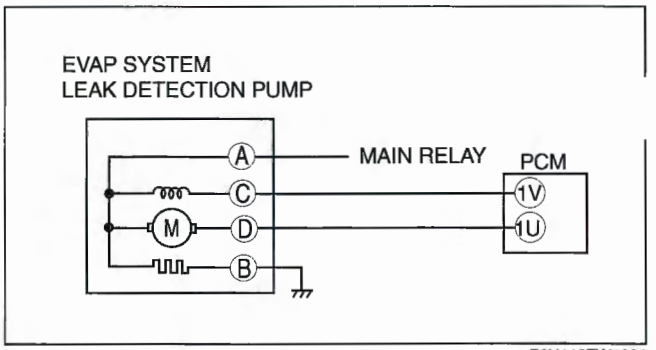
Resistance Inspection

Note
- Perform the following procedure only when directed.

1. Disconnect the negative battery cable.
2. Inspect resistance of the EVAP system leak detection pump.
   - If not as specified, replace the EVAP system leak detection pump.
   - If as specified, carry out the "Circuit Open/Short Inspection".

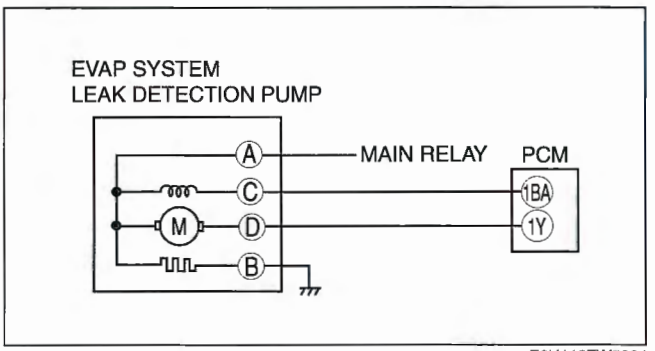
Terminals	Resistance (ohm)
A—B	20—50
A—C	26.6—32.4
A—D	MAX. 118

L3 engine models



E6U116ZW5002

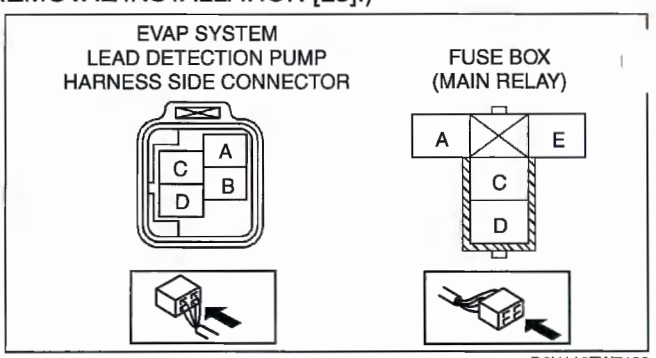
AJ engine models



E6U116ZW5004

Circuit Open/Short Inspection [L3]

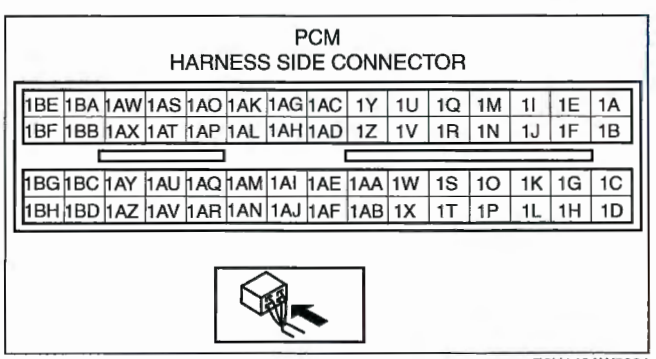
1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harnesses for open or short circuit (continuity check).



D6U116ZW7100

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — EVAP system leak detection pump terminal C and PCM terminal 1V
  - — EVAP system leak detection pump terminal D and PCM terminal 1U
  - — EVAP system leak detection pump terminal A and main relay terminal C
  - — EVAP system leak detection pump terminal B and the body GND



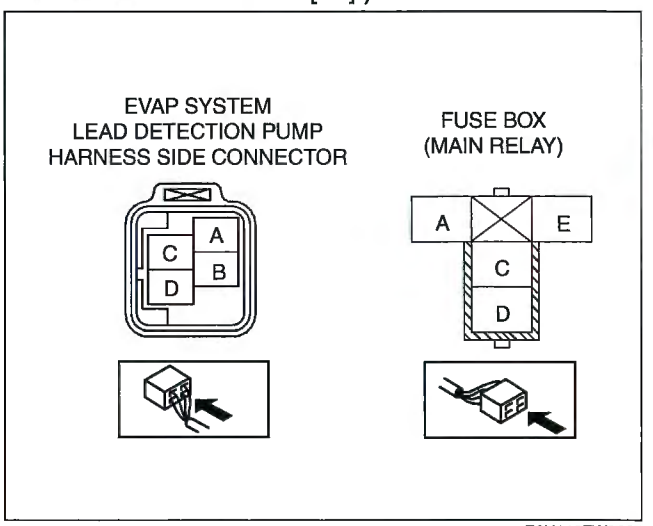
E6U140AW5991

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — EVAP system leak detection pump terminal C and power supply
  - — EVAP system leak detection pump terminal D and power supply
  - — EVAP system leak detection pump terminal A and the body GND
  - — EVAP system leak detection pump terminal B and power supply

Circuit Open/Short Inspection [AJ]

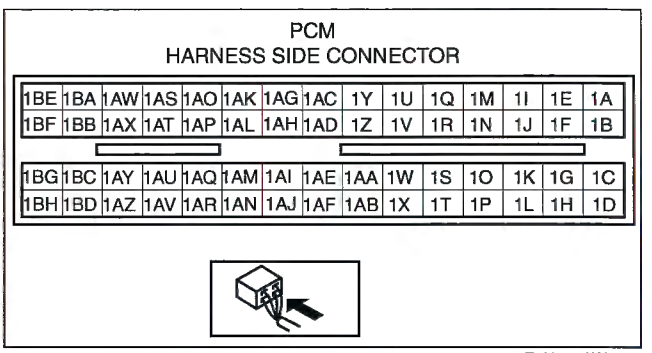
1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following wiring harnesses for open or short circuit (continuity check).



E6U116ZW5005

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — EVAP system leak detection pump terminal C and PCM terminal 1BA
  - — EVAP system leak detection pump terminal D and PCM terminal 1Y
  - — EVAP system leak detection pump terminal A and main relay terminal C
  - — EVAP system leak detection pump terminal B and the body GND



E6U140AW5991

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — EVAP system leak detection pump terminal C and power supply
  - — EVAP system leak detection pump terminal D and power supply
  - — EVAP system leak detection pump terminal A and the body GND
  - — EVAP system leak detection pump terminal B and power supply

PURGE SOLENOID VALVE INSPECTION [L3, AJ]

E6U011618744W01

Airflow Inspection

Note

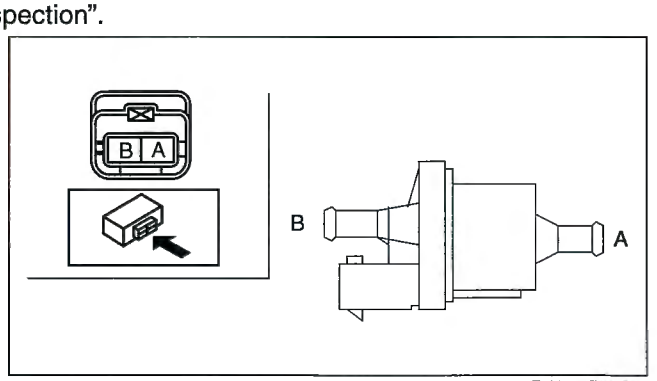
- Perform the following test only when directed.

1. Disconnect the negative battery cable.
2. Remove the purge solenoid valve. (See 01–16A–6 Purge Solenoid Valve Installation Note.)
3. Inspect airflow between the ports under the following conditions.
   - If not as specified, replace the purge solenoid valve.
   - If as specified, carry out the “Circuit Open/Short Inspection”.

O—O : Continuity O=O : Airflow

Step	Terminal		Port	
	A	B	A	B
1	O—O			
2	B+	GND	O=O	

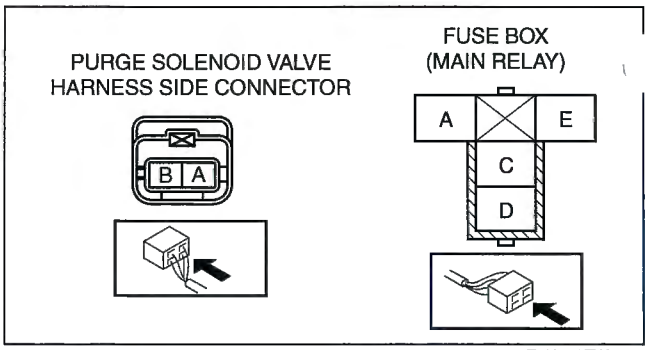
B6U0116W014



E6U116ZW5300

Circuit Open/Short Inspection [L3]

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harnesses for open or short circuit (continuity check).



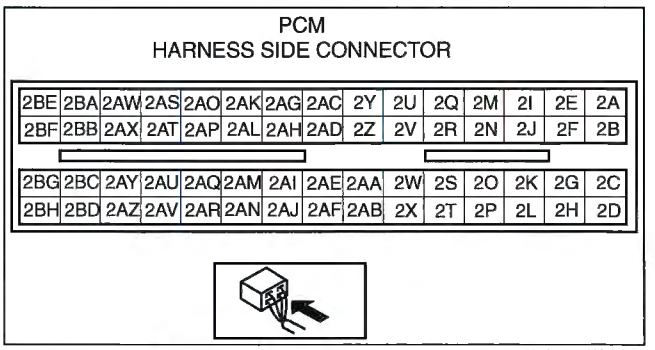
E6U116ZW5301

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Purge solenoid valve terminal A and PCM terminal 2C
  - — Purge solenoid valve terminal B and main relay terminal C

Short circuit

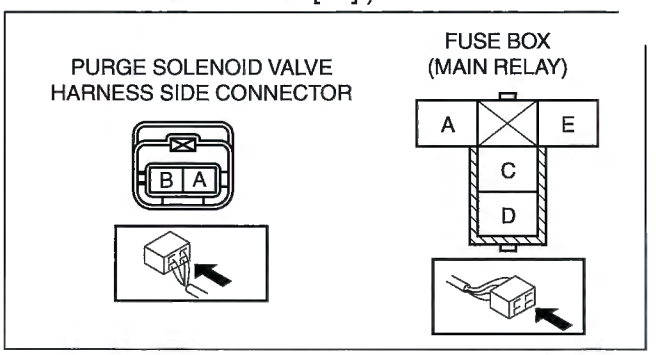
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Purge solenoid valve terminal A and body GND
  - — Purge solenoid valve terminal B and power supply



E6U140AW5992

Circuit Open/Short Inspection [AJ]

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following wiring harnesses for open or short circuit (continuity check).



E6U116ZW5301

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Purge solenoid valve terminal B and PCM terminal 1BF
  - — Purge solenoid valve terminal A and main relay terminal C

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Purge solenoid valve terminal B and body GND
  - — Purge solenoid valve terminal A and power supply

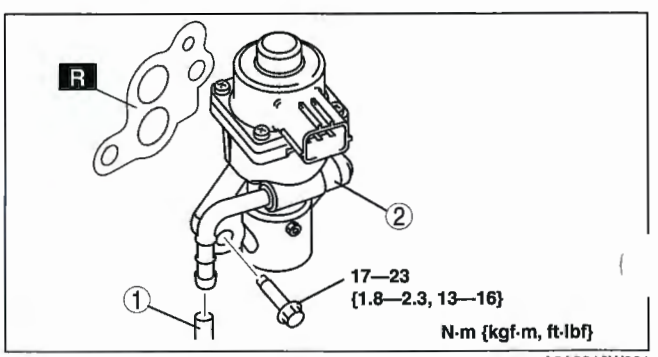
EGR VALVE REMOVAL/INSTALLATION [L3]

E6U011620300W01

1. Disconnect the negative battery cable.
2. Disconnect the EGR valve connector.
3. Remove in the order indicated in the table.

1	Water hose (See 01–16A–17 Water Hose Removal Note)
2	EGR valve (See 01–16A–17 EGR Valve Removal Note)

4. Install in the reverse order of removal.



A6A3916W001

Water Hose Removal Note
- Drain the engine coolant. (See 01–12A–5 ENGINE COOLANT REPLACEMENT [L3, AJ].)

EGR Valve Removal Note
1. Remove the air hose. (See 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3])
2. Remove the upper radiator hose. (See 01–12A–8 RADIATOR REMOVAL/INSTALLATION [L3, AJ].)

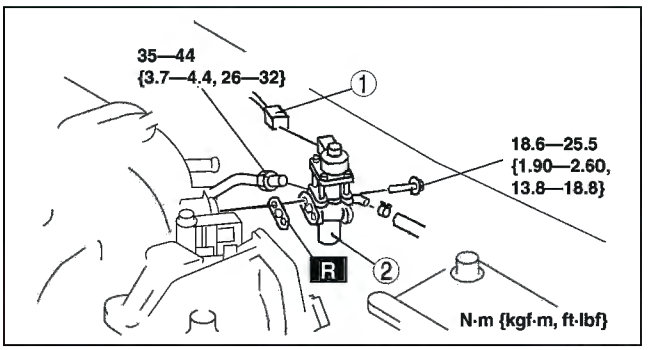
EGR VALVE REMOVAL/INSTALLATION [AJ]

E6U011620300W02

1. Disconnect the negative battery cable.
2. Disconnect the vacuum hose.
3. Disconnect the EGR pipe.
4. Remove in the order indicated in the table.

1	EGR valve connector
2	EGR valve

5. Install in the reverse order of removal.



B6U0116W029

EGR VALVE INSPECTION [L3]

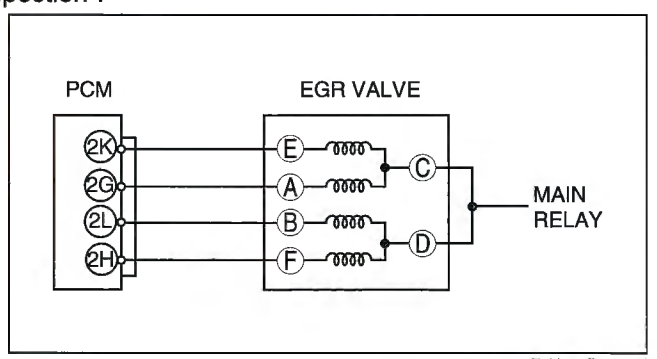
E6U011620300W03

Resistance Inspection

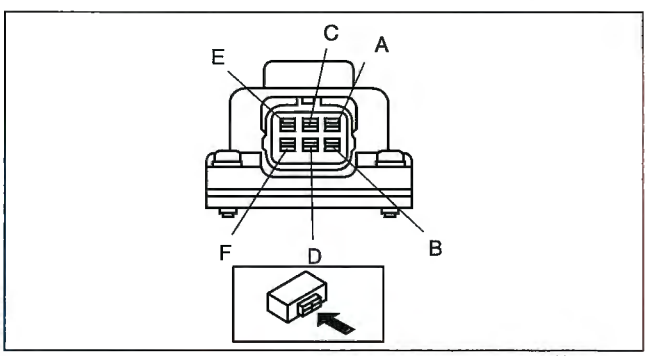
Note
- Perform the following test only when directed.

1. Disconnect the negative battery cable.
2. Inspect resistance of the EGR valve coils.
   - If not as specified, replace the EGR valve.
   - If as specified, carry out the "Circuit Open/Short Inspection".

Terminals	Resistance (ohm)
C—E C—A D—B D—F	12—16



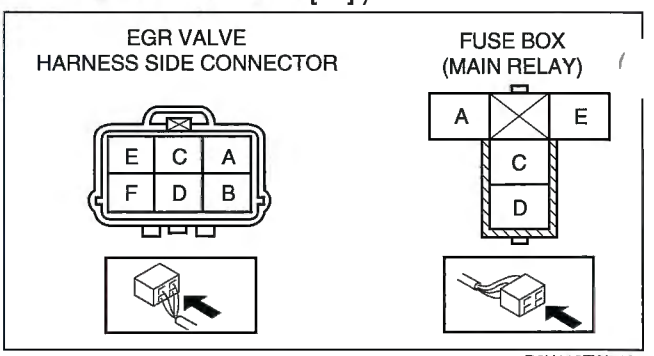
E6U116ZW5003



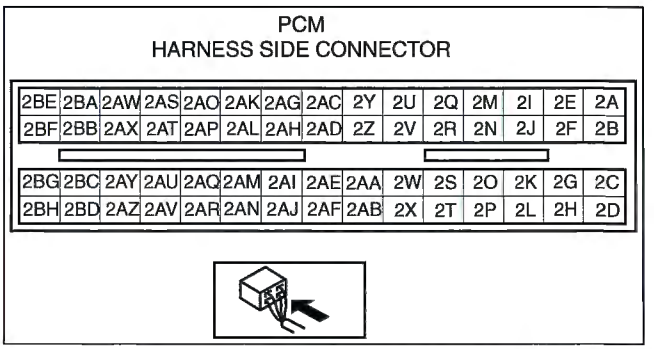
B6U0116W032

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harnesses for open or short circuit (continuity check).



D6U116ZW7105



E6U140AW5992

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — EGR valve terminal E and PCM terminal 2K
  - — EGR valve terminal A and PCM terminal 2G
  - — EGR valve terminal B and PCM terminal 2L
  - — EGR valve terminal F and PCM terminal 2H
  - — EGR valve terminal C or D and main relay terminal C

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — EGR valve terminal E and GND
  - — EGR valve terminal A and GND
  - — EGR valve terminal B and GND
  - — EGR valve terminal F and GND
  - — EGR valve terminal C or D and power supply

3. Remove the EGR valve, and inspect for any damage or clogging.
   - If there is no damage or no clogging, replace the EGR valve.

EGR VALVE INSPECTION [AJ]

E6U011620300W04

Resistance Inspection

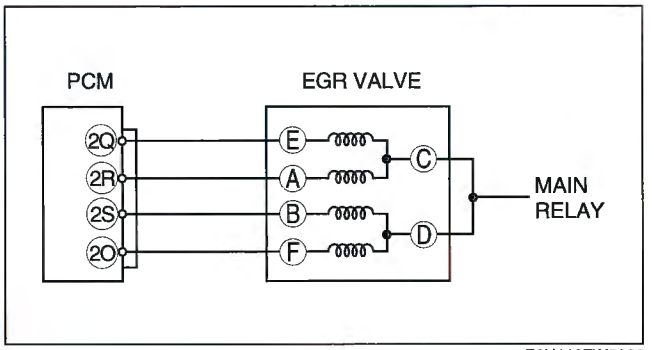
Note

- Perform the following test only when directed.

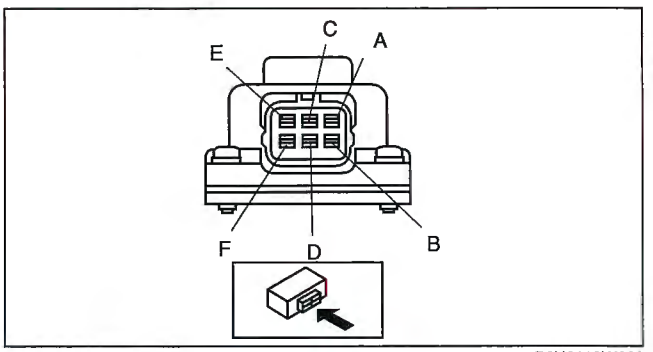
1. Disconnect the negative battery cable.

2. Inspect resistance of the EGR valve coils.
   - If not as specified, replace the EGR valve.
   - If as specified, carry out the "Circuit Open/Short Inspection".

Terminals	Resistance (ohm)
C—E C—A D—B D—F	Approx. 22



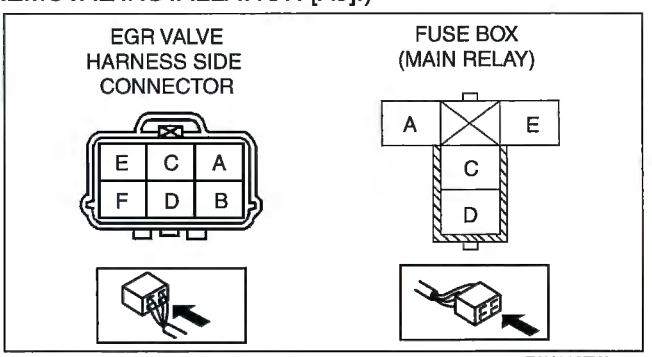
E6U116ZW5006



B6U0116W032

Circuit Open/Short Inspection

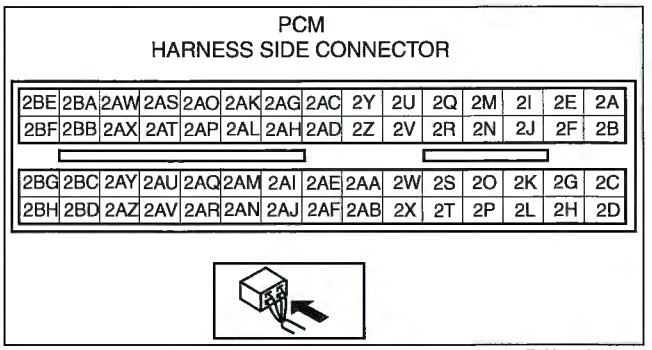
1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following wiring harness for open or short circuit (continuity check).



E6U116ZW5007

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — EGR valve terminal E and PCM terminal 2Q
  - — EGR valve terminal A and PCM terminal 2R
  - — EGR valve terminal B and PCM terminal 2S
  - — EGR valve terminal F and PCM terminal 2O
  - — EGR valve terminal C or D and main relay terminal C



E6U140AW5992

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — EGR valve terminal E and GND
  - — EGR valve terminal A and GND
  - — EGR valve terminal B and GND
  - — EGR valve terminal F and GND
  - — EGR valve terminal C or D and power supply

3. Remove the EGR valve, and inspect for any damage or clogging.
   - If there is no damage or no clogging, replace the EGR valve.

EGR BOOST SENSOR SOLENOID VALVE INSPECTION [AJ]

E6U011618742W01

Airflow Inspection

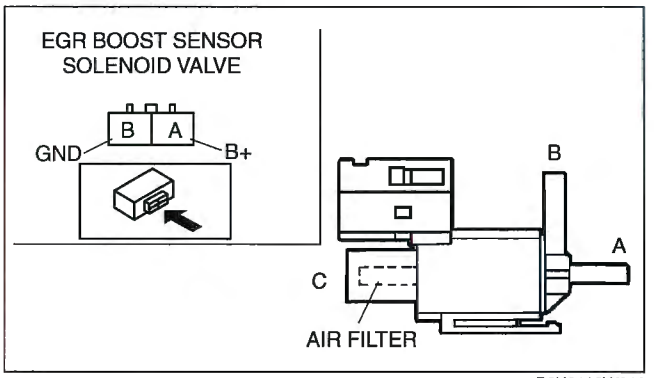
Note
- Perform the following procedure only when directed.

1. Disconnect the negative battery cable.
2. Remove the EGR boost sensor solenoid valve.
3. Inspect airflow between each port under the following conditions.
   - If not as specified, replace the EGR boost sensor solenoid valve.
   - If as specified, carry out the "Circuit Open/Short Inspection".

O—O : Continuity O═O : Airflow

Step	Terminal		Port		
	A	B	A	B	C
1	O—O			O═O	
2	B+	GND	O═O		

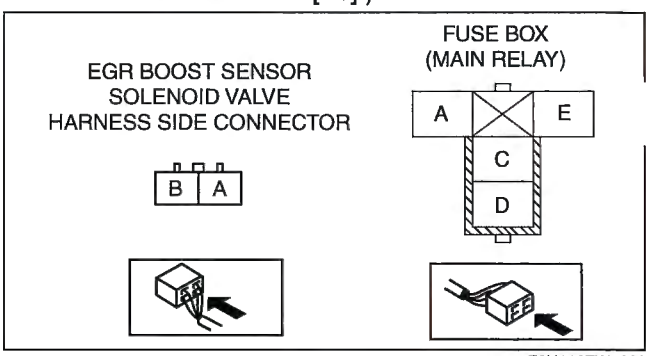
X3U116WCB



B6U0116W019

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following wiring harnesses for open or short circuit (Continuity check).



E6U116ZW5008

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — EGR boost sensor solenoid valve terminal B and PCM terminal 1AX
  - — EGR boost sensor solenoid valve terminal A and main relay terminal C

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — EGR boost sensor solenoid valve terminal B and body GND
  - — EGR boost sensor solenoid valve terminal A and power supply

AJ engine models

D6U116ZW7007

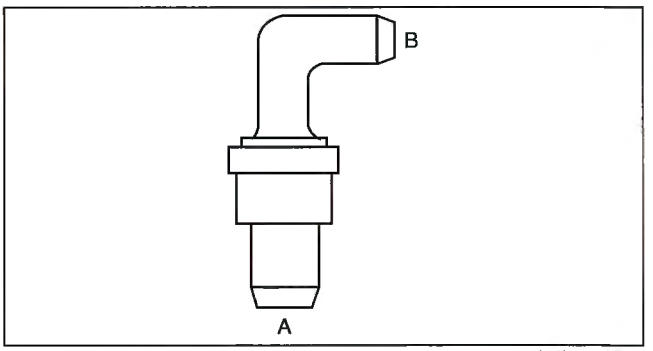
POSITIVE CRANKCASE VENTILATION (PCV) VALVE INSPECTION [L3]

E6U011613890W01

1. Disconnect the negative battery cable.
2. Remove the intake manifold. (see 01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3].) Remove the PCV valve.
3. Blow through the valve and verify that air flows as specified.
   - If not as specified, replace the PCV valve.

Specification

Condition	Airflow
Air applied from port A to B	Yes
Air applied from port B to A	No



A6E3916W007

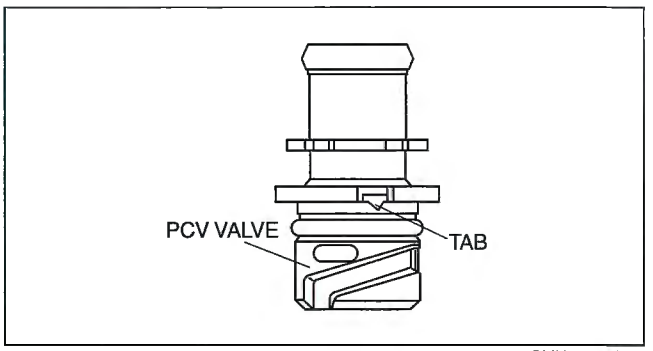
POSITIVE CRANKCASE VENTILATION (PCV) VALVE INSPECTION [AJ]

E6U011613890W02

Note

- Removing the PCV valve might damage to the tab of the PCV valve and it will not be able to be reinstalled. Due to this, inspect the PCV valve with it installed on the vehicle.

1. Disconnect the negative battery cable.
2. Disconnect the PCV hose from the PCV valve.
3. Apply pressure to the PCV valve and verify that there is no airflow.
   - If there is airflow, replace the PCV valve.
4. Apply vacuum to the PCV valve and verify that there is airflow.
   - If there is no airflow, replace the PCV valve.



CMU0116W006

WARM-UP THREE-WAY CATALYTIC CONVERTER (WU-TWC) INSPECTION [L3, AJ]

E6U011620500W02

Caution

- **Perform the following procedures, DTC P0421*1 *2, P0431*2 is indicated only.**

1. Connect the WDS or equivalent to the DLC-2.
2. Start the engine and warm it up to normal operating temperature.
3. Turn off the engine.
4. Verify that the engine compression is within the specification. (See 01–10A–4 COMPRESSION INSPECTION [L3].) (See 01–10C–6 COMPRESSION INSPECTION [AJ].)
   - If the compression pressure is not within the specification, repair or replace the malfunction part.
5. Drive the vehicle for **10 min** at **65—96 km/h {40—60 mph}** to allow the WU-TWC to reach operating temperature.
6. Stop the vehicle and leave it in a safe space.
7. Access Test ID 10:21:80*1, 10:22:80*2 on the "Diagnostic Monitoring Test Result" function.
8. Verify that the test result is within the specified indicated on the WDS or equivalent.
   - If it is not as specified, replace the WU-TWC. (See 01–15A–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3].) (See 01–15C–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [AJ].)

*1 : L3

FUEL-FILLER CAP INSPECTION [L3 WITH TC]

E6U011642250W02

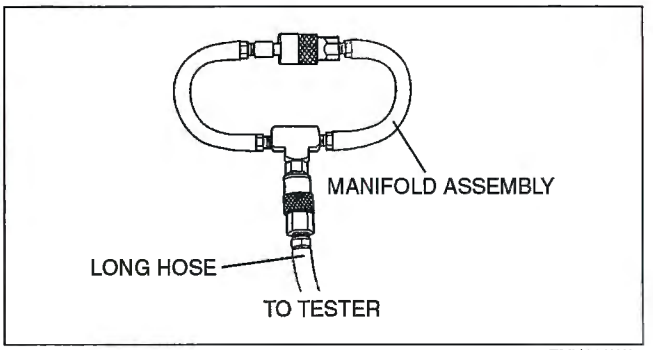
Leakage Inspection

1. Perform the following **SST** (Evaporative Emission System Tester 134-01049) self-test:

Note
- If the tester does not work correctly during self-test, refer to the tester operators manual for more detailed procedures.

(1) Verify that the gas cylinder valve is closed and the control valve located on the tester is in the TEST position. All tester displays should be off at this time.
(2) Connect the long hose (part of **SST**) to the tester.
(3) Connect the manifold assembly (part of **SST**) to the long hose as shown.
(4) Open the gas cylinder valve and verify the gas cylinder regulator left gauge reads **69—82 kPa {0.71—0.84 kgf/cm^2, 10—12 psi}** (preset at factory).
- If not, refer to the tester operators manual to contact tester manufacturer.

(5) Press the ON/OFF switch to turn on the **SST** and make sure the left display reads **0.0**.
(6) Turn the control valve on the tester to the FILL position.



ZMU116WA6

(7) Verify the left display reading is **within 13.9 to 14.0 in of water.**
- If not, adjust the pressure using the regulator knob located on the right side of the tester.

(8) Turn the control valve to TEST position and press the START switch.
(9) After the **2-min** countdown (left display) is completed, the right display shows the total pressure loss for that period. A **0.5 in** of water loss is acceptable on the self-test.
- If the loss is **more than 0.5 in** of water, do one or more self-test. If the failed test repeats, check for leak using the ultrasonic leak detector (part of **SST**).

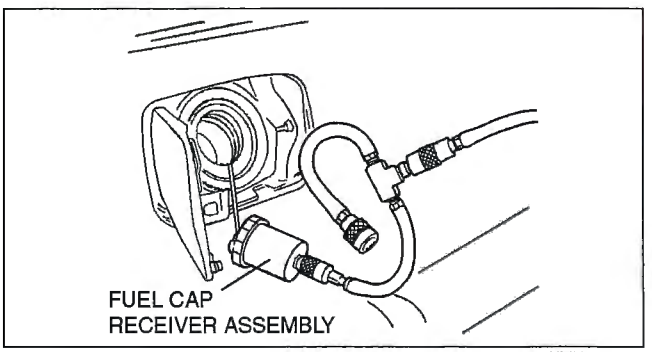
Press the RESET switch to set the left display reading to **0.0**.

3. Connect the fuel cap receiver assembly (part of **SST**) to the manifold assembly and fuel-filler cap from the vehicle.
- If the fuel-filler cap is not a genuine part, replace it.

4. Turn the control valve to the FILL position.
5. Wait (**maximum 20 s**) until the left display reads **13.9 to 14 in of water.**
- If the reading is slightly below the specification, adjust it using the regulator knob.
- If the reading is far below, the fuel-filler cap has leak. Replace it.

6. Turn the control valve to the TEST position and press the START switch.
7. After the **2-min** countdown (left display) is completed, check the test result (the failed/passed light on the tester).
- If the green light turns on, the fuel-filler cap is normal.
- If the red light turns on, the fuel-filler cap has leakage. Replace it.

8. Close the gas cylinder valve.
9. Turn the control valve to the FILL position.
10. Press the ON/OFF switch to turn off the tester.

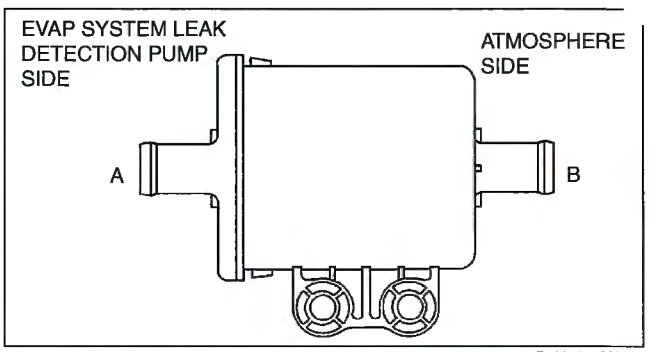


ZMU116WA7

AIR FILTER INSPECTION [L3 WITH TC]

E6U011613988W02

1. Remove the air filter.
2. Blow from port A and verify that there is airflow from port B.
   - If not as specified, replace the air filter.
3. Blow from port B and verify that there is airflow from port A.
   - If not as specified, replace the air filter.



B6U0116W004

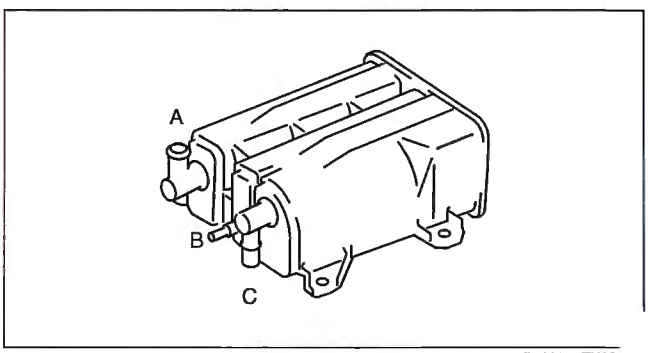
CHARCOAL CANISTER INSPECTION [L3 WITH TC]

E6U011613970W02

1. Remove the charcoal canister. (See 01–16B–4 EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Plug ports A and C, then blow air into port B.

Caution
- **Do not apply the pressure more than 20 kPa {0.2 kgf/cm^2, 2.8 psi} to the charcoal canister. Doing so will damage the charcoal canister.**

3. Verify that there is no air leakage from the case.
   - If not as specified, replace the charcoal canister. (See 01–16B–6 Fuel Tank Side.)

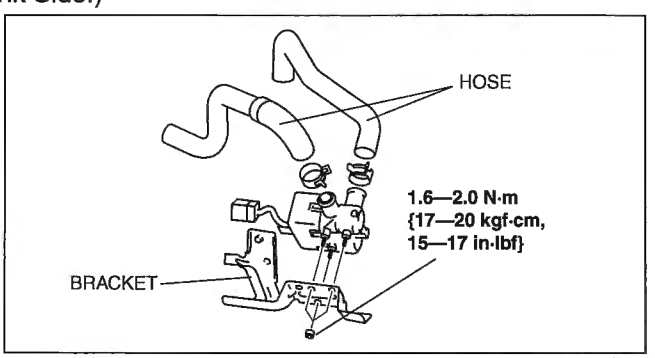


D6U116ZWC(

EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTION PUMP REMOVAL/INSTALLATION [L3 WITH TC]

E6U011618581W02

1. Removal the charcoal canister. (See 01–16B–6 Fuel Tank Side.)
2. Remove the EVAP system leak detection pump. (See 01–16B–6 Fuel Tank Side.)
3. Install in the reverse order of removal.



D6U116ZWC006

EVAPORATIVE EMISSION (EVAP) SYSTEM LEAK DETECTION PUMP INSPECTION [L3 WITH TC]

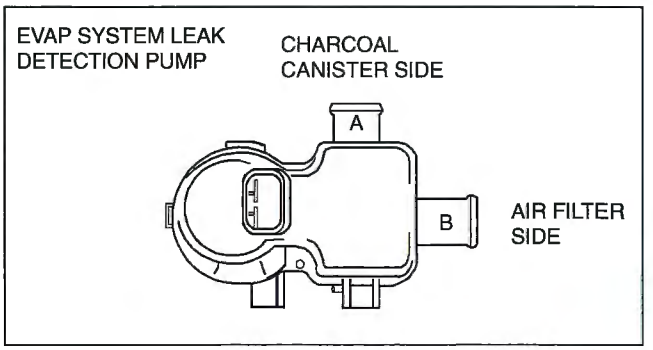
E6U011618581W03

Airflow Inspection

Note
- Perform the following test only when directed.

1. Disconnect the negative battery cable.
2. Remove the EVAP system leak detection pump. (See 01–16B–4 EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
3. Blow air into port A and verify that there is airflow from port B.
   - If not as specified, replace the EVAP system leak detection pump.

4. Blow air into port B and verify that there is airflow from port A.
   - If not as specified, replace the EVAP system leak detection pump.
   - If as specified, perform the following "Resistance Inspection".



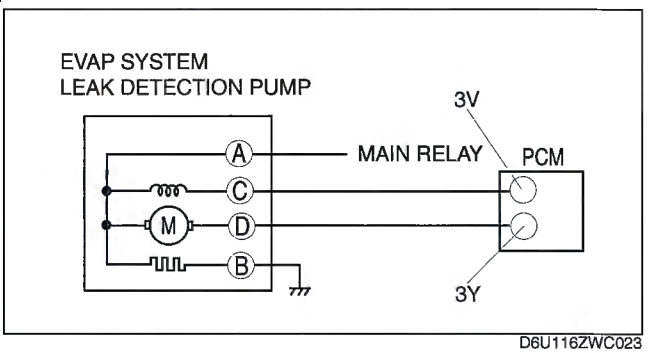
B6U0116W006

Resistance Inspection

Note
- Perform the following procedure only when directed.

1. Disconnect the negative battery cable.
2. Inspect resistance of the EVAP system leak detection pump.
   - If not as specified, replace the EVAP system leak detection pump.
   - If as specified, carry out the "Circuit Open/Short Inspection".

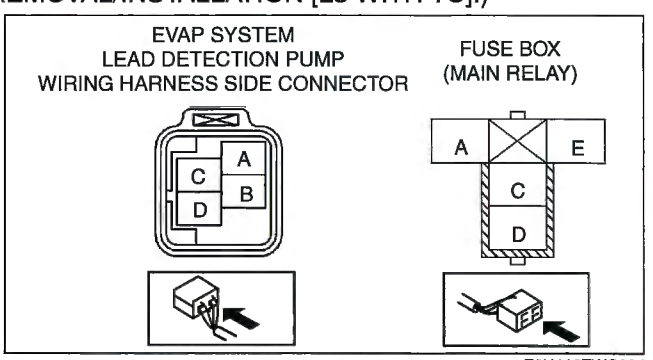
Terminals	Resistance (ohm)
A—B	20—50
A—C	26.6—32.4
A—D	MAX. 118



D6U116ZWC023

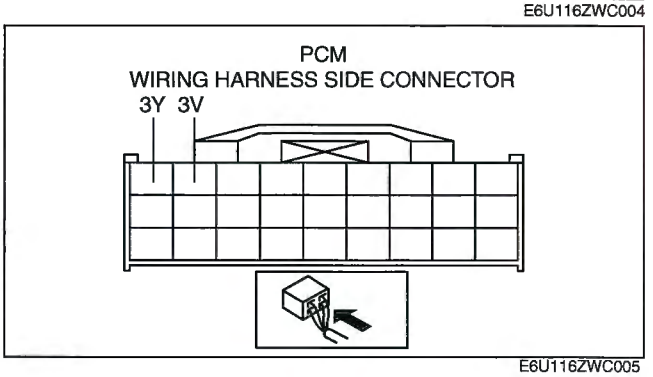
Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harnesses for an open or short circuit (continuity check).



E6U116ZWC004

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — EVAP system leak detection pump terminal C and PCM terminal 3V
  - — EVAP system leak detection pump terminal D and PCM terminal 3Y
  - — EVAP system leak detection pump terminal A and main relay terminal C
  - — EVAP system leak detection pump terminal B and the body Ground



E6U116ZWC005

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — EVAP system leak detection pump terminal C and power supply
  - — EVAP system leak detection pump terminal D and power supply
  - — EVAP system leak detection pump terminal A and the body Ground
  - — EVAP system leak detection pump terminal B and power supply

PURGE SOLENOID VALVE INSPECTION [L3 WITH TC]

E6U011618744W02

Airflow Inspection

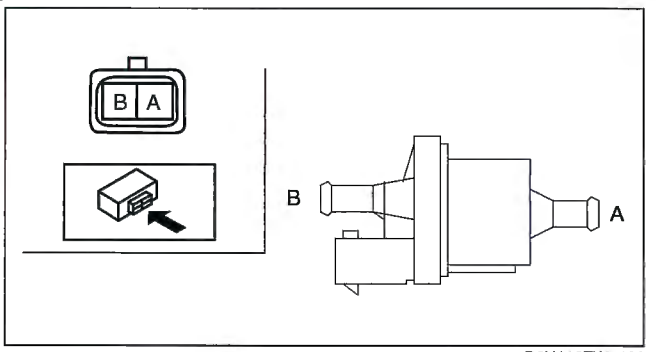
Note
- Perform the following test only when directed.

1. Disconnect the negative battery cable.
2. Remove the purge solenoid valve. (See 01–16B–4 Engine Compartment Side.)
3. Inspect airflow between the ports under the following conditions.
   - If not as specified, replace the purge solenoid valve.
   - If as specified, carry out the "Circuit Open/Short Inspection".

O—O : Continuity O═O : Airflow

Step	Terminal		Port	
	A	B	A	B
1	O—O			
2	B+	GND	O═O	

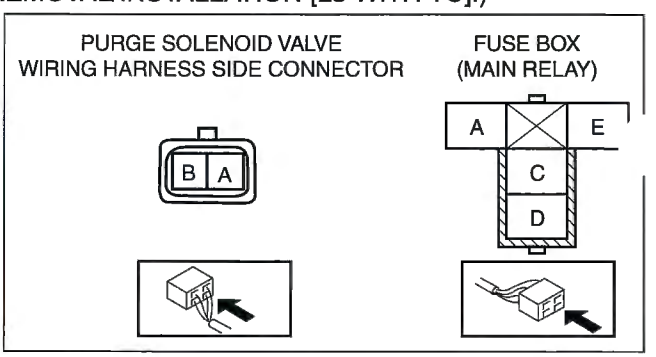
B6U0116W014



D6U116ZW7109

Circuit Open/Short Inspection

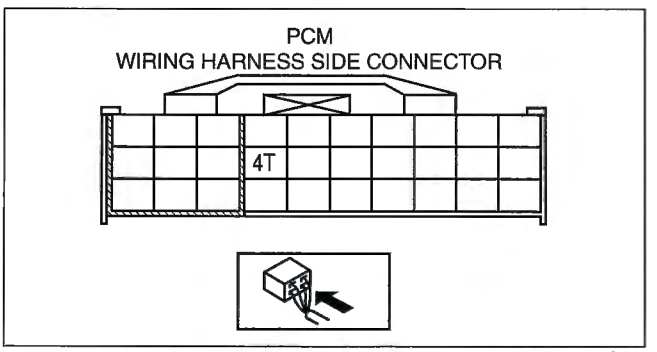
1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harnesses for an open or short circuit (continuity check).



E6U116ZWC006

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Purge solenoid valve terminal B and PCM terminal 4T
  - — Purge solenoid valve terminal A and main relay terminal C

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Purge solenoid valve terminal B and body Ground
  - — Purge solenoid valve terminal A and power supply



D6U116ZWC024

CHECK VALVE INSPECTION [L3 WITH TC]

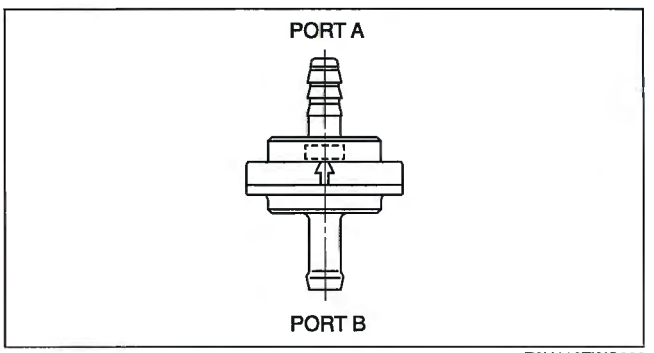
E6U011642910W01

1. Remove the check valve. (See 01–16B–4 EVAPORATIVE EMISSION (EVAP) CONTROL SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Blow through the valve and verify that air flows as specified.
   - If not as specified, replace the check valve.

Specification

Condition	Airflow
Air applied from port B to A	Yes
Air applied from port A to B	No*

* : The check valve is normal if the aeration to port B is **3.5 kPa/min {0.03 kgf/cm^2·min, 0.5 psi/min} or less** when **130 kPa {1.32 kgf/cm^2, 18.9 psi}** is applied to port A.



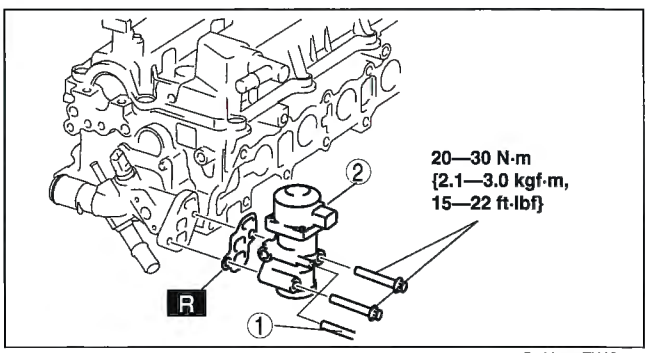
E6U116ZWC003

EGR VALVE REMOVAL/INSTALLATION [L3 WITH TC]

E6U011620300W05

1. Disconnect the negative battery cable.
2. Disconnect the EGR valve connector.
3. Drain the engine coolant. (See 01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)
4. Remove in the order indicated in the table.
5. Install in the reverse order of removal.

1	Water hose
2	EGR valve (See 01–16B–11 EGR Valve Removal Note.)



D6U116ZWC003

EGR Valve Removal Note

1. Remove the air hose. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)

EGR VALVE INSPECTION [L3 WITH TC]

E6U011620300W06

Resistance Inspection

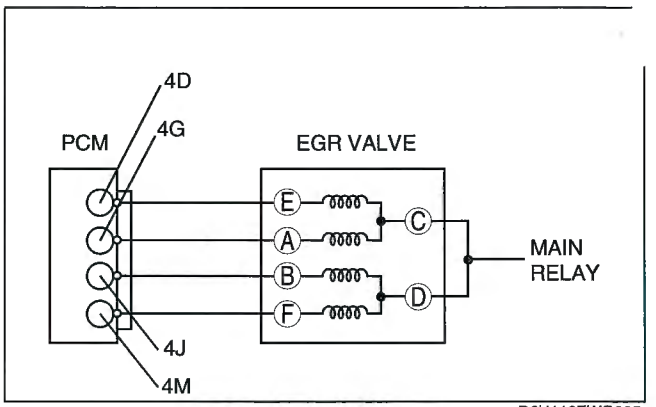
Note

- Perform the following test only when directed.

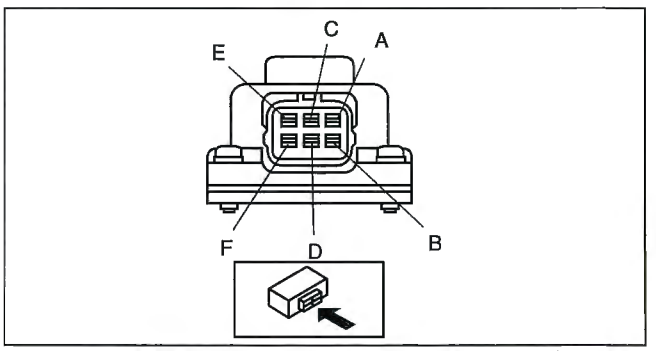
1. Disconnect the negative battery cable.

2. Inspect resistance of the EGR valve coils.
   - If not as specified, replace the EGR valve.
   - If as specified, carry out the "Circuit Open/Short Inspection".

Terminals	Resistance (ohm)
C—E C—A D—B D—F	8—9



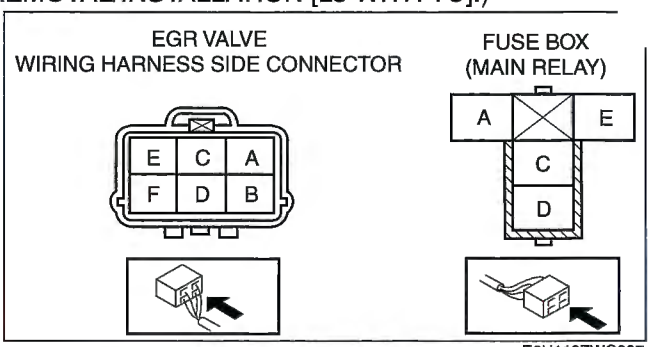
D6U116ZWC025



B6U0116W032

Circuit Open/Short Inspection

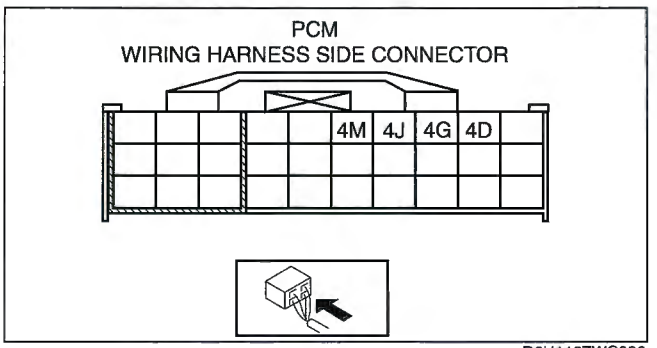
1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harnesses for open or short circuit (continuity check).



E6U116ZWC007

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — EGR valve terminal E and PCM terminal 4D
  - — EGR valve terminal A and PCM terminal 4G
  - — EGR valve terminal B and PCM terminal 4J
  - — EGR valve terminal F and PCM terminal 4M
  - — EGR valve terminal C or D and main relay terminal C



D6U116ZWC026

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — EGR valve terminal E and Ground
  - — EGR valve terminal A and Ground
  - — EGR valve terminal B and Ground
  - — EGR valve terminal F and Ground
  - — EGR valve terminal C or D and power supply

3. Remove the EGR valve, and inspect for any damage or clogging.
   - If there is no damage or clogging, replace the EGR valve.

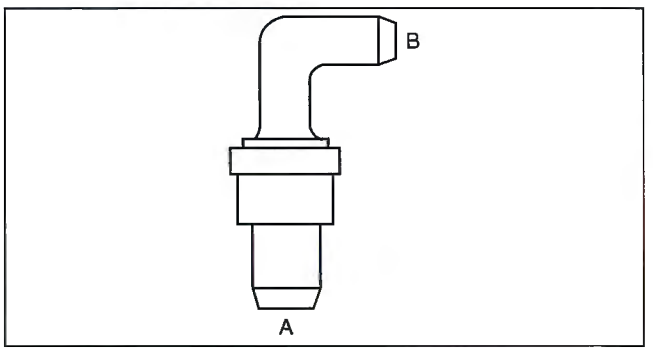
POSITIVE CRANKCASE VENTILATION (PCV) VALVE INSPECTION [L3 WITH TC]

E6U011613890W03

1. Remove the PCV valve. (See 01–16B–5 Positive Crankcase Ventilation (PCV) Valve Removal Note.)
2. Blow through the valve and verify that air flows as specified.
   - If not as specified, replace the PCV valve.

Specification

Condition	Airflow
Air applied from port A to B	Yes
Air applied from port B to A	No



A6E3916W007

WARM-UP THREE-WAY CATALYTIC CONVERTER (WU-TWC) INSPECTION [L3 WITH TC]

E6U011620500W03

Caution
- **Perform the following procedures, DTC P0421 is indicated only.**

1. Connect the WDS or equivalent to the DLC-2.
2. Start the engine and warm it up to normal operating temperature.
3. Turn off the engine.
4. Verify that the engine compression is within the specification. (See 01–10B–9 COMPRESSION INSPECTION [L3 WITH TC].)
   - If the compression pressure is not within the specification, repair or replace the malfunction part.
5. Drive the vehicle for **10 min** at **65—96 km/h {40—60 mph}** to allow the WU-TWC to reach operating temperature.
6. Stop the vehicle and leave it in a safe space.
   Access Test ID 10:21:80 on the "Diagnostic Monitoring Test Result" function.
7. Verify that the test result is within the specified indicated on the WDS or equivalent.
   - If it is not as specified, replace the WU-TWC. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/ INSTALLATION [L3 WITH TC].)

01–17A CHARGING SYSTEM [L3, AJ]

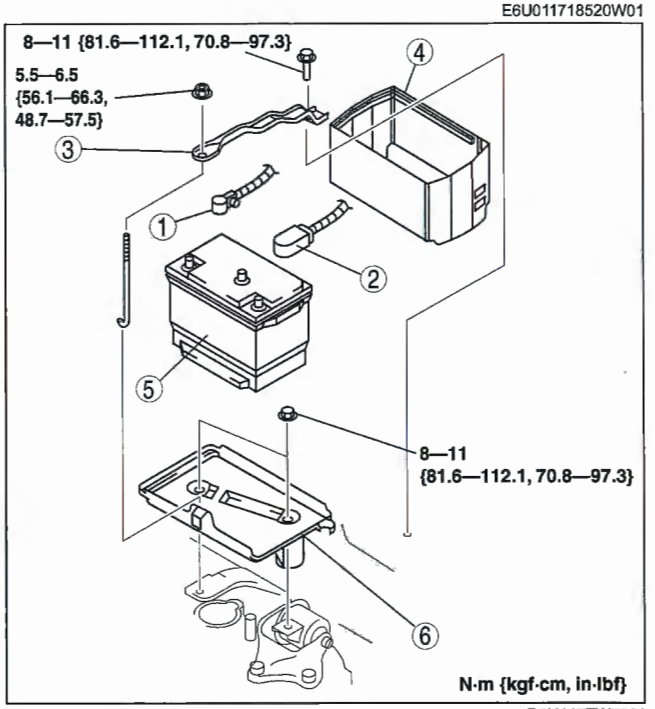
BATTERY REMOVAL/INSTALLATION [L3, AJ]

1. Remove in the order indicated in the table.

1	Negative battery cable
2	Positive battery cable
3	Battery clamp
4	Battery box
5	Battery
6	Battery tray

2. Install in the reverse order of removal.

E6U011718520W01



D6U117ZW7001

BATTERY INSPECTION [L3, AJ]

E6U011718520W02

Warning
- **Since battery acid is toxic, be careful when handling the battery.**
- **Since battery acid is highly corrosive, be careful not to allow it to contact clothing or the vehicle.**
- **In case battery acid contacts skin, eyes, or clothing, flush it immediately with running water. Especially if the acid gets in the eyes, flush with water for more than 15 min. and get prompt medical attention.**

Electrolyte gravity

1. Measure the electrolyte gravity using a hydrometer.
   - If it is less than the specification, recharge the battery. (See 01–17A–3 BATTERY RECHARGING [L3, AJ].)

Standard electrolyte gravity
1.22—1.29 [20 °C {68 °F}]

Inspection and Verification

1. Verify that the customer concern by operating the system.
2. Visually inspect for obvious signs of mechanical or electrical damage.

Visual Inspection Chart

Mechanical	Electrical
• Battery • Battery mounting	• Battery cables • Battery posts

3. If an obvious cause for a concern is found, correct the cause before proceeding to the next step.
4. If the fault is not visually evident, proceed to the pin point test.

Battery Condition Test

Note
- Failure to fully charge the battery before retesting may cause false readings.

Pin point test

1. Verify the battery condition using the Battery Analyzer.
   - If the meter read, GOOD BATTERY, inspect the generator. (See 01–17A–5 GENERATOR INSPECTION [L3, AJ].)
   - If the meter read, GOOD-RECHARGE, charge the battery and inspect the generator. (See 01–17A–5 GENERATOR INSPECTION [L3, AJ].)
   - If the meter read, CHARGE & RETEST, fully charge the battery and retest.
   - If the meter read, REPLACE BATTERY, install a new battery.
   - If the meter read, BAD CELL-REPLACE, install a new battery.

Back-up current

1. Verify that the ignition switch is off (key has been removed) and that all doors are closed.
2. Disconnect the negative battery cable.
3. Connect the tester between the negative battery terminal and negative battery cable, leave the battery undisturbed for **15 min.**, and then measure the back-up current.
   - If not within the specification, measure the back-up current while removing the fuses one by one from the inside of the main fuse block and the inside of the fuse block.

Note
- If the battery is not left undisturbed for **15 min.**, the tester will indicate a high value (**approx. 300 mA**).
- If the key or any electrical accessory is operated within **approx. 15 min.** after the tester is connected, the battery must be left undisturbed for **approx. 15 min.** from that point.

Caution
- **Operating electrical loads while the back-up current is being measured can damage the tester.**

Note
- For vehicles with the immobilizer system, the system periodically shifts synchronization of the security light flashing. Therefore, **45 mA (0.1 s)** current is supplied when the security light is illuminated, and **25 mA (2 s)** current is supplied when the security light is not illuminated. In addition, the measuring instrument, which shows the average value, indicates around **30 mA**.

Battery back-up current
Vehicles with immobilizer system: 25—45 mA
Vehicles without immobilizer system: 30 mA or less

4. Inspect and repair wiring harnesses and connectors of the fuse where the current has decreased.

BATTERY RECHARGING [L3, AJ]

E6U011718520W03

Warning

- **Hydrogen and oxygen gases are produced during normal battery operation. This gas mixture can explode if flames, sparks, or lighted tobacco are brought near the battery. When charging or using a battery in an enclosed space, always provide ventilation and shield your face and eyes. Failure to follow these instructions may result in personal injury.**
- **Batteries contain sulfuric acid. Avoid contact with skin or eyes. Also, shield your eyes when working near the battery to protect against possible splashing of the acid solution. In case contact with the skin, eyes, or clothing, flush immediately with water for a period of 15 min. and get prompt medical attention. If acid is swallowed, call physician immediately. Failure to follow these instructions may result in personal injury.**
- **Wear safety glasses. Battery charging can be dangerous. While being charged, the battery produces a potentially explosive mixture of hydrogen and oxygen gases. Keep sparks, flames and lighted cigarettes away from batteries. In case of acid contact with skin, eyes or clothing, flush immediately with large amounts of water. Get medical attention. Failure to follow these instructions may result in personal injury.**

Caution

- **Keep the battery and the surrounding parts, particularly the top, clean and dry. If electrolyte is evident on the top of the battery, clean it immediately. Even a weak electrolyte quickly attacks and corrodes the cable connections, battery hold-down clamp and battery ground cable. Use a rag soaked in a weak solution of water and baking soda to counteract the action of the spilled electrolyte.**

Note

- If excessive gassing of electrolyte spewing occurs during the charge, discontinue charging. The battery has reached usable charge. If the battery will not accept at least **5 A** after **20 min.** of charging, install a new battery.

1. Before recharging a discharged battery, inspect and repair the following conditions, if they exist:
   (1) Loose drive belt
   (2) Pinched or grounded generator voltage regulator wiring
   (3) Loose connections of generator voltage regulator wiring at the generator or voltage regulator
   (4) Loose or corroded connections at battery, grounded starter motor relay or engine
2. Excessive battery drain due to:
   (1) Interior lamps remaining energized (damaged or misadjusted switch, door ajar, etc.)
   (2) Lamp switch continuously on

Note

- Cold batteries will not readily accept a charge. Therefore, batteries should be allowed to warm up to **approx. 5 °C {41 °F}** before charging. This may require four to eight hours at room temperature depending on the initial temperature and battery size.
- A battery which has been completely discharged may be slow to accept a charge initially, and in some cases may not accept a charge at the normal charger setting. When batteries are in this condition, charging can be started by use of the dead battery switch on the charger setting so equipped.
- To determine whether a battery is accepting a charge, follow the charger manufacturer's instructions for use of the dead battery switch. If switch is a spring-loaded type, it should be held in the ON position for up to **3 min.**
- After releasing the switch and with the charger still on, measure the battery voltage using a tester. If it indicates **12 V** or higher, the battery is accepting a charge and is capable of being recharged. However, it may require up to **2 h** of charging with batteries colder than **5 °C {41 °F}** before the charge rate is high enough to be indicated on the charger ohmmeter. For all non-damaged batteries that cannot be charged by this procedure, install a new battery.
- A rapid recharge procedure has been developed for recharging batteries that have passed the Load Test and only need a recharge. This can be due to: in-use no start battery failures (vehicle will not crank due to low battery charge), or the battery has discharged in the vehicle due to key-off drains; refer to the component test.

The battery can be rapidly recharged by using either of the following method:
(1) Perform a **2 h** charge using **20 A** constant current (manual setting on charger)
(2) Perform a **2 h** charge using a constant potential (automatic setting on charger)

GENERATOR REMOVAL/INSTALLATION [L3, AJ]

E6U011718300W01

Warning

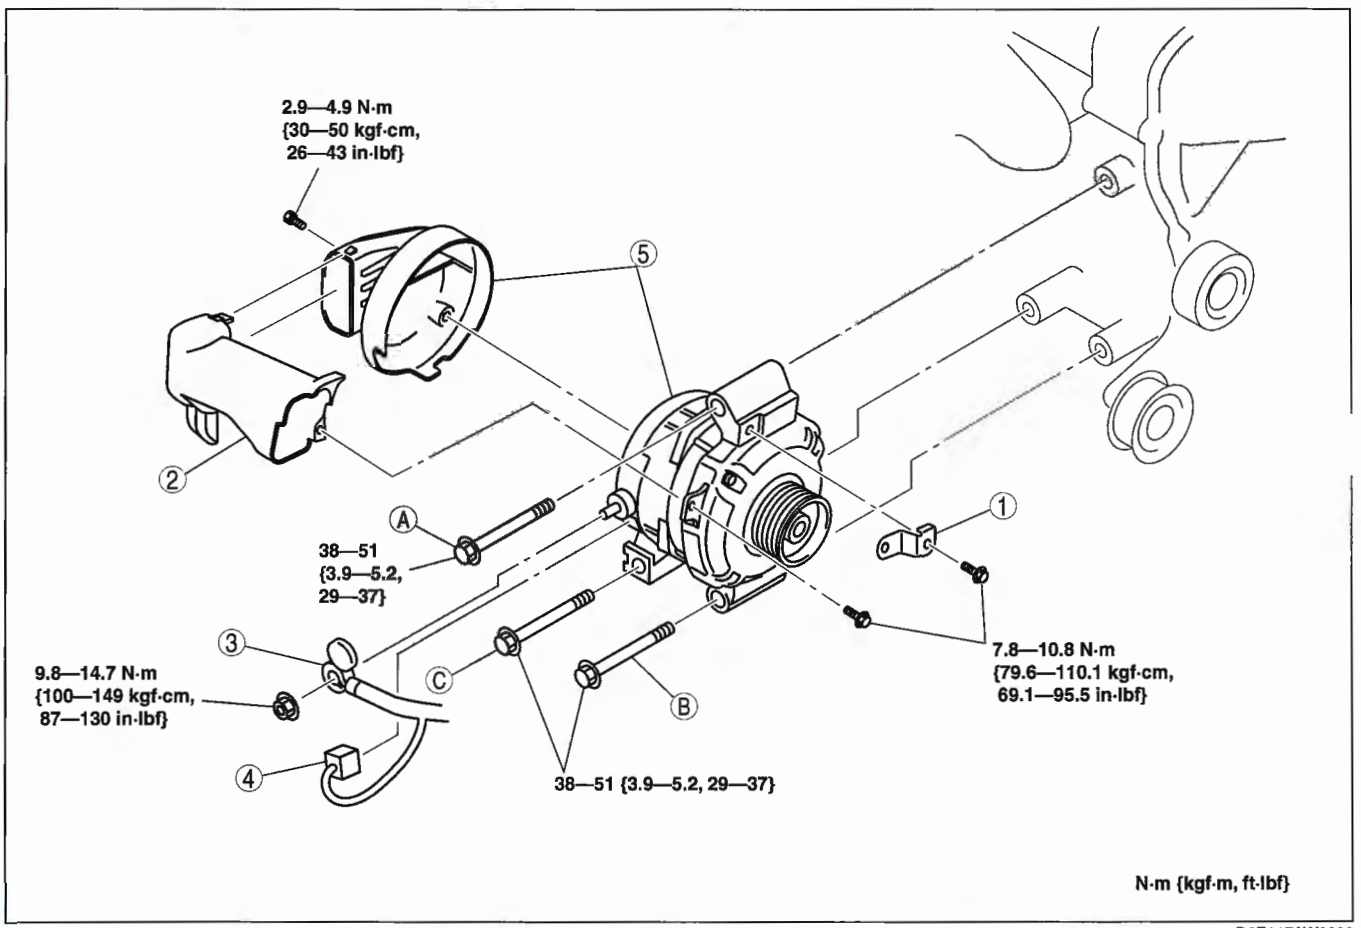
- **When the battery cables are connected, touching the vehicle body with generator terminal B generates sparks. This can cause personal injury, fire, and damage to the electrical components. Always disconnect the battery before performing the following operation.**

Caution

- **The generator can be damaged by the heat from the exhaust manifold. Make sure the generator duct and the generator heat insulator are installed securely. (L3 engine model)**

L3

1. Disconnect the negative battery cable.
2. Remove the under cover.
3. Remove the drive belt. (See 01–10A–3 DRIVE BELT REPLACEMENT [L3].)
4. Remove in the order indicated in the table.
5. Install in the reverse order of removal.



D6E117AW3002

1	Generator bracket
2	Generator duct
3	Terminal B cable
4	Generator connector

5	Generator and generator heat insulator (See 01–17A–5 Generator and Generator Heat Insulator Removal Note (L3).) (See 01–17A–5 Generator and Generator Heat Insulator Installation Note (L3).)

Generator and Generator Heat Insulator Removal Note (L3)

1. Remove the generator and generator heat insulator together from the engine, and position them in the engine compartment in a location where no part can be damaged.
2. Remove the generator heat insulator from the generator.
3. Remove the generator from above the engine compartment.

Generator and Generator Heat Insulator Installation Note (L3)

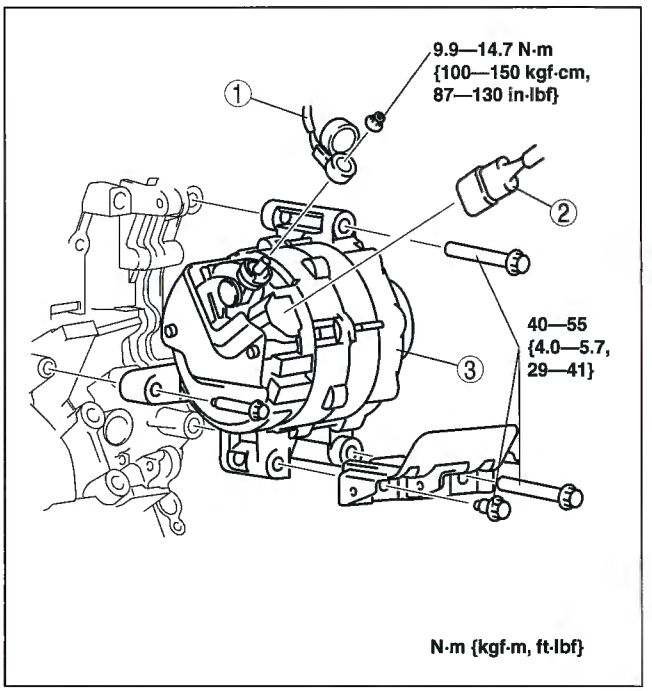
1. From above the engine compartment, set the generator down inside the engine compartment in a position where no part can be damaged.
2. Install the generator heat insulator to the generator.
3. Install the generator and generator heat insulator together to the engine.
4. Tighten bolt A temporarily.
5. Tighten bolt B, C to the specified tightening torque.
6. Tighten bolt A to the specified tightening torque.

AJ

1. Disconnect the negative battery cable.
2. Remove the under cover.
3. Remove the drive belt. (See 01–10C–4 DRIVE BELT REPLACEMENT [AJ].)
4. Remove the TWC (RH) and the front pipe. (See 01–15C–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [AJ].)
5. Remove in the order indicated in the table.

1	Terminal B wire
2	Connector
3	Generator

6. Install in the reverse order of removal.



B6U0117W010

GENERATOR INSPECTION [L3, AJ]

E6U011718300W02

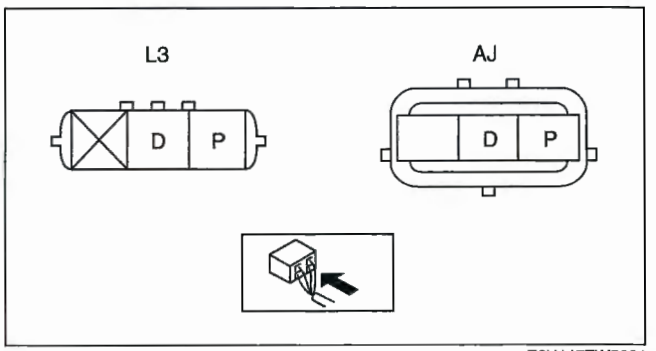
Generator Warning Light

1. Verify that the battery is fully charged.
   - Charge if necessary.
2. Verify that the drive belt deflection/tension is within the specification. (L3) (See 01–10A–3 DRIVE BELT INSPECTION [L3].)
3. Turn the ignition switch on and verify that the generator warning light illuminates.
   - If not as specified, inspect generator warning light, wiring harnesses between the battery and the generator warning light.
4. Verify that the generator warning light goes out after the engine is started.
   - If not as specified, inspect if any of the following DTCs are displayed: P0112, P0113, P2502, P2503, P2504. (See 01–02A–11 ON-BOARD DIAGNOSTIC TEST [L3].) (See 01–02C–6 ON-BOARD DIAGNOSTIC TEST [AJ].)

Generator

Voltage

1. Verify that the battery is fully charged.
   - Charge if necessary.
2. Verify that the drive belt deflection/tension is within the specification. (L3) (See 01–10A–3 DRIVE BELT INSPECTION [L3].)
3. Turn off all electrical loads.
4. Turn the ignition switch to start the engine and verify that the generator rotates smoothly without any noise while the engine is running.
5. Measure the voltage at the terminals shown in the table.
   - If not as specified, repair or replace the generator if necessary.



E6U117ZW5001

Standard voltage

Terminal	Ignition switch ON (V)	Idle (V) [20 °C {68 °F}]
B	B+	13—15
P	Approx. 1	Approx. 3—8
D	Approx. 0	*

* : Turn the following electrical loads on and verify that the voltage reading increases.

- Headlights
- Blower motor
- Rear window defroster

Current

Note

- Since the charging current decreases rapidly after starting the engine, perform the following procedure quickly, and read the maximum current value.

1. Verify that the battery is fully charged.
   - Charge if necessary.
2. Verify that the drive belt deflection/tension is within the specification. (L3) (See 01–10A–3 DRIVE BELT INSPECTION [L3].)
3. Disconnect the negative battery cable.
4. Connect a tester cable of reading **120 A or more** between generator terminal B and the wiring harness.
5. Turn off all electrical loads.
6. Start the engine and increase the engine speed to **2,000—2,500 rpm**.
7. Turn the following electrical loads on and verify that the current reading increases.
   (1) Headlights
   (2) Blower motor
   (3) Rear window defroster
   - If generator terminal B current does not increase, repair or replace the generator if necessary.

Note

- Current required for generating power varies with electrical loads applied.

Standard current (Reference)
Measuring conditions:
Room temperature: 20 °C {68 °F}
Voltage: 13.5 V
Engine hot

Engine speed (rpm)	Terminal B current (A)*	
	L3	AJ
1,000	0*—80	0*—90
2,000	0*—100	0*—105

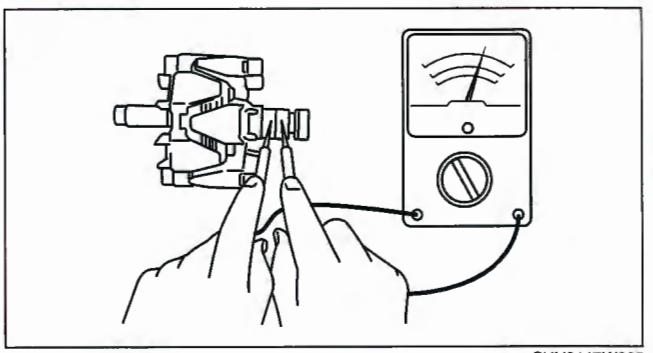
* : Lower limit of current must be more than 0 A.

Generator Inner Parts

Rotor

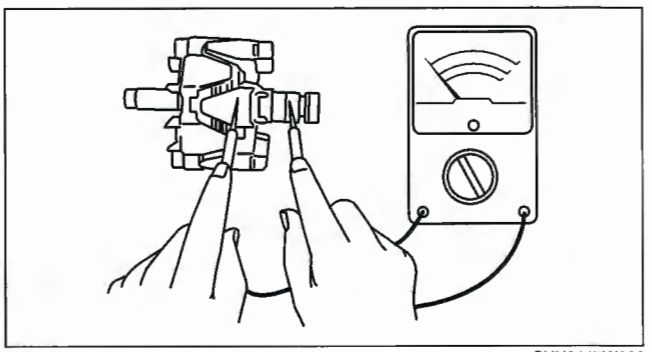
1. Measure the resistance between the slip rings using a tester.
   - If not within the specification, replace the rotor.

Specification [20 °C {68 °F}]
L3: 2.0—2.3 ohm
AJ: 2.4—2.9 ohm



CHU0117W005

2. Verify that there is no continuity between the slip ring and core using a tester.
   - If there is continuity, replace the rotor.
3. Inspect the slip ring surface condition.
   - If the slip ring surface is rough, use a lathe or fine sandpaper to repair it.



CHU0117W006

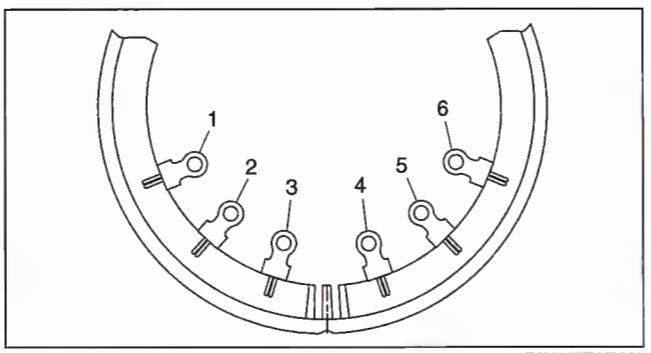
Stator coil (L3)

1. Verify that the continuity is as indicated in the table.

O—O : Continuity

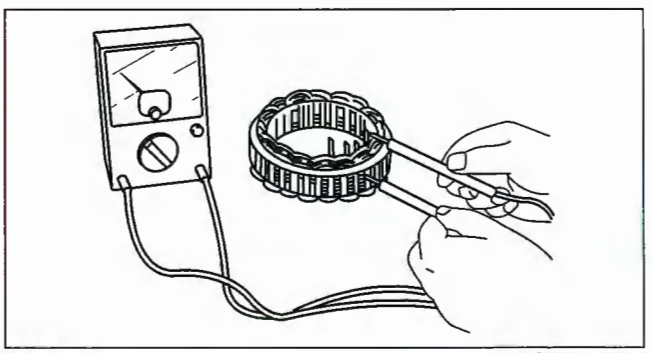
Terminal					
1	2	3	4	5	6
O—O					
O———O					
	O—O				
			O—O		
			O———O		
				O—O	

E6U117ZWB006



E6U117ZWB005

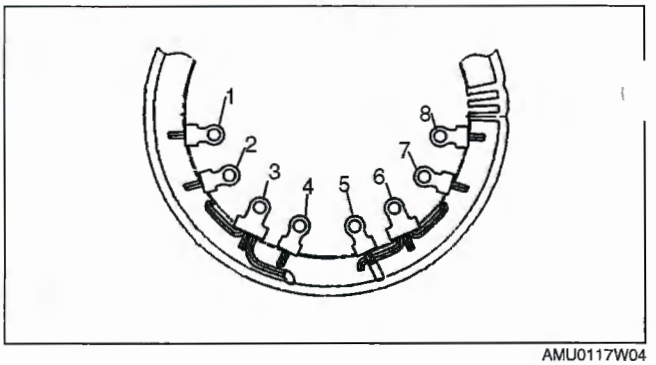
   - If there is any malfunction, replace the stator.
2. Verify that there is no continuity between the stator coil leads and core using a tester.
   - If there is continuity, replace the stator coil.



CHU0117W008

Stator coil (AJ)

1. Verify that the continuity is as indicated in the table.



AMU0117W04

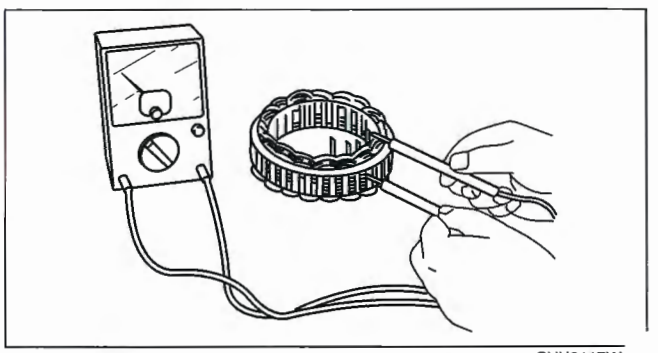
○—○ : Continuity

Terminal							
1	2	3	4	5	6	7	8
○		○					
	○	○					
		○		○			
			○		○		
					○	○	
					○		○

B6U0117W01

- If there is any malfunction, replace the stator.

2. Verify that there is no continuity between the stator coil leads and core using a tester.
   - If there is continuity, replace the stator coil.

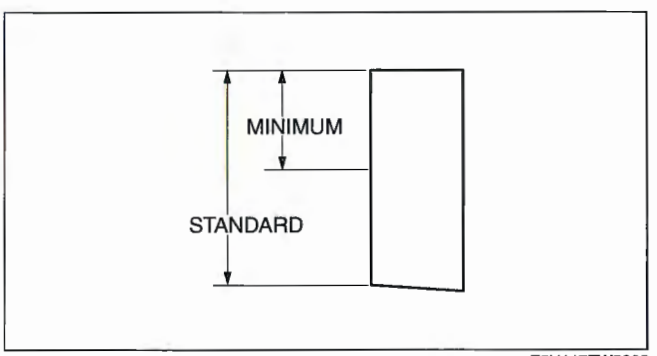


CHU0117W

Brush

1. Inspect brushes for wear.
   - If any brush is worn almost to or beyond the limit, replace all of the brushes.

Standard
22.5 mm {0.89 in}
Minimum
5.0 mm {0.20 in}

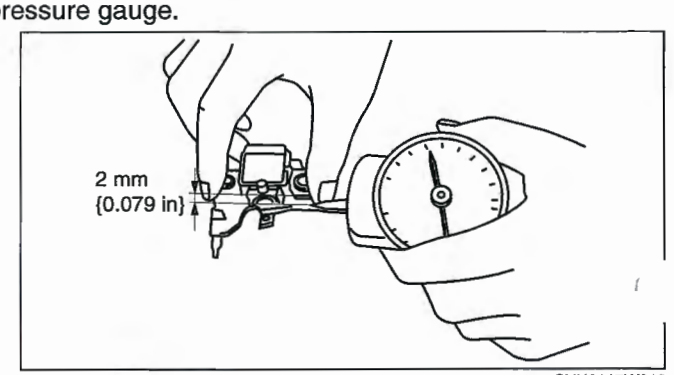


E5U117ZW5005

Brush spring

1. Measure the force of the brush spring using a spring pressure gauge.
2. Read the spring pressure gauge at the brush tip projection of **2 mm {0.079 in}**.
   - Replace the brush spring if necessary.

Standard force
4.1—5.3 N {0.42—0.54 kgf, 0.92—1.19 lbf}
Minimum
1.7 N {0.17 kgf, 0.38 lbf}

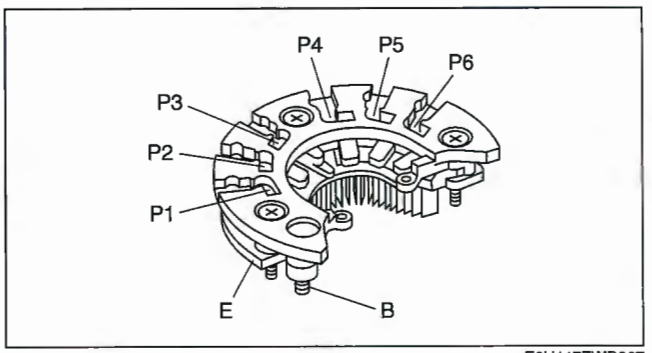


CHU0117W010

Rectifier (Using an analog circuit tester)

1. Inspect for continuity of the diodes using an analog circuit tester.

L3



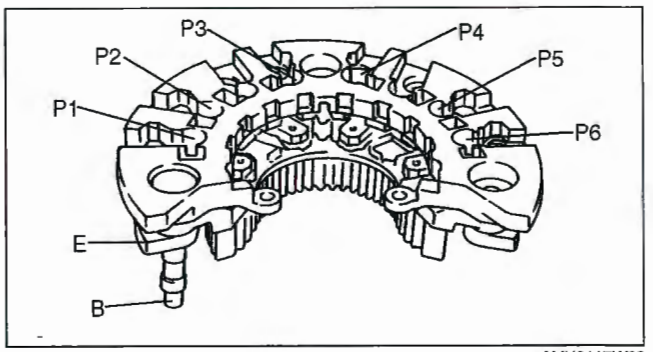
E6U117ZWB007

AJ

- If not as specified, replace the rectifier.

Specification

Negative	Positive	Continuity
E	P1, P2, P3, P4, P5, P6	Yes
B		No
P1, P2, P3, P4, P5, P6	E	No
	B	Yes



AMU0117W03

Rectifier (Using a digital circuit tester)

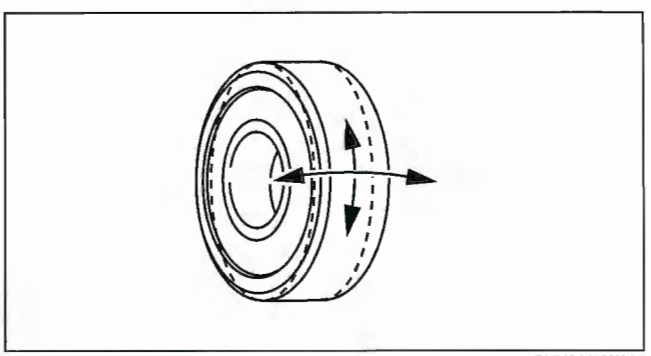
1. Inspect for continuity of the diodes using a digital circuit tester.
   - If not as specified, replace the rectifier.

Specification

Negative	Positive	Continuity
E	P1, P2, P3, P4, P5, P6	No
B		Yes
P1, P2, P3, P4, P5, P6	E	Yes
	B	No

Bearing

1. Inspect for abnormal noise, looseness, and sticking.
   - Replace the bearing if necessary.



CHU0117W015

GENERATOR DISASSEMBLY/ASSEMBLY [L3, AJ]

E6U011718300W03

Caution
- **Melt the solder quickly, otherwise the diodes (rectifier) and regulator will be damaged by excessiv heat.**

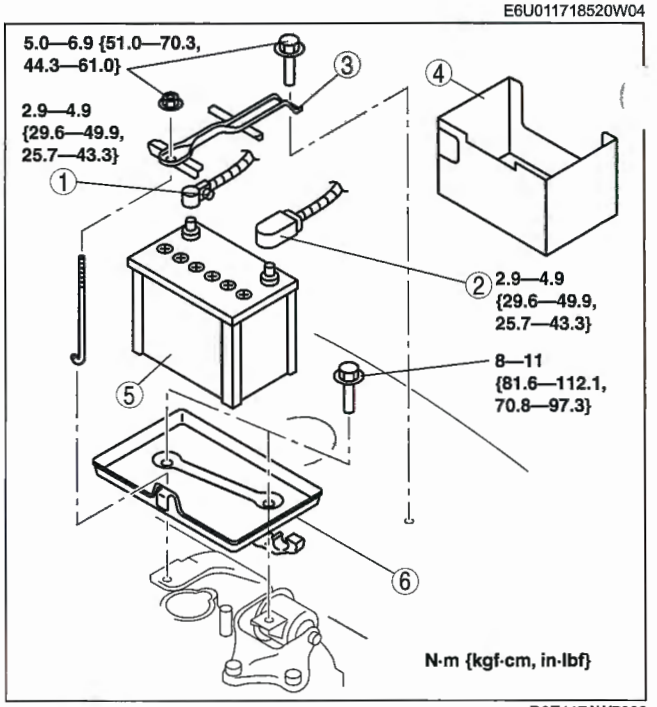
BATTERY REMOVAL/INSTALLATION [L3 WITH TC]

E6U011718520W04

1. Remove in the order indicated in the table.

1	Negative battery cable
2	Positive battery cable
3	Battery clamp
4	Battery box (See 01–17B–2 Battery Box Installation Note.)
5	Battery
6	Battery tray

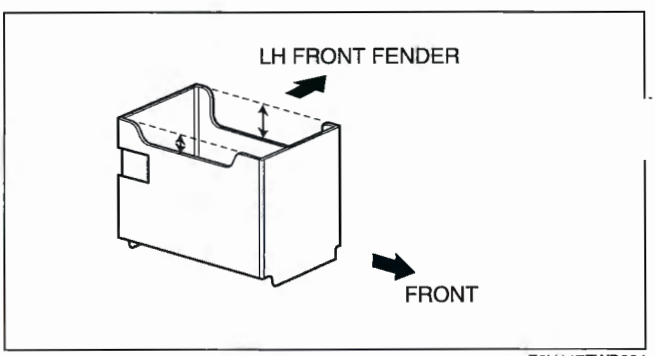
2. Install in the reverse order of removal.



D6E117AW7002

Battery Box Installation Note

1. Install the battery box so that the side with the larger notch faces toward the front fender (LH).



E6U117ZWB004

BATTERY INSPECTION [L3 WITH TC]

E6U011718520W05

Warning

- **Since battery acid is toxic, be careful when handling the battery.**
- **Since battery acid is highly corrosive, be careful not to allow it to contact clothing or the vehicle.**
- **In case battery acid contacts skin, eyes, or clothing, flush it immediately with running water. Especially if the acid gets in the eyes, flush with water for more than 15 min and get prompt medical attention.**

Electrolyte specific gravity

1. Measure the electrolyte specific gravity using a hydrometer.
   - If it is less than the specification, recharge the battery. (See 01–17B–4 BATTERY RECHARGING [L3 WITH TC].)

Battery electrolyte specific gravity [20 °C {68 °F}]
1.22—1.29

Battery voltage

1. Inspect the battery as follows:

Step	Inspection		Action
1	Measure the battery positive voltage.	12.4 V or more	Go to Step 3.
		Less than 12.4 V	Go to the next step.
2	Quick charge for **30 min** and recheck voltage.	12.4 V or more	Go to the next step.
		Less than 12.4 V	Replace the battery.
3	Using the battery load tester, apply load current (see battery load test current) and record battery voltage after **15 s**. Is voltage more than the specification?	Yes	Normal
		No	Replace the battery.

Battery load test current
55D23L (48): 180 A
80D26L (55): 195 A

Standard specification

Battery temp. (°C {°F})	Minimum voltage (V)
4 {39}	9.3
10 {50}	9.4
16 {61}	9.5
21 {70}	9.6

Back-up current

1. Verify that the ignition switch is off (key has been removed) and that all doors are closed.
2. Disconnect the negative battery cable.
3. Connect the tester between the negative battery terminal and negative battery cable, leave the battery undisturbed for **15 min**, and then measure the back-up current.
   - If not within the specification, measure the back-up current while removing the fuses one by one from the inside of the main fuse block and the inside of the fuse block.

Note
- If the battery is not left undisturbed for **15 min**, the tester will indicate a high value (**approx. 300 mA**).
- If the key or any electrical accessory is operated within **approx. 15 min** after the tester is connected, the battery must be left undisturbed for **approx. 15 min** from that point.

Caution
- **Operating electrical loads while the back-up current is being measured can damage the tester.**

Note
- For vehicles with the immobilizer system, the system periodically shifts synchronization of the security light flashing. Therefore, **45 mA (0.1 s)** current is supplied when the security light is illuminated, and **25 mA (2 s)** current is supplied when the security light is not illuminated. In addition, the measuring instrument, which shows the average value, indicates around **30 mA**.

Battery back-up current
Vehicles with immobilizer system: 25—45 mA
Vehicles without immobilizer system: 30 mA or less

4. Inspect and repair wiring harnesses and connectors of the fuse where the current has decreased.

BATTERY RECHARGING [L3 WITH TC]

E6U011718520W06

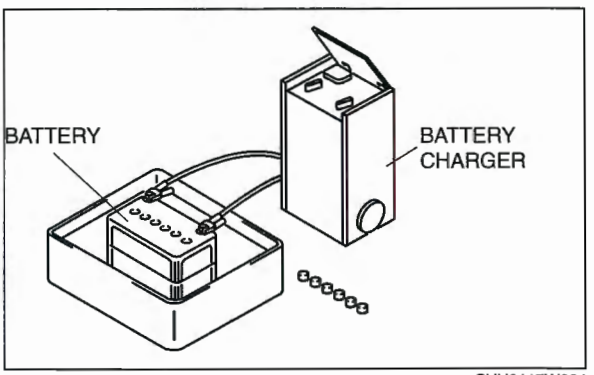
Warning
- **Keep all flames away from the battery, otherwise evaporated gas from the battery fluid may catch fire, and cause serious injury.**
- **Remove the battery filler caps when recharging to prevent battery deformation or damage.**

Caution
- **Do not quick charge for more than 30 min. It will damage the battery.**

1. Remove the battery and then place it in a pan of water.
2. Connect a battery charger to the battery and adjust the charging current as follows.

Battery slow charge current
55D23L (48): 4.5—5.5 A
80D26L (55): 5.5—6.5 A

Battery quick charge current [30 min]
55D23L (48): 30 A
80D26L (55): 35 A



CHU0117W004

3. After the battery is recharged, verify that the voltage is within the specification and remains at the same value for **1 h or more** after the recharging has been completed.
   - If not within the specification, replace the battery.

Standard voltage
12.4 V or more

GENERATOR REMOVAL/INSTALLATION [L3 WITH TC]

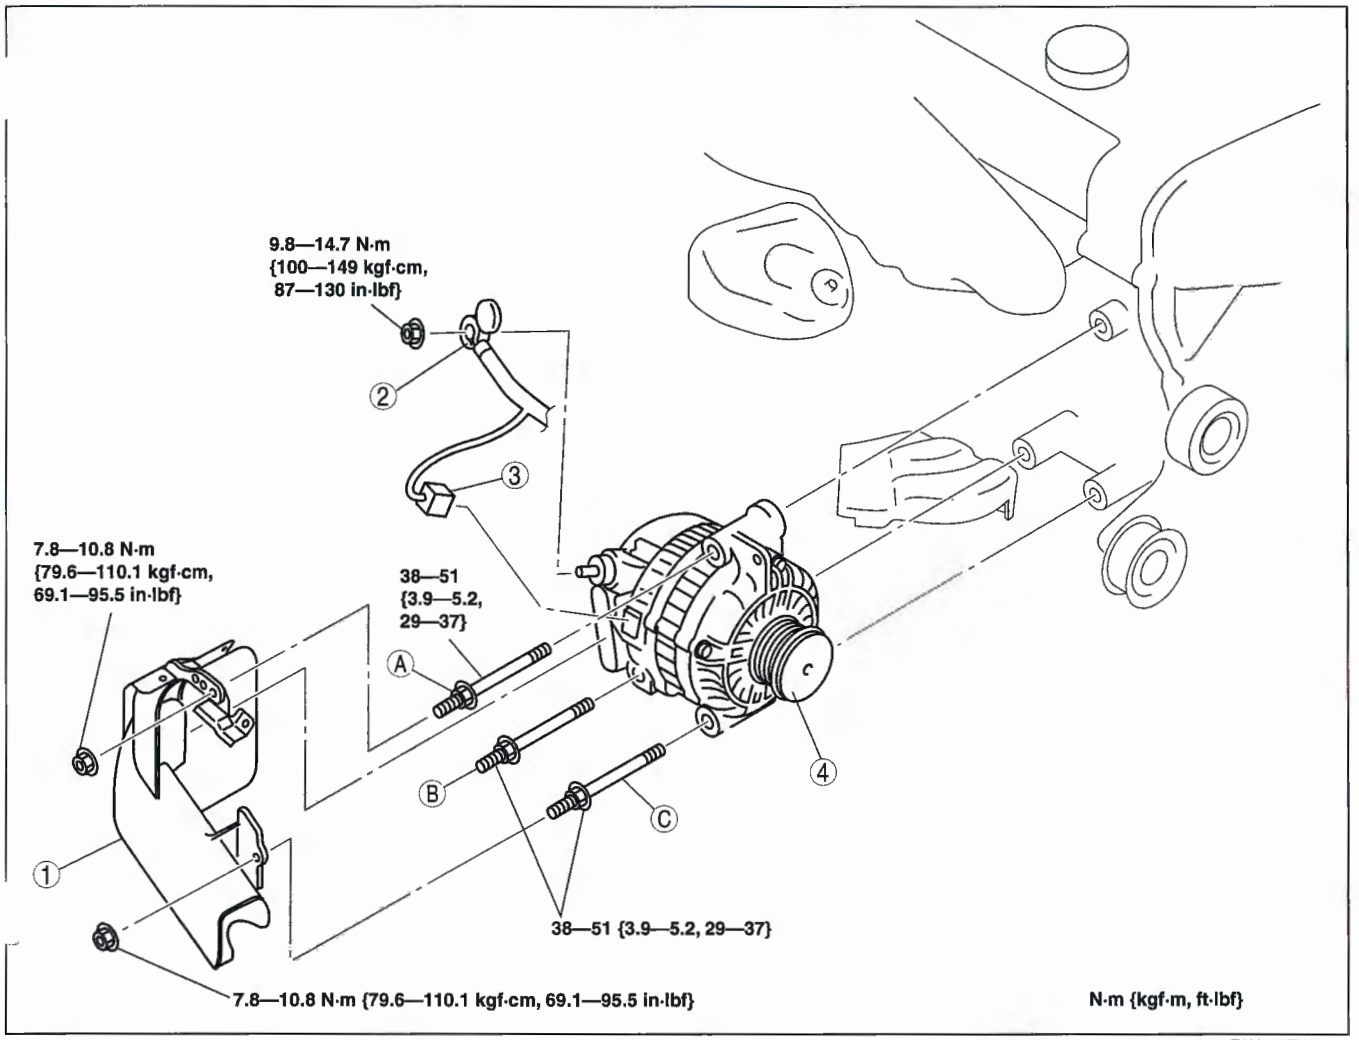
E6U011718300W0

Warning
- **When the battery cables are connected, touching the vehicle body with generator terminal B will generate sparks. This can cause personal injury, fire, and damage to the electrical components. Always disconnect the battery negative cable before performing the following operation.**

Caution
- **The generator can be damaged by the heat from the exhaust manifold. Make sure the generator duct is installed securely.**

1. Disconnect the negative battery cable.
2. Remove the under cover.
3. Remove the drive belt. (See 01–10B–3 DRIVE BELT REPLACEMENT [L3 WITH TC].)
4. Remove the charge air cooler cover. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
5. Remove the cowl panel. (See 09–10–17 COWL PANEL REMOVAL/INSTALLATION.)
6. Remove in the order indicated in the table.

7. Install in the reverse order of removal.



E6U117ZWB009

1	Generator duct
2	Terminal B cable
3	Generator connector

4	Generator (See 01–17B–5 Generator Removal Note.) (See 01–17B–5 Generator Installation Note.)

Generator Removal Note

1. Remove the generator from above the engine compartment.

Generator Installation Note

1. Tighten bolt A temporarily.
2. Tighten bolt B, C to the specified tightening torque.
3. Tighten bolt A to the specified tightening torque.

GENERATOR INSPECTION [L3 WITH TC]

E6U011718300W05

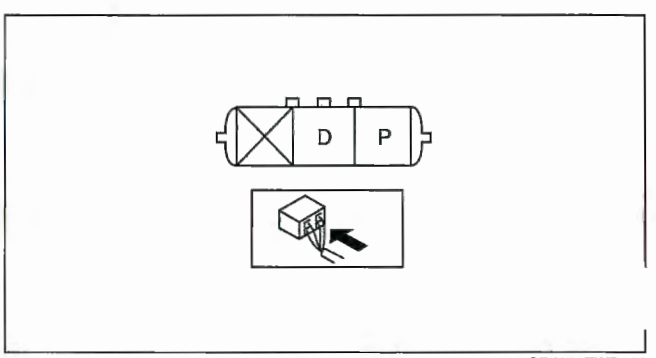
Generator Warning Light

1. Verify that the battery is fully charged.
   - Charge if necessary.
2. Verify that the drive belt deflection/tension is within the specification. (See 01–10B–3 DRIVE BELT INSPECTION [L3 WITH TC].)
3. Turn the ignition switch on and verify that the generator warning light illuminates.
   - If not as specified, inspect the generator warning light, and wiring harnesses between the battery and the generator warning light.
4. Verify that the generator warning light goes out after the engine is started.
   - If not as specified, inspect if any of the following DTCs are displayed: P0112, P0113, P2502, P2503, P2504. (See 01–02B–14 DTC TABLE [L3 WITH TC].)

Generator

Voltage

1. Verify that the battery is fully charged.
   - Charge if necessary.
2. Verify that the drive belt deflection/tension is within the specification. (See 01–10B–3 DRIVE BELT INSPECTION [L3 WITH TC].)
3. Turn off all electrical loads.
4. Turn the ignition switch to start the engine and verify that the generator rotates smoothly without any noise while the engine is running.
5. Measure the voltage at each terminal using a tester.
   - If not as specified, repair or replace the generator if necessary.



CPJ117ZWB006

Generator standard voltage [IG-ON]
Terminal B: B+
Terminal P: Approx. 1 V
Terminal D: Approx. 0 V

Generator standard voltage [Idle, 20 °C {68 °F}]
Terminal B: 13—15 V
Terminal P: Approx. 3—8 V
Terminal D: Turn the electrical loads (headlights, blower motor, rear window defroster) on and verify that the voltage reading increases.

Current

Note
- Since the charging current decreases rapidly after starting the engine, perform the following procedure quickly, and read the maximum current value.

1. Verify that the battery is fully charged.
   - Charge if necessary.
2. Verify that the drive belt deflection/tension is within the specification. (See 01–10B–3 DRIVE BELT INSPECTION [L3 WITH TC].)
3. Disconnect the negative battery cable.
4. Connect a tester, which can read **120 A or more,** between generator terminal B and the wiring harness.
5. Turn off all electrical loads.
6. Start the engine and increase the engine speed to **2,000—2,500 rpm.**
7. Turn the following electrical loads on and verify that the current reading increases.
   (1) Headlights
   (2) Blower motor
   (3) Rear window defroster
      - If generator terminal B current does not increase, repair or replace the generator if necessary.

Note
- Current required for generating power varies with the electrical loads applied.

Generator generated current (reference value) [Conditions] Ambient temperature: 20 °C {68 °F}, Voltage: 13.5 V, Engine hot

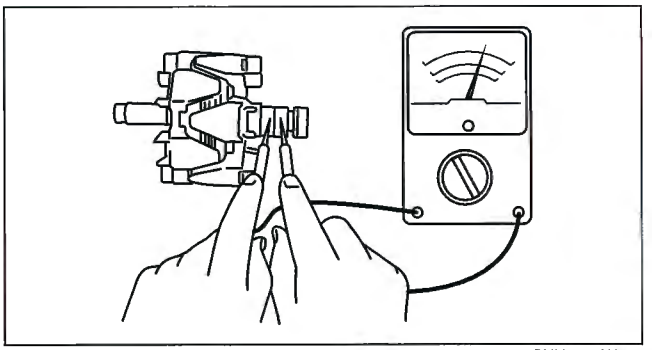
Engine speed (rpm)	Terminal B current (Lower limit of current must be more than 0 A.)
1,000	0—80 A
2,000	0—100 A

Generator Inner Parts

Rotor

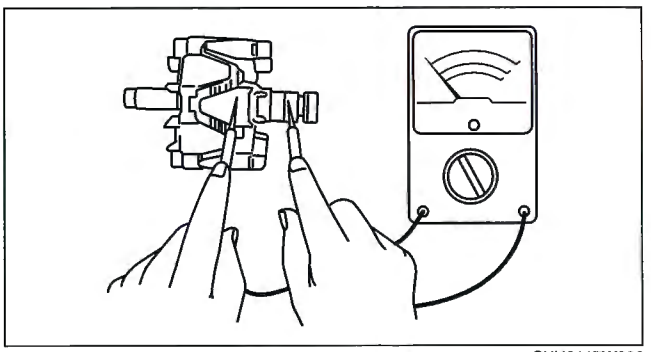
1. Measure the resistance between the slip rings using a tester.
   - If not within the specification, replace the rotor.

   Generator rotor resistance (between slip rings) [20 °C {68 °F}]
   2.0—2.3 ohm



CHU0117W005

2. Verify that there is no continuity between the slip ring and core using a tester.
   - If there is continuity, replace the rotor.
3. Inspect the slip ring surface condition.
   - If the slip ring surface is rough, use a lathe or fine sandpaper to smooth it.



CHU0117W006

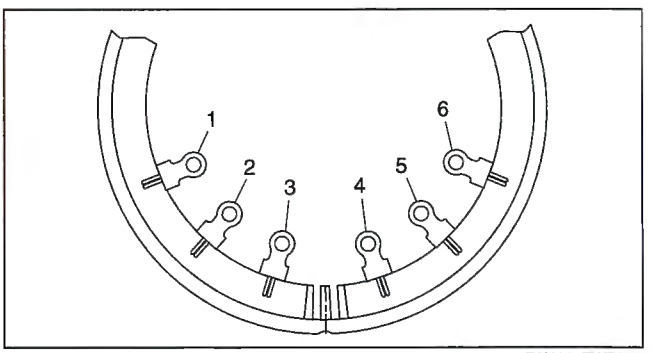
Stator coil

1. Verify that the continuity is as indicated in the table.

O—O : Continuity

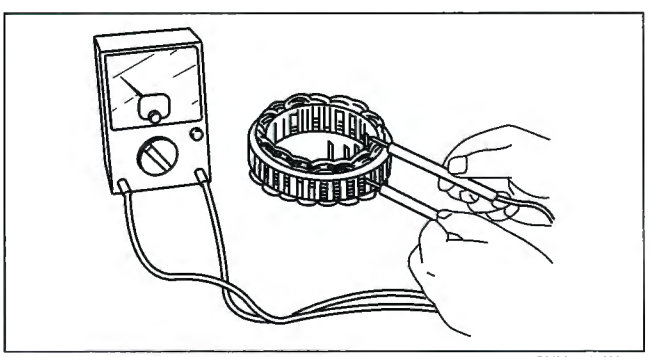
Terminal					
1	2	3	4	5	6
O—O					
O		O			
	O—O				
			O—O		
			O		O
				O—O	

E6U117ZWB006



E6U117ZWB005

   - If there is any malfunction, replace the stator.
2. Verify that there is no continuity between the stator coil leads and core using a tester.
   - If there is continuity, replace the stator coil.

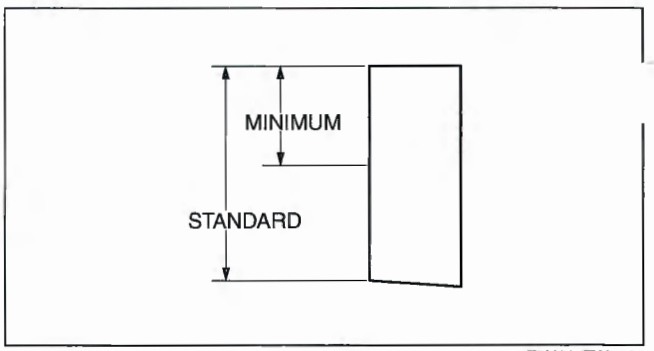


CHU0117W008

Brush

1. Inspect brushes for wear.
   - If any brush is worn almost to or beyond the limit, replace all of the brushes.

Generator brush length
Standard: 22.5 mm {0.89 in}
Minimum: 5.0 mm {0.20 in}

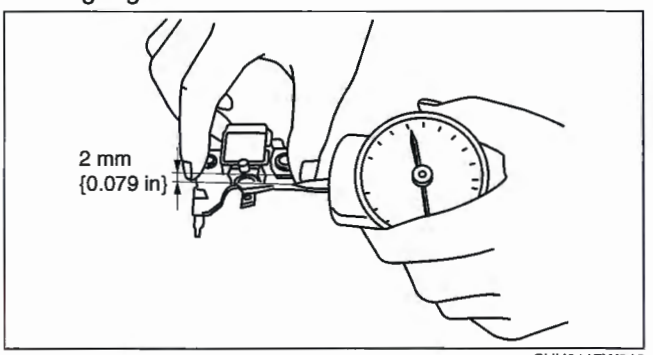


E5U117ZW5005

Brush spring

1. Measure the force of the brush spring using a spring pressure gauge.
2. Read the spring pressure gauge at the brush tip projection of **2 mm {0.079 in}**.
   - Replace the brush spring if necessary.

Generator brush spring force
Standard: 4.1—5.3 N {0.42—0.54 kgf, 0.92—1.19 lbf}
Minimum: 1.7 N {0.17 kgf, 0.38 lbf}



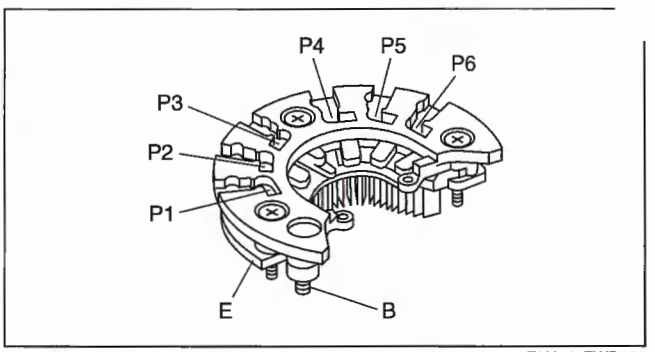
CHU0117W010

Rectifier (Using an analog circuit tester)

1. Inspect for continuity of the diodes using an analog circuit tester.
   - If not as specified, replace the rectifier.

Specification

Negative	Positive	Continuity
E	P1, P2, P3, P4, P5, P6	Yes
B		No
P1, P2, P3, P4, P5, P6	E	No
	B	Yes



E6U117ZWB007

Rectifier (Using a digital circuit tester)

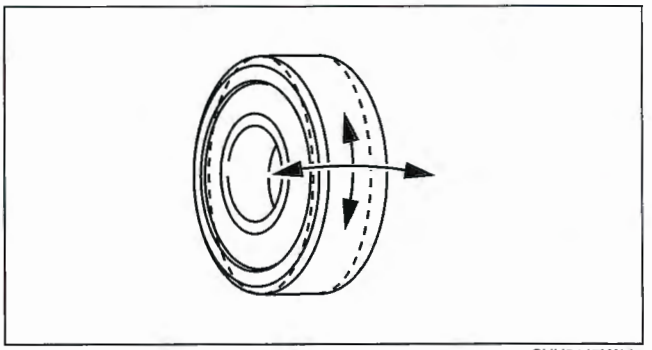
1. Inspect for continuity of the diodes using a digital circuit tester.
   - If not as specified, replace the rectifier.

Specification

Negative	Positive	Continuity
E	P1, P2, P3, P4, P5, P6	No
B		Yes
P1, P2, P3, P4, P5, P6	E	Yes
	B	No

Bearing

1. Inspect for abnormal noise, looseness, and sticking.
   - Replace the bearing if necessary.



CHU0117W015

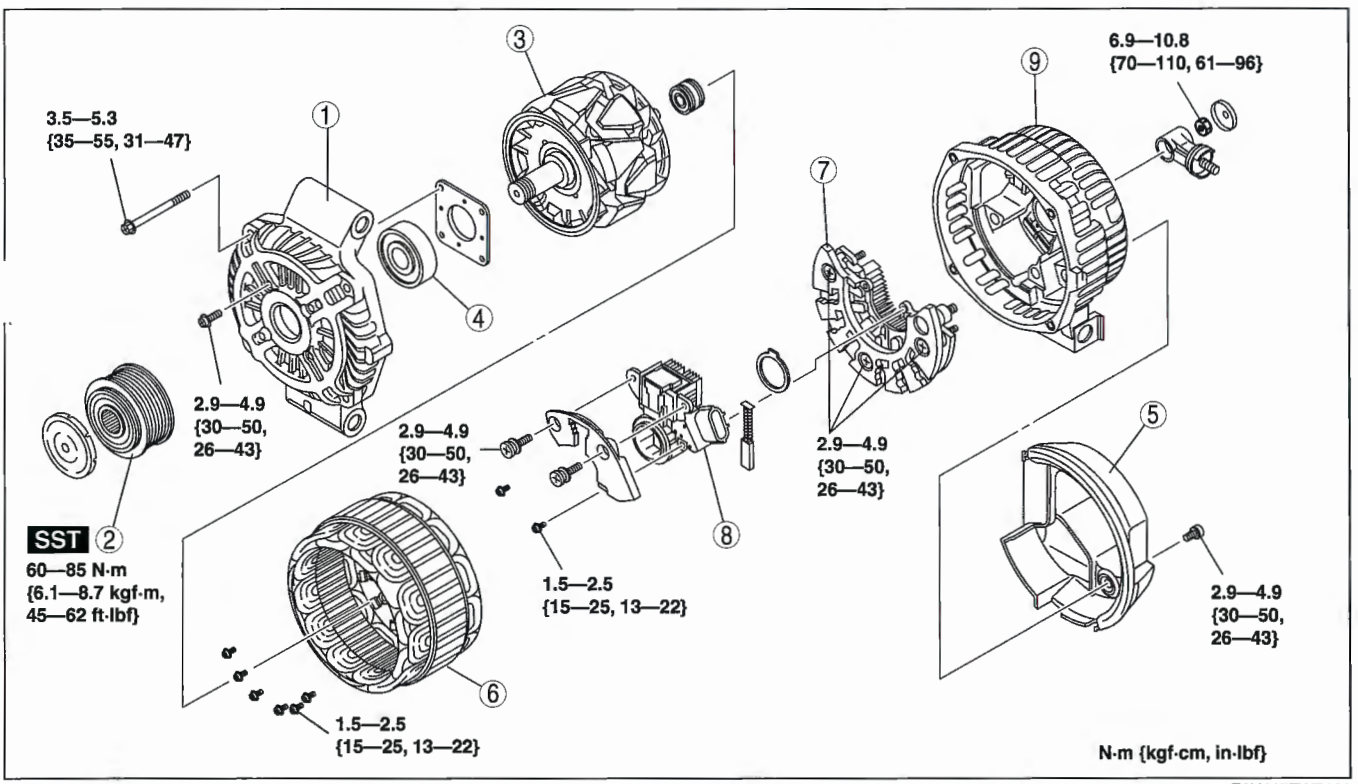
GENERATOR DISASSEMBLY/ASSEMBLY [L3 WITH TC]

E6U011718300W06

Caution

- **Melt the solder quickly, otherwise the diodes (rectifier) and regulator will be damaged by excessive heat.**

1. Disassemble in the order indicated in the table.
2. Assemble in the reverse order of disassembly.



E6U117ZWB008

1	Front cover
2	Pulley (See 01–17B–10 Pulley Disassembly/Assembly Note.)
3	Rotor
4	Bearing
5	Generator heat insulator

6	Stator coil
7	Rectifier
8	Brush holder
9	Rear bracket

Pulley Disassembly/Assembly Note

1. Disassemble/assemble the pulley using the **SST**.

Tightening torque
60—85 N·m {6.1—8.7 kgf·m, 45—62 ft·lbf}

3. Remove in the order indicated in the table.

1	Connector
2	Ignition coil

4. Install in the reverse order of removal.

B6U0118W101

IGNITION COIL INSPECTION [L3, AJ]

E6U011818100W02

L3

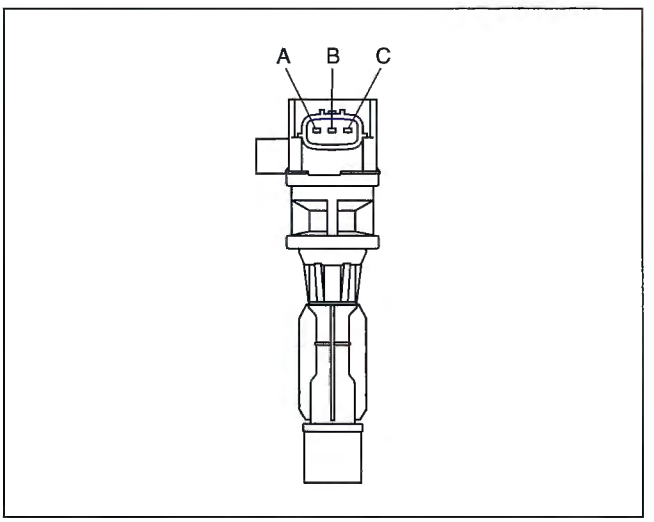
Ignition coil inspection

1. Perform the spark test and identify the malfunctioning cylinder.
2. Replace the ignition coil of the malfunctioning cylinder with that of a normal cylinder, and reperform the spark test.
   - If the spark is not normal due to a malfunctioning ignition coil, replace that ignition coil.
   - It is unlikely that all four ignition coils fail to operate properly. To prevent replacing a normal component, perform the above procedure, identify the malfunctioning ignition coil, and replace it.

Ignition coil with built-in igniter inspection

1. Disconnect the ignition coil connector.
2. Measure the resistance between each terminal on the ignition coil connector using an analog circuit tester.
   - If the measurement corresponds to the table, replace the ignition coil.

Item	Tester Connection Position		Condition
	Positive	Negative	
Terminal	C	A	0 ohm is not normal (∞ ohm is normal)
	A	C	
	C	B	
	B	C	
	A	B	∞ or 0 ohm is not normal (several kilohm is normal)
	B	A	



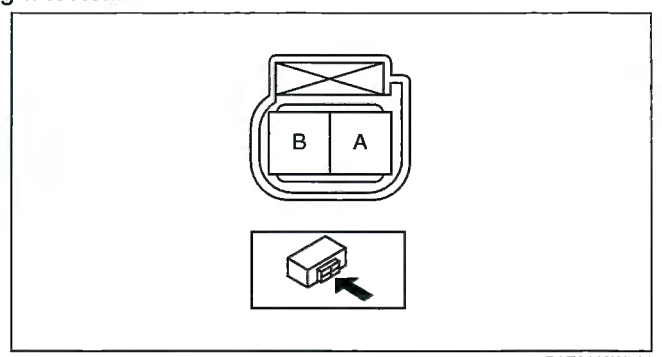
CPJ118ZWB003

AJ

Primary coil winding

1. Disconnect the ignition coil connector. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)
2. Measure the resistance between terminal A and B using a tester.
   - If not within the specification, replace the ignition coil.

Specification
0.45—1.15 ohms [25 °C {77 °F}]

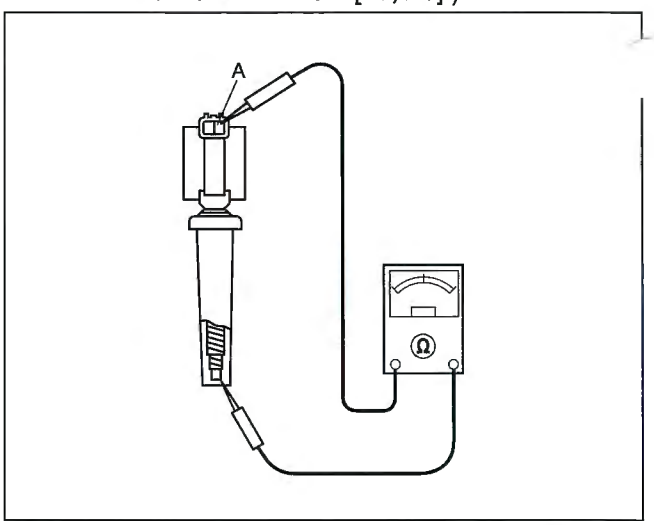


B3E0118W066

Secondary coil winding

1. Remove the ignition coil. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)
2. Measure the resistance between terminal A to ignition coil boot socket using a tester.
   - If not within the specification, replace the ignition coil.

Specification
5.0—6.0 kilohms [25 °C {77 °F}]

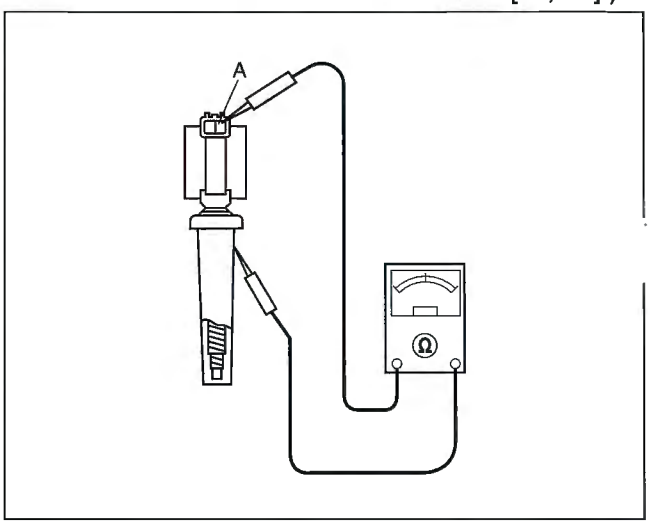


B3E0118W011

Insulation resistance of case

1. Disconnect the ignition coil connector. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)
2. Measure the insulation resistance between terminal A to ignition coil case using a tester.
   - If not as specified, replace the ignition coil.

Specification
10 megohms or more



B3E0118W012

SPARK PLUG REMOVAL/INSTALLATION [L3, AJ]

E6U011818110W01

Caution
- **If a spark plug that is not as specified is installed, engine performance will be deteriorated. Install only the specified spark plug when replacing.**

1. Disconnect the negative battery cable.
2. Remove the ignition coils. (See 01–18A–2 IGNITION COIL REMOVAL/INSTALLATION [L3, AJ].)
3. Remove the spark plugs using a plug-wrench.
4. Install in the reverse order of removal.

Tightening torque
L3: 10—14 N·m {1.1—1.4 kgf·m, 8.0—10.3 ft·lbf}
AJ: 9—20 N·m {91—204 kgf·cm, 79—177 in·lbf}

SPARK PLUG INSPECTION [L3, AJ]

E6U011818110W02

Plug Gap Inspection

Caution
- **To avoid possible damage to the tip, do not adjust the plug gap.**
- **To prevent damaging the tip, use a wire type plug gap gauge when inspecting the plug gap.**

1. Measure the spark plug gap using a wire type plug gap gauge.
   - If it exceeds the specification, replace the spark plug.

Standard plug gap
L3: 1.25—1.35 mm {0.050—0.053 in}
AJ: 1.29—1.45 mm {0.051—0.057 in}

Cleaning

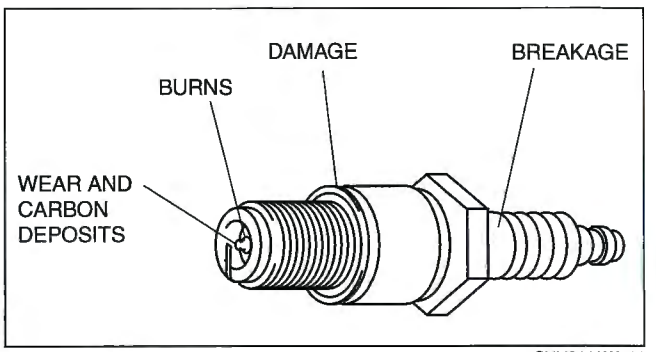
Caution
- **Carbon may adhere to the tip of the spark plug during vehicle delivery or repeated short distance driving during the winter time. If there is any malfunction such as rough idling or start difficulty due to carbon adhesion causing plug fouling, burn off the carbon by performing no-load racing of the engine.**
- **When performing the no-load racing, apply the side brake and foot brake, move the shift lever to neutral (MTX), or the selector lever to P position (ATX) to prevent an accident and serious injury.**
- **To avoid possible damage to the spark plug tip, do not use a wire brush for cleaning.**

Note
- To avoid possible damage to the tip, use gasoline to clean the spark plugs after removing dirt.

1. If there is carbon adhering to the spark plug, perform no-load racing at **3,000 rpm for 3 min.**

Visual inspection

1. Inspect the following items:
   - If any of the following malfunctions are indicated, replace the spark plug.
     — Insulator breakage
     — Worn electrode
     — Damaged gasket
     — Badly burned insulator (sparking side)



CHU0118W012

Resistance Inspection

1. Measure the resistance of the spark plug using a tester as shown in the figure.
   - If not within the specification, replace the spark plug.

Resistance
L3: 3.0—7.5 kilohms [25°C {77 °F}]
AJ: 8.0—20 kilohms [25°C {77 °F}]

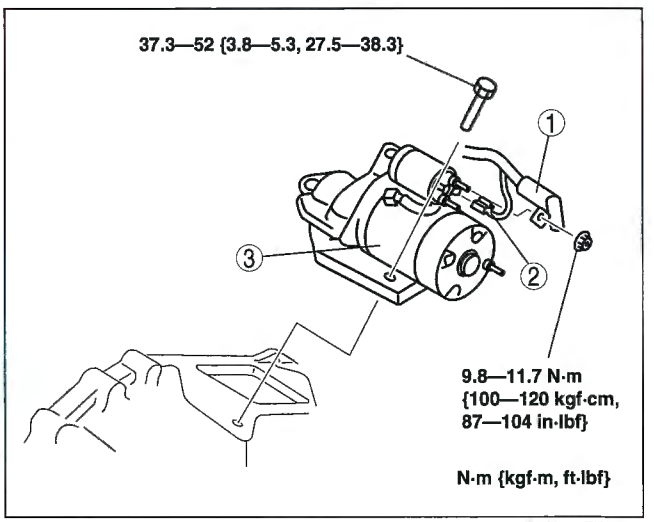
1	Water hose bracket	3	Terminal S connector
2	Terminal B cable	4	Starter

AJ

1. Remove the battery and the battery tray. (See 01–17A–1 BATTERY REMOVAL/INSTALLATION [L3, AJ].)
2. Remove the air cleaner. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)
   Disconnect the selector cable and the selector cable bracket. (See 05–18–7 SELECTOR LEVER COMPONENT REMOVAL/INSTALLATION.) (ATX)
4. Position the harness bracket out of the way. (ATX)
5. Remove in the order indicated in the table.

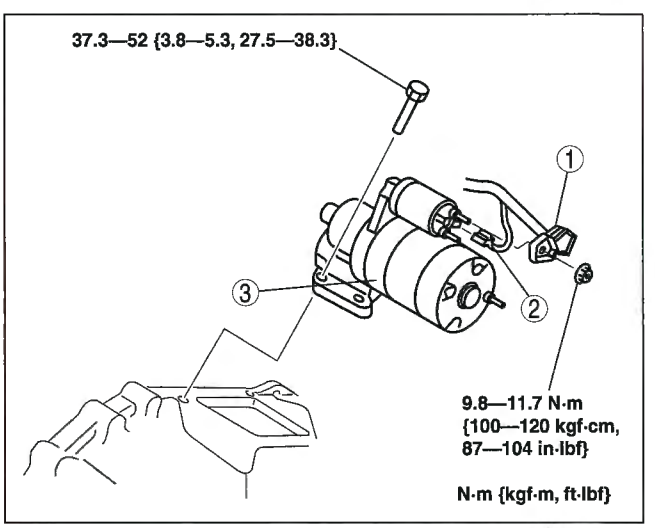
MTX



D6U119ZW7001

ATX

1	Terminal B wire
2	Terminal S wire
3	Starter



D6U119ZW7002

Install in the reverse order of removal.

STARTER INSPECTION [L3, AJ]

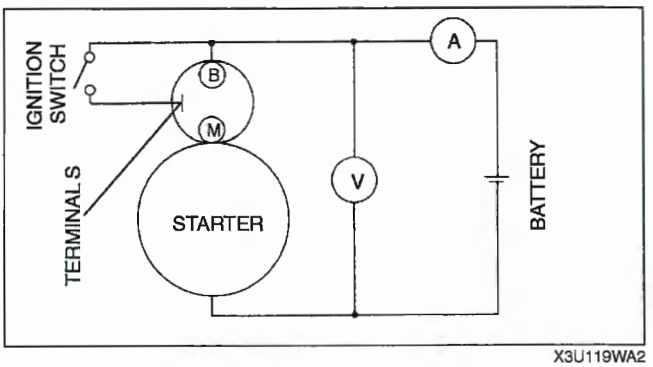
E6U011918400W02

On-vehicle Inspection

1. Verify that the battery is fully charged.
2. The starter is normal if it rotates smoothly and without any noise when the engine is cranked.
   - If the starter does not operate, inspect the following:
     — Remove the starter, and inspect the starter unit.
     — Inspect the related wiring harnesses, the ignition switch, and the transaxle range switch (ATX).

No-load test

1. Verify that the battery is fully charged.
2. Connect the starter, battery, and a tester as shown in the figure.
3. Operate the starter and verify that it rotates smoothly.
   - If the starter does not rotate smoothly, inspect the starter unit.
4. Measure the voltage and current while the starter is operating.
   - If not within the specification, replace the starter.



X3U119WA2

Specification

Voltage (V)	11
Current (A)	90 or less

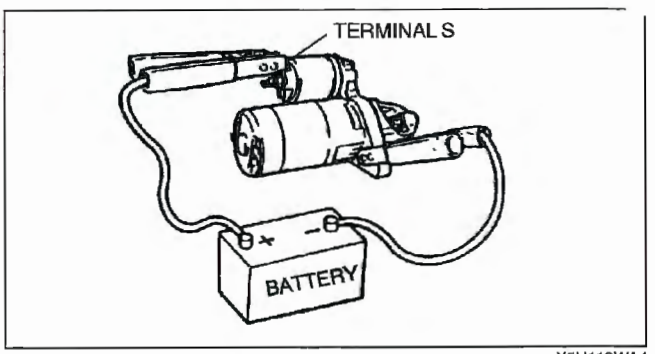
Magnetic Switch Operation Inspection

Pull-out test

Note

- Depending on the battery charge condition, the starter motor pinion may rotate while in an extended state. This is due to current flowing to the starter motor through the pull-in coil to turn the starter motor, and does not indicate an abnormality.

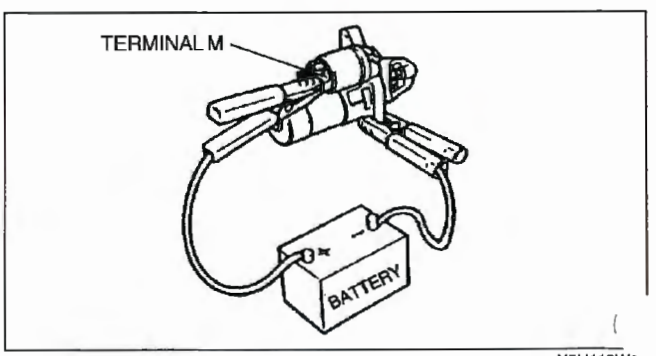
1. Verify that the starter motor pinion is extended while battery positive voltage is connected to terminal S and the starter body is grounded.
   - If the starter motor pinion is not extended, repair or replace the starter.



X5U119WA4

Return test

1. Disconnect the motor wire from terminal M.
2. Connect battery positive voltage to terminal M and ground the starter body.
3. Pull out the drive pinion with a screwdriver. Verify that it returns to its original position when released.
   - If it does not return, repair or replace the starter.

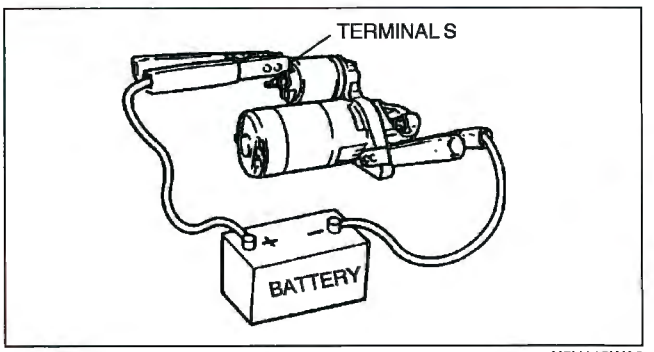


X5U119WA5

Pinion Gap Inspection

1. Pull out the drive pinion with the battery positive voltage connected to terminal S and the starter body grounded.

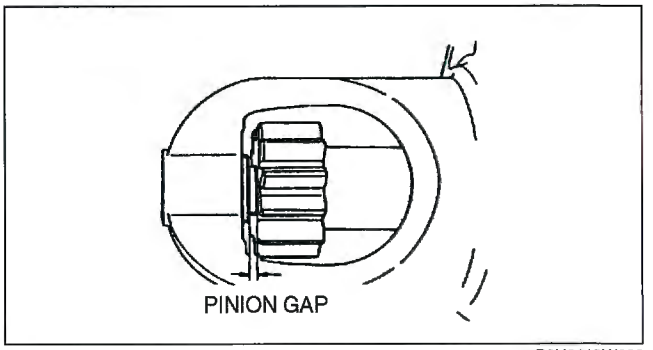
   Caution
   - **Applying power for more than 10 s can damage the starter. Do not apply power for more than 10 s.**



X5U119WA6

2. Measure the pinion gap while the drive pinion is extended.
   - If not as specified, adjust with an adjustment washer (between drive housing front cover and magnetic switch).

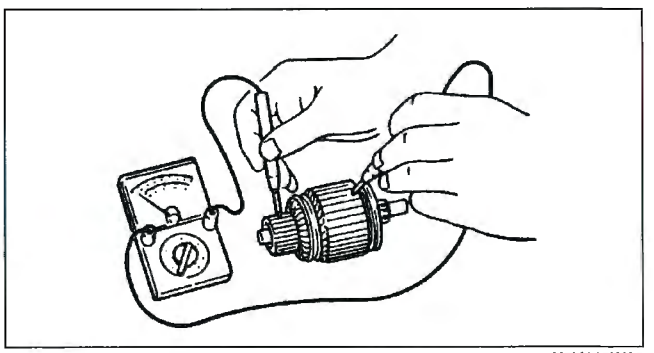
   Specification
   L3: 0.5—2.0 mm {0.02—0.08 in}
   AJ: 0 mm {0 in}



B6U0119W003

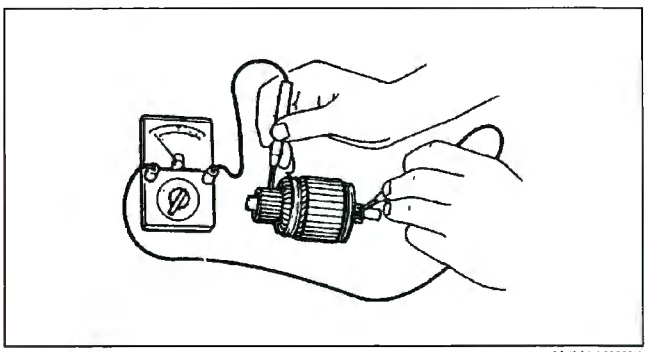
Starter Inner Parts Inspection
Armature

1. Verify that there is no continuity between the commutator and the core at each segment using a tester.
   - If there is continuity, replace the armature.



X5U119WA8

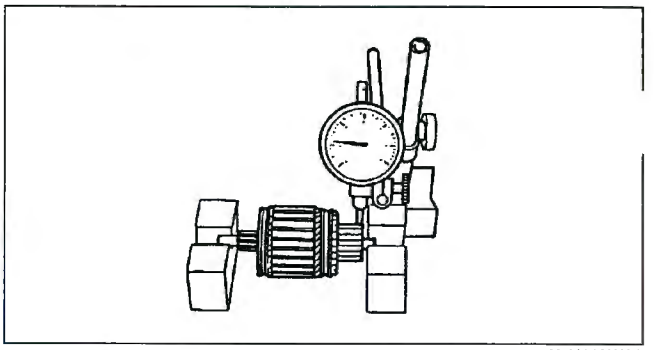
2. Verify that there is no continuity between the commutator and the shaft using a tester.
   - If there is continuity, replace the armature.



X5U119WA9

3. Place the armature on V-blocks, and measure the runout using a dial indicator.

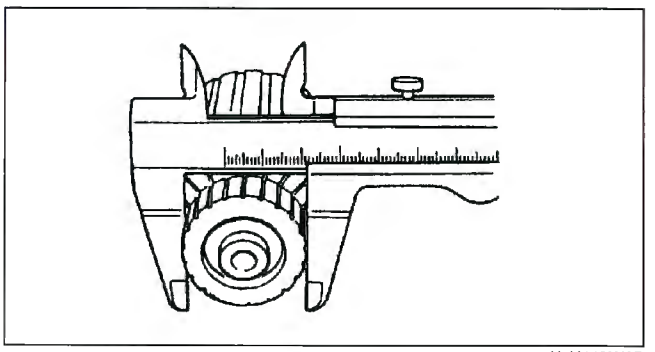
Maximum runout
L3: 0.05 mm {0.002 in}
AJ MTX: 0.1 mm {0.004 in}
AJ ATX: 0.05 mm {0.002 in}



X5U119WAA

4. Measure the commutator diameter.
   - If not within the minimum specification, replace the armature.

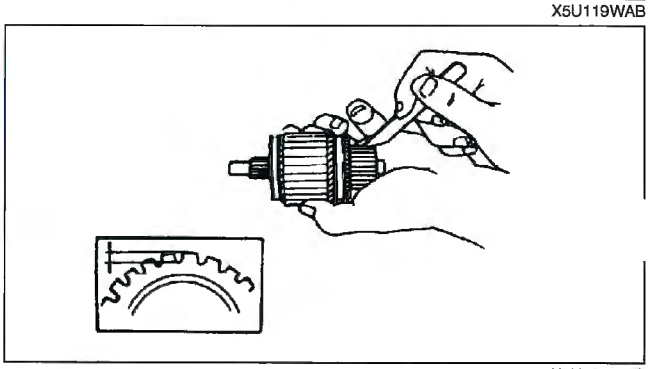
Standard commutator diameter
29.4 mm {1.16 in}
Minimum commutator diameter
28.8 mm {1.13 in}



X5U119WAB

5. Measure the segment groove depth of the commutator.
   - If not within the minimum specification, undercut the grooves to the standard depth.

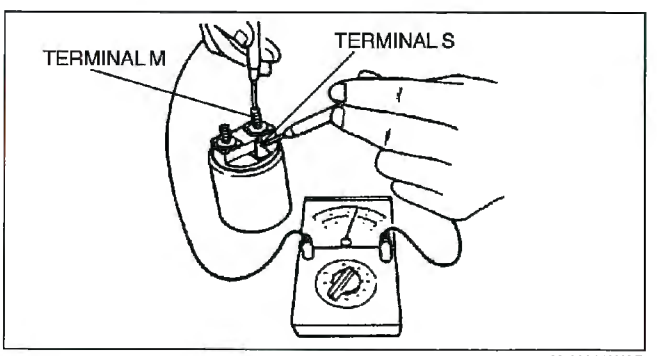
Standard depth
L3: 0.4—0.6 mm {0.016—0.023 in}
AJ MTX: 0.5 mm {0.02 in}
AJ ATX: 0.4—0.6 mm {0.016—0.023 in}
Minimum depth
0.2 mm {0.008 in}



X5U119WAC

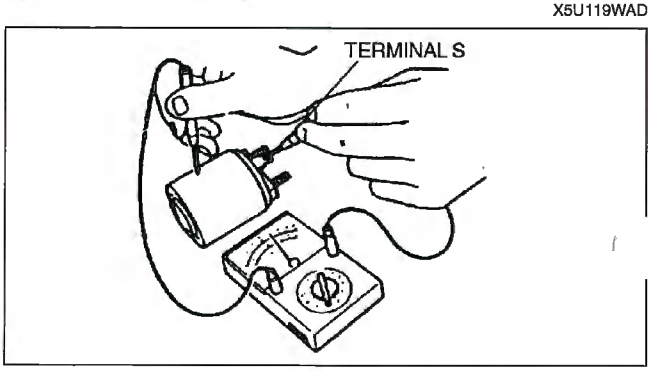
Magnetic switch

1. Inspect for continuity between terminals S and M using a tester.
   - If there is no continuity, replace the magnetic switch.



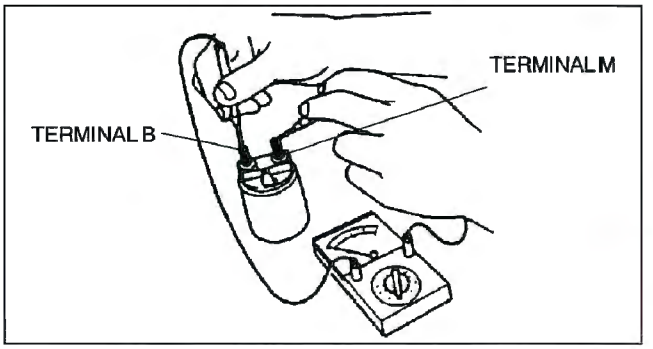
X5U119WAD

2. Inspect for continuity between terminal S and the body using a tester.
   - If there is no continuity, replace the magnetic switch.



X5U119WAE

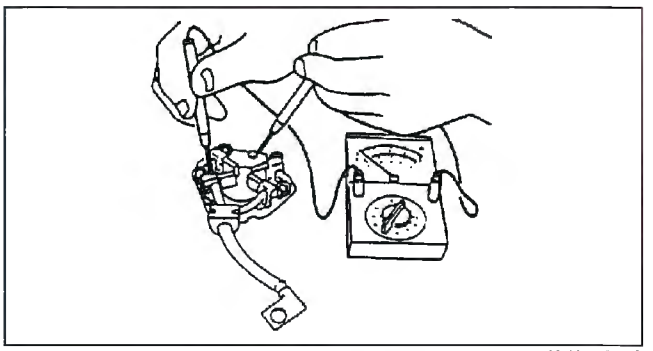
3. Verify that there is no continuity between terminals M and B using a tester.
   - If there is continuity, replace the magnetic switch.



YMU119WA3

Brush and brush holder

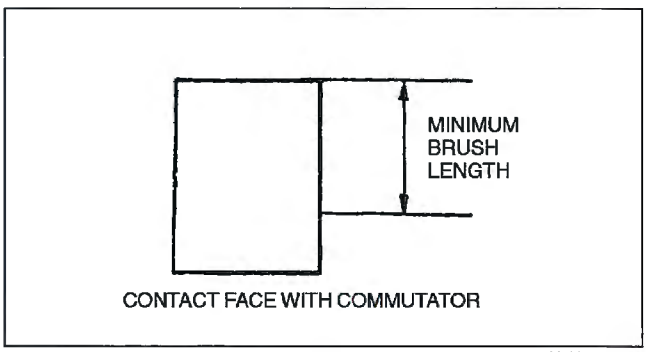
1. Verify that there is no continuity between each insulated brush and plate using a tester.
   - If there is continuity, replace the brush holder.



X5U119WAG

2. Measure the brush length.
   - If any brush is worn almost to or beyond the minimum specification, replace all of the brushes.

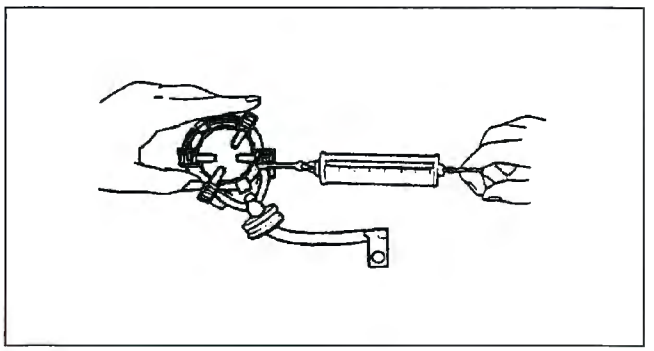
Standard brush length
12.3 mm {0.48 in}
Minimum brush length
7.0 mm {0.28 in}



X5U119WAH

3. Measure the brush spring force using a spring balance.
   - If not within the minimum specification, replace the brush and brush holder component.

Standard spring force
L3: 21.6 N {2.20 kgf, 4.84 lbf}
AJ MTX: 18.3—24.8 N {1.87—2.52 kgf, 4.42—5.57 lbf}
AJ ATX: 21.6 N {2.20 kgf, 4.84 lbf}
Minimum spring force
5.9 N {0.6 kgf, 1.3 lbf}



X5U119WAJ

STARTER DISASSEMBLY/ASSEMBLY [L3, AJ]

E6U011918400W03

1. Disassemble in the order indicated in the table.
2. Assemble in the reverse order of disassembly.

STARTER INTERLOCK SWITCH INSPECTION (MTX)

E6U011943440W01

On-vehicle Inspection

1. Inspect the following.
   - With the clutch pedal not depressed, verify that the engine does not start.
   - With the clutch pedal fully depressed, verify that the engine starts.
     — If not as specified, perform continuity inspection.

Continuity Inspection

1. Disconnect the starter interlock switch connector.
2. Verify that the continuity is as indicated in the table.
   - If there is any malfunction, replace the starter interlock switch.

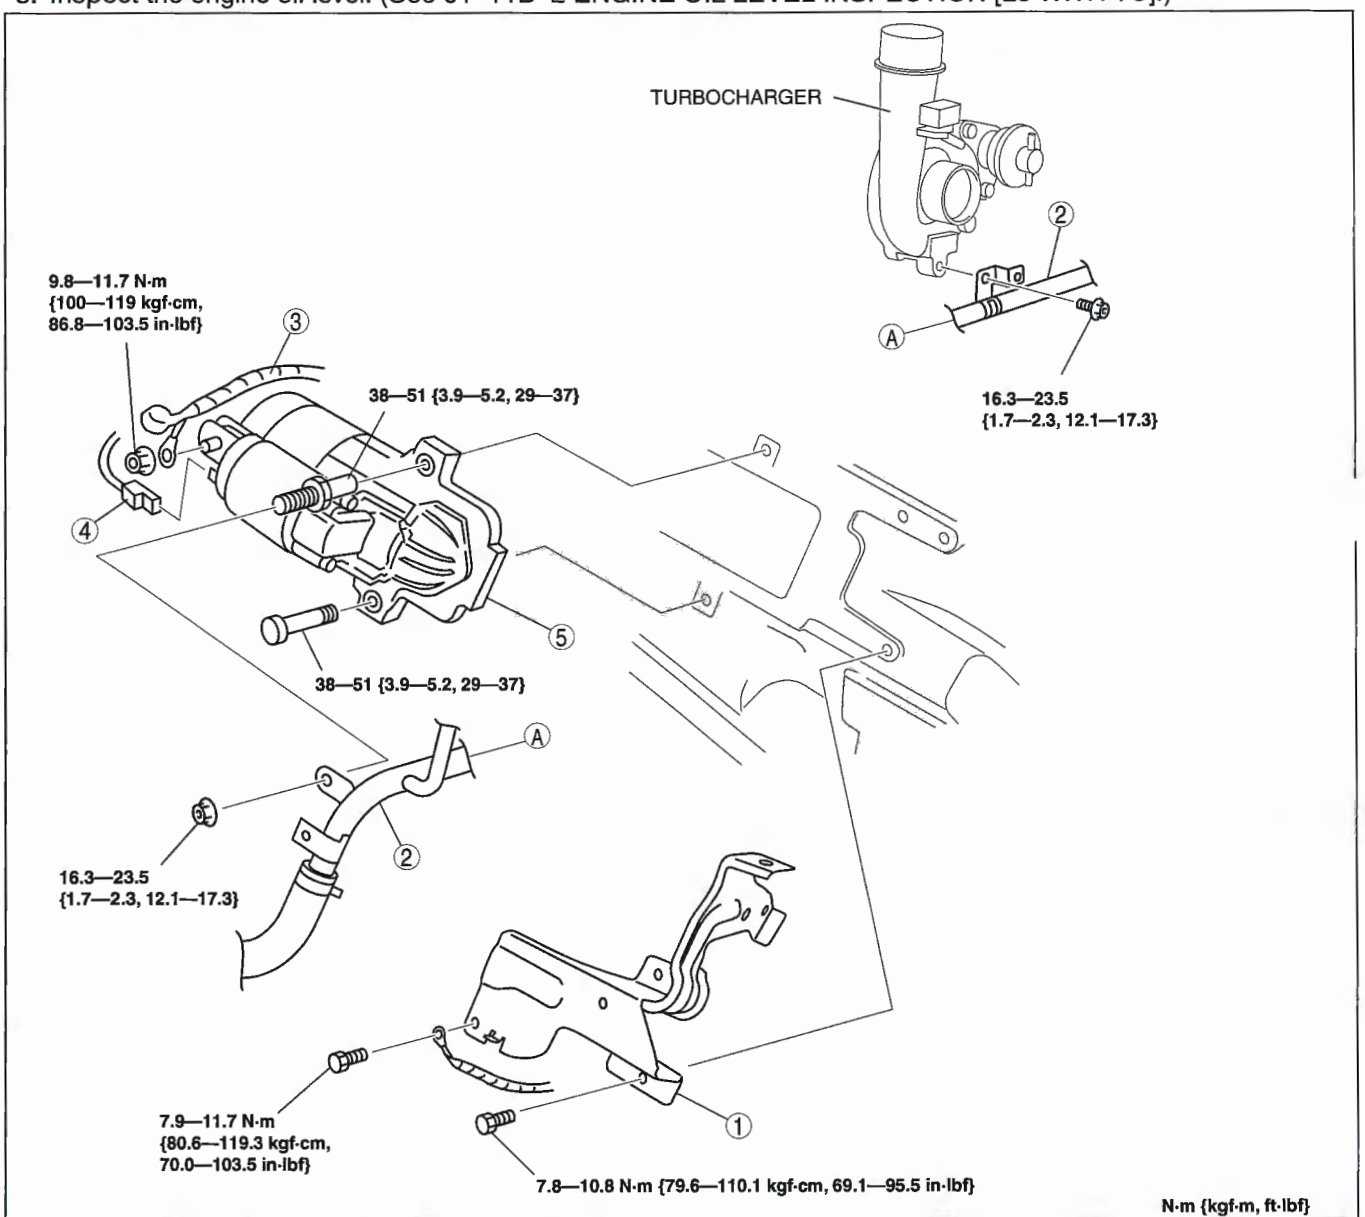
STARTER REMOVAL/INSTALLATION [L3 WITH TC]

E6U011918400W04

Warning

- **When the battery cables are connected, touching the vehicle body with starter terminal B will generate sparks. This can cause personal injury, fire, and damage to the electrical components. Always disconnect the negative battery cable before performing the following operation.**

1. Disconnect the negative battery cable.
2. Remove the battery and battery tray. (See 01–17B–2 BATTERY REMOVAL/INSTALLATION [L3 WITH TC].)
3. Remove the air cleaner, charge air cooler cover, and air hose. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
4. Remove the under cover.
5. Remove the oil filter and oil cooler component with the water hoses still connected. Position the oil filter and oil cooler component so that it is out of the way.
6. Remove in the order indicated in the table.
7. Install in the reverse order of removal.
8. Inspect the engine oil level. (See 01–11B–2 ENGINE OIL LEVEL INSPECTION [L3 WITH TC].)



E6U119ZWB002

1	Harness bracket	3	Terminal B cable
2	Heater pipe (See 01–19B–2 Heater Pipe Removal Note.)	4	Terminal S connector
		5	Starter

Heater Pipe Removal Note

1. Remove the heater pipe with the water hoses still connected. Position the heater pipe so that it is out of the way.

STARTER INSPECTION [L3 WITH TC]

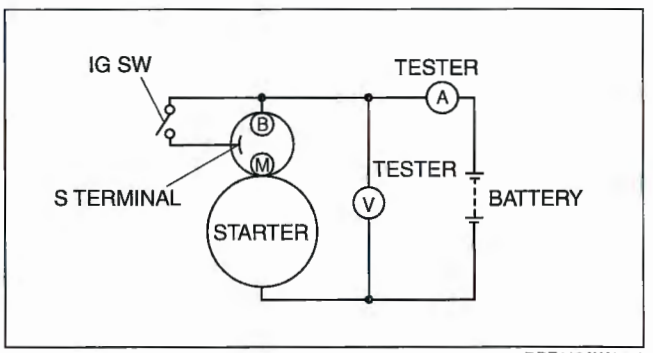
E6U011918400W05

On-vehicle Inspection

1. Verify that the battery is fully charged.
   The starter is normal if it rotates smoothly and without any noise when the engine is cranked.
   - If the starter does not operate, inspect the following:
     — Remove the starter, and inspect the starter unit.
     — Inspect the related wiring harnesses and the ignition switch.

No-load test

1. Verify that the battery is fully charged.
2. Connect the starter, battery, and a tester as shown in the figure.
3. Operate the starter and verify that it rotates smoothly.
   - If the starter does not rotate smoothly, inspect the starter unit.
4. Measure the voltage and current while the starter is operating.
   - If not within the specification, replace the starter.



DPE119AW1003

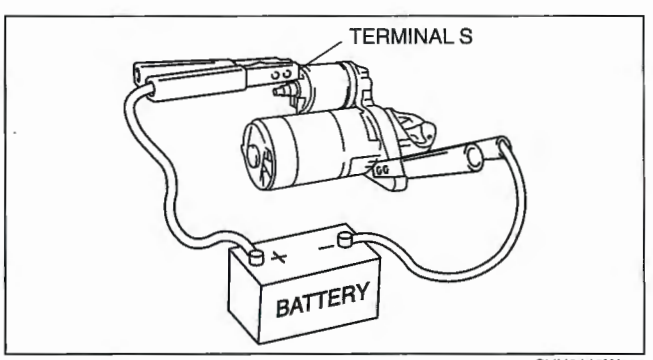
Starter no load test voltage
11 V

Starter no load test current
90 A or less

Magnetic Switch Operation Inspection
Pull-out test

Note
- Depending on the battery charge condition, the starter motor pinion may rotate while in an extended state. This is due to current flowing to the starter motor through the pull-in coil to turn the starter motor, and does not indicate an abnormality.

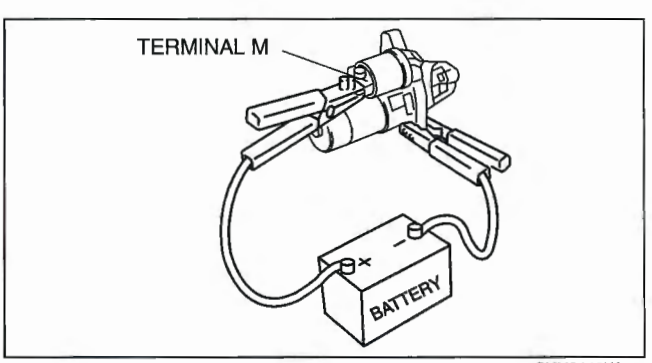
1. Verify that the starter motor pinion is extended while battery positive voltage is connected to terminal S and the starter body is grounded.
   - If the starter motor pinion is not extended, repair or replace the starter.



CHU0119W023

Return test

1. Disconnect the motor wire from terminal M.
2. Connect battery positive voltage to terminal M and ground the starter body.
3. Pull out the drive pinion with a screwdriver. Verify that it returns to its original position when released.
   - If it does not return, repair or replace the starter.

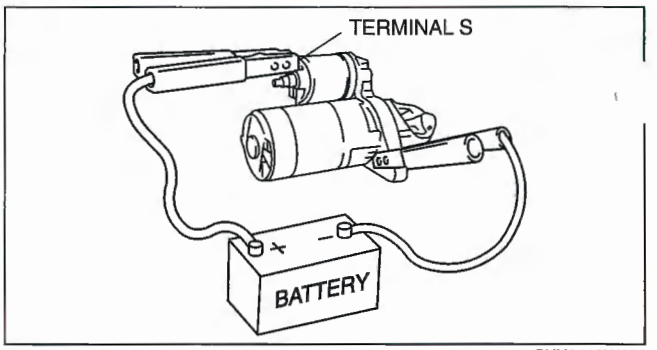


CHU0119W022

Pinion Gap Inspection

1. Pull out the drive pinion with the battery positive voltage connected to terminal S and the starter body grounded.

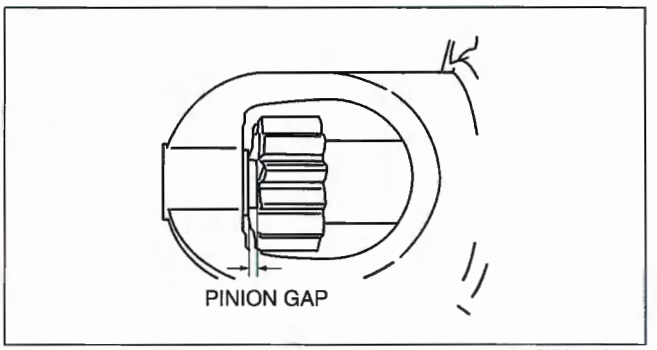
   Caution
   - **Applying power for more than 10 s can damage the starter. Do not apply power for more than 10 s.**



CHU0119W023

2. Measure the pinion gap while the drive pinion is extended.
   - If not as specified, adjust with an adjustment washer (between drive housing front cover and magnetic switch).

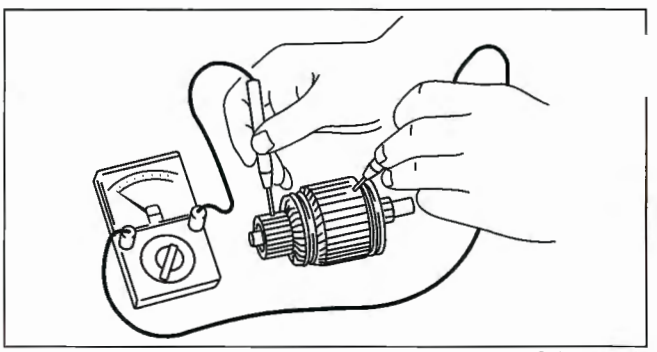
   Starter pinion gap
   0.5—2.0 mm {0.02—0.07 in}



CHU0119W015

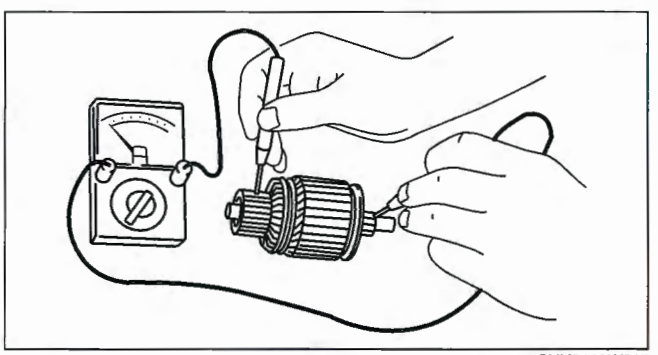
Starter Inner Parts Inspection
Armature

1. Verify that there is no continuity between the commutator and the core at each segment using a tester.
   - If there is continuity, replace the armature.



CHU0119W016

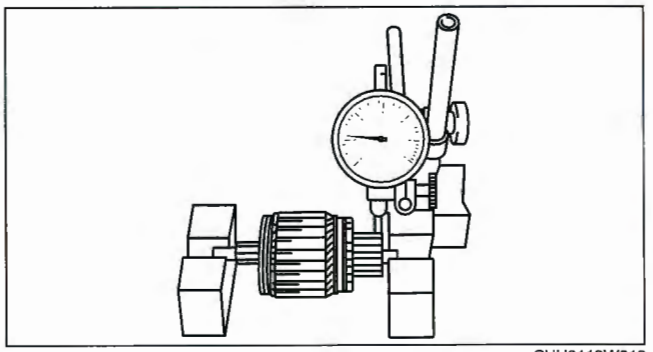
2. Verify that there is no continuity between the commutator and the shaft using a tester.
   - If there is continuity, replace the armature.



CHU0119W017

3. Place the armature on V-blocks, and measure the runout using a dial indicator.

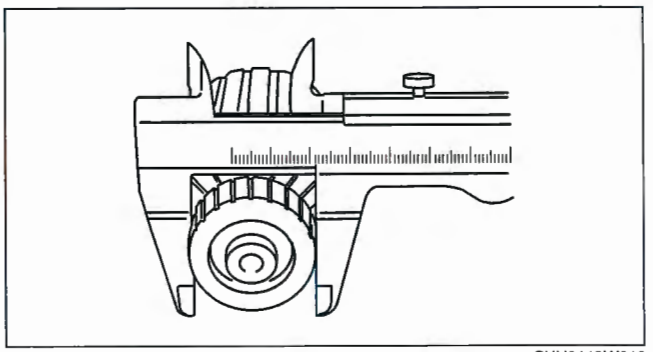
Starter armature runout
0.05 mm {0.002 in} max.



CHU0119W018

4. Measure the commutator diameter.
   - If not within the minimum specification, replace the armature.

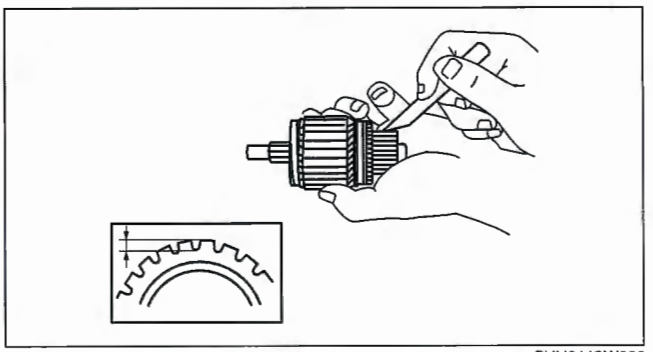
Starter commutator diameter
Standard: 29.4 mm {1.16 in}
Minimum: 28.8 mm {1.13 in}



CHU0119W019

5. Measure the segment groove depth of the commutator.
   - If not within the minimum specification, undercut the grooves to the standard depth.

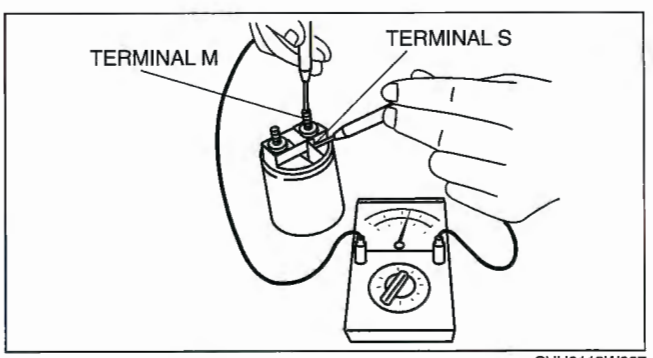
Segment groove depth of starter commutator
Standard: 0.4—0.6 mm {0.016—0.023 in}
Minimum: 0.2 mm {0.008 in}



CHU0119W020

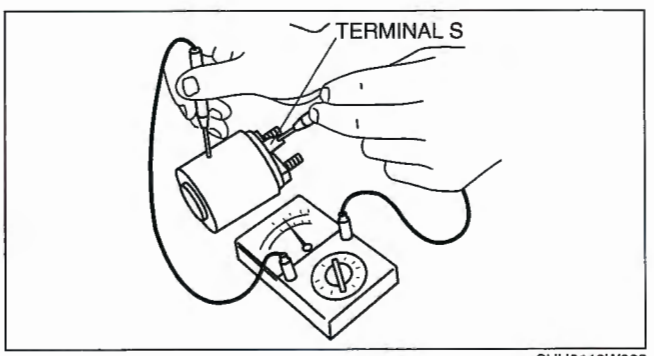
Magnetic switch

1. Inspect for continuity between terminals S and M using a tester.
   - If there is no continuity, replace the magnetic switch.



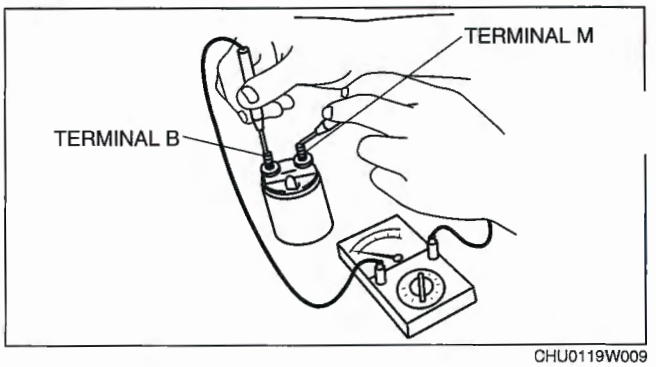
CHU0119W007

2. Inspect for continuity between terminal S and the body using a tester.
   - If there is no continuity, replace the magnetic switch.



CHU0119W008

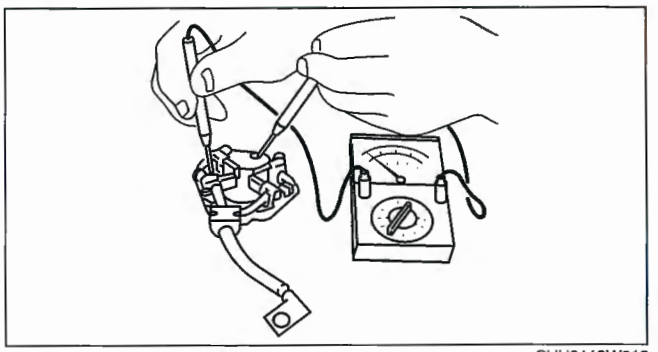
3. Verify that there is no continuity between terminals M and B using a tester.
   - If there is continuity, replace the magnetic switch.



CHU0119W009

Brush and brush holder

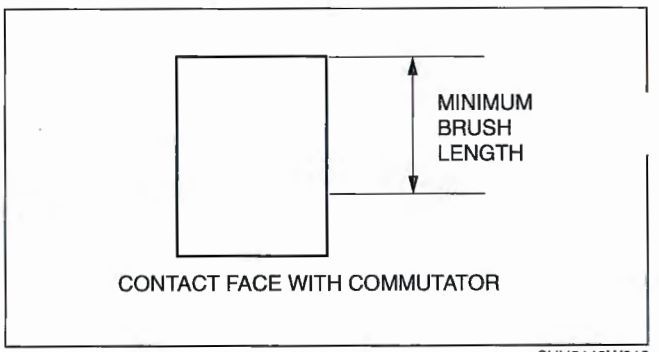
1. Verify that there is no continuity between each insulated brush and plate using a tester.
   - If there is continuity, replace the brush holder.



CHU0119W012

2. Measure the brush length.
   - If any brush is worn almost to or beyond the minimum specification, replace all of the brushes.

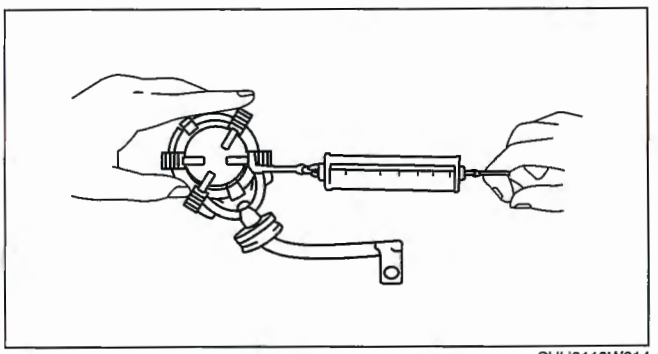
   Starter brush length
   Standard: 12.3 mm {0.48 in}
   Minimum: 7.0 mm {0.28 in}



CHU0119W013

3. Measure the brush spring force using a spring balance.
   - If not within the minimum specification, replace the brush and brush holder component.

   Starter brush spring force
   Standard: 18.3—24.9 N {1.87—2.53 kgf, 4.12—5.59 lbf}
   Minimum: 5.9 N {0.6 kgf, 1.3 lbf}



CHU0119W014

STARTER DISASSEMBLY/ASSEMBLY [L3 WITH TC]

E6U011918400W06

1. Disassemble in the order indicated in the table.
2. Assemble in the reverse order of disassembly.

STARTER INTERLOCK SWITCH INSPECTION [L3 WITH TC]

E6U011943440W02

On-vehicle Inspection

1. Inspect the following.
   - With the clutch pedal not depressed, verify that the engine does not start.
   - With the clutch pedal fully depressed, verify that the engine starts.
     — If not as specified, perform the continuity inspection.

Continuity Inspection

1. Disconnect the starter interlock switch connector.
2. Verify that the continuity is as indicated in the table.
   - If there is any malfunction, replace the starter interlock switch.

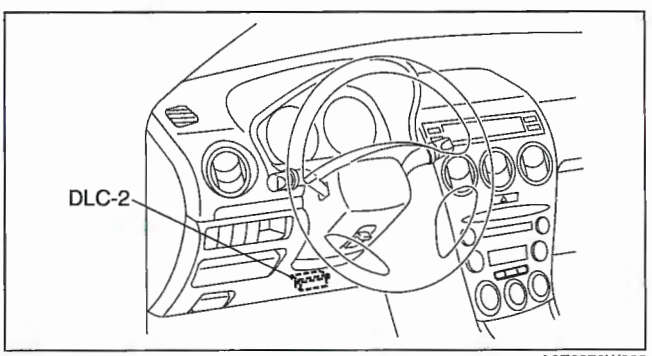
M INSPECTION [L3]

E6U014018880W08

Using the WDS or Equivalent

Note
- PIDs for the following parts are not available on this model. Perform the specific inspections for the following parts:
  - — CMP sensor (See 01–40A–48 CAMSHAFT POSITION (CMP) SENSOR INSPECTION [L3].)
  - — Main relay (See 09–21–7 RELAY INSPECTION.)

1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to ON position.
3. Measure the PID value.
   - If PID value is not within the specification, follow the instructions in Action column.



A6E3970W002

Note
- The PID/DATA MONITOR function monitors the calculated value of the input/output signals in the PCM. Therefore, an output device malfunction is not directly indicated as a malfunction of the monitored value for the output device. If a monitored value of an output device is out of specification, inspect the monitored value of the input device related to the output control.
- For input/output signals except those of the monitoring items, use a voltmeter to measure the PCM terminal voltage.
- The simulation items that are used in the ENGINE CONTROL SYSTEM OPERATION INSPECTION are as follows.
  - — ACCS, ALTF, EVAPCP, FAN1, FAN2, FAN3, FP, FUELPW1, GENVDSD, HTR11, HTR12, HTR13*, IASV, IMRC, IMTV, INJ_1, INJ_2, INJ_3, INJ_4, SEGRP, test, VT DUTY1 Wt

* : California emission regulation applicable ATX model

PID/DATA monitor table (reference)

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Action	PCM terminal
AAT	°C / °F	Ignition switch at ON position: Indicate the ambient air temperature	Inspect IAT sensor. (See 01–40A–33 INTAKE AIR TEMPERATURE (IAT) SENSOR INSPECTION [L3])	—
AC_REQ (A/C request signal)	ON/OFF	A/C switch and fan switch ON at ignition switch ON: On A/C switch OFF at ignition switch ON: Off	Inspect A/C switch.	1AU
ACCS (A/C relay)	ON/OFF	Ignition switch ON: OFF A/C switch ON and fan switch ON at idle: ON	Inspect following PIDs: RPM, TP, ECT, ACSW, TR. Inspect A/C relay.	1I
AFR (Air fuel ratio)	—	Ignition switch at ON position: Indicate the air fuel ratio*4	Inspect following PIDs: O2S11, O2S12, O2S13*1. Inspect fuel injector.	—
AFR_ACT (Actual air fuel ratio)	—	Ignition switch at ON position: Indicate the actual air fuel ratio	Inspect following PIDs: O2S11, O2S12, O2S13*1. Inspect fuel injector.	—
ALTF (Generator field coil control duty value)	%	Ignition switch ON: 0% Idle: 0—100% Just after A/C switch ON and fan switch ON at idle: Duty value rises	Inspect following PIDs: IAT, ECT, RPM, VPWR, ALTT V. Inspect generator.	2AI
ALTT V (Generator output voltage)	V	Ignition switch ON: 0 V Idle: Approx. 14.9 V (E/L not operating)	Inspect generator.	2AJ
APP (Accelerator pedal position)	%	APP released: 0% APP open: 100%	Inspect following PIDs: APP1, APP2. Inspect accelerator pedal position sensor.	1AO 1AP
APP 1 (Accelerator pedal position sensor 1)	%	APP released: 31.0—32.4% APP open: 69.8—81.8%	Inspect accelerator pedal position sensor.	1AO
	V	APP released: 1.55—1.62 V APP depressed: 3.49—4.09 V		
APP 2 (Accelerator pedal position sensor 2)	%	APP released: 20.2—21.4% APP depressed: 58.8—70.8%	Inspect accelerator pedal position sensor.	1AP
	V	APP released: 1.01—1.07 V APP depressed: 2.94—3.54 V		
ARPMDES (Target engine speed)	RPM	No load: 700 rpm E/L operating: 700 rpm P/S operating: 700 rpm A/C ON: 750 rpm	Inspect following PIDs: IAT, RPM, MAP, ECT, MAF, TP, INGEAR, ACSW, TR, PSP, ALTT V. Inspect IAC valve. Inspect CKP sensor.	—
BARO (Barometric pressure)	kPa, Bar, psi	Ignition switch ON: Indicate the atmospheric pressure	Inspect BARO sensor.	—
	V	Ignition switch ON (at sea level): Approx. 4.0 V		
BOO (Brake switch)	ON/OFF	Brake pedal depressed: ON Brake pedal released: OFF	Inspect brake switch.	1AB 1AF
BPA (Brake pressure applied switch)	ON/OFF	Brake pedal depressed: ON Brake pedal released: OFF	Inspect brake switch.	—
CATT11_DSD (Desired catalyst temperature bank one, sensor one)	°C	Indicate the estimated catalytic converter temperature	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3])	—
CHRGLP (Generator warning light)	ON/OFF	Ignition switch ON: ON Idle: OFF	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	—
COLP (Refrigerant pressure switch (middle))	ON/OFF	Refrigerant pressure switch (middle) ON *5 at idle: ON Refrigerant pressure switch (middle) OFF*6 at idle: OFF	Inspect refrigerant pressure switch.	1J

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Action	PCM terminal
CPP*3 (Clutch pedal position)	ON/OFF	Clutch pedal depressed: ON Clutch pedal released: OFF	Inspect clutch pedal position switch.	1D
CPP/PNP*3 (Shift lever position)	Drive/ Neutral	Neutral position: Neutral Others: Drive	Inspect neutral switch.	1X
DTCCNT (Number of DTC detected)	—	—	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	—
ECT (Engine coolant temperature)	°C / °F	ECT 20 °C {68 °F}: 20 °C {68 °F} ECT 60 °C {140 °F}: 60 °C {140 °F}	Inspect ECT sensor.	2AH
	V	ECT 20 °C {68 °F}: 3.04—3.14 V ECT 60 °C {140 °F}: 1.29—1.39 V		
EQ_RAT11 (Equivalence ratio (lambda))	—	Idling after warm-up: Approx. 1	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	2Z 2AC 2AD
EQ_RAT11_DSD (Desired equivalence ratio (lambda))	—	Idling after warm-up: Approx. 1	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	2Z 2AC 2AD
ETC_ACT (Electronic throttle control actual)	°	Indicate the desired TP by angle	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	2AL 2AK
ETC_DSD (Electronic throttle control desired)	%	Indicate the desired TP by percent	Inspect following PIDs:APP1, APP2, ETC_ACT. Inspect TP sensor.	1AO 1AP
	°	Indicate the desired TP by angle		
EVAPCP (Purge solenoid valve duty value)	%	Ignition switch ON: 0% Idle: 0%	Inspect following PIDs: IAT, RPM, ECT, MAF, O2S11, INGEAR, TR, VPWR.	2C
FAN1 (Cooling fan control)	ON/OFF	ECT less than 100 °C {212 °F}: OFF Others: ON	Inspect following PIDs: RPM, TP, ECT, ACSW, COLP, TEST. Inspect cooling fan relay.	1M
FAN2 (Cooling fan control)	ON/OFF	ECT less than 108 °C {226 °F}: OFF A/C operating, refrigerant pressure switch (middle) is OFF, and ECT less than 108 °C {226 °F}: OFF Others: ON	Inspect following PIDs: RPM, TP, ECT, ACSW, COLP, TEST. Inspect cooling fan relay.	1R
FAN3 (Cooling fan control)	ON/OFF	ECT less than 100 °C {212 °F}: OFF A/C operating, refrigerant pressure switch (middle) is ON, and ECT less than 108 °C {226 °F}: OFF Other: ON	Inspect following PIDs: RPM, TP, ECT, ACSW, COLP, TEST. Inspect cooling fan relay.	1R
FLI (Fuel level)	%	Fuel gauge level F: Approx. 100% Fuel gauge level E: Approx. 0%	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3])	—
FP (Fuel pump relay)	ON/OFF	Ignition switch ON: OFF Idle: ON Cranking: ON	Inspect following PIDs: RPM. Inspect fuel pump relay.	1H
FUELPW (Fuel injector duration)	ms	Ignition switch ON: 0 ms Idle (after warm up): approx. 2.5 ms	Inspect following PIDs: IAT, MAF, TP, MAP, ECT, RPM, O2S11, O2S12, INGEAR, TR, PSP, ACSW, VPWR, ALTT V. Inspect fuel injector.	2AZ 2BB 2BC 2BD
FUELSYS (Fuel system status)	OL/CL/ OL-Drive/ OL-Fault/ CL-Fault	Ignition switch ON: Open loop Idle (after warm up): Closed loop	Inspect following PIDs: IAT, MAF, TP, MAP, ECT, RPM, O2S11, O2S12, INGEAR, TR, PSP, ACSW, VPWR, ALTT V. Inspect fuel injector.	—
GENVDSD (Generator voltage desired)	V	Ignition switch ON: 0 V Idle: Approx. 14.9 V (E/L not operating)	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	—
HTR11 (HO2S heater (front))	ON/OFF	Idle (after warm up): ON⇔OFF	Inspect following PIDs: IAT, MAF, TP, ECT, RPM, ACSW.	2BG

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Action	PCM terminal
HTR12 (HO2S heater (middle*1, rear*2))	ON/OFF	Ignition switch ON: OFF (HO2S heater not operating) Idle: ON (HO2S heater operating)	Inspect following PIDs: IAT, MAF, ECT, RPM, ACSW.	2BF*1 2BE*2
HTR13*1 (HO2S heater (rear))	ON/OFF	Ignition switch ON: OFF (HO2S heater not operating) Idle: ON (HO2S heater operating)	Inspect following PIDs: IAT, MAF, ECT, RPM, ACSW.	2BE
IASV (Variable air duct control solenoid valve)	ON/OFF	ECT is more than 70 °C {158 °F}, engine speed is more than 5,800 rpm, and TP opening angle is more than 50%: ON Others: OFF	Inspect following PIDs: ECT, RPM, TP. Inspect VAD solenoid valve.	1K
IAT (Intake air temperature)	°C | °F	Indicate the IAT.	Inspect IAT sensor.	1AT
	V	IAT 0 °C {32 °F}: Approx. 3.43 V IAT 20 °C {68 °F}: Approx. 2.38 V IAT 40 °C {104 °F}: Approx. 1.49 V		
IMRC (Variable tumble solenoid valve)	ON/OFF	Engine speed is less than approx. 3,750 rpm: ON Others: OFF	Inspect following PIDs: TP, ECT, RPM. Inspect variable tumble solenoid valve.	2I
IMTV (Variable Intake air control solenoid valve)	ON/OFF	Engine speed is less than approx. 4,500 rpm: ON Others: OFF	Inspect following PIDs: RPM. Inspect VIS control solenoid valve.	2J
INGEAR (Load/no load condition)	ON/OFF	CPP or CPP/PNP is ON: OFF Others: ON	Perform applicable DTC troubleshooting.	1D 1X
IVS (CTP condition)	IDLE/ OFF IDLE	CTP: IDLE Others: OFF IDLE	Perform applicable DTC troubleshooting.	1AO 1AP
KNOCKR (Knocking retard)	°	Ignition switch ON: 0° Idle: 0°	Inspect knock sensor.	2U 2V
LDP_EVAPCP (EVAP system leak detection pump detect incorrect purge flow)	mA	Indicate the EVAP control system incorrect purge flow detection value	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3])	—
LDP_IDL (EVAP system leak detection pump idle current)	mA	Indicate the EVAP system leak detection pump idle current	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3])	—
LDP_MON (EVAP system leak detection pump monitoring current)	mA	Indicate the EVAP system leak detection pump monitoring current	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3])	—
LDP_REF (EVAP system leak detection pump reference current)	mA	Indicate the EVAP system leak detection pump reference current	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3])	—
LDP_SLDV (EVAP system small leak detection value)	mA	Indicate the EVAP control system small leak detection value	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3])	—
LDP_VSL_FV*7 (EVAP system small leak detection value)	mA/sec	Indicate the EVAP control system vary small leak-fail value	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3])	—
LDP_VSL_SV*7 (EVAP system small leak detection value)	mA/sec	Indicate the EVAP control system vary small leak-safe value	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3])	—
LDP_VSLDV*7 (EVAP system small leak detection value)	mA/sec	Indicate the EVAP control system vary small leak detection value	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3])	—
LOAD (Engine load)	%	Ignition switch ON: 0% Idle (after warm up): approx.19%	Inspect MAF sensor.	—
LONGFT1 (long term fuel trim)	%	Idle (after warm up): approx. –14—14%	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	—

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Action	PCM terminal
MAF (Mass airflow)	g/s	Ignition switch ON: approx. 0 g/s Idle (after warm up): approx. 1.5 g/s	Inspect MAF sensor.	1AK
	V	Ignition switch ON: approx. 0.7 V Idle (after warm up): approx. 1.3 V		
MAP (Manifold absolute pressure)	kPa, inHg	Ignition switch ON (at sea level): approx. 101 kPa {29.8 inHg}	Inspect MAP sensor.	2AG
	V	Ignition switch ON (at sea level): approx. 4.1 V		
MIL (Malfunction indicator lamp)	ON/OFF	Ignition switch ON: ON Idle: OFF	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	—
MIL_DIS (Travelled distance since the MIL illuminated)	km, mile	No DTC: 0 km {0 mile} DTC detected: Not 0 km {0 mile}	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	—
NUMKEYS (Number of keys stored in module)	—	Indicate the number of the keys stored module	—	—
O2S11 (Front oxygen sensor)	A	Ignition switch ON: 0—1.0 V Idle (After warm up): 0—1.0 V	Inspect HO2S (front).	2Z 2AC*2 2AD
O2S12 (middle*1, rear*2 oxygen sensor)	V	Idle (After warm up): approx. 0.6 V	Inspect HO2S (middle*1, rear*2).	2R*1 2Q*2
O2S13*1 (rear oxygen sensor)	V	Idle (After warm up): approx. 0.6 V	Inspect HO2S (rear).	2Q
PSP (Power steering pressure switch)	Low/High	Steering wheel in straight ahead position: Low Others: High	Inspect PSP switch.	2T
RFCFLAG (Readness function code)	Learnt/Not Learnt	Before running PCM adaptive memory procedure drive mode: Not Learnt After running PCM adaptive memory procedure drive mode: Learnt	Run PCM adaptive memory procedure drive mode.	—
RO2FT1 (rear oxygen sensor fuel trim)	—	Idle (after warm up): approx. –0.03—0.03	Perform applicable DTC troubleshooting.	—
RPM (Engine speed)	rpm	Indicate the engine speed	Inspect CKP sensor.	2W
SCCS (Speed control command switch)	V	Press ON/OFF: Approx. 0 V Press CANCEL: Approx. 1.2 V Press SET/COAST: Approx. 3.2 V Press RES/ACCEL: Approx. 4.2 V Others: Approx. 5.0 V	Inspect cruise control switch.	—
SEGRP (EGR valve (stepping motor) position)	Step	Ignition switch ON: 0 step Idle: 0 step Cranking: 0—60 steps	Inspect following PIDs: MAF, TP, ECT, RPM, VSS. Inspect EGR valve.	2G 2H 2K 2L
SEGRP DSD (Desired SEGRP valve position)	%	Idle: 0%	Inspect following PIDs: MAF, TP, ECT, RPM, VSS.	2G 2H 2K 2L
SHRTFT1 (Short term fuel trim)	%	Idle (after warm up): approx.–30—25%	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	—
SHRTFT12 (Short term fuel trim bank 1 sensor 2)	%	Idle (after warm up): Approx.–30—25%	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	—
SHRTFT13*1 (Short term fuel trim bank 1 sensor 3)	%	Idle (after warm up): Approx.–30—25%	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	—

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Action	PCM terminal
SPARKADV (Ignition timing)	°	Ignition switch ON: BTDC 0° Idle: BTDC approx. 10°	Inspect following PIDs: MAF, TP, ECT, RPM, INGEAR, TR, PSP, ACSW, VPWR. Inspect ignition timing.	2AT 2AW 2AX 2BA
test (Test mode)	ON/OFF	—	—	—
TIRESIZE (Tire Size (rev / mile))	rev/mile	Indicate the tire circumference length	—	—
TP REL (Relative throttle position)	%	APP released: Approx. 10% APP depressed: Approx. 93%	Inspect TP sensor.	—
TP 1 (TP)	%	APP released: 8—12% APP depressed: 88—94%	Inspect TP sensor.	2AK
	V	APP released: 0.4—0.6 V APP depressed: 4.4—4.7 V		
TP 2 (TP)	%	APP released: 88—92% APP depressed: 6—12%	Inspect TP sensor.	2AL
	V	APP released: 4.4—4.6 V APP depressed: 0.3—0.6 V		
TPCT (TP sensor voltage at CTP)	V	Approx. 0.5 V	Inspect TP sensor.	2AK 2AL
VPWR (Module supply voltage)	V	Indicate the Module supply voltage.	Inspect battery.	—
VSS (Vehicle speed)	kph, mph	Vehicle speed 20 kph {12 mph}: 20 kph {12 mph} Vehicle speed 40 kph {25 mph}: 20 kph {12 mph}	Perform applicable DTC troubleshooting. (See 01–02A–18 DTC TABLE [L3].)	—
VT ACT1 (Actual valve timing)	°	Idle: Approx. 0°	Inspect following PIDs: TP, ECT, RPM. Inspect OCV.	2E
VT DIFF1 (Difference between target and actual valve timing)	°	Idle: Approx. 0°	Inspect following PIDs: TP, ECT, RPM. Inspect OCV.	2E
VT DUTY1 (Oil control valve duty value)	%	Idle: Approx. 11.5%	Inspect following PIDs: TP, ECT, RPM. Inspect OCV.	2E
VTC (Variable tumble shutter valve control)	Off/On	Indicate the condition of the variable tumble shutter valve switch	Inspect following PIDs: IMRC Inspect variable tumble shutter valve switch.	2AE

*1 : California emission regulation applicable ATX model
*2 : Except for California emission regulation applicable ATX model
*3 : MTX
*4 : Calculated value; differs from terminal voltage
*5 : Refrigerant pressure switch (middle) turns off when the refrigerant pressure is 1.26—1.49 MPa {12.9—15.1 kgf/cm^6, 184—214 psi}
*6 : Refrigerant pressure switch (middle) turns on when the refrigerant pressure is 1.69—1.84 MPa {17.3—18.7 kgf/cm^2, 247—265 psi}
*7 : California emission regulation applicable model

Without Using the SST

Caution

- **The PCM terminal voltages vary with change in measuring conditions and vehicle conditions. Always carry out a total inspection of the input systems, output systems, and PCM to determine the cause of trouble. Otherwise, a wrong diagnosis will be made.**

1. Measure the voltage at each terminal.
   - If any incorrect voltage is detected, inspect the related system(s), wiring harnesses and connector(s) referring to the Action column in the terminal voltage table.

Terminal	Signal	Connected to	Test condition		Voltage (V)	Inspection item
1A	Security light control	Security light	IG SW ON		Approx. 11.3	• Related wiring harness
1B	Starter relay control	Starter relay	Under any condition		Below 1.0	• Starter relay • Related wiring harnesses
1C	—	—	—		—	—
1D	Clutch operation*1	CPP switch	Clutch pedal depressed		Below 1.0	• CPP switch • Related wiring harnesses
			Clutch pedal released		B+	
1E	Coil (Immobilizer system)	Coil	Because this terminal is for communication, good/no good judgment by terminal voltage is not possible.			• Coil • Related wiring harnesses
1F	Coil (Immobilizer system)	Coil	Because this terminal is for communication, good/no good judgment by terminal voltage is not possible.			• Coil • Related wiring harnesses
1G	—	—	—		—	—
1H	Fuel pump control	Fuel pump relay	Ignition switch ON		B+	• Fuel pump relay • Related wiring harnesses
			Cranking		Below 1.0	
			Idle		Below 1.0	
1I	A/C	A/C relay	A/C operating		Below 1.0	• A/C
			A/C not operating		B+	
1J	A/C compressor load	Refrigerant pressure switch (middle)	A/C ON	Refrigerant pressure is more than 1.52 MPa {15.5 kgf/cm^2, 220 psi}	Below 1.0	• Refrigerant pressure switch • Related wiring harnesses
				Refrigerant pressure is less than 1.23 MPa {12.5 kgf/cm^2, 178 psi}	B+	

Terminal	Signal	Connected to	Test condition		Voltage (V)	Inspection item
1K	VAD control	VAD solenoid valve	Idle after warm up	Engine speed less than 5,800 rpm	B+	• VAD solenoid valve • Related wiring harnesses
				Engine speed more than 5,800 rpm	Below 1.0	
1L	—	—	—		—	—
1M	Cooling fan control (Main)	Cooling fan relay No.1	Idling	ECT less than 100 °C {212 °F}	B+	• Cooling fan relay • Related wiring harnesses
				A/C operating	Below 1.0	
1N	Cooling fan control (Add)	Cooling fan relay No.4	Idling	ECT less than 100 °C {212 °F}	B+	• Cooling fan relay • Related wiring harnesses
				A/C operating	Below 1.0	
1O	VSS output signal	VSS	• Inspect using the wave profile. (See 01–40A–21 Inspection Using An Oscilloscope (Reference).)			• Related wiring harnesses
1P	MAF sensor GND	MAF/IAT sensor	Under any condition		Below 1.0	• Related wiring harnesses
1Q	Main relay control	Main relay	Ignition switch OFF		B+	• Main relay • Related wiring harnesses
			Ignition switch ON		Below 1.0	
1R	Cooling fan control (Transfer)	Cooling fan relay No.2 or No.3	Idling	ECT less than 100 °C {212 °F}	B+	• Cooling fan relay • Related wiring harnesses
				A/C operating	Below 1.0	
1S	—	—	—		—	—
1T	—	—	—		—	—
1U	EVAP system leak detection pump (pump)	EVAP system leak detection pump	Ignition switch ON		B+	• EVAP system leak detection pump • Related wiring harness
			Idle		B+	
1V	EVAP system leak detection pump (solenoid)	EVAP system leak detection pump	IG SW ON		B+	• EVAP system leak detection pump • Related wiring harnesses
			Idle		B+	
1W	—	—	—		—	—
1X	Neutral position*1	Neutral switch	Shift lever is at neutral position		Below 1.0	• Neutral switch • Related wiring harnesses
			Shift lever is not at neutral position		B+	
1Y	—	—	—		—	—
1Z	—	—	—		—	—
1AA	—	—	—		—	—
1AB	Brake1	Brake switch	Brake pedal depressed		B+	• Brake switch • Related wiring harnesses
			Brake pedal released		Below 1.0	
1AC	—	—	—		—	—
1AD	—	—	—		—	—
1AE	—	—	—		—	—
1AF	Brake2	Brake switch	Brake pedal depressed		B+	• Brake switch • Related wiring harnesses
			Brake pedal released		Below 1.0	
1AG	—	—	—		—	—
1AH	—	—	—		—	—
1AI	CAN (L)	Instrument cluster, ABS/TCS HU/CM, TCM	Because this terminal is for CAN, good/no good judgment by terminal voltage is not possible.			• Related wiring harnesses
1AJ	Constant voltage (Vref)	APP sensor	Ignition switch ON		Approx. 5.0	• Related wiring harnesses

Terminal	Signal	Connected to	Test condition		Voltage (V)	Inspection item
1AK	MAF	MAF sensor	Ignition switch ON		Approx. 0.7	• MAF sensor • Related wiring harnesses
			Idle (after warm up)	MTX	1.15—1.28	
				ATX	1.18—1.31	
1AL	Constant voltage (Vref)	APP sensor	Ignition switch ON		Approx. 5.0	• Related wiring harnesses
1AM	CAN (H)	Instrument cluster, ABS HU/CM, TCM	Because this terminal is for CAN, good/no good judgment by terminal voltage is not possible.			• Related wiring harness
1AN	—	—	—		—	—
1AO	APP sensor 1	APP sensor	IG SW ON	APP released	1.55—1.62	• APP sensor • Related wiring harness
				APP depressed	3.49—4.09	
1AP	APP sensor 2	APP sensor	IG SW ON	APP released	1.01—1.07	• APP sensor • Related wiring harness
				APP depressed	2.94—3.54	
1AQ	Cruise control switch*2	Cruise control switch	IG SW ON	Depressing ON/OFF	Approx. 0	• Cruise control switch • Related wiring harnesses
				Depressing CANCEL	Approx. 1.2	
				Depressing SET/COAST	Approx. 3.2	
				Depressing Res/ACCEL	Approx. 4.2	
				Others	Approx. 5.0	
1AR	IAT sensor GND	MAF/IAT sensor	Under any condition		Below 1.0	• Related wiring harnesses
1AS	APP sensor GND	APP sensor	Under any condition		Below 1.0	• Related wiring harnesses
1AT	IAT	MAF/IAT sensor	IG SW ON	IAT 0 °C {32 °F}	Approx. 3.43	• MAF/IAT sensor • Related wiring harness
				IAT 20 °C {68 °F}	Approx. 2.38	
				IAT 40 °C {104 °F}	Approx. 1.49	
				IAT 60 °C {140 °F}	Approx. 0.89	
				IAT 80 °C {176 °F}	Approx. 0.53	
				IAT 100 °C {212 °F}	Approx. 0.33	
1AU	A/C	A/C relay	Idle	A/C operating	Below 1.0	• A/C relay • Related wiring harness
				A/C not operating	B+	
1AV	APP sensor GND	APP sensor	Under any condition		Below 1.0	• Related wiring harnesses
1AW	Back-up power supply*3	Main relay	Under any condition		B+	• Main relay • Related wiring harness
1AX	Throttle actuator control power supply	Drive-by-wire relay	Ignition switch OFF (after 90 s)		Below 1.0	• Drive-by-wire relay • Related wiring harnesses
			Ignition switch ON		B+	
1AY	Ignition switch (IG1)	Ignition switch	Ignition switch OFF		Below 1.0	• Ignition switch • Related wiring harnesses
			Ignition switch ON		B+	

Terminal	Signal	Connected to	Test condition	Voltage (V)	Inspection item
1AZ	GND	Ground	Under any condition	Below 1.0	• Related wiring harnesses
1BA	Back-up power supply	Battery (positive terminal)	Under any condition	B+	• Battery • Related wiring harness
1BB	GND	Ground	Under any condition	Below 1.0	• Related wiring harnesses
1BC	Sensor GND	HO2S (rear)	Under any condition	Below 1.0	• Related wiring harnesses
1BD	GND	Ground	Under any condition	Below 1.0	• Related wiring harnesses
1BE	Main relay control	Main relay	Ignition switch OFF	B+	• Main relay • Related wiring harnesses
			Ignition switch ON	Below 1.0	
1BF	Throttle actuator control power supply	Drive-by-wire relay	Ignition switch OFF (after 90 s)	Below 1.0	• Drive-by-wire relay • Related wiring harnesses
			Ignition switch ON	B+	
1BG	Sensor GND*3	HO2S (middle)	Under any condition	Below 1.0	• Related wiring harnesses
1BH	GND	Ground	Under any condition	Below 1.0	• Related wiring harnesses
2A	Throttle actuator control (+)	Throttle body	Ignition switch ON	B+	• Throttle actuator • Related wiring harnesses
2B	Throttle actuator control (–)	Throttle body	Idle (after warm up)	3.5—5.5	• Throttle actuator • Related wiring harnesses
2C	Purge control	Purge solenoid valve	• Inspect using the wave profile. (See 01–40A–21 Inspection Using An Oscilloscope (Reference).)		• Purge solenoid valve • Related wiring harnesses
2D	—	—	—	—	—
2E	OCV control	OCV	• Inspect using the wave profile. (See 01–40A–21 Inspection Using An Oscilloscope (Reference).)		• OCV valve • Related wiring harnesses
2F	—	—	—	—	—
2G	EGR valve #2 coil control	EGR valve (terminal A)	Ignition switch ON	B+	• EGR valve • Related wiring harnesses
			Idle	B+	
2H	EGR valve #4 coil control	EGR valve (terminal F)	Ignition switch ON	Below 1.0	• EGR valve • Related wiring harnesses
			Idle	Below 1.0	
2I	Variable tumble control	Variable tumble solenoid valve	ECT more than 60 °C {140 °F} while idling.	B+	• Variable tumble solenoid valve • Related wiring harnesses
			ECT less than 60 °C {140 °F} and engine speed less than 3,750 rpm	Below 1.0	
2J	Variable intake air control	Variable intake air solenoid valve	Engine speed: more than 4,500 rpm	B+	• Variable intake air solenoid valve • Related wiring harnesses
			Engine speed: less than 4,500 rpm	Below 1.0	
2K	EGR valve #1 coil control	EGR valve (terminal E)	Ignition switch ON	Below 1.0	• EGR valve • Related wiring harnesses
			Idle	Below 1.0	
2L	EGR valve #3 coil control	EGR valve (terminal B)	Ignition switch ON	B+	• EGR valve • Related wiring harnesses
			Idle	B+	
2M	VSS (–)*4	VSS	• Inspect using the wave profile. (See 01–40A–21 Inspection Using An Oscilloscope (Reference).)		• VSS sensor • Related wiring harnesses

Terminal	Signal	Connected to	Test condition		Voltage (V)	Inspection item
2N	VSS (+)*4	VSS	• Inspect using the wave profile. (See 01–40A–21 Inspection Using An Oscilloscope (Reference).)			• VSS sensor • Related wiring harnesses
2O	—	—	—		—	—
2P	—	—	—		—	—
2Q	HO2S (rear)	HO2S (rear)	Ignition switch ON		Approx. 0	• HO2S (rear) • Related wiring harnesses
			Idle (after warm up)		0⇔1.0	
2R	HO2S (middle)*3	HO2S (middle)	Ignition switch ON		Approx. 0	• HO2S (middle) • Related wiring harnesses
			Idle (after warm up)		0⇔1.0	
2S	CMP signal	CMP sensor	• Inspect using the wave profile. (See 01–40A–21 Inspection Using An Oscilloscope (Reference).)			• CMP sensor • Related wiring harnesses
2T	PSP	PSP switch	Idle	Steering wheel at straight ahead position	B+	• PSP switch • Power steering system • Related wiring harnesses
				While turning steering wheel	Below 1.0	
2U	Knocking (+)	Knock sensor	Ignition switch ON (Use digital type voltmeter, because measurement voltage will be detected less than true voltage when using analog type voltmeter)		Approx. 4.3	• Perform "On-Board Diagnostic Test" • Related wiring harnesses
2V	Knocking (–)	Knock sensor	Ignition switch ON (Use digital type voltmeter, because measurement voltage will be detected less than true voltage when using analog type voltmeter)		Below 1.0	• Perform "On-Board Diagnostic Test" • Related wiring harnesses
2W	CKP signal	CKP sensor	• Inspect using the wave profile. (See 01–40A–21 Inspection Using An Oscilloscope (Reference).)			• CKP sensor • Related wiring harnesses
2X	HO2S (front) shield	HO2S (front)	Under any condition		Below 1.0	• Related wiring harnesses
2Y	—	—	—		—	—
2Z	HO2S (front) sensor GND*3	HO2S (front)	Under any condition		Below 1.0	• Related wiring harnesses
	HO2S (front)*5	HO2S (front)	Ignition switch ON		Approx. 6.19	• HO2S (front) • Related wiring harnesses
			Ignition switch OFF (after 90 s)		Below 1.0	
			Idle (after warm up)		Approx. 4.1	
2AA	—	—	—		—	—
2AB	—	—	—		—	—
2AC	HO2S (front)*5	HO2S (front)	Idle (after warm up): Approx. 0 mA		—	• HO2S (front) • Related wiring harnesses
2AD	HO2S (front)*3	HO2S (front)	• Inspect using the wave profile. (See 01–40A–21 Inspection Using An Oscilloscope (Reference).)			• HO2S (front) • Related wiring harness
	HO2S (front)*5	HO2S (front)	• Verify that the voltage increases when the engine speed increases.			• HO2S (front) • Related wiring harnesses
2AE	Variable tumble shutter valve monitor	Variable tumble shutter valve switch	ECT less than 62 °C {144 °F} while engine speed less than 3,750 rpm		Approx. 5.0	• Variable tumble shutter valve switch • Related wiring harness
			ECT more than 62 °C {144 °F} or engine speed 3,750 rpm or more		Below 1.0	
2AF	—	—	—		—	—

Terminal	Signal	Connected to	Test condition		Voltage (V)	Inspection item
2AG	Manifold absolute pressure	MAP sensor	Ignition switch ON (Engine OFF) at sea level		Approx. 4.1	• MAP sensor • Related wiring harnesses
2AH	ECT	ECT sensor	IG SW ON	IAT 20 °C {68 °F}	3.04—3.14	• ECT sensor • Related wiring harness
				IAT 40 °C {104 °F}	2.09—2.21	
				IAT 60 °C {140 °F}	1.29—1.39	
				IAT 80 °C {176 °F}	0.76—0.83	
				IAT 100 °C {212 °F}	0.45—0.49	
2AI	Generator field coil control	Generator (terminal D)	• Inspect using the wave profile. (See 01–40A–21 Inspection Using An Oscilloscope (Reference).)			• Following PIDs: IAT, ECT, RPM, VPWR, ALTT V • Generator • Related wiring harness
2AJ	Generator output voltage	Generator (terminal P)	• Inspect using the wave profile. (See 01–40A–21 Inspection Using An Oscilloscope (Reference).)			• Generator • Related wiring harness
2AK	TP (No. 1)	TP sensor No. 1	Ignition switch ON	APP released	0.4—0.6	• TP sensor • Related wiring harness
				APP depressed	4.4—4.7

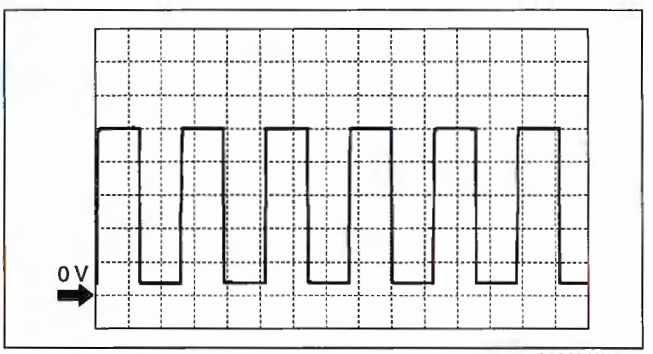
...spection Using An Oscilloscope (Reference)
VSS signal
PCM terminals
- 1O, 2M, 2N(+)—body ground(–)

Oscilloscope setting
- 1 V/DIV (Y), 10 ms/DIV (X), DC range

Vehicle condition
- Drive the vehicle with approx. 10 km/h {6.2 mph}

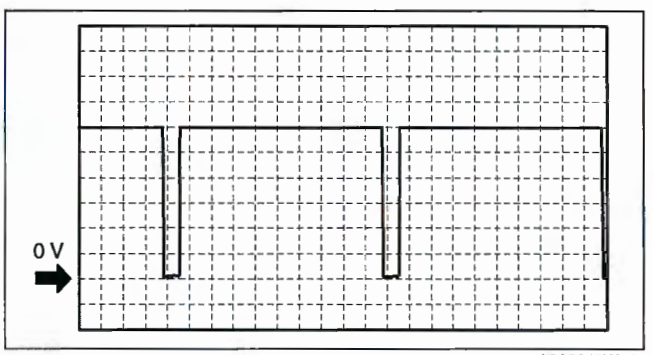


A6A3940W011

Purge control signal
PCM terminals
- 2C(+)—body ground(–)

Oscilloscope setting
- 2 V/DIV (Y), 10 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)

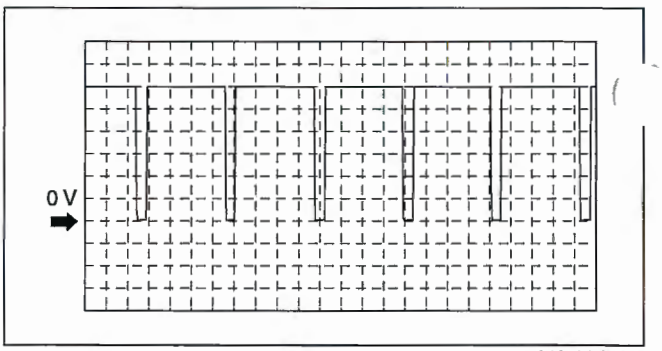


A6A3940W023

OCV control signal
PCM terminals
- 2E(+)—body ground(–)

Oscilloscope setting
- 2 V/DIV (Y), 0.8 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)

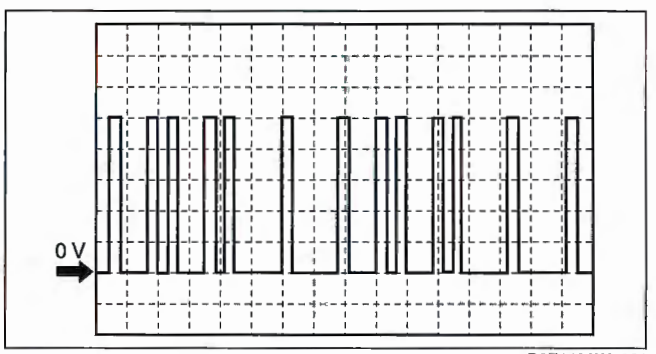


A6A3940W022

CMP sensor signal
PCM terminals
- 2S(+)—body ground(–)

Oscilloscope setting
- 1 V/DIV (Y), 25 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)

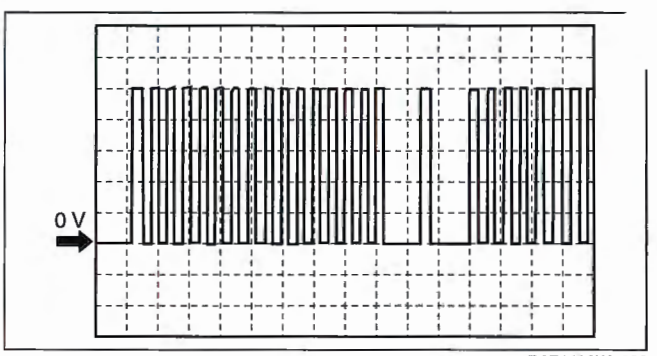


D6E140AW3021

CKP sensor signal
PCM terminals
- 2W(+)—body ground(–)

Oscilloscope setting
- 1 V/DIV (Y), 2.5 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)

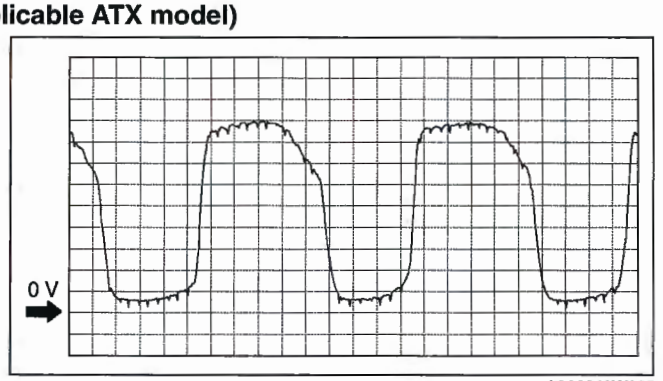


D6E140AW3022

HO2S (front) signal (California emission regulation applicable ATX model)
PCM terminals
- 2AD(+)—body ground(–)

Oscilloscope setting
- 0.1 V/DIV (Y), 400 ms/DIV (X), DC range

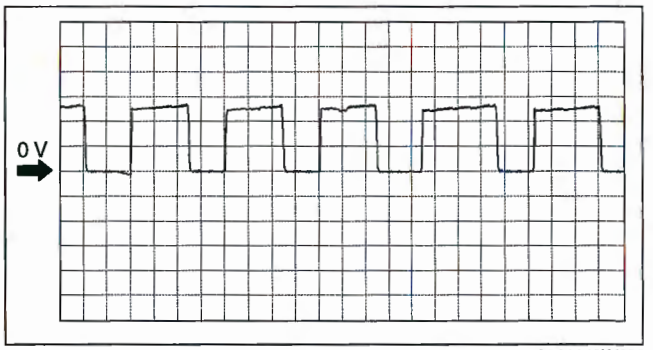
Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)



A6A3940W005

Generator field coil control signal
PCM terminals
- 2AI(+)—body ground(–)

Oscilloscope setting
0.5 V/DIV (Y), 1 ms/DIV (X), DC range
Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)

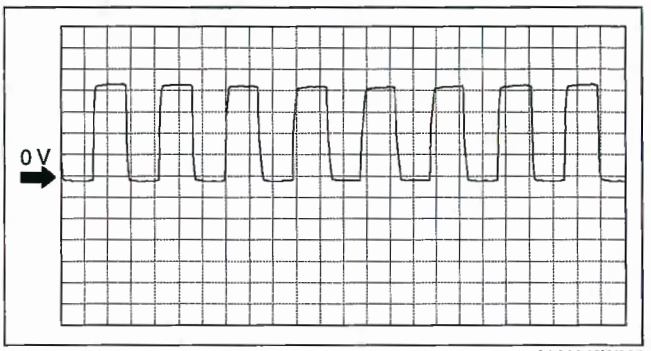


A6A3940W006

Generator output voltage signal
PCM terminals
- 2AJ(+)—body ground(–)

Oscilloscope setting
- 2 V/DIV (Y), 2 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)

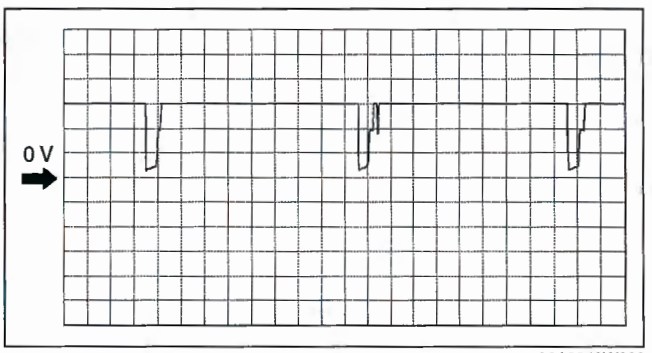


A6A3940W004

IGT1, IGT2, IGT3, IGT4 control signals
PCM terminals
IGT1 (ignition coil No.1): 2BA(+)—body ground(–)
- IGT2 (ignition coil No.2): 2AW(+)—body ground(–)
- IGT3 (ignition coil No.3): 2AX(+)—body ground(–)
- IGT4 (ignition coil No.4): 2AT(+)—body ground(–)

Oscilloscope setting
- 4 V/DIV (Y), 0.01 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)



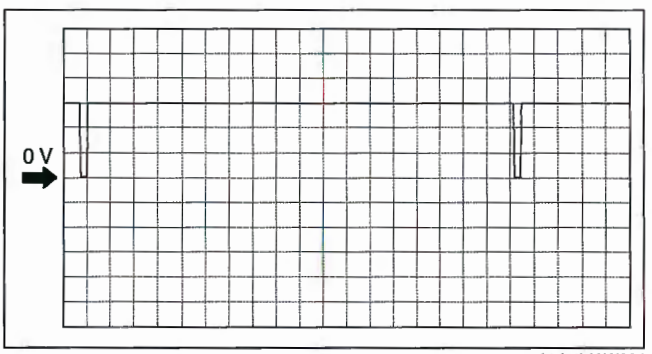
A6A3940W003

Fuel injection control

PCM terminals
- Fuel Injection No.1: 2BB(+)—body ground(–)
- Fuel Injection No.2: 2BC(+)—body ground(–)
- Fuel Injection No.3: 2BD(+)—body ground(–)
- Fuel Injection No.4: 2AZ(+)—body ground(–)

Oscilloscope setting
- 4 V/DIV (Y), 10 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)

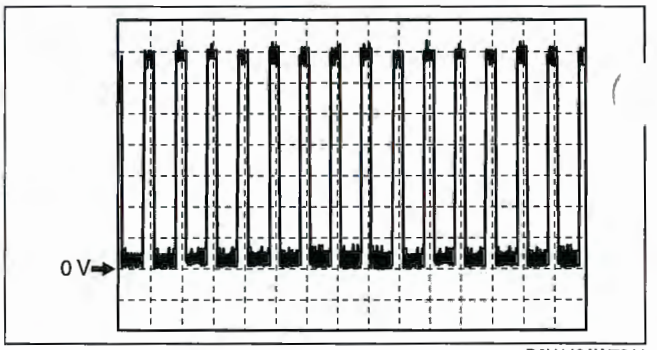


A6A3940W024

HO2S (rear) heater control
PCM terminals
- 2BE(+)—body ground(–)

Oscilloscope setting
- 2 V/DIV (Y), 1 s/DIV (X), DC range

Vehicle condition
- Idle (immediately after starting the engine)

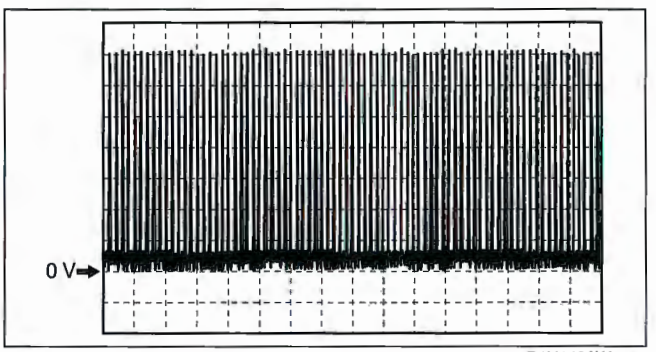


D6U140AW7311

HO2S (front) heater control
PCM terminals
- 2BG(+)—body ground(–)

Oscilloscope setting
- 2 V/DIV (Y), 500 ms/DIV (X), DC range

Vehicle condition
- Idle (immediately after starting the engine)



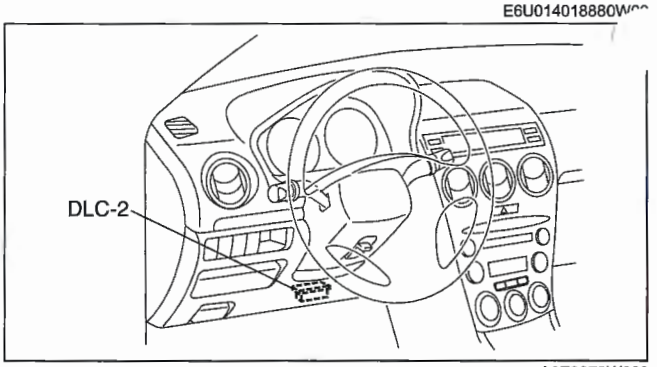
D6U140AW7312

PCM REPLACEMENT [L3]

1. Connect the WDS or equivalent to the DLC-2.
2. Set up the WDS or equivalent (including the vehicle recognition).
3. Select "Module Programming".
4. Select "Programmable Module Installation".
5. Select "PCM" and perform procedures according to directions on the WDS or equivalent screen.

Note
- If the PCM is replaced with a new one, the PCM stores DTC P0602 and illuminates the MIL even though no malfunction is detected. When the configuration is completed, DTC P0602 is cleared.

E6U014018880W



A6E3970W002

6. Retrieve DTC's by the WDS or equivalent, then verify that there in no DTC present.
   - If DTC is present, perform applicable DTC inspection. (See 01–02A–18 DTC TABLE [L3].)

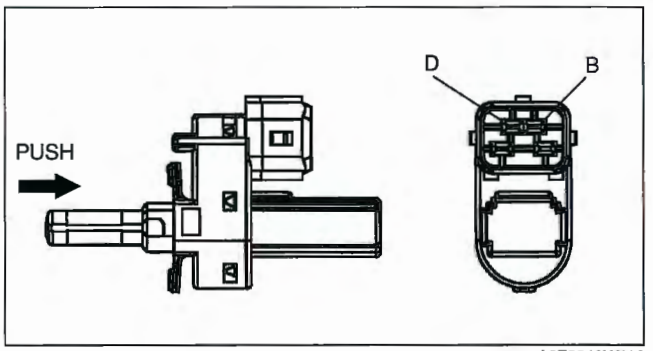
CLUTCH PEDAL POSITION (CPP) SWITCH INSPECTION [L3]

E6U014018660W03

Note
- Perform the following inspection only when directed.

Continuity Inspection

1. Verify that the clutch switch is installed properly.
2. Disconnect the negative battery cable.
3. Remove the clutch switch.
4. Inspect for continuity between the clutch switch terminals using an ohmmeter.
   - If the clutch switch is normal, but PID value is out of specification, perform the "Circuit Open/ Short Inspection".
   - If not as specified, replace the clutch switch.



A6E3940W020

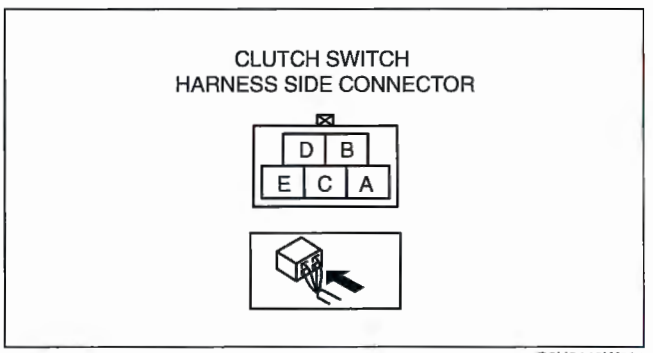
Specification

○—○ :Continuity

Rod condition	Terminal	
	B	D
Released	○	○
Pushed		

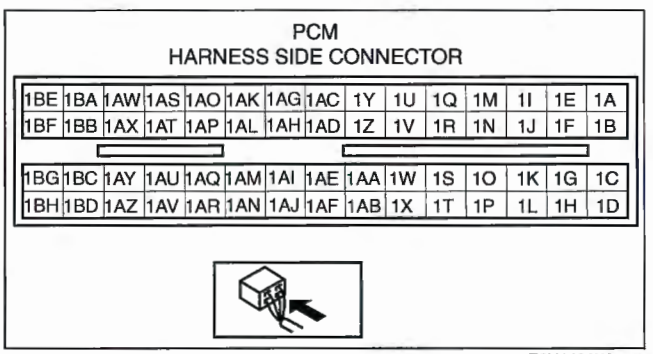
A6E3940W022

Circuit Open/Short Inspection



B6U0140W031

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following harnesses for open or short circuit. (Continuity inspection)



E6U140AW5991

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the harness.
  - — Clutch switch terminal B and PCM terminal 1D
  - — Clutch switch terminal D and body GND

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the harness.
  - — Clutch switch terminal B and body GND

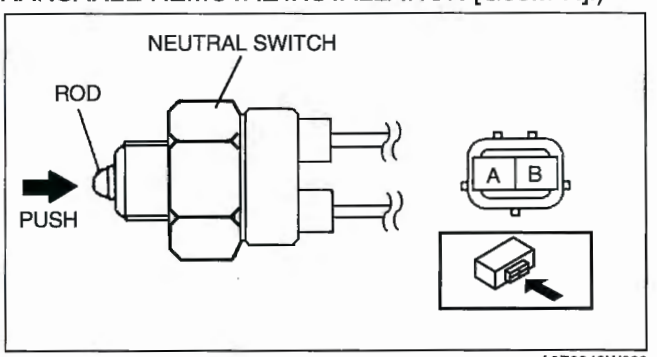
NEUTRAL SWITCH INSPECTION [L3]

E6U014017640W03

Note
- Perform the following inspection only when directed.

Continuity Inspection

1. Disconnect the negative battery cable.
2. Remove the neutral switch. (See 05–15A–4 MANUAL TRANSAXLE REMOVAL/INSTALLATION [G35M-R].)
3. Inspect for continuity between the neutral switch terminals using an ohmmeter.
   - If the neutral switch is normal, but PID value is out of specification, perform the "Circuit Open/Short Inspection".
   - If not as specified, replace the neutral switch.



A6E3940W023

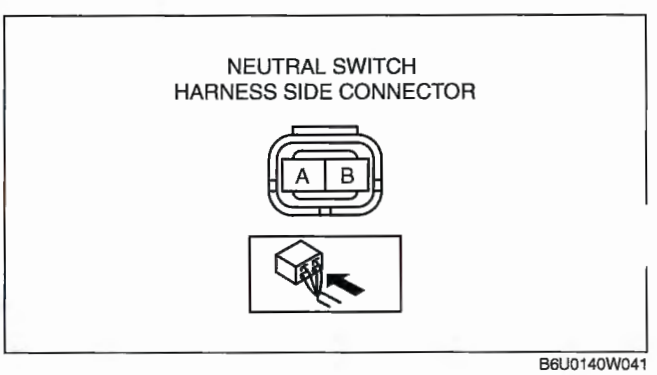
Specification

O—O : Continuity

Condition	Terminal	
	A	B
Rod pushed	O	O
Except above		

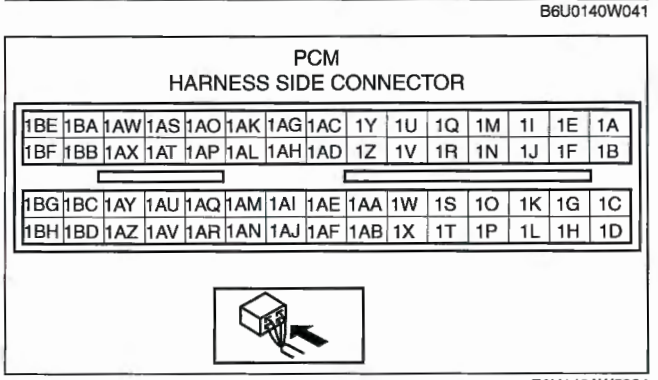
A6E3940W025

Circuit Open/Short Inspection



B6U0140W041

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following harnesses for open or short circuit. (Continuity inspection)



E6U140AW5991

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the harness.
  - — Neutral switch terminal B and PCM terminal 1X
  - — Neutral switch terminal A and body GND

Short circuit

- If there is no continuity, there is a short circuit. Repair or replace the harness.
  - — Neutral switch terminal B and body GND

POWER STEERING PRESSURE (PSP) SWITCH INSPECTION [L3]

E6U014032230W03

Note
- Perform the following inspection only when directed.

Continuity Inspection

1. Inspect the following if the power steering is inoperative (See 06–12–4 POWER STEERING FLUID INSPECTION.):
   - Power steering fluid level
   - Power steering fluid leakage
   - Power steering fluid pressure
2. Disconnect the PSP switch connector.
3. Start the engine.
4. Inspect for continuity between the PSP switch terminal and GND using an ohmmeter.
   - If not as specified, replace the PSP switch.
   - If the PSP switch is normal, but PID value is out of specification, perform the "Circuit Open/Short Inspection".

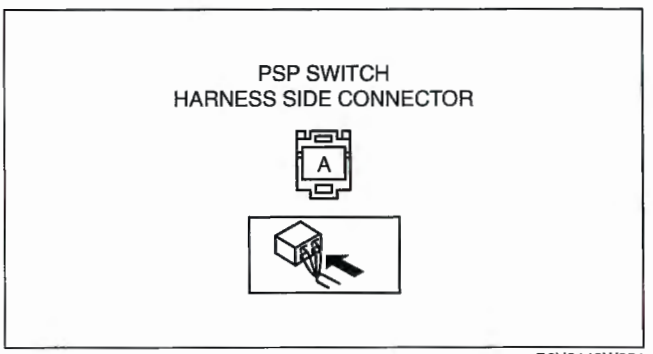
Specification

O—O :Continuity

Condition	Terminal	GND
Steering wheel in straight ahead position		
While turning steering wheel	O	O

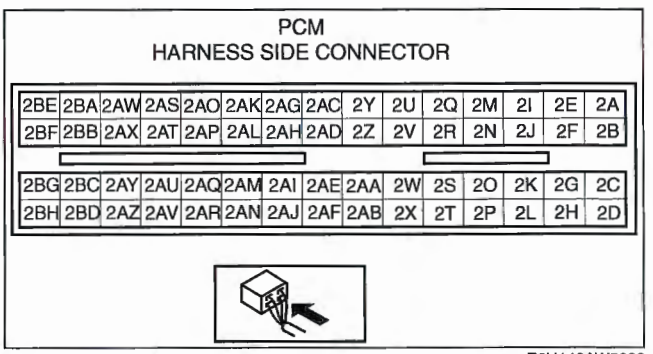
A6E3940W019

Circuit Open/Short Inspection



B6U0140W051

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following harnesses for open or short circuit. (Continuity inspection)



E6U140AW5992

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the harness.
  — PSP switch terminal and PCM terminal 2T

Short circuit
- If there is no continuity, there is a short circuit. Repair or replace the harness.
  — PSP switch terminal and body GND

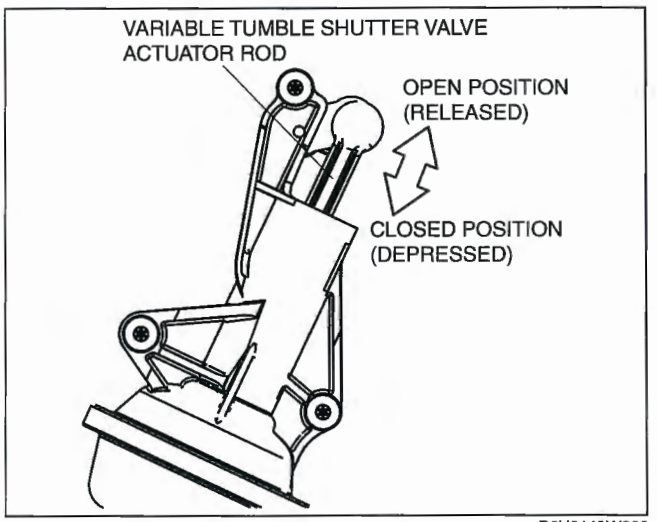
VARIABLE TUMBLE SHUTTER VALVE SWITCH INSPECTION [L3]

E6U014018995W01

Note
- Perform the following inspection only when directed.

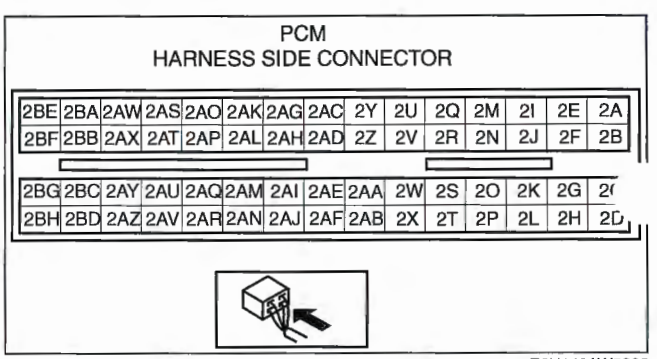
Voltage Inspection

1. Turn the ignition switch to ON position (Engine OFF).
2. Verify that the PCM terminal 2AE voltage is as shown in the following table when the Variable tumble shutter valve actuator rod is depressed and released by hand.



B6U0140W063

- If not as specified, perform the "Circuit Open/ Short Inspection".
  - — If there is no open or short circuit, replace the intake manifold.

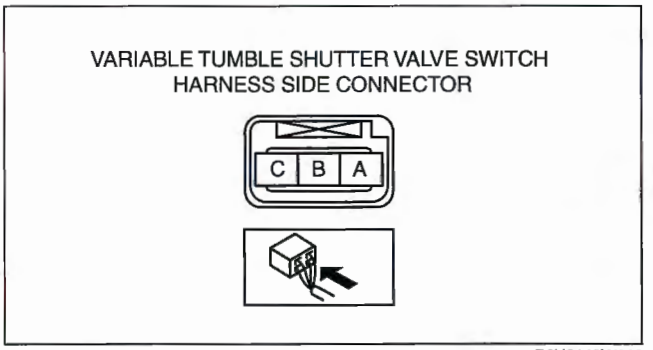


E6U140AW5992

Variable tumble shutter valve switch output voltage

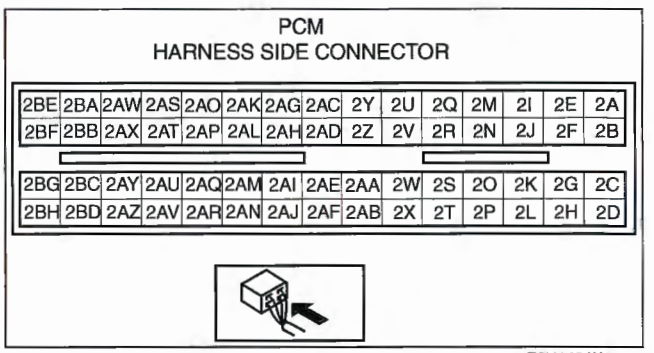
Condition	PCM terminal 2AE
Released (Open position)	Approx. 5.0 V
Depressed (Closed position)	Less than 0.4 V

Circuit Open/Short Inspection



B6U0140W062

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following harnesses for open or short circuit. (Continuity inspection)



E6U140AW5992

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the harness.
  - — Variable tumble shutter valve switch terminal A and PCM terminal 2AU
  - — Variable tumble shutter valve switch terminal B and PCM terminal 2AY
  - — Variable tumble shutter valve switch terminal C and PCM terminal 2AE

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the harness.
  - — Variable tumble shutter valve switch terminal A and power supply
  - — Variable tumble shutter valve switch terminal A and body GND
  - — Variable tumble shutter valve switch terminal B and power supply
  - — Variable tumble shutter valve switch terminal C and power supply
  - — Variable tumble shutter valve switch terminal C and body GND

ACCELERATOR PEDAL POSITION (APP) SENSOR INSPECTION [L3]

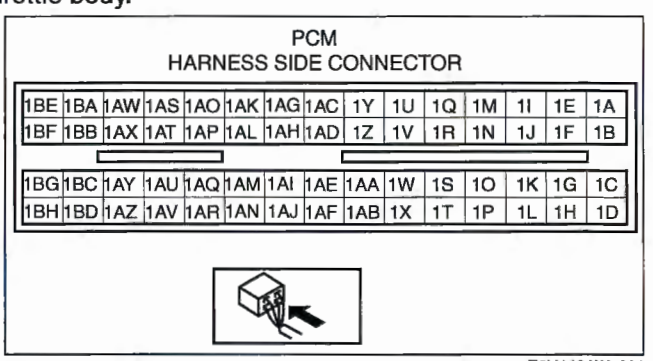
E6U014041609W03

Note

- Perform the following inspection only when directed.

Voltage Inspection

1. Turn the ignition key to ON position (Engine OFF).
2. Verify that the PCM terminal 1AO and 1AP change smoothly while throttle valve is gradually opened.
   - If as verified, go to next step.
   - If not as verified, perform the "Circuit Open/Short Inspection".
     - — If there is no open or short circuit, replace the throttle body.
3. Verify that the PCM terminal 1AO and 1AP voltages are as shown in the following table.



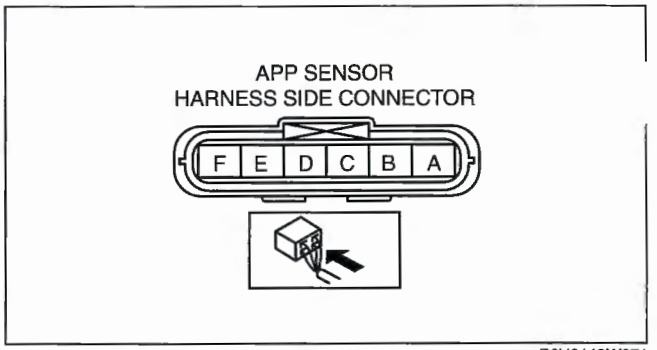
E6U140AW5991

APP sensor output voltage

Condition	PCM terminal 1AO (APP sensor No.1)	PCM terminal 1AP (APP sensor No.2)
Accelerator pedal released	1.55—1.62 V	1.01—1.07 V
Accelerator pedal depressed	3.49—4.09 V	2.94—3.54 V

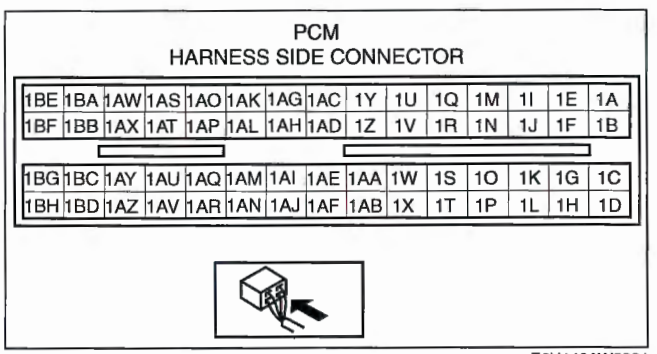
- If voltage is not as following table, perform the "Circuit Open/Short Inspection".
  - — If there is no open or short circuit, replace accelerator pedal. (See 01–13A–10 ACCELERATOR PEDAL REMOVAL/INSTALLATION [L3].)

Circuit Open/Short Inspection



B6U0140W071

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harnesses for open or short circuit. (Continuity inspection)



E6U140AW5991

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — APP sensor terminal A and PCM terminal 1AJ
  - — APP sensor terminal B and PCM terminal 1AV
  - — APP sensor terminal C and PCM terminal 1AP
  - — APP sensor terminal D and PCM terminal 1AL
  - — APP sensor terminal E and PCM terminal 1AS
  - — APP sensor terminal F and PCM terminal 1AO

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — APP sensor terminal A and power supply
  - — APP sensor terminal A and body GND
  - — APP sensor terminal B and power supply
  - — APP sensor terminal C and power supply
  - — APP sensor terminal C and body GND
  - — APP sensor terminal D and power supply
  - — APP sensor terminal D and body GND
  - — APP sensor terminal E and power supply
  - — APP sensor terminal F and power supply
  - — APP sensor terminal F and body GND

THROTTLE POSITION (TP) SENSOR INSPECTION [L3]

E6U014018910W03

Note

- Perform the following inspection only when directed.

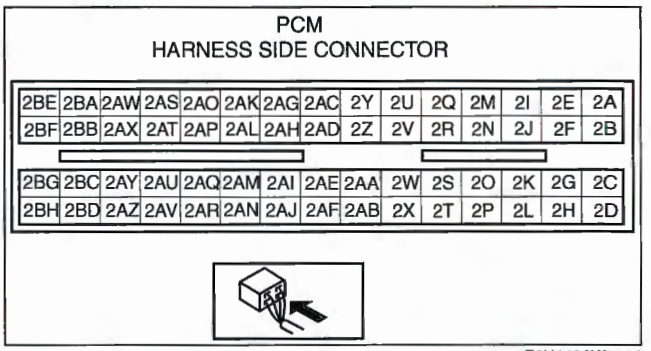
Voltage Inspection

1. Verify that no DTC related to APP sensor has been detected.
   - If any DTCs related to APP sensor have been detected, perform the DTC inspection. (See 01–02A–18 DTC TABLE [L3].)
2. Start the engine and warm it up (ECT: **more than 80°C {176 °F}**.
3. Turn the ignition switch to ON position (Engine OFF).
4. Verify that the PCM terminal 2AK and 2AL change smoothly while throttle valve is gradually opened.
   - If as verified, go to next step.
   - If not as verified, perform the "Circuit Open/Short Inspection".
     - — If there is no open or short circuit, replace the throttle body.

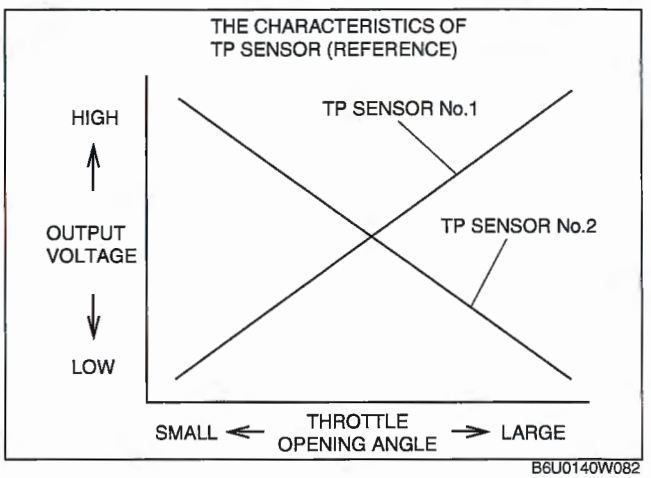
5. Verify that the PCM terminal 2AK and 2AL voltages are as shown in the following table.
   - If voltage is not as following table, perform the "Circuit Open/Short Inspection".
     — If there is no open or short circuit, replace the throttle body.

TP sensor output voltage

Condition	PCM terminal 2AK (TP sensor No.1)	PCM terminal 2AL (TP sensor No.2)
APP close	0.4—0.6 V	4.4—4.6 V
APP open	4.4—4.7 V	0.3—0.6 V

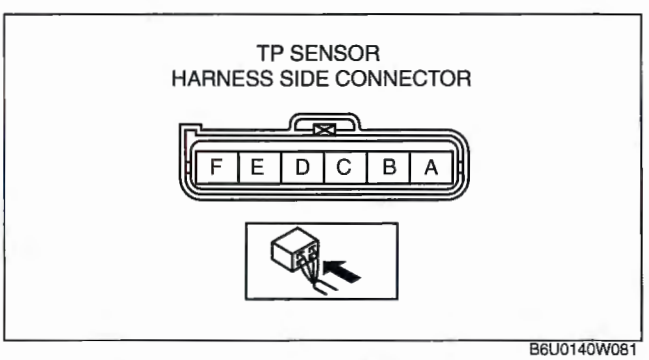


E6U140AW5992



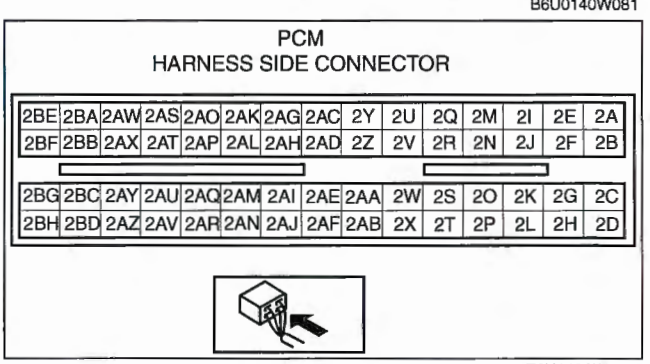
B6U0140W082

Circuit Open/Short Inspection



B6U0140W081

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harnesses for open or short circuit. (Continuity inspection)



E6U140AW5992

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  — Throttle body terminal A and PCM terminal 2AK
  — Throttle body terminal B and PCM terminal 2AO
  — Throttle body terminal C and PCM terminal 2AL
  — Throttle body terminal D and PCM terminal 2AP

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  — Throttle body terminal A and power supply
  — Throttle body terminal A and body GND
  — Throttle body terminal B and power supply
  — Throttle body terminal B and body GND
  — Throttle body terminal C and power supply
  — Throttle body terminal C and body GND
  — Throttle body terminal D and power supply

MASS AIR FLOW (MAF) SENSOR INSPECTION [L3]

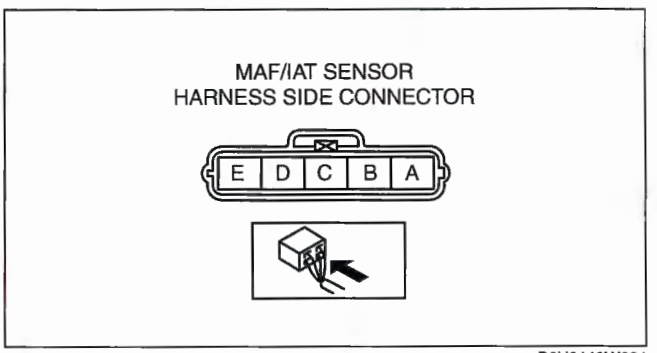
E6U014013215W01

Visual Inspection

Note
- Perform the following inspection only when directed.

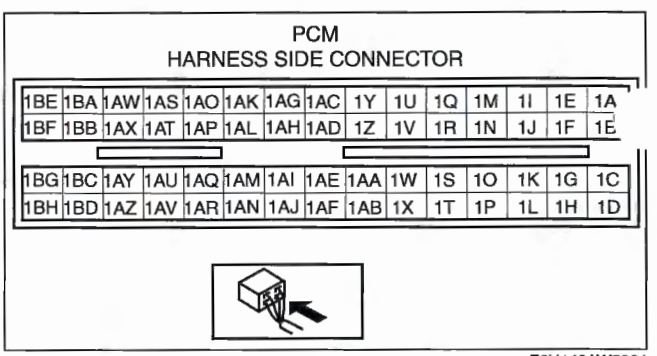
1. Visually inspect for the following on the MAF sensor.
   - Damage
   - Cracks
   - Bent terminals
   - Terminal rust
     - — If any of the above are found, replace the MAF sensor.
     - — If the MAF PID value is out of specification, carry out the "Circuit Open/Short Inspection".

Circuit Open/Short Inspection



B6U0140W091

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Disconnect the MAF sensor connector.
3. Inspect the following wiring harnesses for open or short circuit. (Continuity inspection)



E6U140AW5991

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — MAF sensor terminal A and main relay terminal C
  - — MAF sensor terminal B and PCM terminal 1P
  - — MAF sensor terminal C and PCM terminal 1AK

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — MAF sensor terminal A and body GND
  - — MAF sensor terminal B and power supply
  - — MAF sensor terminal C and power supply
  - — MAF sensor terminal C and body GND

Specification

Condition	Intake MAF (g/s)		Engine load calculated value (%)	
	MTX	ATX	MTX	ATX
Idle*1	2.50—2.70	2.72—2.94	15.9—17.1	17.1—18.5
Engine Speed 2,500 rpm*2	7.56—8.18	8.00—8.66	13.3—14.3	14.2—15.2

*1 : 650—750 rpm
*2 : No load or neutral position

INTAKE AIR TEMPERATURE (IAT) SENSOR INSPECTION [L3]

E6U014018842W03

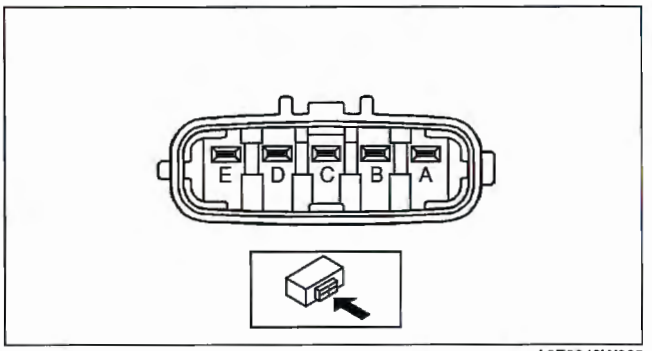
Resistance Inspection

Note
- Perform the following inspection only when directed.

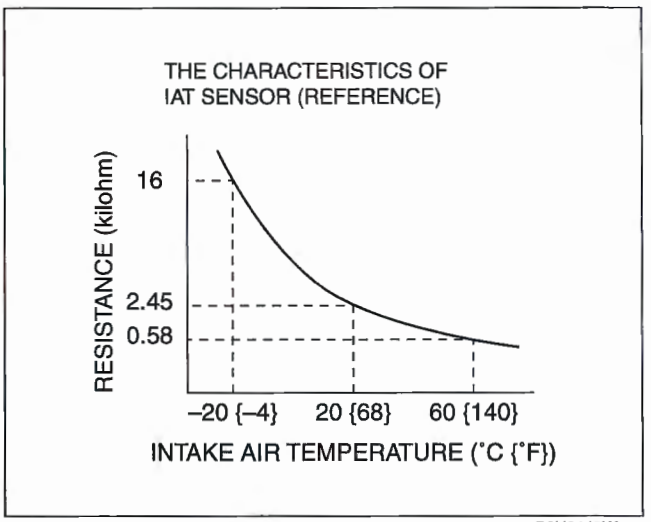
1. Disconnect MAF/IAT sensor.
2. Measure the resistance between the MAF/IAT sensor terminals D and E using an ohmmeter.
   - If not as specified, replace the MAF/IAT sensor.
   - If the MAF/IAT sensor is normal, but PID are out of specification, perform the "Circuit Open/ Short Inspection".

Specification

Ambient temperature (°C {°F})	Resistance (kilohm)
–20 {–4}	13.6—18.4
20 {68}	2.21—2.69
60 {140}	0.493—0.667

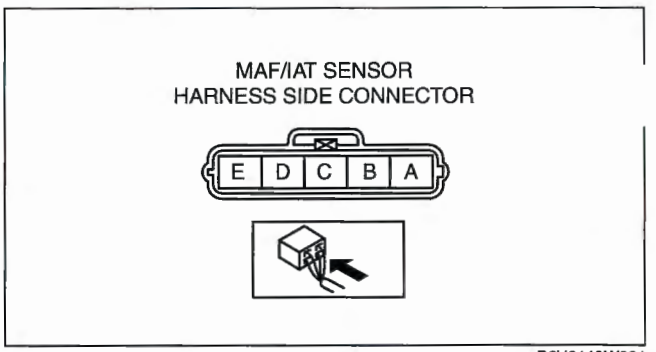


A6E3940W005



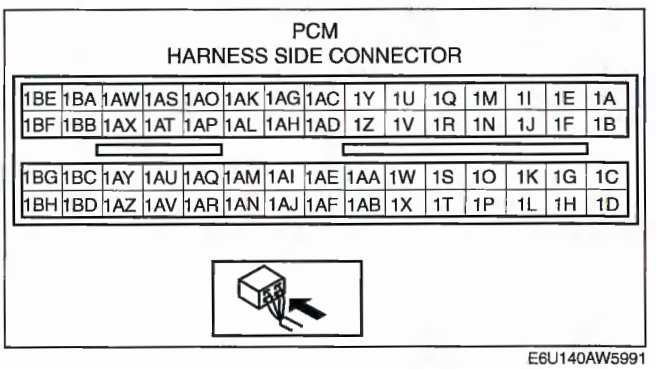
B6U0140W092

Circuit Open/Short Inspection



B6U0140W091

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harnesses for open or short circuit. (Continuity inspection)



E6U140AW5991

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — MAF/IAT sensor terminal D and PCM terminal 1AT
  - — MAF/IAT sensor terminal E and PCM terminal 1AR

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — MAF/IAT sensor terminal E and power supply
  - — MAF/IAT sensor terminal D and power supply
  - — MAF/IAT sensor terminal D and body GND

ENGINE COOLANT TEMPERATURE (ECT) SENSOR REMOVAL/INSTALLATION [L3]

E6U014018840W05

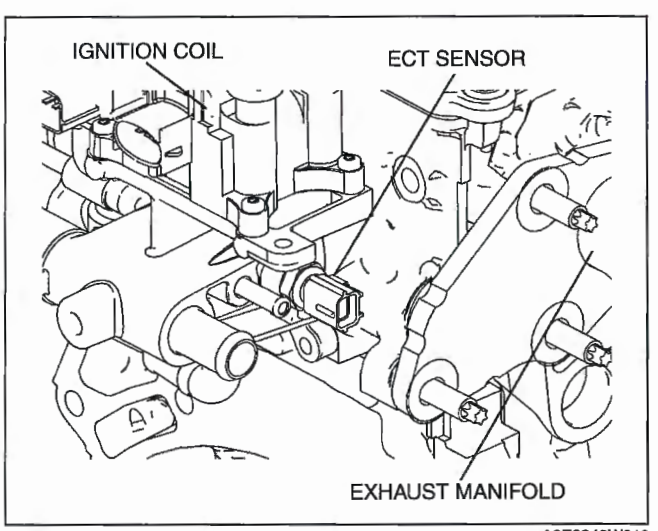
Warning

- **A hot engine can cause severe burns. Turn off the engine and wait until it is cool before removing the ECT sensor.**

1. Drain the engine coolant. (See 01–12A–3 COOLING SYSTEM SERVICE WARNINGS [L3, AJ].)
2. Disconnect the ECT sensor connector.
3. Remove the ECT sensor.
4. Install in the reverse order of removal.

Tightening torque
10—14 N·m
{1.02—1.42 kgf·m, 7.38—10.32 ft·lbf}

5. Refill the engine coolant. (See 01–12A–3 COOLING SYSTEM SERVICE WARNINGS [L3, AJ].)



A6E3940W01

ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [L3]

E6U014018840W06

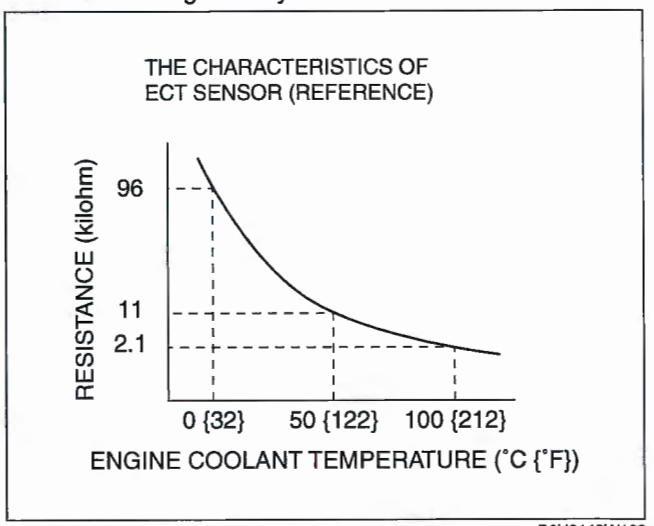
Note
- Perform the following inspection only when directed.

ECT Sensor Resistance Inspection

1. Drain the engine coolant. (See 01–12A–3 COOLING SYSTEM SERVICE WARNINGS [L3, AJ].)
2. Remove the ECT sensor (located above the starter).
3. Place the ECT sensor in water with a thermometer, and heat the water gradually.
4. Measure the resistance between the ECT sensor terminals A and B using an ohmmeter.
   - If not as specified, replace the ECT sensor.
   - If the ECT sensor is normal, but PID value is out of specification, perform the "Circuit Open/ Short Inspection".

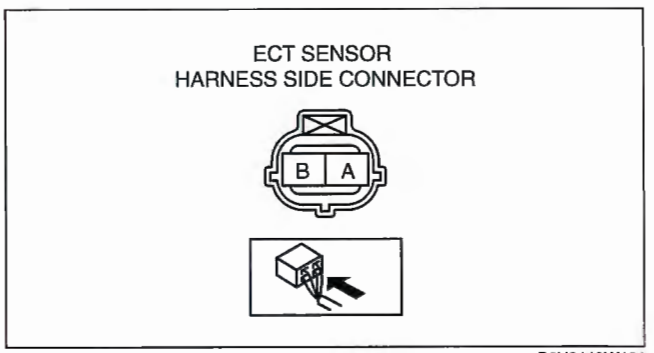
Specification

Water temperature (°C {°F})	Resistance (kilohm)
20 {68}	35.48—39.20
70 {158}	5.07—5.60
80 {176}	3.65—4.02



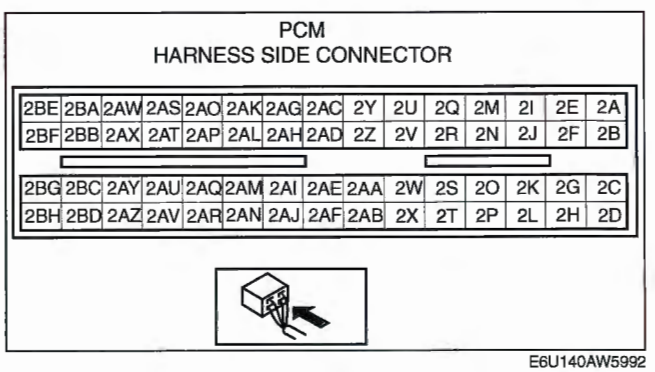
B6U0140W102

Circuit Open/Short Inspection



B6U0140W101

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harnesses for open or short circuit. (Continuity inspection)



E6U140AW5992

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — ECT sensor terminal A and PCM terminal 2AH
  - — ECT sensor terminal B and PCM terminal 2AY

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — ECT sensor terminal A and power supply
  - — ECT sensor terminal A and body GND
  - — ECT sensor terminal B and power supply

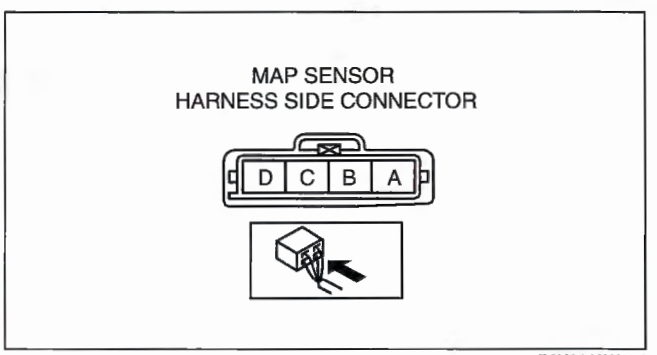
MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR INSPECTION [L3]

E6U014018212W01

Note
- Perform the following inspection only when directed.
- The following vacuum values are indicated by relative pressure from the MAP sensor.

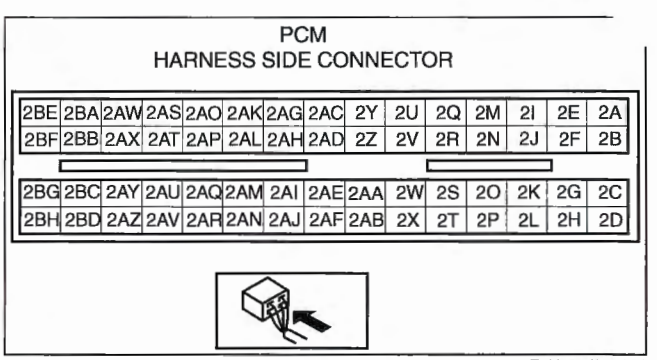
1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to ON (Engine OFF).
3. Select MAP PID on the WDS or equivalent.
4. Verify that the MAP PID (pressure) and barometric pressure are practically equal.
   - If not as verified, perform the "Circuit Open/Short Inspection".
     — If there is no open or short circuit, replace the MAP sensor.
   - If as verified, go to next step.
5. Apply vacuum of **–25.0 kPa {–187 mmHg, –7.38 inHg}** to the MAP sensor, and verify that the MAP variation from that of Step 4 is approx. **25.0 kPa {187 mmHg, 7.38 inHg}**.
   - If not as verified, perform the "Circuit Open/Short inspection".
     — If there is no open or short circuit, replace the barometric pressure sensor.

Circuit Open/Short Inspection



B6U0140W1[illegible]

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harnesses for open or short circuit. (Continuity inspection)



E6U140AW5992

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  — MAP sensor terminal A and PCM terminal 2AY
  — MAP sensor terminal D and PCM terminal 2AG
  — MAP sensor terminal C and PCM terminal 2AU

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  — MAP sensor terminal A and power supply.
  — MAP sensor terminal C and power supply.
  — MAP sensor terminal C and body GND.
  — MAP sensor terminal D and power supply.
  — MAP sensor terminal D and body GND

HEATED OXYGEN SENSOR (HO2S) INSPECTION [L3]

E6U014018860W03

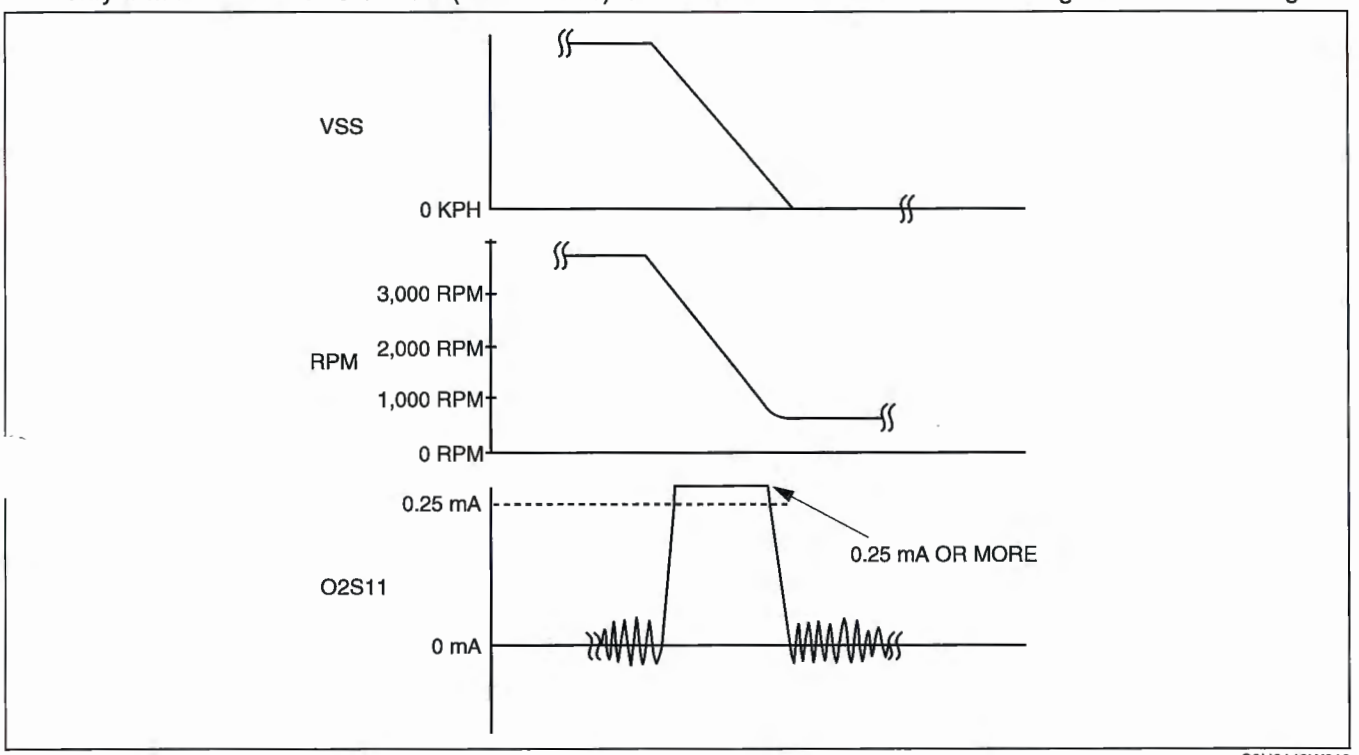
California Emission Regulation Applicable ATX Model

Note

- Before performing the following inspection, make sure to follow the troubleshooting flowchart. (See 01–03A–7 FOREWORD [L3].)

Front HO2S current inspection

1. Warm up the engine to normal operating temperature.
2. Using the WDS or equivalent, monitor the following:
   — Vehicle speed (PID: VSS)
   — Engine speed (PID: RPM)
   — Front HO2S current (PID: O2S11)
3. Drive the vehicle and decelerate the engine speed by releasing the accelerator pedal fully when the engine speed is **3,000 rpm or more**.
4. Verify that the front HO2S current (PID: O2S11) is **0.25 mA or more** while decelerating as shown in the figure.



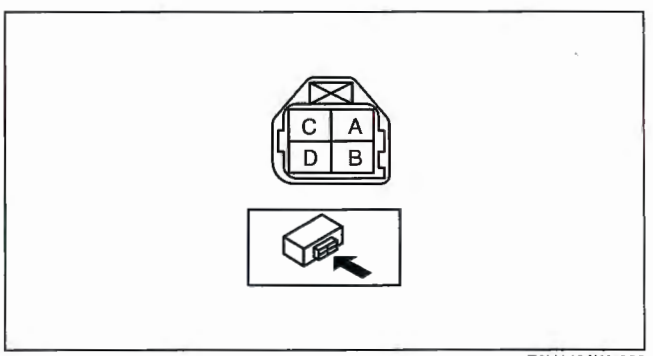
C3U0140W019

- If not within the specification, inspect the HO2S for an open or short circuit. (See 01–40A–38 Front HO2S circuit open/short inspection (sensor).) Then if there is no malfunction in the wiring harness, replace the front HO2S.

Front HO2S heater resistance inspection

1. Disconnect the front HO2S connector.
2. Measure the resistance between front HO2S terminals C and D.
   - If not within the specification, replace the front HO2S. (See 01–15A–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3].)

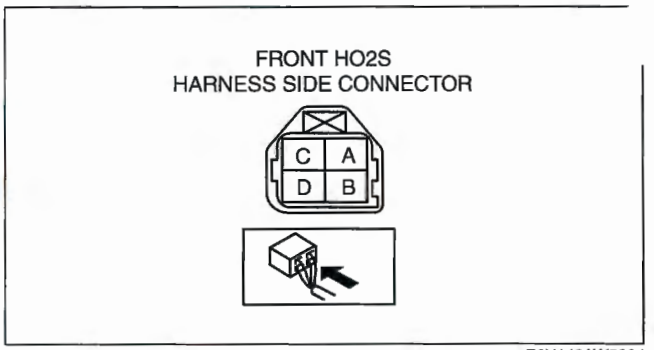
Front HO2S heater resistance
1—10 ohms



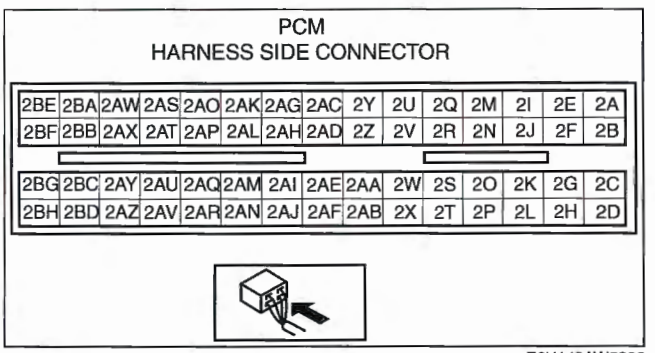
E6U140AW5803

Front HO2S circuit open/short inspection (sensor)

1. Disconnect the PCM connector.
2. Disconnect the front HO2S connector.
3. Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)



E6U140AW5804



E6U140AW5992

Open circuit

- If there is no continuity in the following wiring harnesses, there is an open circuit. Repair or replace the wiring harness.
  - — Front HO2S terminal A and PCM terminal 2AD
  - — Front HO2S terminal B and PCM terminal 2Z
  - — Front HO2S terminal C and PCM terminal 2BG
  - — Front HO2S terminal D and ignition switch

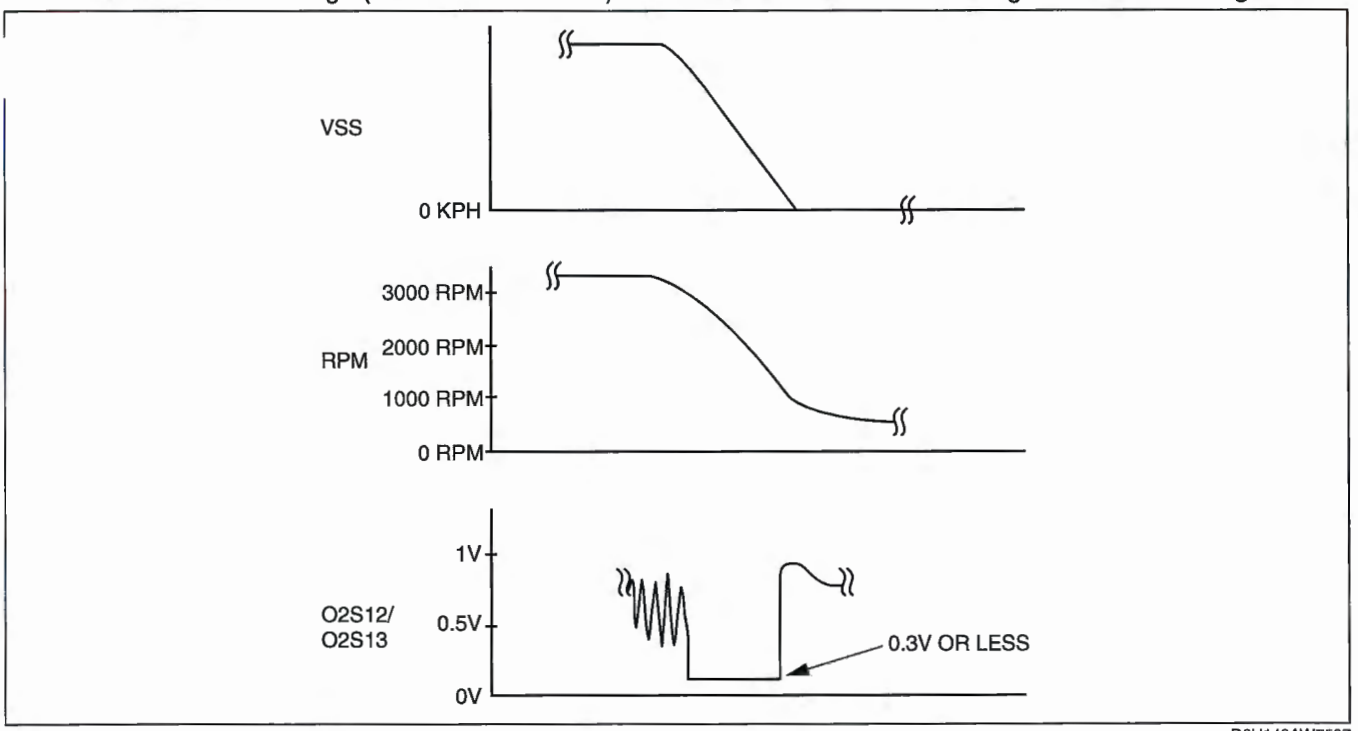
Short circuit

- If there is continuity in the following wiring harnesses, there is a short circuit. Repair or replace the wiring harness.
  - — Front HO2S terminal A and body ground
  - — Front HO2S terminal A and power supply
  - — Front HO2S terminal B and body ground
  - — Front HO2S terminal B and power supply
  - — Front HO2S terminal D and body ground

Middle/rear HO2S voltage inspection

1. Warm up the engine to normal operating temperature.
2. Using the WDS or equivalent, monitor the following:
   - — Vehicle speed (PID: VSS)
   - — Engine speed (PID: RPM)
   - — Middle/rear HO2S voltage (PID: O2S12/O2S13)
3. Drive the vehicle and decelerate the engine speed by releasing the accelerator pedal fully when the engine speed is **3,000 rpm or more**.

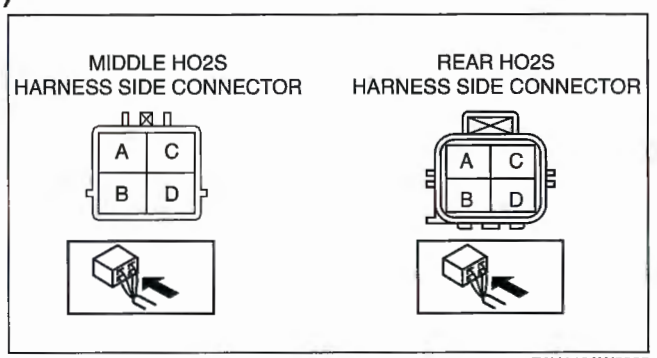
4. Verify that the middle/rear HO2S outputs a voltage of **0.6 V or more**, one time or more, then verify that the middle/rear HO2S voltage (PID: O2S12/O2S13) is **0.3 V or less** while decelerating as shown in the figure.



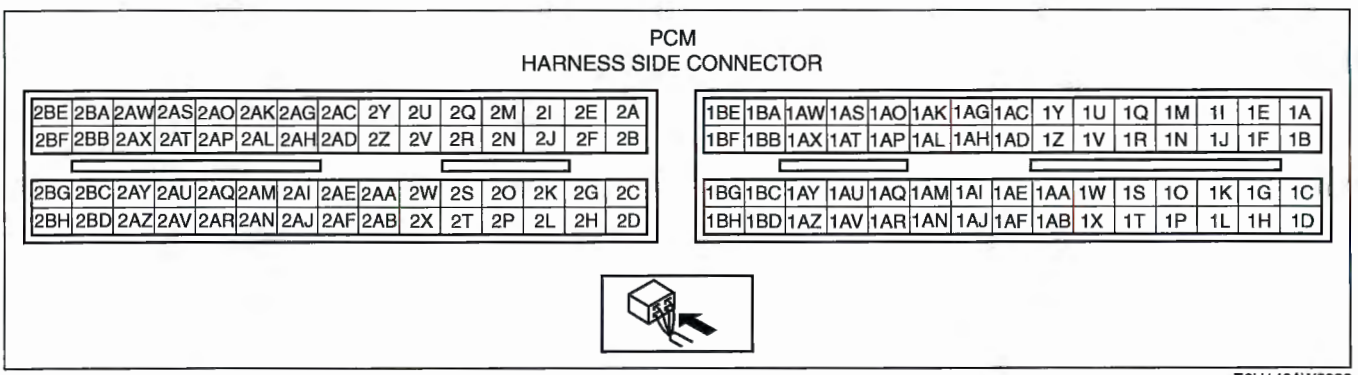
D6U140AW7507

- If not within the specification, inspect the HO2S for an open or short circuit. (See 01–40A–39 Middle/rear HO2S circuit open/short inspection (sensor).) Then if there is no malfunction in the wiring harness, replace the middle/rear HO2S.

Middle/rear HO2S circuit open/short inspection (sensor)



E6U140AW5805



E6U140AW5990

Disconnect the PCM connector.

2. Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)

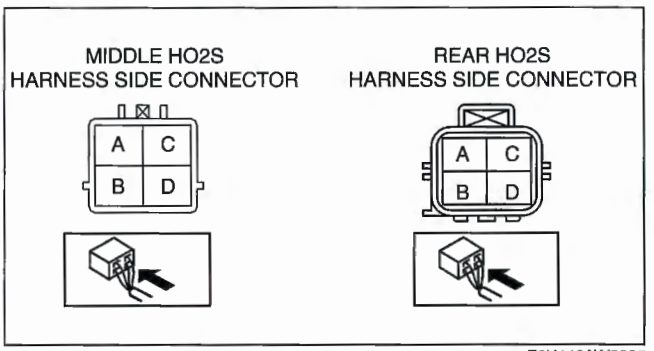
Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Middle HO2S terminal A and PCM terminal 2R
  - — Middle HO2S terminal B and PCM terminal 1BG
  - — Rear HO2S terminal A and PCM terminal 2Q
  - — Rear HO2S terminal B and PCM terminal 1BC

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Middle/rear HO2S terminal A and body GND
  - — Middle/rear HO2S terminal A and power supply
  - — Middle/rear HO2S terminal B and power supply

Middle/rear HO2S heater resistance inspection

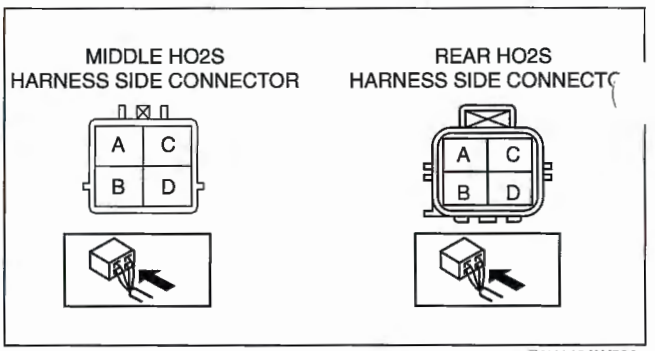
1. Disconnect the middle/rear HO2S connector.
2. Measure the middle/rear HO2S resistance between terminals C and D.
   - If not within the specification, replace the HO2S.

Middle/rear HO2S heater resistance
2—50 ohms



E6U140AW5805

Middle/rear HO2S circuit open/short inspection (heater)

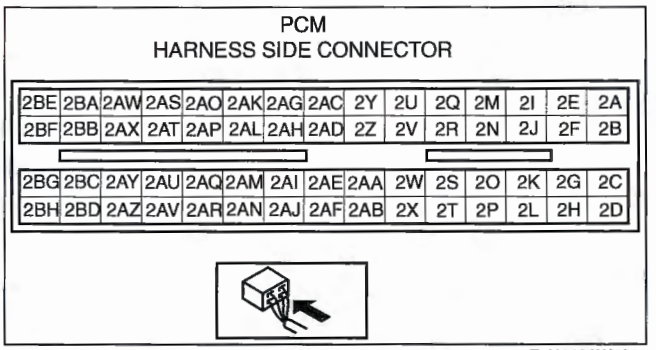


E6U140AW5805

1. Disconnect the PCM connector.
2. Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Middle HO2S terminal C and ignition switch
  - — Middle HO2S terminal D and PCM terminal 2BF
  - — Rear HO2S terminal C and ignition switch
  - — Rear HO2S terminal D and PCM terminal 2BE

Short circuit
- If there is no continuity, there is a short circuit. Repair or replace the wiring harness.
  Middle and rear
  - — Middle/rear HO2S terminal C and body GND
  - — Middle/rear HO2S terminal D and power supply
  - — Middle/rear HO2S terminal D and body GND

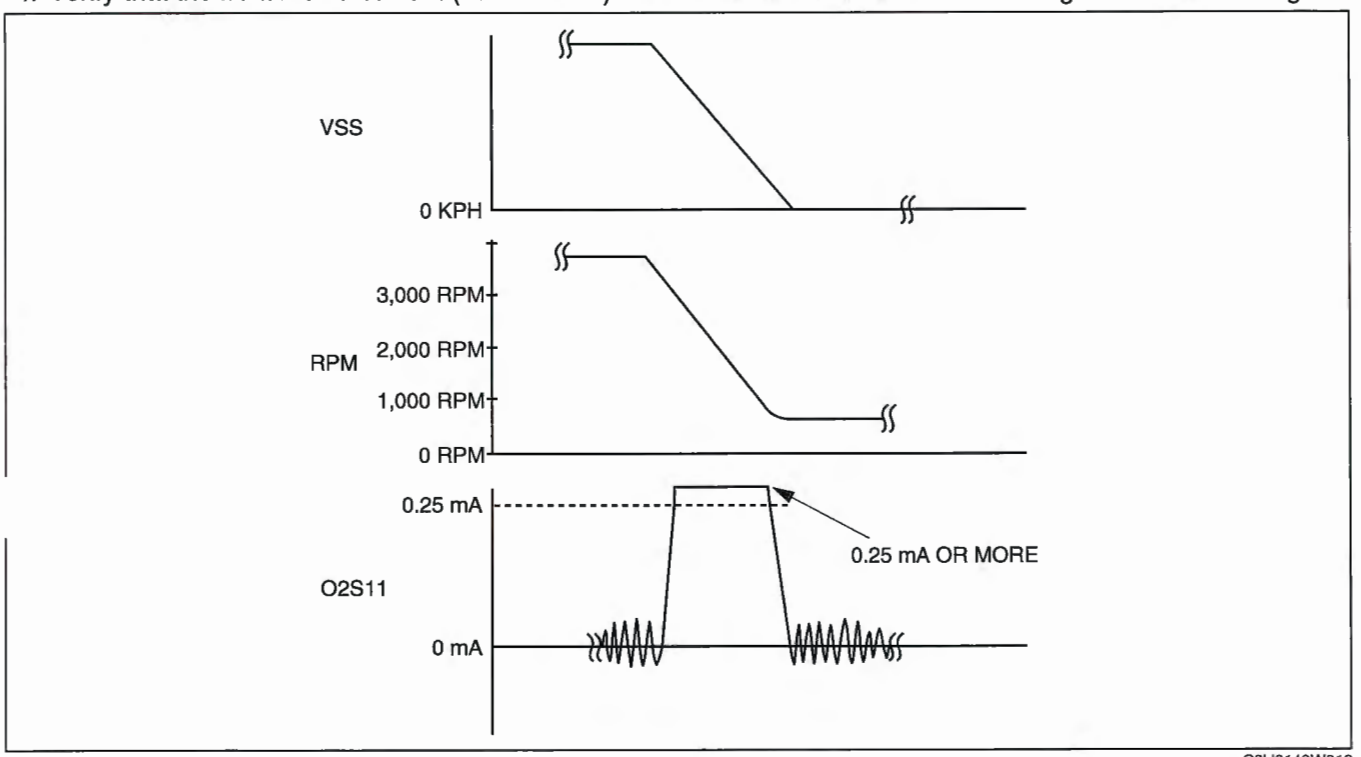


E6U140AW5992

Except for California Emission Regulation Applicable ATX Model

Note
- Before performing the following inspection, make sure to follow the procedure as indicated in the troubleshooting flowchart.

Front HO2S current inspection
1. Warm up the engine to normal operating temperature.
2. Using the WDS or equivalent, monitor the following:
   — Vehicle speed (PID: VSS)
   — Engine speed (PID: RPM)
   — Front HO2S current (PID: O2S11)
3. Drive the vehicle and decelerate the engine speed by releasing the accelerator pedal fully when the engine speed is **3,000 rpm or more**.
4. Verify that the front HO2S current (PID: O2S11) is **0.25 mA or more** while decelerating as shown in the figure.

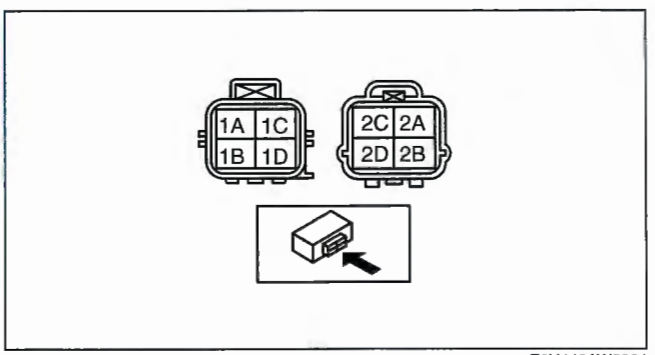


C3U0140W019

- If not within the specification, inspect the HO2S for an open or short circuit. (See 01–40A–38 Front HO2S circuit open/short inspection (sensor).) Then if there is no malfunction in the wiring harness, replace the front HO2S.

Front HO2S heater resistance inspection
1. Disconnect the front HO2S connector.
2. Measure the resistance between front HO2S terminals 2B and 2D.
   - If not within the specification, replace the front HO2S. (See 01–15A–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3].)

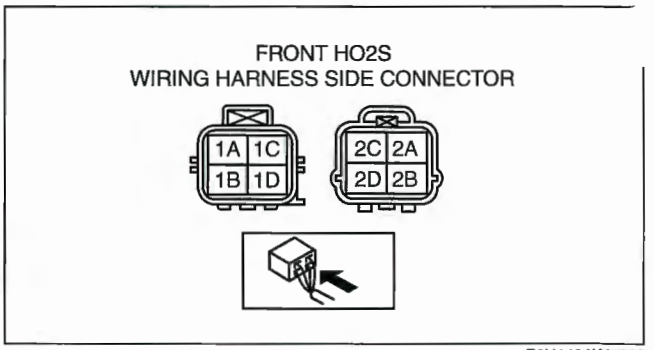
Front HO2S heater resistance
1—10 ohms



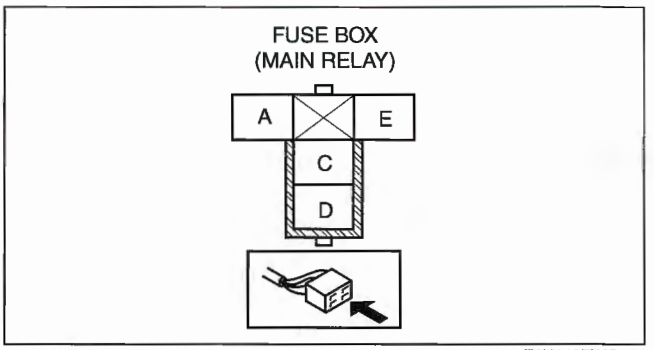
E6U140AW5801

Front HO2S circuit open/short inspection (sensor)

1. Disconnect the PCM connector.
2. Disconnect the front HO2S connector.
3. Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)



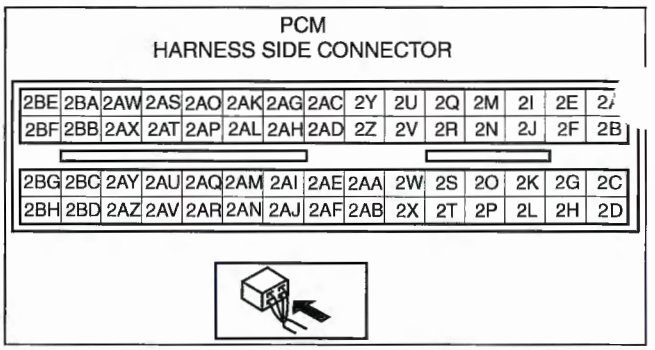
E6U140AW5802



E6U140ZWC304

Open circuit

- If there is no continuity in the following wiring harnesses, there is an open circuit. Repair or replace the wiring harness.
  - — Front HO2S terminal 1A and PCM terminal 2AD
  - — Front HO2S terminal 1B and PCM terminal 2AC
  - — Front HO2S terminal 1C and PCM terminal 2Z
  - — Front HO2S terminal 2B and main relay terminal C
  - — Front HO2S terminal 2D and PCM terminal 2BG



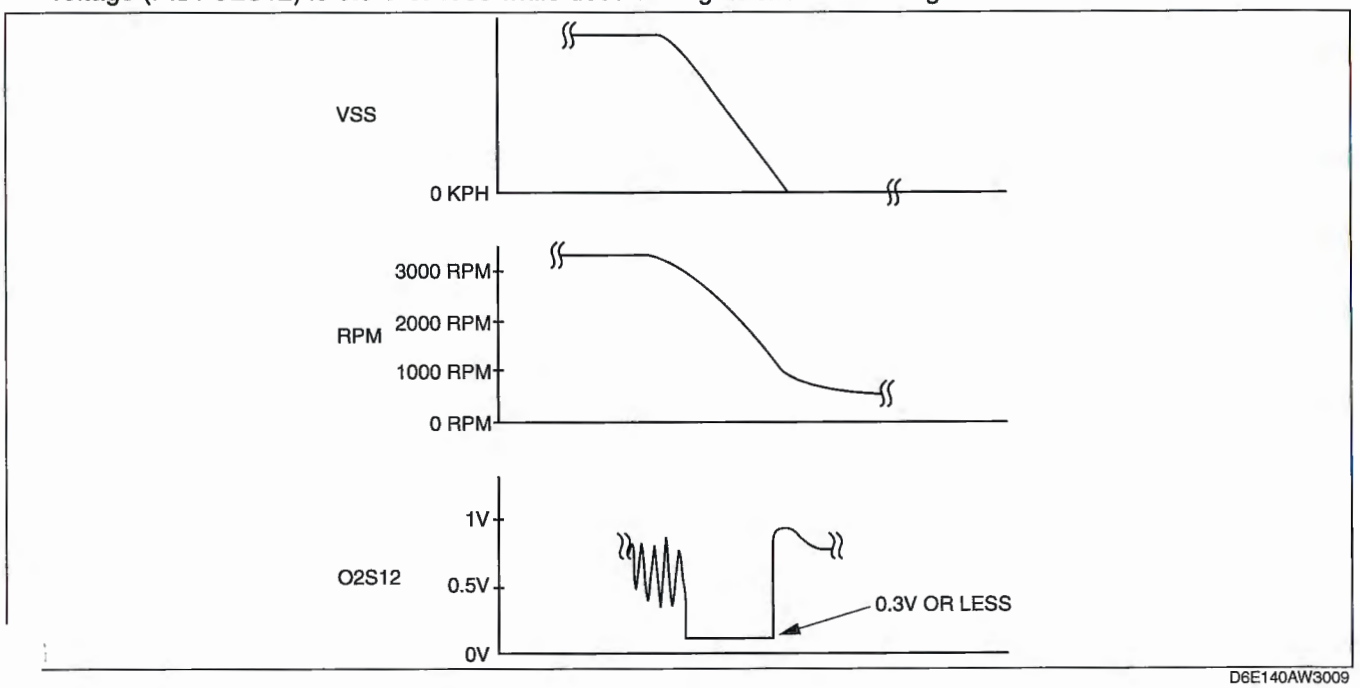
E6U140AW5992

Short circuit

- If there is continuity in the following wiring harnesses, there is a short circuit. Repair or replace the wiring harness.
  - — Front HO2S terminal 1A and body ground
  - — Front HO2S terminal 1A and power supply
  - — Front HO2S terminal 1B and body ground
  - — Front HO2S terminal 1B and power supply
  - — Front HO2S terminal 1C and body ground
  - — Front HO2S terminal 1C and power supply
  - — Front HO2S terminal 2B and body ground
  - — Front HO2S terminal 2B and power supply
  - — Front HO2S terminal 2D and body ground
  - — Front HO2S terminal 2D and power supply

Rear HO2S voltage inspection

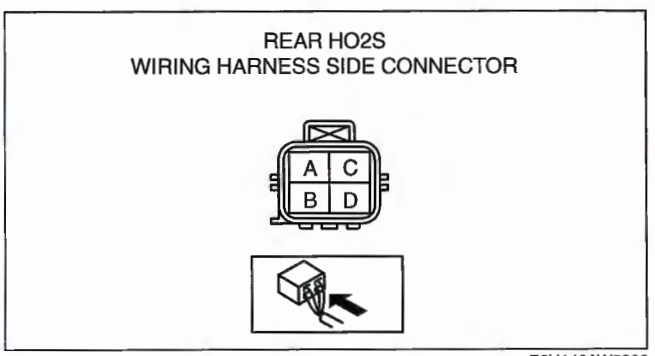
1. Warm up the engine to normal operating temperature.
2. Using the WDS or equivalent, monitor the following:
   — Vehicle speed (PID: VSS)
   — Engine speed (PID: RPM)
   — Rear HO2S voltage (PID: O2S12)
3. Drive the vehicle and decelerate the engine speed by releasing the accelerator pedal fully when the engine speed is **3,000 rpm or more**.
4. Verify that the rear HO2S outputs a voltage of **0.6 V or more**, one time or more, then verify that the rear HO2S voltage (PID: O2S12) is **0.3 V or less** while decelerating as shown in the figure.



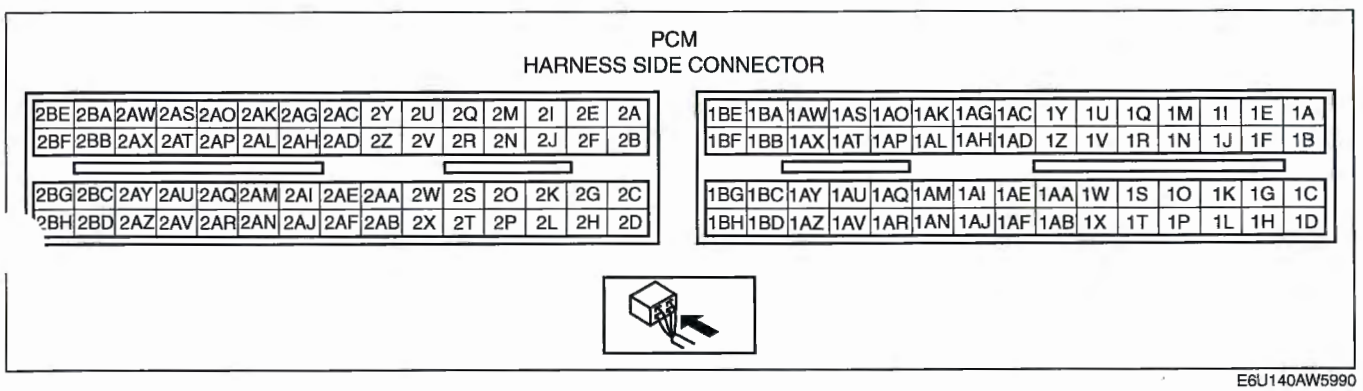
D6E140AW3009

- If not within the specification, inspect the HO2S for an open or short circuit. (See 01–40A–43 Rear HO2S circuit open/short inspection (sensor).) Then if there is no malfunction in the wiring harness, replace the rear HO2S.

Rear HO2S circuit open/short inspection (sensor)



E6U140AW5806



E6U140AW5990

1. Disconnect the PCM connector.
2. Disconnect the rear HO2S connector.
3. Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Rear HO2S terminal A and PCM terminal 2Q
  - — Rear HO2S terminal B and PCM terminal 1BC

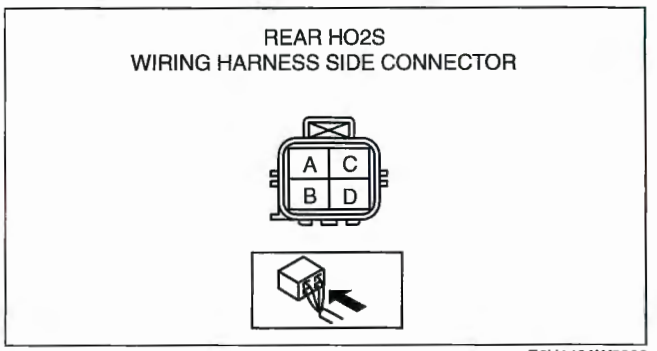
Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Rear HO2S terminal A and body ground
  - — Rear HO2S terminal A and power supply
  - — Rear HO2S terminal B and power supply

Rear HO2S heater resistance inspection

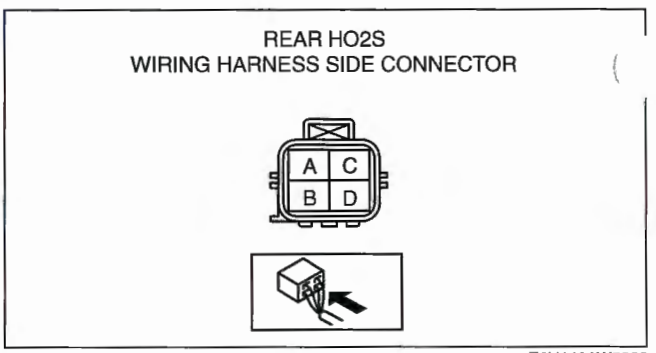
1. Disconnect the rear HO2S connector.
2. Measure the rear HO2S resistance between terminals C and D.
   - If not within the specification, replace the HO2S.

Rear HO2S heater resistance
2—50 ohms



E6U140AW5806

Rear HO2S circuit open/short inspection (heater)



E6U140AW5806

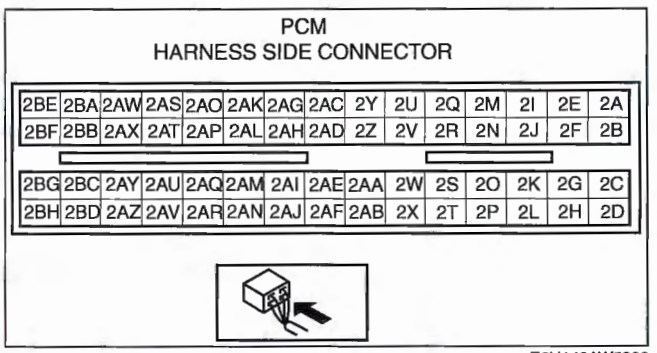
1. Disconnect the PCM connector.
2. Disconnect the rear HO2S connector.
3. Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Rear HO2S terminal C and ignition switch
  - — Rear HO2S terminal D and PCM terminal 2BE

Short circuit

- If there is no continuity, there is a short circuit. Repair or replace the wiring harness.
  Rear
  - — Rear HO2S terminal C and body ground
  - — Rear HO2S terminal D and power supply
  - — Rear HO2S terminal D and body ground



E6U140AW5992

CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3]

E6U014018220W01

Removal

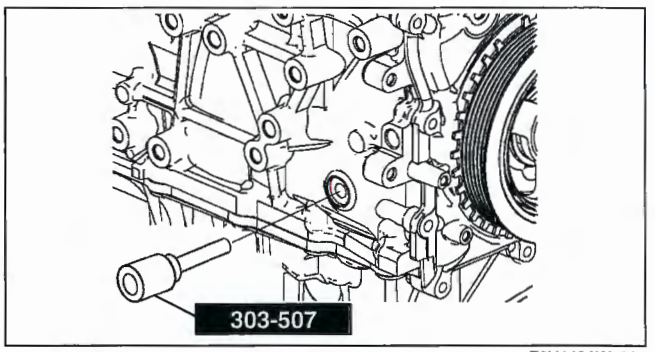
1. Perform the following procedure to making the working space.
   (1) Remove the Front wheel (RH).
   (2) Remove the splash shield.
2. Disconnect the CKP sensor connector.
3. Remove the installation bolts to remove the CKP sensor.

Installation

Caution

- **When foreign material such as an iron chip is on the CKP sensor, it can cause abnormal output from the sensor because of flux turbulence and adversely affect the engine control. Be sure there is no foreign material on the CKP sensor when replacing.**

1. Perform the following procedure so that piston No.1 is at the top dead center.
   (1) Remove the front drive shaft (RH). (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC].)
   (2) Remove the cylinder block lower blind plug and install the **SST**.
   (3) Turn the crankshaft pulley to the clockwise until it stops.
2. Install the CKP sensor to the CKP sensor installer.



E6U140AW5005

Fit the forked part of the CKP sensor installer with the fifth tooth (counting counterclockwise from the empty space A as shown in the figure) of the pulse wheel.

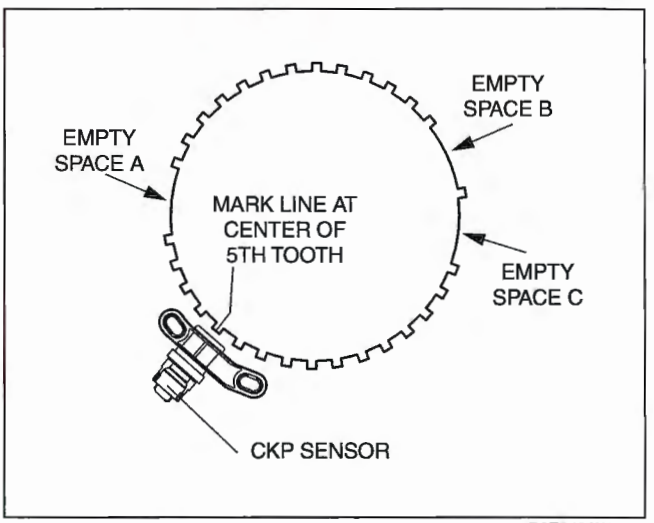
4. Install the CKP sensor fitting bolts.

   Tightening torque
   5.5—7.5 N·m {56—76 kgf·cm, 4.1—5.5 ft·lbf}

5. Remove the CKP sensor installer
6. Remove the **SST** then install the cylinder block lower blind plug.

   Tightening torque
   20 N·m {2.0 kgf·m, 15 ft·lbf}

7. Install the front drive shaft (RH). (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/ INSTALLATION [L3, L3 WITH TC].)



D6E140AW3104

CRANKSHAFT POSITION (CKP) SENSOR INSPECTION [L3]

E6U014018220W02

Note
- Perform the following inspection according to the DATA MONITOR function (indicated by monitor item fro' here onwards).

Air Gap Inspection
1. Verify that the CKP sensor is securely installed.
2. Using a thickness gauge, measure the air gap between the plate projections at the back of crankshaft pulley and the CKP sensor.
   - If not within the specification, inspect the plate projections for cracks or bending.
     — If there is any malfunction, replace the plate.
     — If the monitor item condition/specification (reference) is not within the specification, even though there is no malfunction, carry out the "Circuit Open/Short Inspection".

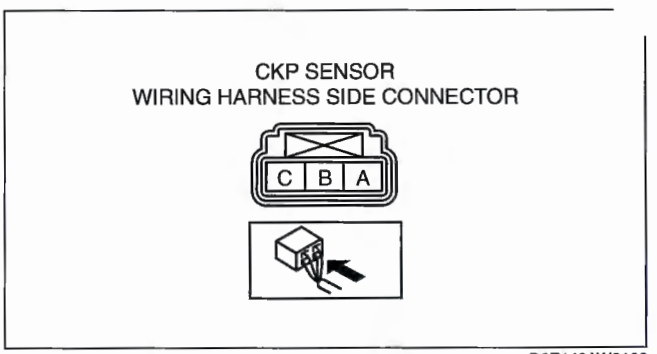
Air gap
0.5—1.5 mm {0.02—0.05 in}

Visual Inspection
1. Disconnect the negative battery cable.
2. Remove the CKP sensor. (See 01–40A–46 CRANKSHAFT POSITION (CKP) SENSOR INSPECTION [L3].)
3. Verify that there are no metal shavings on the sensor.
   - If the monitor item condition/specification (reference) is without the specification even though there is no malfunction, carry out the "Circuit Open/Short Inspection".

Voltage Inspection
1. Idle the engine.

Caution
- **Water penetrating the connector will cause sensor malfunction. To prevent this, be careful not to damage the wiring harnesses or the waterproof connector so as to cause water penetration.**

2. Measure the output voltage using a oscilloscope.
   - If not within the specification, replace the CKP sensor.
   - If the monitor item condition/specification (reference) is without the specification, even though the voltage is within the specification, carry out the "Circuit Open/Short Inspection".



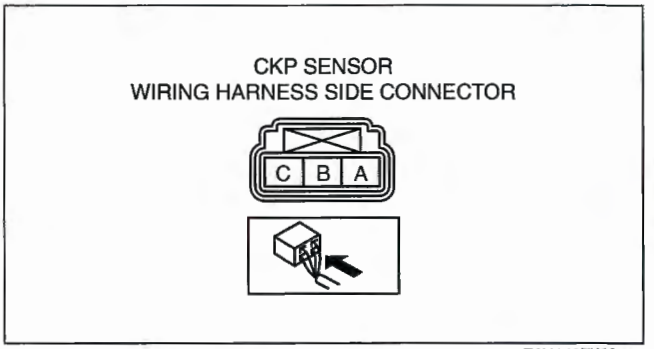
D6E140AW3103

Voltage

Terminal	Voltage (V)	Condition
A	0	Under any condition
B	4.8 or more	High output*
	0.8 or less	Low output*
C	B+	Under any condition

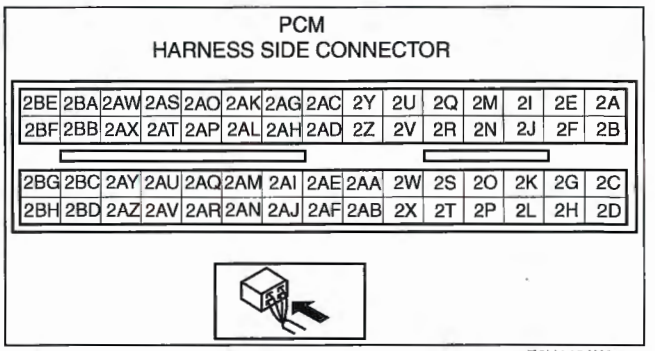
* : Output voltage varies with crankshaft rotation.

Circuit Open/Short Inspection



E6U140ZWC310

1. Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)



E6U140AW5992

Open circuit

- If there is no continuity, the circuit is open. Repair or replace the wiring harness.
  - — CKP sensor terminal A and body ground
  - — CKP sensor terminal B and PCM terminal 2W
  - — CKP sensor terminal C and PCM terminal 2AQ

Short circuit

- If there is continuity, the circuit is shorted. Repair or replace the wiring harness.
  - — CKP sensor terminal A and power supply
  - — CKP sensor terminal B and power supply
  - — CKP sensor terminal B and body ground
  - — CKP sensor terminal C and body ground

CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3]

E6U014018230W09

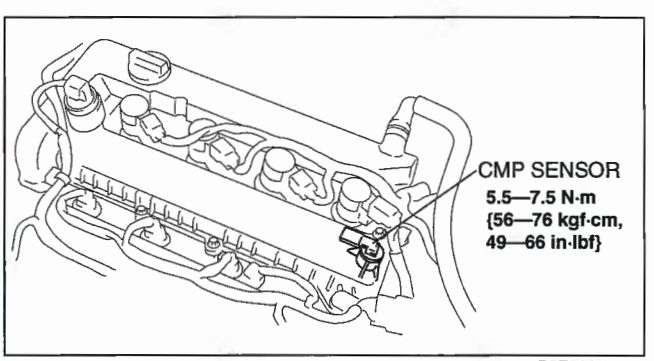
1. Remove the battery cover.
2. Disconnect the negative battery cable.
3. Remove the plug hole cover.

Caution

- **When replacing the CMP sensor, make sure there is no foreign material on it such as metal shavings. If it is installed with foreign material, the sensor output signal will malfunction resulting from fluctuation in magnetic flux and cause a deterioration in engine control.**

4. Disconnect the CMP sensor connector.
5. Remove the CMP sensor installation bolt.
6. Remove the CMP sensor from the cylinder head cover.
7. Install in the reverse order of removal.

Tightening torque
5.5—7.5 N·m {56—76 kgf·cm, 49—66 in·lbf}



B3E0140W019

CAMSHAFT POSITION (CMP) SENSOR INSPECTION [L3]

E6U014018230W10

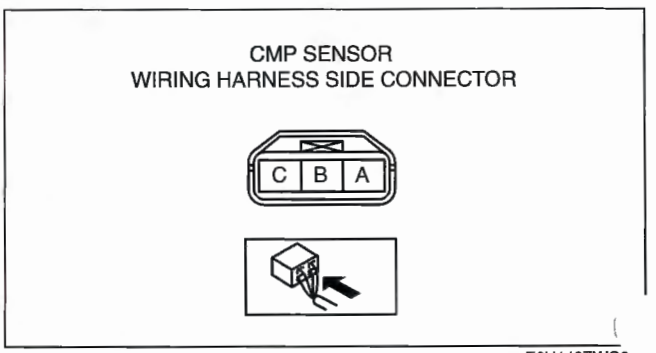
Note
- Perform the following inspection according to the DATA MONITOR function (indicated by monitor item fro' here onwards).

Visual Inspection
1. Disconnect the negative battery cable.
2. Remove the CMP sensor. (See 01–40A–47 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/ INSTALLATION [L3].)
3. Verify that there are no metal shavings on the sensor.
   - If the monitor item condition/specification (reference) is not within the specification even though there is no malfunction, carry out the "Circuit Open/Short Inspection".

Voltage inspection
1. Idle the engine.

Caution
- **Water penetrating the connector will cause sensor malfunction. To prevent this, be careful not to damage the wiring harnesses or the waterproof connector so as to cause water penetration.**

2. Measure the output voltage using a oscilloscope.
   - If not within the specification, replace the CMP sensor.
   - If the monitor item condition/specification (reference) is not within the specification, even though the voltage is within the specification, carry out the "Circuit Open/ Short Inspection".



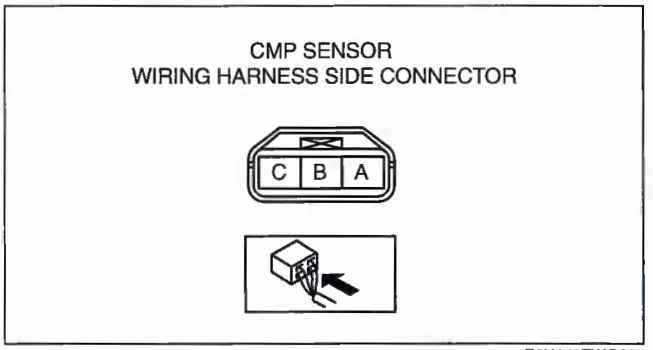
E6U140ZWC3

Voltage

Terminal	Voltage (V)	Condition
A	0	Under any condition
B	4.8 or more	High output*
	0.8 or less	Low output*
C	B+	Under any condition

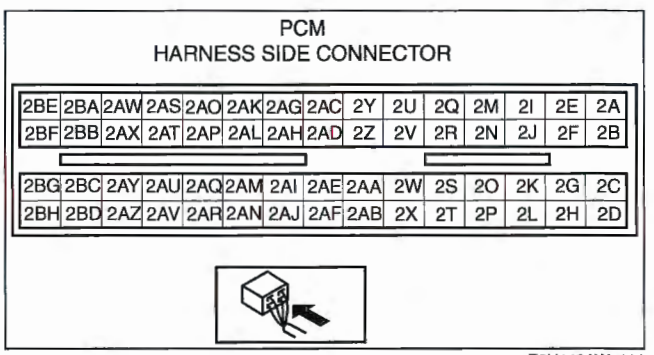
* : Output voltage varies with camshaft rotation.

Circuit Open/Short Inspection



E6U140ZWC308

1. Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)



E6U140AW5992

Open circuit

- If there is no continuity, the circuit is open. Repair or replace the wiring harness.
  - — CMP sensor terminal A and body ground
  - — CMP sensor terminal B and PCM terminal 2S
  - — CMP sensor terminal C and PCM terminal 2AM

Short circuit

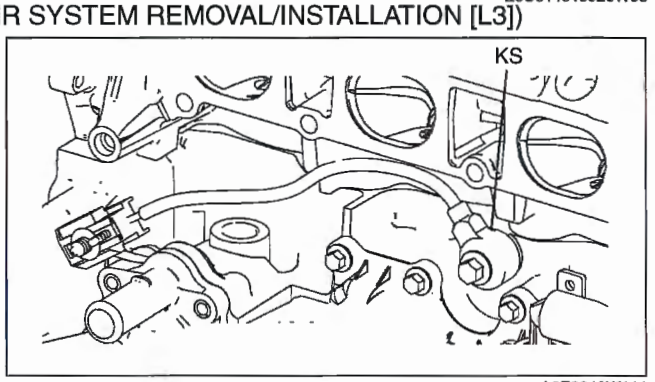
- If there is continuity, the circuit is shorted. Repair or replace the wiring harness.
  - — CMP sensor terminal A and power supply
  - — CMP sensor terminal B and power supply
  - — CMP sensor terminal B and body ground
  - — CMP sensor terminal C and power supply

KNOCK SENSOR (KS) REMOVAL/INSTALLATION [L3]

E6U014018920W06

1. Remove the intake manifold. (See01–13A–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3])
2. Remove the KS attachment bolt to remove the KS.
3. Install in the reverse order of removal.

Tightening torque
16.2—23.8 N·m
{1.66—2.42 kgf·m, 12.0—17.5 ft·lbf}



A6E3940W016

KNOCK SENSOR (KS) INSPECTION [L3]

E6U014018920W05

Note

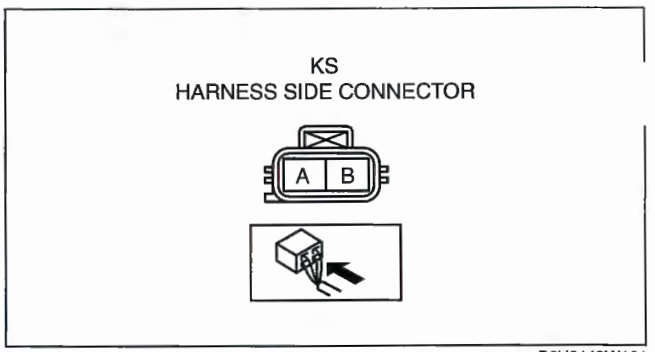
- Perform the following test only when directed.

Resistance Inspection

1. Turn the ignition switch to LOCK.
2. Disconnect the KS connector.
3. Measure the resistance between the KS terminals A and B using an ohmmeter.
   - If not as specified, replace the KS.
   - If the KS is normal, but PID value is out of specification, perform the “Circuit Open/Short Inspection”.

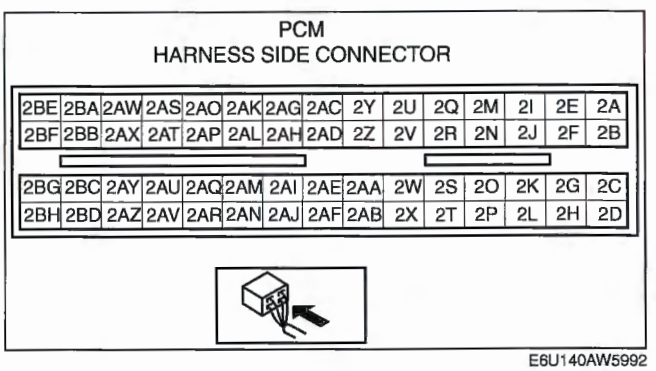
Specification
Approx. 4.87 megohms

Circuit Open/Short Inspection



B6U0140W161

1. Disconnect the PCM connector. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)
2. Inspect the following wiring harnesses for open or short circuit. (Continuity inspection)



E6U140AW5992

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — KS terminal A and PCM terminal 2U
  - — KS terminal B and PCM terminal 2V

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — KS terminal A and power supply
  - — KS terminal A and body GND
  - — KS terminal B and power supply
  - — KS terminal B and body GND

BAROMETRIC PRESSURE (BARO) SENSOR INSPECTION [L3 (VEHICLES EQUIPPED WITH BARO SENSOR BUILT INTO PCM)]

E6U014018211W03

Note

- Perform the following inspection only when directed.
- The following vacuum values are indicated by relative pressure from the PCM. (See 01–40A–9 PCM REMOVAL/INSTALLATION [L3].)

1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to the ON position.
3. Select BARO on the WDS or equivalent.
4. Verify that the BARO PID (pressure) and barometric pressure are practically equal.
   - If not as verified, perform the "Circuit Open/Short Inspection".
     - — If there is no open or short circuit, replace the PCM.

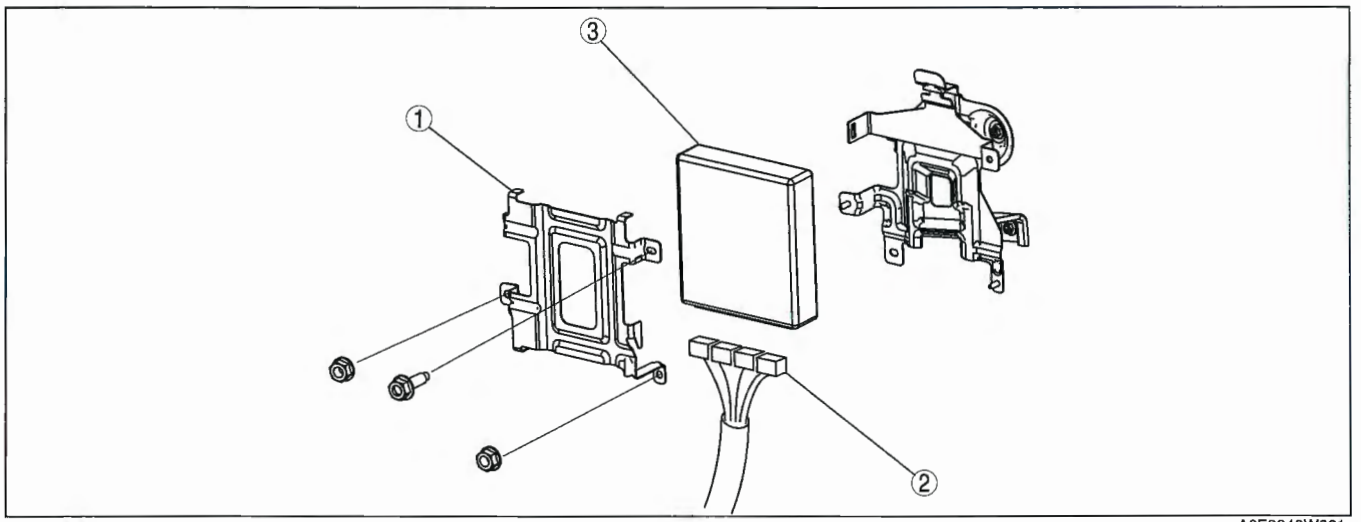
PCM REMOVAL/INSTALLATION [L3 WITH TC]

E6U014018880W11

Note
- For PCM replacement, set up the WDS and perform the PCM configuration. (See 01–40B–20 PCM CONFIGURATION [L3 WITH TC].)

1. Disconnect the negative battery cable.
2. Remove in the order indicated in the table.
3. Install in the reverse order of removal.



A6E3940W001

1	PCM cover
2	PCM connector
3	PCM

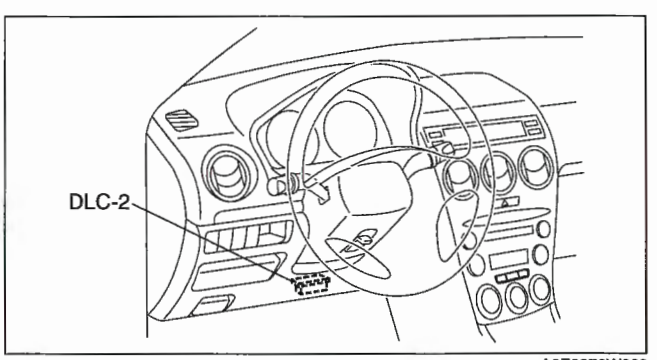
PCM INSPECTION [L3 WITH TC]

E6U014018880W12

Using the WDS or Equivalent

Note
- PIDs for the following parts are not available on this model. Perform the specific inspections for the following parts:
  - — CMP sensor (See 01–40B–36 CAMSHAFT POSITION (CMP) SENSOR INSPECTION [L3 WITH TC].)
  - — Main relay (See 09–21–7 RELAY INSPECTION.)

1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to the ON position.
3. Measure the PID value.
   - If PID value is not within the specification, follow the instructions in the "Inspection item" column.



A6E3970W002

Note
- The PID/DATA MONITOR function monitors the calculated value of the input/output signals in the PCM. Therefore, an output device malfunction is not directly indicated as a malfunction of the monitored value for the output device. If a monitored value of an output device is out of specification, inspect the monitored value of the input device related to the output control.
- For input/output signals except those of the monitoring items, use a voltmeter to measure the PCM terminal voltage.
- The simulation items that are used in the ENGINE CONTROL SYSTEM OPERATION INSPECTION are as follows.
  - — ACCS, ALTF, ARPMDES, FAN_DUTY, EVAPCP, FP, FUELPW1, GENVDSD, HTR11, HTR12, IMRC, INJ_1, INJ_2, INJ_3, INJ_4, SEGRP, test, VT DUTY1, WGC

PID/DATA monitor table (reference)

Monitor item (Definition)	Unit/ Condition		Condition/Specification (Reference)	Inspection item	PCM terminal
T	°C	°F	Ignition switch at ON position: Indicate the ambient air temperature	• IAT sensor	2V
AC_REQ (A/C switch)	On/Off		A/C switch and fan switch ON at ignition switch ON: On A/C switch OFF at ignition switch ON: Off	• A/C switch	1AC
ACCS (A/C relay)	On/Off		Ignition switch ON: Off A/C switch ON and fan switch ON at idle: On	• The following PIDs: — RPM, TP, ECT, ACSW • A/C relay	4N
ALTF (Generator field coil control duty value)	%		Ignition switch ON: 0% Idle: 0—100% Just after A/C switch ON and fan switch ON at idle: Duty value rises	• The following PIDs: — IAT, ECT, RPM, VPWR, ALTT V • Generator	1AD
ALTT V (Generator output voltage)	V		Ignition switch ON: 0 V Idle: Approx. 14.5 V*1 (E/L not operating)	• Generator	1AB
AFR	—		Target air-oil ratio is displayed	• HO2S	1Y 2D 2G 2J
AFR_ACT	—		Actual air-oil ratio is displayed	• HO2S	1Y 2D 2G 2J
APP (Accelerator pedal position)	%		AP is released: 0% AP is depressed: 100%	• The following PIDs: — APP1, APP2 • Accelerator pedal position sensor	2A 3D
APP1 (Accelerator pedal position)	%		AP is released: 31.0—32.4% AP is depressed: 69.8—81.8%	• Accelerator pedal position sensor	3D
	V		AP is released: Approx. 1.6 V AP is depressed: Approx. 3.9 V		
APP2 (Accelerator pedal position)	%		AP is released: 20.2—21.4% AP is depressed: 58.8—70.8%	• Accelerator pedal position sensor	2A
	V		AP is released: Approx. 1.0 V AP is depressed: Approx. 3.4 V		
ARPMDES (Target engine speed)	RPM		No load: 700 rpm E/L operating: 700 rpm P/S operating: 700 rpm A/C ON: 750 rpm	• The following PIDs: — IAT, RPM, MAP, ECT, MAF, TP, INGEAR, ACSW, PSP, ALTT V • CKP sensor	—
B+ (Battery positive voltage)	V		Ignition switch ON: B+	• Main relay • Battery	2Y
BARO (Barometric pressure)	kPa, Bar, psi		Ignition switch ON: Indicate the atmospheric pressure	• BARO sensor	—
	V				
BAT	°C		Boost air temperature is displayed	• MAP/boost air temperature sensor	1S
BAT_V	V		Boost air temperature 20 °C {68 °F}: 2.4—2.6 V	• MAP/boost air temperature sensor	1S
			Boost air temperature 30 °C {86 °F}: 1.7—1.9 V		
BOO (Brake switch)	On/Off		Brake pedal depressed: On Brake pedal released: Off	• Brake switch	1K 3T
BPA (Brake pressure applied switch)	On/Off		Brake pedal depressed: On Brake pedal released: Off	• Brake switch	1K 3T
CATT11_DSD (Estimated catalytic converter temperature)	°C	°F	Indicate the estimated catalytic converter temperature	• Perform applicable DTC troubleshooting.	—
CHRGLP (Generator warning light)	On/Off		Ignition switch ON: On Idle: Off	• Perform applicable DTC troubleshooting.	—

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Inspection item	PCM terminal
COLP (Refrigerant pressure switch (middle))	ON/OFF	Refrigerant pressure switch (middle) ON*2 at idle: ON Refrigerant pressure switch (middle) OFF*3 at idle: OFF	• Refrigerant pressure switch	1Q
CPP (Clutch pedal position)	On/Off	Clutch pedal depressed: On Clutch pedal released: Off	• CPP switch	1H
CPP/PNP (Shift lever position)	Drive/ Neutral	Neutral position: Neutral Others: Drive	• Neutral switch	1W
DTCCNT (Number of DTC detected)	—	—	• Perform applicable DTC troubleshooting.	—
ECT (Engine coolant temperature)	°C | °F	Ignition switch at ON position: Indicate the ECT	• ECT sensor	1M
	V	ECT 20 °C {68 °F}: 3.04—3.14 V ECT 60 °C {140 °F}: 1.29—1.39 V		
EQ_RAT11 (Equivalence ratio (lambda))	—	Idling after warm-up: Approx. 1	• Perform applicable DTC troubleshooting.	2D 2G 2J
EQ_RAT11_DSD (Front oxygen sensor)	—	Idling after warm-up: Approx. 1	• Perform applicable DTC troubleshooting.	2D 2G 2J
ETC_ACT (Electronic throttle control actual)	°	Indicate the desired TP by angle	• Perform applicable DTC troubleshooting.	3J 3M
ETC_DSD (Electronic throttle control desired)	%	Indicate the desired TP by percent	• The following PIDs: — APP1, APP2, ETC_ACT • TP sensor	3J 3M
	°	Indicate the desired TP by angle		
EVAPCP (Purge solenoid valve duty value)	%	Ignition switch ON: 0% Idle: 0%	• The following PIDs: — IAT, RPM, ECT, MAF, O2S11,BARO, INGEAR, VPWR • Purge solenoid valve	4T
FAN_DUTY	%	ECT less than 98 °C {208 °F}: 0% ECT 100 °C {212 °F}: 30% ECT 106 °C {223 °F}: 70% ECT 110 °C {230 °F}: 100%	• Fan control module	4A
FIA (Fuel injection amount)	mg/cylinder	Indicate the fuel injection amount.	• Fuel injector • Injector driver module	—
FLI (Fuel level)	%	Fuel gauge level F: Approx. 100% Fuel gauge level E: Approx. 0%	• Perform applicable DTC troubleshooting.	—
FP (Fuel pump relay)	On/Off	Idle: On Cranking: On	• The following PIDs: — RPM • Fuel pump relay	4Q
FP_Hi_PRES	On/Off	Spill valve control solenoid valve work: On Spill valve control solenoid valve don't work: Off	• High pressure fuel pump	1A 1B
FUEL_PRES	Pa	Idle: Approx. 3 MPa Load 60 % or more: Approx. 11.5 MPa	• Fuel pressure sensor	1V
FUEL_PRES_V	V	Idle: Approx. 1.4 V	• Fuel pressure sensor	1V
FUELSYS (Fuel system status)	OL/CL/ OL-Drive/ OL-Fault/ CL-Fault	Ignition switch ON: OL_Drive Idle (after warm up): CL	• The following PIDs: — IAT, MAF, TP, MAP, ECT, RPM, O2S11, O2S12, INGEAR, PSP, ACSW, VPWR, ALTT V • Fuel injector	—
GENVDSD (Generator voltage desired)	V	Idle: Approx. 13.83 V*1 (E/L not operating)	• Perform applicable DTC troubleshooting.	—
HTR11 (HO2S heater (front))	On/Off	Idle (after warm up): On⇔Off	• The following PIDs: — IAT, MAF, TP, ECT, RPM, ACSW	4AD

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Inspection item	PCM terminal
TR12 O2S heater (rear))	On/Off	Idle: On Engine speed is above 4,000 rpm: Off	• The following PIDs: — IAT, MAF, ECT, RPM, ACSW	4Z
IAT (Intake air temperature)	°C / °F	Ignition switch at ON position: Indicate the IAT	• IAT sensor	2V
	V	IAT 20 °C {68 °F}: 2.4—2.6V IAT 30 °C {86 °F}: 1.7—1.9V		
IMRC (Variable swirl solenoid valve)	On/Off	Engine speed is below Approx. 3,750 rpm and ECT is below 60 °C {140 °F}: On Others: Off	• The following PIDs: — TP, ECT, RPM • Variable swirl solenoid valve	4K
INGEAR (Load/no load condition)	On/Off	CPP or CPP/PNP is On: Off Others: On	• Perform applicable DTC troubleshooting.	1H 1W
IVS (CTP condition)	Idle/ Off Idle	APP closed: Idle Others: Off Idle	• Perform applicable DTC troubleshooting.	3J 3M
KNOCKR (Knocking retard)	°	Ignition switch ON: 0 ° Idle: 0 °	• Knock sensor	2P 2S
LDP_EVAPCP (EVAP system leak detection pump detect incorrect purge flow)	mA	Indicate the EVAP control system incorrect purge flow detection value	• Perform applicable DTC troubleshooting.	—
LDP_IDL (EVAP system leak detection pump idle current)	mA	Indicate the EVAP system leak detection pump idle current	• Perform applicable DTC troubleshooting.	3V 3Y
LDP_MON (EVAP system leak detection pump monitoring current)	mA	Indicate the EVAP system leak detection pump monitoring current	• Perform applicable DTC troubleshooting.	3V 3Y
LDP_REF (EVAP system leak detection pump reference current)	mA	Indicate the EVAP system leak detection pump reference current	• Perform applicable DTC troubleshooting.	—
LDP_SLDV (EVAP system small leak detection value)	mA	Indicate the EVAP control system small leak detection value	• Perform applicable DTC troubleshooting.	3V 3Y
LDP_VSLDV (EVAP system small leak detection value)	mA/sec	Indicate the EVAP control system vary small leak detection value	• Perform applicable DTC troubleshooting.	3V 3Y
LOAD (Engine load)	%	Ignition switch ON: 0% Idle (after warm up): 17.1—18.5% Engine speed is 2,500 rpm: 14.2—15.2	• MAF sensor	—
LONGFT1 (long term fuel trim)	%	Idle (after warm up):–14—14%	• Perform applicable DTC troubleshooting.	—
MAF (Mass airflow)	g/s	Ignition switch ON: Approx. 0 g/s Idle (after warm up): 2.72—2.94 g/s Engine speed is 2,500 rpm: 8.00—8.66	• MAF sensor	1P
	V	Ignition switch ON: Approx. 0.7 V Idle (after warm up): 1.15—1.28 V		
MAP (Manifold absolute pressure)	kPa, Bar, psi	Ignition switch at ON position: Indicate the atmospheric pressure	• MAP sensor	1J
	V	Ignition switch ON Manifold absolute pressure Approx. 102 kPa: Approx. 1.9 V		
		Idle Manifold absolute pressure Approx. 30 kPa: Approx. 0.7 V		
MIL (Malfunction indicator lamp)	On/Off	Ignition switch ON: On Idle: Off	• Perform applicable DTC troubleshooting.	—

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Inspection item	PCM terminal
MIL_DIS (Traveled distance since the MIL illuminated)	km / mile	No DTC: 0 km {0 mile} DTC detected: Not 0 km {0 mile}	• Perform applicable DTC troubleshooting.	—
NUMKEYS (Number of keys stored in module)	—	Indicate the number of keys stored in module	—	—
O2S11 (Front oxygen sensor)	A	Idle (after warm up): –1.0—1.0 A Deceleration (after warm up): 0.25 A or more	• HO2S (front)	2D 2G 2J
O2S12 (Rear oxygen sensor)	V	Idle (after warm up): 0—1.0 V Acceleration (after warm up): 0.5—1.0 V Deceleration (after warm up): 0—0.5 V	• HO2S (rear)	1Y
PSP (Power steering pressure switch)	High/Low	Steering wheel in straight ahead position: Low Others: High	• PSP switch	1Z
RFCFLAG (Readness function code)	Learnt/ Not Learnt	Before running PCM adaptive memory procedure drive mode: Not Learnt After running PCM adaptive memory procedure drive mode: Learnt	• Run PCM adaptive memory procedure drive mode.	—
RO2FT1 (Rear oxygen sensor fuel trim)	—	• Idle after warm-up: Approx. 0.2	• The following PID — O2S12	1Y
RPM (Engine speed)	RPM	No load: 650—750 rpm E/L operating: 650—750 rpm P/S operating: 650—750 rpm A/C ON: 700—800 rpm	• CKP sensor	2C
SCCS (Speed control command switch)	V	Press ON/OFF: Approx. 0 V Press CANCEL: Approx. 1.2 V Press SET/COAST: Approx. 3.2 V Press RES/ACCEL: Approx. 4.2 V Others: Approx. 5.0 V	• Cruise control switch	—
SEGRP (EGR valve (stepping motor) position)	No. of step	Idle: 0 step Cranking: 0—60 steps	• The following PIDs: — MAF, TP, ECT, RPM, VSS • EGR valve	—
SEGRP DSD (Desired EGR valve (stepping motor) position)	%	Idle: 0%	• The following PIDs: — MAF, TP, ECT, RPM, VSS	—
SELTESTDTC (DTC of KOEO/KOER self-test)	—	—	• Perform applicable DTC troubleshooting.	—
SHRTFT1 (Short term fuel trim [front HO2S])	%	Idle (after warm up): Approx.–30—25%	• Perform applicable DTC troubleshooting.	—
SHRTFT12 (Short term fuel trim)	%	Idle (after warm up): Approx.–30—25%	• Perform applicable DTC troubleshooting.	—
SPARKADV (Ignition timing)	°(BTDC)	Idle: BTDC Approx. 8°	• The following PIDs: — MAF, TP, ECT, RPM, INGEAR, PSP, ACSW, VPWR • Ignition timing	—
test (Test mode)	On/Off	—	—	—
TIRESIZE (Tire revolution per mile)	rev/mile	Indicate the tire circumference length	—	—
TP REL (Relative TP)	%	Ignition switch ON APP is released: Approx. 5% APP is depressed: Approx. 46 %	• TP sensor	3J 3M

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Inspection item	PCM terminal
TP1 (TP sensor 1)	%	Ignition switch ON APP is released: Approx. 15% APP is depressed: Approx. 55 %	• TP sensor	3M
	V	Ignition switch ON APP is released: 0.4—0.6 V APP is depressed: 4.25—4.75 V		
TP2 (TP sensor 2)	%	Ignition switch ON APP is released: Approx. 15% APP is depressed: Approx. 56%	• TP sensor	3J
	V	Ignition switch ON APP is released: 4.4—4.6 V APP is depressed: 0.25—0.75 V		
TPCT (Lowest closed throttle voltage)	V	Indicate the voltage of the closed TP sensor	• TP sensor	3J 3M
VSS (Vehicle speed)	KPH / MPH	Indicate the vehicle speed	• Perform applicable DTC troubleshooting.	—
VT ACT1 (Actual valve timing)	°	Idle: Approx. 0°	• The following PIDs: — TP, ECT, RPM • OCV	—
VT DIFF1 (Difference between actual valve timing and target valve timing)	°	Idle: Approx. 0°	• The following PIDs: — TP, ECT, RPM • OCV	4S
VT DUTY1	%	Idle: Approx. 11.5%	• The following PIDs: — TP, ECT, RPM • OCV	4S
TC	On/Off	Variable swirl shutter valve switch ON: On	• Variable swirl shutter valve switch	1N
		Variable swirl shutter valve switch OFF: Off		
WGC	%	Racing with the accelerator pedal fully depressed: 10—100 %	• Wastegate control solenoid valve	4H
		Fully closed: 0 %		

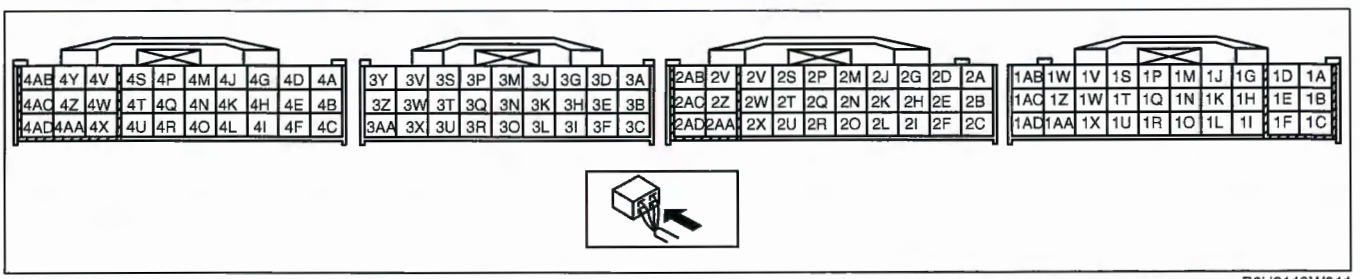
*1 : Calculated value; differs from terminal voltage
*2 : Refrigerant pressure switch (middle) turns off when the refrigerant pressure is 1.26—1.49 MPa {12.9—15.1 kgf/cm^6, 184—214 psi}
*3 : Refrigerant pressure switch (middle) turns on when the refrigerant pressure is 1.69—1.84 MPa {17.3—18.7 kgf/cm^2, 247—265 psi}

Without Using the SST

Caution
- **The PCM terminal voltages vary with change in measuring conditions and vehicle conditions. Always carry out a total inspection of the input systems, output systems, and PCM to determine the cause of trouble. Otherwise, a wrong diagnosis will be made.**

1. Measure the voltage at each terminal.
   - If any incorrect voltage is detected, inspect the related system(s), wiring harnesses and connector(s) referring to the Action column in the terminal voltage table.

Terminal voltage table (Reference)



B6U0140W011

Terminal	Signal	Connected to	Test condition		Voltage (V)	Inspection item
1A	High pressure fuel pump control (+)	High pressure fuel pump	Ignition switch OFF		Approx. 10.0	• High pressure fuel pump • Related wiring harness Related wiring harness
			Ignition switch ON		Approx. 9.6	
			Idle		Approx. 9.4	
1B	High pressure fuel pump control (–)	High pressure fuel pump	Ignition switch OFF		Approx. 9.9	• High pressure fuel pump • Related wiring harness Related wiring harness
			Ignition switch ON		Approx. 9.7	
			Idle		Approx. 9.1	
1C	GND	Body ground	Under any condition		Below 1.0	• Related wiring harness
1D	Variable swirl solenoid valve power supply	Main relay	Ignition switch OFF after 90s		Bellow 1.0	• Main relay • Related wiring harness
			Ignition switch ON		B+	
1E	—	—	—		—	—
1F	—	—	—		—	—
1G	—	—	—		—	—
1H	Clutch operation	Clutch switch	Clutch pedal depressed		Below 1.0	• Clutch switch • Related wiring harness
			Clutch pedal released		B+	
1I	MAF sensor GND	MAF/IAT sensor	Under any condition		Below 1.0	• MAF/IAT sensor • Related wiring harness
1J	Manifold absolute pressure	MAP sensor	Ignition switch ON (Engine off) at sea level		Approx. 1.9	• MAP sensor • Related wiring harness
			Idle		Approx. 0.7	
1K	Brake (No. 1)	Brake switch No. 1	Brake pedal depressed		B+	• Brake switch • Related wiring harness
			Brake pedal released		Below 1.0	
1L	—	—	—		—	—
1M	ECT	ECT sensor	Ignition switch ON	ECT 20 °C {68 °F}	3.04—3.14	• ECT sensor • Related wiring harness
				ECT 60 °C {140 °F}	1.29—1.39	

Terminal	Signal	Connected to	Test condition		Voltage (V)	Inspection item
1N	Variable swirl shutter valve monitor	Variable swirl shutter valve switch	Racing (variable swirl shutter valve close)		Below 1.0	• Variable swirl shutter valve switch • Related wiring harness
			Idle (variable swirl shutter valve open)		Approx. 5.0	
1O	—	—	—		—	—
1P	MAF	MAF sensor	Ignition switch ON		Approx. 0.7	• MAF sensor • Related wiring harness
			Idle (after warm up)		1.15—1.28	
1Q	A/C compressor load	Refrigerant pressure switch (middle)	A/C ON	Refrigerant pressure is above 1.52 MPa {15.5 kgf/cm^2, 220 psi}	Below 1.0	• Refrigerant pressure switch • Related wiring harness
				Refrigerant pressure is below 1.23 MPa {12.5 kgf/cm^2, 178 psi}	B+	
1R	—	—	—		—	—
1S	Boost air temperature	MAP/Boost air temperature sensor	Ignition switch ON	IAT 20 °C {68 °F}	2.4—2.6	• Boost air temperature sensor • Related wiring harness
				IAT 30 °C {86 °F}	1.7—1.9	
1T	—	—	—		—	—
1U	—	—	—		—	—
1V	Fuel pressure sensor	Fuel pressure sensor	Ignition switch OFF		Approx. 1.4	• Fuel pressure sensor • Related wiring harness
			Ignition switch ON		Approx. 1.5	
			Idle		Approx. 1.4	
1W	Neutral position	Neutral switch	Shift lever is at neutral position		Below 1.0	• Neutral switch • Related wiring harness
			Shift lever is not at neutral position		B+	
1X	—	—	—		—	—
1Y	HO2S (rear)	HO2S (rear)	Ignition switch ON		Below 1.0	• HO2S (rear) • Related wiring harness
			Voltage changes between 0 and 1 according to the amount of racing			
1Z	PSP	PSP switch	Idle	Steering wheel at straight ahead position	B+	• PSP switch • Power steering system • Related wiring harness
				While turning steering wheel	Below 1.0	
1AA	—	—	—		—	—
1AB	Generator output voltage	Generator (terminal P)	• Inspect using the wave profile. (See 01–40B–18 Inspection Using An Oscilloscope (Reference).)			• Generator • Related wiring harness
1AC	A/C operation	Refrigerant pressure switch (high, low)	Idle	A/C switch and fan switch on	Below 1.0	• Refrigerant pressure switch • Related wiring harness
				A/C switch off	B+	
1AD	Generator field coil control	Generator (terminal D)	• Inspect using the wave profile. (See 01–40B–18 Inspection Using An Oscilloscope (Reference).)			• Following PIDs: IAT, ECT, RPM, VPWR, ALTT V. • Generator • Related wiring harness

Terminal	Signal	Connected to	Test condition		Voltage (V)	Inspection item
2A	APP position (No. 2)	APP sensor No. 2	Ignition switch ON	APP is released	Approx. 1.0	• APP sensor • Related wiring harness
				APP is depressed	Approx. 3.4	
2B	Fuel injector check signal	Injector driver module	• Inspect using the wave profile. (See 01–40B–18 Inspection Using An Oscilloscope (Reference).)			• Injector driver module • Related wiring harness
2C	CKP	CKP sensor	• Inspect using the wave profile. (See 01–40B–18 Inspection Using An Oscilloscope (Reference).)			• CKP sensor • Related wiring harness
2D	HO2S (front) IP+	HO2S (front)	Idle (after warm up)		Approx. 3.7—3.9	• HO2S (front) • Related wiring harness
			When the engine speed is increased, the voltage increased.			
2E	CMP	CMP sensor	• Inspect using the wave profile. (See 01–40B–18 Inspection Using An Oscilloscope (Reference).)			• CMP sensor • Related wiring harness
2F	—	—	—		—	—
2G	HO2S (front) VSIP	HO2S (front)	Idle (after warm up)		Approx. 4.0	• HO2S (front) • Related wiring harness
2H	Sensor GND	MAF/IAT sensor, HO2S (front, rear), APP sensor, CKP sensor, CMP sensor, Fuel pressure sensor, ECT sensor, MAP sensor, purge solenoid valve	Under any condition		Below 1.0	• Related wiring harness
2I	—	—	—		—	—
2J	HO2S (front) power supply	HO2S (front)	Idle (after warm up)		Approx. 4.1	• HO2S (front) • Related wiring harness
2K	Constant voltage (Vref)	MAP sensor, fuel pressure sensor, APP sensor	Ignition switch ON		Approx. 5.0	• Related wiring harness
2L	—	—	—		—	—
2M	HO2S (front) calibration resistor	HO2S (front)	Ignition switch OFF after 90s		Approx. 0	• HO2S (front) • Related wiring harness
			Ignition switch ON		Approx. 1.7	
2N	—	—	—		—	—
2O	—	—	—		—	—
2P	Knocking (–)	Knock sensor	Ignition switch ON (Use digital type voltmeter, because measurement voltage will be detected less than true voltage when using analog type voltmeter)		Below 1.0	• Perform "On-Board Diagnostic Test" • Related wiring harness
2Q	Coil (Immobilizer system)	Coil	Because this terminal is for communication, good/no good judgment by terminal voltage is not possible.			• Coil • Related wiring harness
2R	CAN (low)	Instrument cluster, DSC HU/CM	Because this terminal is for CAN, good/no good judgment by terminal voltage is not possible.			• Related wiring harness
2S	Knocking (+)	Knock sensor	Ignition switch ON (Use digital type voltmeter, because measurement voltage will be detected less than true voltage when using analog type voltmeter)		Approx. 4.3	• Perform "On-Board Diagnostic Test" • Related wiring harness

Terminal	Signal	Connected to	Test condition		Voltage (V)	Inspection item
2T	Coil (Immobilizer system)	Coil	Because this terminal is for communication, good/no good judgment by terminal voltage is not possible.			• Coil • Related wiring harness
2U	CAN (high)	Instrument cluster, DSC HU/CM	Because this terminal is for CAN, good/no good judgment by terminal voltage is not possible.			• Related wiring harness
2V	IAT	MAF/IAT sensor	Ignition switch ON	IAT 20 °C {68 °F}	2.4—2.6	• IAT sensor • Related wiring harness
				IAT 30 °C {86 °F}	1.7—1.9	
2W	Security light control	Instrument cluster (Security light)	Security light illuminate		Approx. 3.1	• Related wiring harness
			Others		B+	
2X	Main relay control	Main relay	Ignition switch OFF after 90s		B+	• Main relay • Related wiring harness
			Ignition switch ON		Approx. 0.8	
2Y	B+	Main relay	Ignition switch OFF		Below 1.0	• Battery • Related wiring harness
			Ignition switch ON		B+	
2Z	Back-up power supply	Battery (positive terminal)	Under any condition		B+	• Battery • Related wiring harness
2AA	—	—	—		—	—
2AB	GND	Body ground	Under any condition		Below 1.0	• Related wiring harness
2AC	GND	Body ground	Under any condition		Below 1.0	• Related wiring harness
2AD	Ignition switch (IG1)	Ignition switch	Ignition switch OFF		Below 1.0	• Ignition switch • Related wiring harness
			Ignition switch ON		B+	
3A	APP sensor GND	APP sensor	Under any condition		Below 1.0	• Related wiring harness
3B	Fuel injection (#1)	Fuel injector No.1	• Inspect using the wave profile. (See 01–40B–18 Inspection Using An Oscilloscope (Reference).)			• Fuel injector No.1 • Related wiring harness
3C	Drive-by-wire-relay	Drive-by-wire-relay	Ignition switch OFF		Below 1.0	• Drive-by-wire-relay • Related wiring harness
			Ignition switch ON		Below 1.0	
3D	APP position (No. 1)	APP sensor No. 1	Ignition switch ON	APP is released	Approx. 1.6	• APP sensor • Related wiring harness
				APP is depressed	Approx. 3.9	
3E	Fuel injection (#2)	Fuel injector No.2	• Inspect using the wave profile. (See 01–40B–18 Inspection Using An Oscilloscope (Reference).)			• Fuel injector No.2 • Related wiring harness
3F	—	—	—		—	—
3G	APP sensor 1 power	APP sensor	Under any condition		Approx. 5.0	• APP sensor • Related wiring harness
3H	Fuel injection (#3)	Fuel injector No.3	• Inspect using the wave profile. (See 01–40B–18 Inspection Using An Oscilloscope (Reference).)			• Fuel injector No.3 • Related wiring harness
3I	—	—	—		—	—
3J	TP position (No. 2)	TP sensor No. 2	Ignition switch ON	APP is released	4.4—4.6	• TP sensor • Related wiring harness
				APP is depressed	0.25—0.75	
3K	Fuel injection (#4)	Fuel injector No.4	• Inspect using the wave profile. (See 01–40B–18 Inspection Using An Oscilloscope (Reference).)			• Fuel injector No.4 • Related wiring harness
3L	—	—	—		—	—

Terminal	Signal	Connected to	Test condition		Voltage (V)	Inspection item
3M	TP position (No. 1)	TP sensor No. 1	Ignition switch ON	APP is released	0.4—0.6	• TP sensor • Related wiring harness
				APP is depressed	4.25—4.75	
3N	Injector control	Injector driver relay	Under any condition		Below 1.0	• Related wiring harness
3O	—	—	—		—	—
3P	Constant voltage (Vref)	TP sensor	Under any condition		Approx. 5.0	• TP sensor • Related wiring harness
3Q	TP sensor GND	TP sensor	under any condition		Below 1.0	• TP sensor • Related wiring harness
3R	—	—	—		—	—
3S	Cruise control	Cruise control switch	Ignition switch ON	Depressing ON/OFF	Approx. 0	• Cruise control switch • Related wiring harness

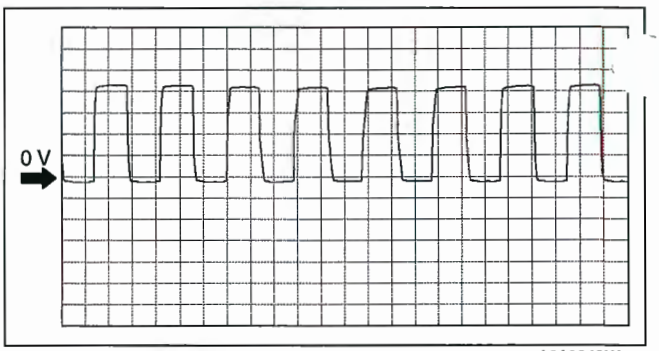
Inspection Using An Oscilloscope (Reference)

Generator output voltage signal

PCM terminals
- 1AB(+)—Body ground(–)

Oscilloscope setting
- 2 V/DIV (Y), 2 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)



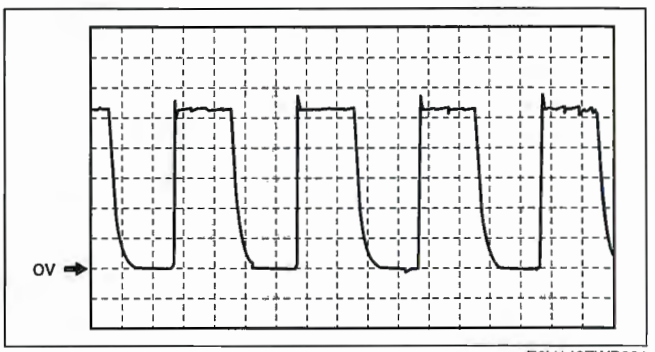
A6A3940W004

Generator field coil control signal

PCM terminals
- 1AD(+)—Body ground(–)

Oscilloscope setting
- 0.5 V/DIV (Y), 1 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)



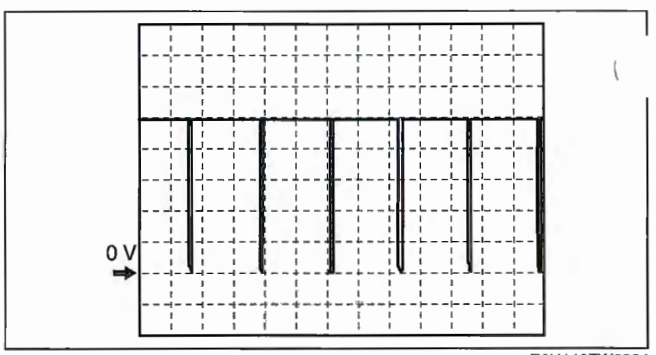
E6U140ZWB001

Fuel injector check signal

PCM terminals
- 2B(+)—Body ground(–)

Oscilloscope setting
- 2 V/DIV (Y), 10 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)



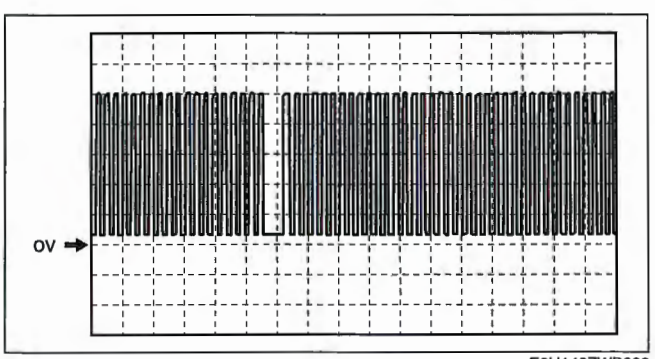
E6U140ZW6304

CKP sensor signal

PCM terminals
- 2C(+)—Body ground(–)

Oscilloscope setting
- 2 V/DIV (Y), 5 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)



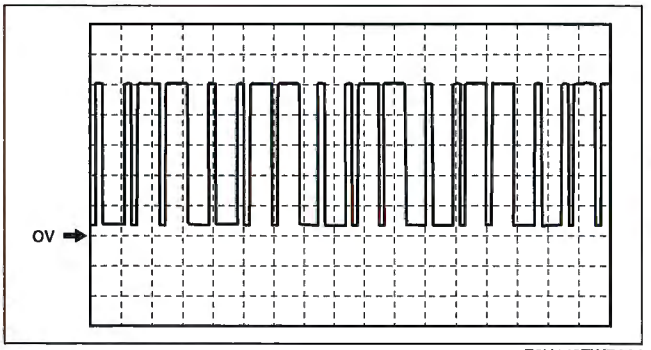
E6U140ZWB003

CMP sensor signal

PCM terminals
- 2E(+)—Body ground(–)

Oscilloscope setting
- 2 V/DIV (Y), 50 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)



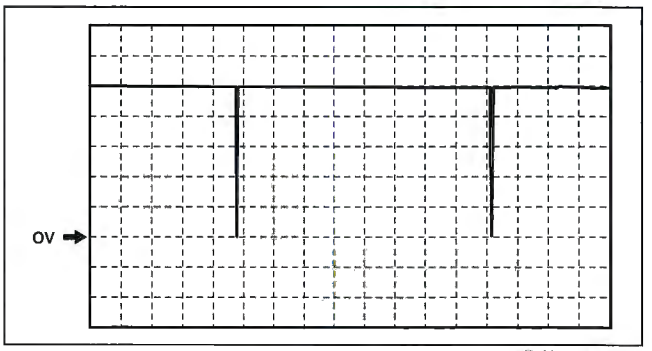
E6U140ZWB004

Fuel injection control

PCM terminals
- Fuel Injection No.1: 3B(+)—Body ground(–)
- Fuel Injection No.2: 3E(+)—Body ground(–)
- Fuel Injection No.3: 3H(+)—Body ground(–)
- Fuel Injection No.4: 3K(+)—Body ground(–)

Oscilloscope setting
- 2 V/DIV (Y), 20 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)



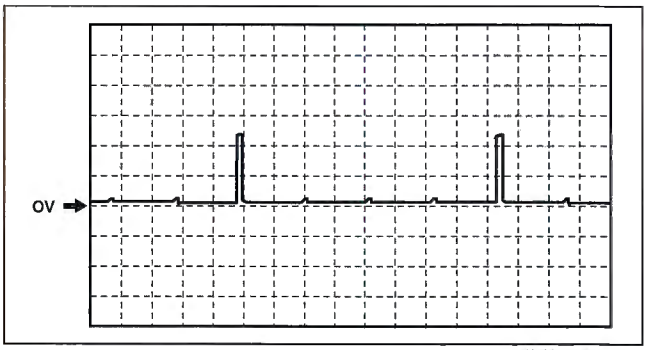
E6U140ZWB005

IGT control signals

PCM terminals
- IGT1(No.1): 3W(+)—Body ground(–)
- IGT2(No.2): 3X(+)—Body ground(–)
- IGT3(No.3): 3Z(+)—Body ground(–)
- IGT4(No.4): 3AA(+)—Body ground(–)

Oscilloscope setting
- 2 V/DIV (Y), 20 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)



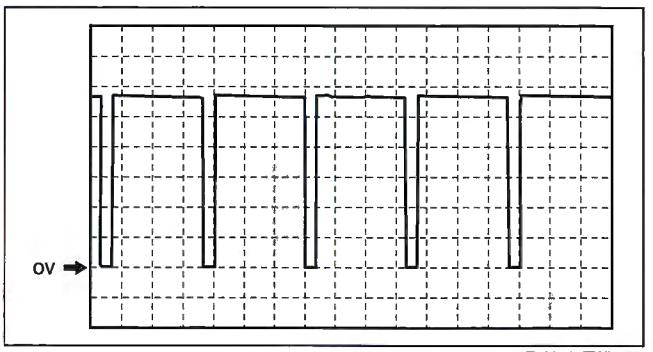
E6U140ZWB006

OCV control signal

PCM terminals
- 4S(+)—Body ground(–)

Oscilloscope setting
- 2.5 V/DIV (Y), 1 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)



E6U140ZWB008

Purge control signal

PCM terminals

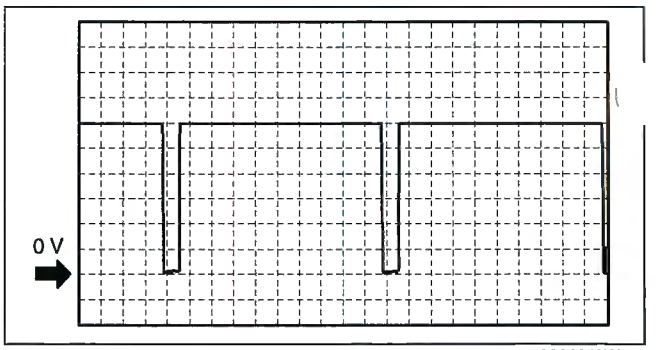
- 4T(+)—Body ground(–)

Oscilloscope setting

- 2 V/DIV (Y), 10 ms/DIV (X), DC range

Vehicle condition

- Idle after warm up (no load, P/S off, A/C off)



A6A3940W023

HO2S (front) heater control signal

PCM terminals

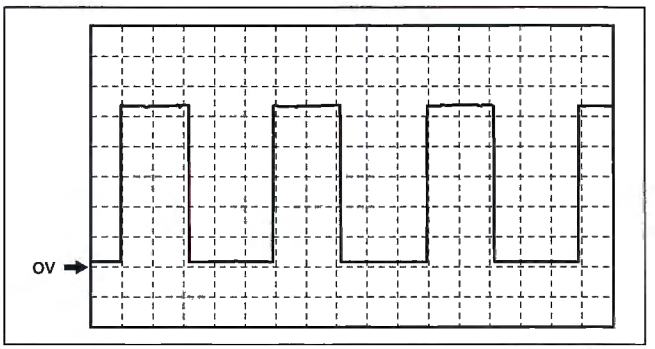
- 4AD(+)—Body ground(–)

Oscilloscope setting

- 2.5 V/DIV (Y), 20 ms/DIV (X), DC range

Vehicle condition

- Idle after engine start (no load, P/S off, A/C off)



E6U140ZWB007

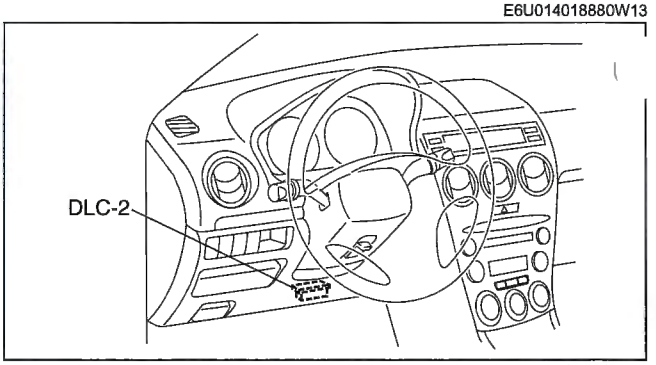
PCM CONFIGURATION [L3 WITH TC]

1. Connect the WDS or equivalent to the DLC-2.
2. Perform the vehicle identification procedure.
3. Select "toolbox" and "Module Programming".
4. Select "Programmable Module Installation".
5. Select "PCM" and perform procedures according to directions.

Note

- If the PCM is replaced with a new one without performing "Programmable Module Installation" procedure, the PCM will be set DTC P0602 and illuminates the MIL. This is because the configuration data is not programmed in the PCM.

E6U014018880W13



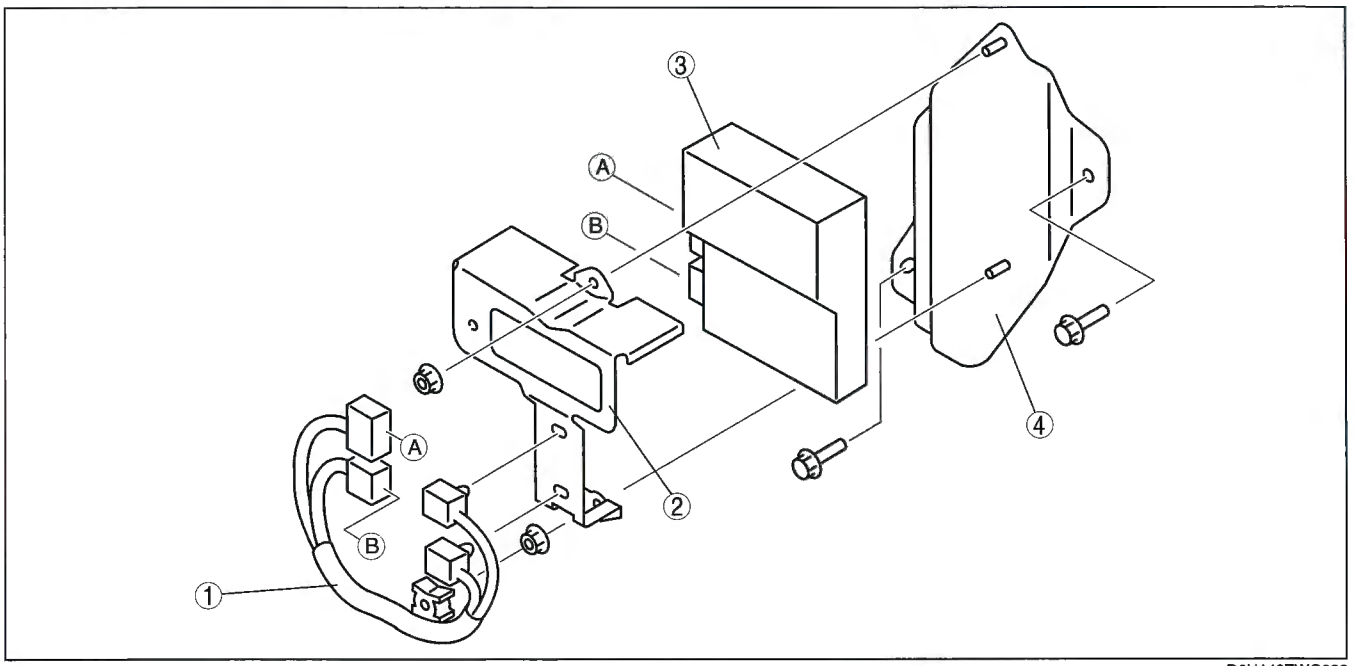
A6E3970W002

6. Retrieve DTCs with the WDS or equivalent, erase them, and verify that there are no DTCs present and the MIL is off.
   - If DTCs are still present, perform applicable DTC inspection.

INJECTOR DRIVER MODULE REMOVAL/INSTALLATION [L3 WITH TC]

E6U014018701W01

1. Disconnect the negative battery cable.
2. Remove the battery and the battery tray.
   Remove in the order indicated in the table.
   .. Install in the reverse order of removal.



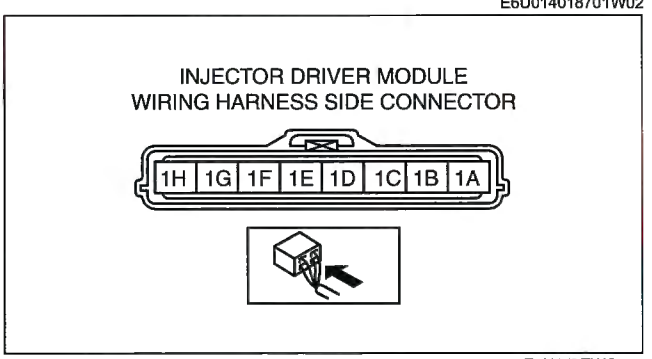
D6U140ZWC022

1	Wiring harness	3	Injector driver module
2	Connector bracket	4	Injector driver module bracket

INJECTOR DRIVER MODULE INSPECTION [L3 WITH TC]

E6U014018701W02

1. Inspect using the wave profile.
   - If any incorrect voltage is detected, inspect the related system(s), wiring harnesses and connector(s).



E6U140ZWC301

Fuel Injector Signal (+)

Injector driver module terminals

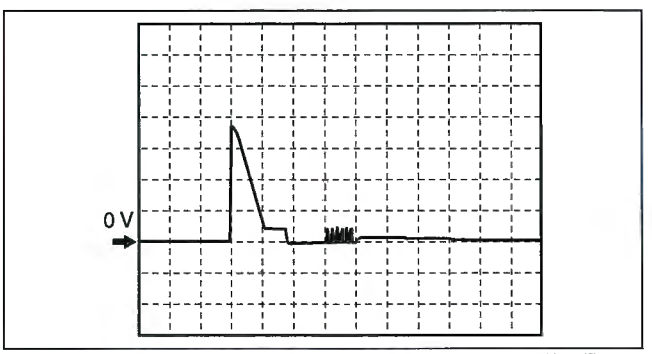
- Fuel injection No.1: 1F(+) — Body ground(–)
- Fuel injection No.2: 1A(+) — Body ground(–)
- Fuel injection No.3: 1A(+) — Body ground(–)
- Fuel injection No.4: 1F(+) — Body ground(–)

Oscilloscope setting

- 25 V/DIV (Y), 0.2 ms/DIV (X), DC range

Vehicle condition

- Idle after warm up (no load, P/S off, A/C off)



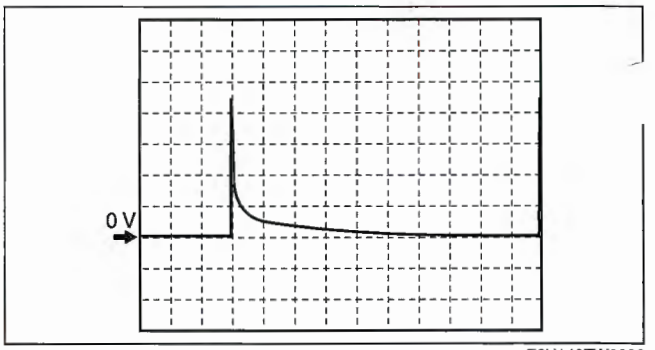
E6U140ZW6302

Fuel Injector Signal (–)

Injector driver module terminals
- Fuel injection No.1: 1E(+) — Body ground(–)
- Fuel injection No.2: 1B(+) — Body ground(–)
- Fuel injection No.3: 1C(+) — Body ground(–)
- Fuel injection No.4: 1D(+) — Body ground(–)

Oscilloscope setting
- 25 V/DIV (Y), 0.2 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, P/S off, A/C off)



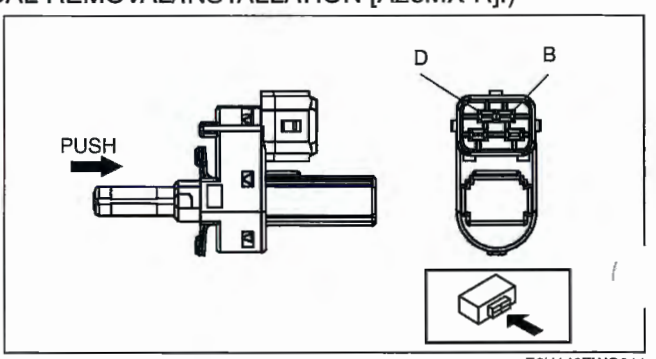
E6U140ZW6303

CLUTCH PEDAL POSITION (CPP) SWITCH INSPECTION [L3 WITH TC]

E6U014018660W04

Note
- Perform the following inspection only when directed.

Continuity Inspection
1. Verify that the clutch switch is installed properly.
2. Disconnect the negative battery cable.
3. Remove the clutch switch. (See 05–10–9 CLUTCH PEDAL REMOVAL/INSTALLATION [A26MX-R].)
4. Inspect for continuity between the clutch switch terminals using a tester.
   - If the clutch switch is normal, but PID value is out of specification, perform the "Circuit Open/ Short Inspection".
   - If not as specified, replace the clutch switch.



E6U140ZWC011

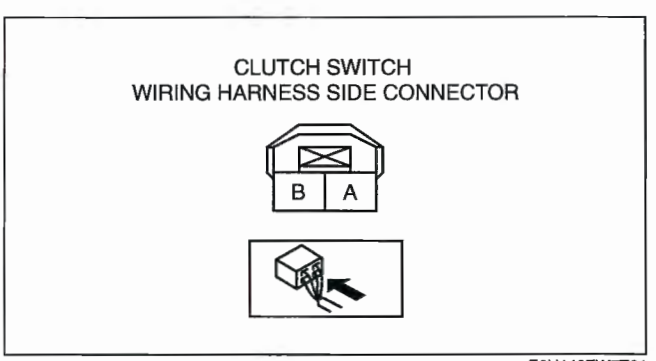
Specification

O—O :Continuity

Rod condition	Terminal	
	B	D
Released	O	O
Pushed		

A6E3940W022

Circuit Open/Short Inspection
1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following harnesses for an open or short circuit. (Continuity check)



E6U140ZW7T01

Open circuit
- If there is no continuity, there is a open circuit. Repair or replace the wiring harness.
  - — Clutch switch terminal A and PCM terminal 1H
  - — Clutch switch terminal B and body ground

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Clutch switch terminal B and power supply
  - — Clutch switch terminal B and body ground

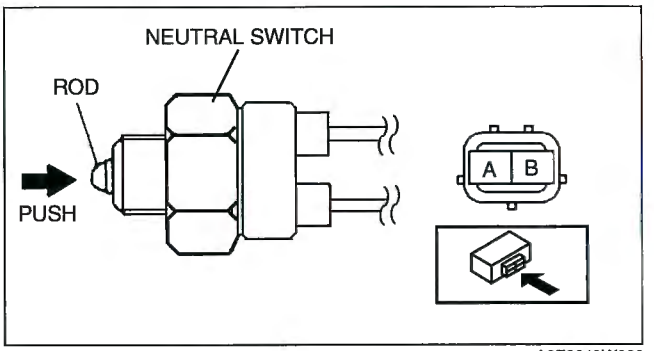
NEUTRAL SWITCH INSPECTION [L3 WITH TC]

E6U014017640W04

Note
- Perform the following inspection only when directed.

Continuity Inspection

1. Disconnect the negative battery cable.
2. Remove the neutral switch. (See 05–15A–4 MANUAL TRANSAXLE REMOVAL/INSTALLATION [G35M-R].)
3. Inspect for continuity between the neutral switch terminals using a tester.
   - If the neutral switch is normal, but PID value is out of specification, perform the "Circuit Open/Short Inspection".
   - If not as specified, replace the neutral switch.



A6E3940W023

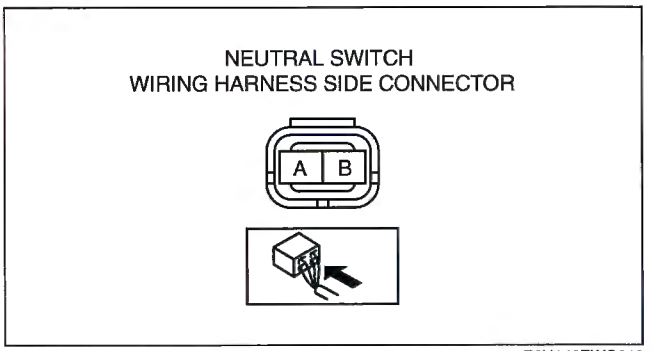
Specification

O—O : Continuity

Condition	Terminal	
	A	B
Rod pushed	O	O
Rod released		

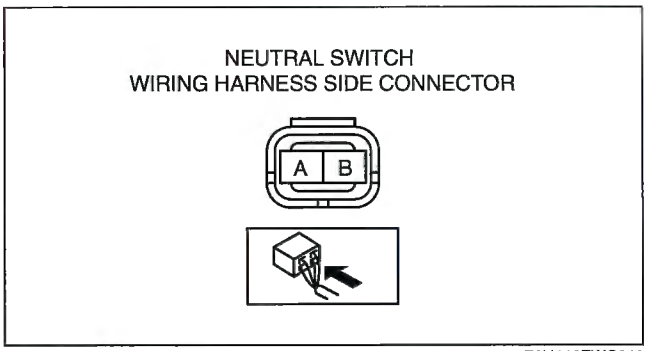
E6U140ZWC028

Circuit Open/Short Inspection



E6U140ZWC013

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following harnesses for an open or short circuit. (Continuity check)



E6U140ZWC018

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Neutral switch terminal B and PCM terminal 1W
  - — Neutral switch terminal A and body ground

Short circuit
- If there is no continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Neutral switch terminal B and body ground

POWER STEERING PRESSURE (PSP) SWITCH INSPECTION [L3 WITH TC]

E6U014032230W04

Note
- Perform the following inspection only when directed.

Continuity Inspection

1. Inspect the following if the power steering is inoperative (See 06–12–4 POWER STEERING FLUID INSPECTION.):
   - Power steering fluid level
   - Power steering fluid leakage
   - Power steering fluid pressure
2. Disconnect the PSP switch connector.
3. Start the engine.
4. Inspect for continuity between the PSP switch terminal and ground using a tester.
   - If not as specified, replace the PSP switch. (See 06–12–27 POWER STEERING OIL PUMP REMOVAL/INSTALLATION [L3, L3 WITH TC].)
   - If the PSP switch is normal, but PID value is out of specification, perform the "Circuit Open/Short Inspection".

Specification

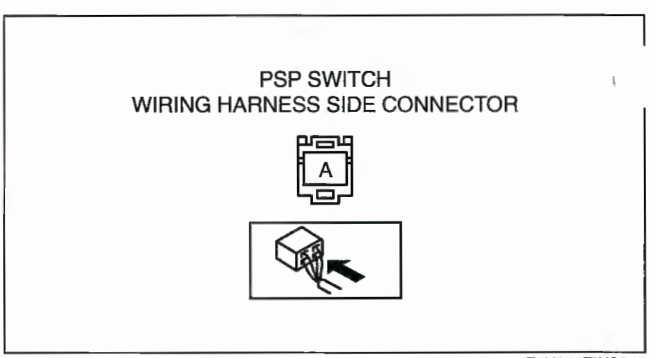
○—○ :Continuity

Condition	Terminal	GND
Steering wheel in straight ahead position		
While turning steering wheel	○	○

A6E3940W019

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following harnesses for an open or short circuit. (Continuity check)



E6U140ZWC016

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  — PSP switch terminal and PCM terminal 1Z

Short circuit
- If there is no continuity, there is a short circuit. Repair or replace the wiring harness.
  — PSP switch terminal and body ground

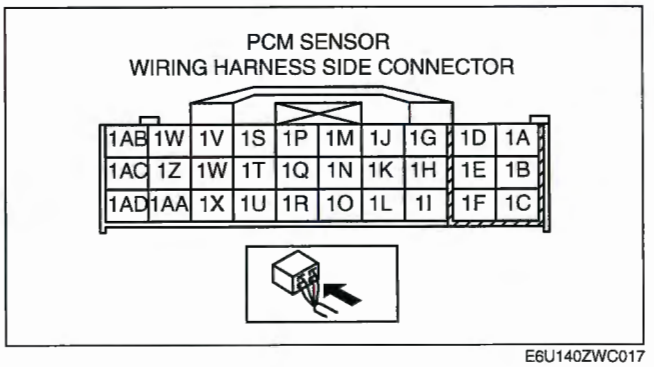
VARIABLE SWIRL SHUTTER VALVE SWITCH INSPECTION [L3 WITH TC]

E6U014018990W01

Note
- Perform the following inspection only when directed.

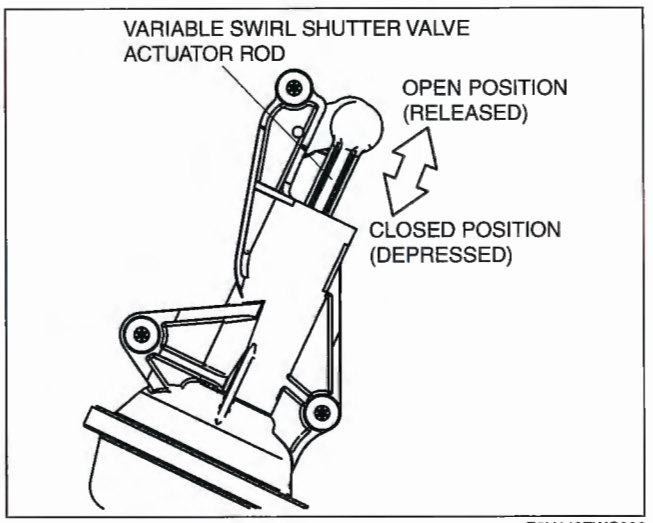
Voltage Inspection

1. Turn the ignition switch to the ON position (Engine off).
2. Verify that the PCM terminal 1N voltage is as shown in the following table when the variable swirl shutter valve actuator rod is depressed and released by hand.



E6U140ZWC017

- If not as specified, perform the "Circuit Open/Short Inspection".
  - — If there is no open or short circuit, replace the intake manifold. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)



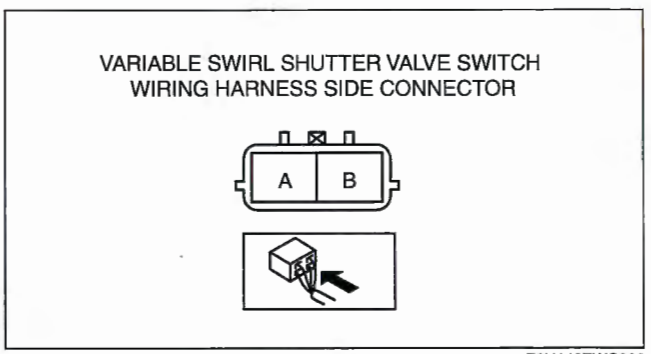
E6U140ZWC302

Variable swirl shutter valve switch output voltage

Condition	PCM terminal 1N
Released (Open position)	Approx. 5.0 V
Depressed (Closed position)	Below 1.0 V

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following harnesses for an open or short circuit. (Continuity check)



E6U140ZWC303

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — Variable swirl shutter valve switch terminal A and PCM terminal 1N
  - — Variable swirl shutter valve switch terminal B and body ground.

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Variable swirl shutter valve switch terminal A and power supply
  - — Variable swirl shutter valve switch terminal A and body ground
  - — Variable swirl shutter valve switch terminal B and power supply

ACCELERATOR PEDAL POSITION (APP) SENSOR INSPECTION [L3 WITH TC]

E6U014041609W04

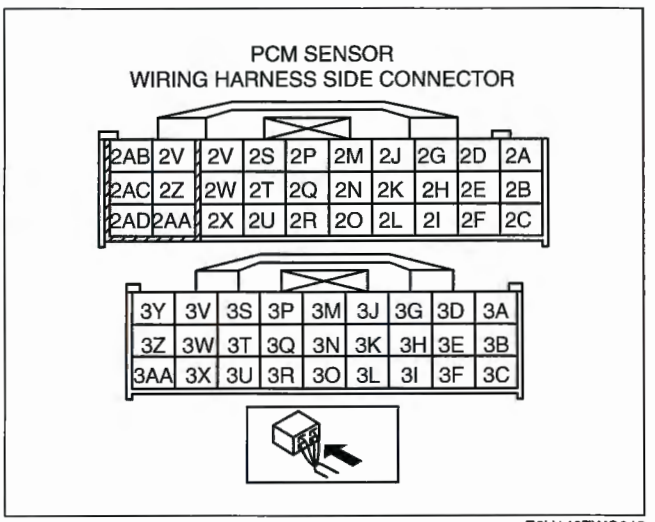
Note
- Perform the following inspection only when directed.

Voltage Inspection

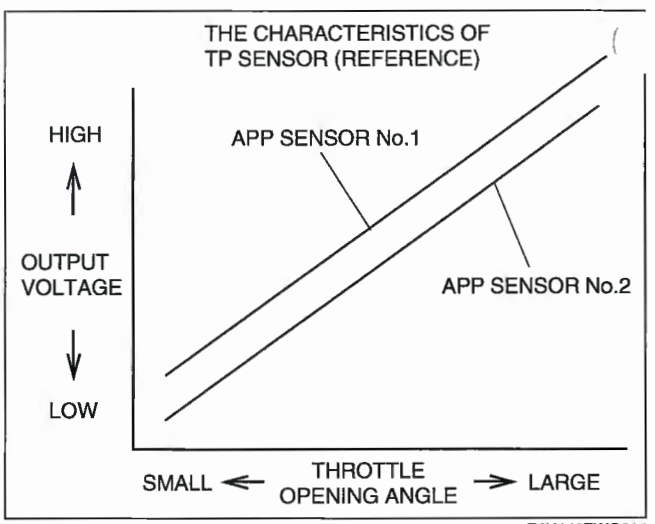
1. Turn the ignition switch to the ON position (Engine off).
2. Verify that the PCM terminal 2A and 3D change smoothly while throttle valve is gradually opened.
   - If as verified, go to next step.
   - If not as verified, perform the "Circuit Open/Short Inspection".
     — If there is no open or short circuit, replace the throttle body. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
3. Verify that the PCM terminal 2A and 3D voltages are as shown in the following table.
   - If voltage is not as following table, perform the "Circuit Open/Short Inspection".
     — If there is no open or short circuit, replace accelerator pedal. (See 01–13B–15 ACCELERATOR PEDAL REMOVAL/INSTALLATION [L3 WITH TC].)

APP sensor output voltage

Condition	PCM terminal 3D (APP sensor No.1)	PCM terminal 2A (APP sensor No.2)
APP is released	Approx. 1.6 V	Approx. 1.0 V
APP is depressed	Approx. 3.9 V	Approx. 3.4 V



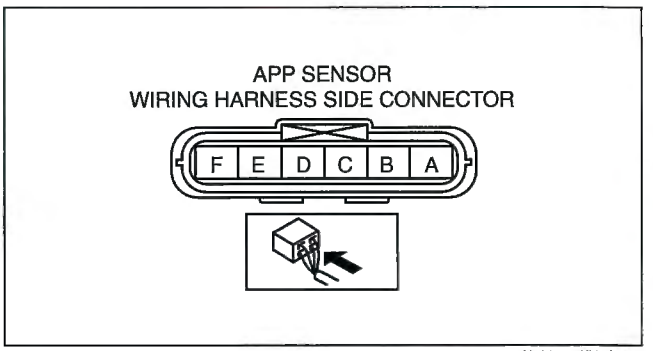
E6U140ZWC019



E6U140ZWC014

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].) Inspect the following wiring harnesses for an open or short circuit. (Continuity check)



E6U140ZWC020

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — APP sensor terminal A and PCM terminal 2K
  - — APP sensor terminal B and PCM terminal 2H
  - — APP sensor terminal C and PCM terminal 2A
  - — APP sensor terminal D and PCM terminal 3G
  - — APP sensor terminal E and PCM terminal 3A
  - — APP sensor terminal F and PCM terminal 3D

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — APP sensor terminal A and power supply
  - — APP sensor terminal A and body ground
  - — APP sensor terminal B and power supply
  - — APP sensor terminal C and power supply
  - — APP sensor terminal C and body ground
  - — APP sensor terminal D and power supply
  - — APP sensor terminal D and body ground
  - — APP sensor terminal E and power supply
  - — APP sensor terminal F and power supply
  - — APP sensor terminal F and body ground

THROTTLE POSITION (TP) SENSOR INSPECTION [L3 WITH TC]

E6U014018910W04

Note

- Perform the following inspection only when directed.

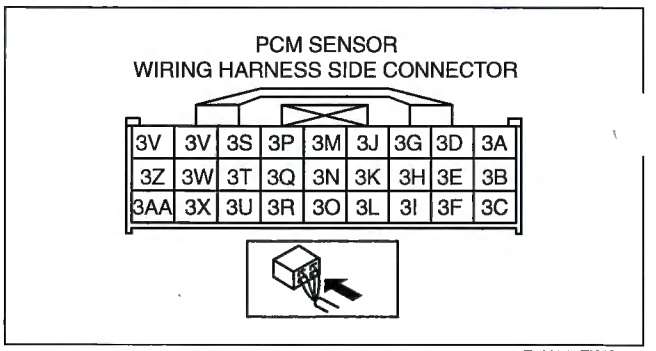
tage Inspection

1. Verify that no DTC related to APP sensor has been detected.
   - If any DTCs related to APP sensor have been detected, perform the DTC inspection. (See 01–02B–14 DTC TABLE [L3 WITH TC].)
2. Start the engine and warm it up (ECT: **more than 80°C {176 °F}**).
3. Turn the ignition switch to the ON position (Engine off).
4. Verify that the PCM terminal 3J and 3M change smoothly while throttle valve is gradually opened.
   - If as verified, go to next step.
   - If not as verified, perform the "Circuit Open/Short Inspection".
     - — If there is no open or short circuit, replace the throttle body.

5. Verify that the PCM terminal 3J and 3M voltages are as shown in the following table.
   - If voltage is not as following table, perform the "Circuit Open/Short Inspection".
     — If there is no open or short circuit, replace the throttle body.

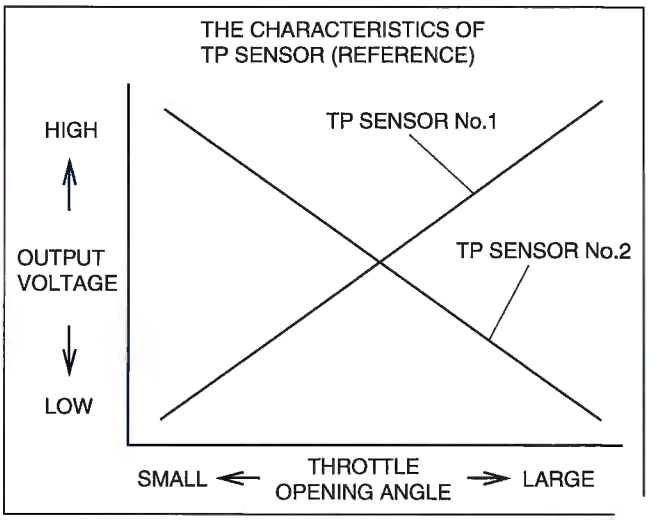
TP sensor output voltage

Condition	PCM terminal 3M (TP sensor No.1)	PCM terminal 3J (TP sensor No.2)
APP is released	0.4—0.6 V	4.4—4.6 V
APP is depressed	4.25—4.75 V	0.25—0.75 V



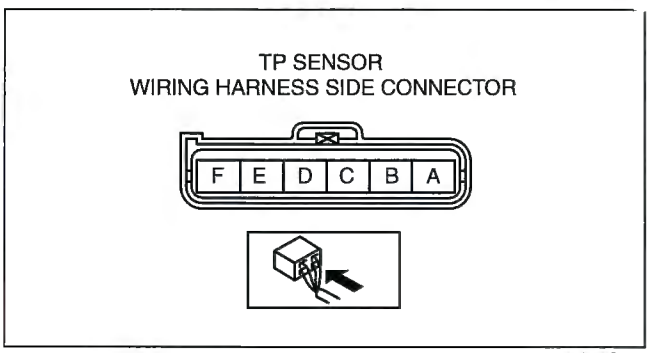
E6U140ZWC021

Circuit Open/Short Inspection



B6U0140V

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harnesses for an open or short circuit. (Continuity check)



E6U140ZWC022

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  — Throttle body terminal A and PCM terminal 3M
  — Throttle body terminal B and PCM terminal 3P
  — Throttle body terminal C and PCM terminal 3J
  — Throttle body terminal D and PCM terminal 3Q

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  — Throttle body terminal A and power supply
  — Throttle body terminal A and body ground
  — Throttle body terminal B and power supply
  — Throttle body terminal B and body ground
  — Throttle body terminal C and power supply
  — Throttle body terminal C and body ground
  — Throttle body terminal D and power supply

MASS AIR FLOW (MAF) SENSOR INSPECTION [L3 WITH TC]

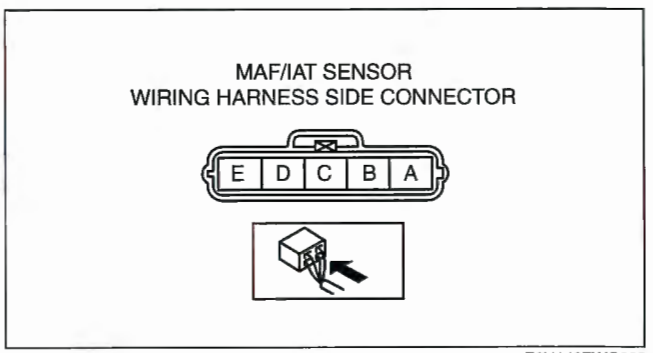
E6U014013215W02

Visual Inspection

Note
- Perform the following inspection only when directed.

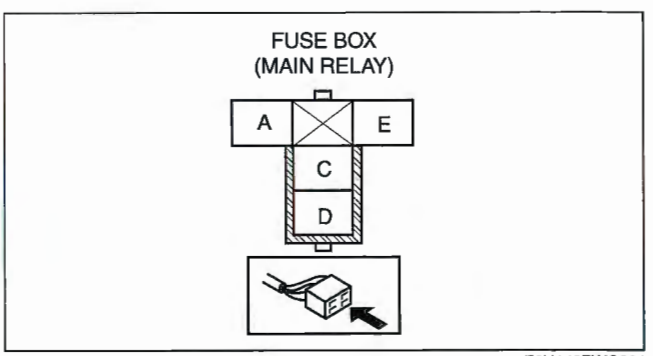
1. Visually inspect for the following on the MAF sensor. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
   - Damage
   - Cracks
   - Bent terminals
   - Terminal rust
     - — If any of the above are found, replace the MAF sensor.
     - — If the MAF PID value is out of specification, carry out the "Circuit Open/Short Inspection".

Circuit Open/Short Inspection



E6U140ZWC023

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].) Disconnect the MAF sensor connector.
2. Inspect the following wiring harnesses for an open or short circuit. (Continuity check)



E6U140ZWC304

Open circuit
- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — MAF sensor terminal A and main relay terminal C
  - — MAF sensor terminal B and PCM terminal 1I
  - — MAF sensor terminal C and PCM terminal 1P

Short circuit
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — MAF sensor terminal A and body ground
  - — MAF sensor terminal C and power supply
  - — MAF sensor terminal C and body ground
  - — MAF sensor terminal B and power supply

Specification

Condition	Intake MAF (g/s)	Engine load calculated value (%)
Idle*1	2.72—2.94	17.1—18.5
Engine Speed 2,500 rpm*2	8.00—8.66	14.2—15.2

*1 : 650—750 rpm
*2 : No load or neutral position

ENGINE COOLANT TEMPERATURE (ECT) SENSOR REMOVAL/INSTALLATION [L3 WITH TC]

E6U014018840W07

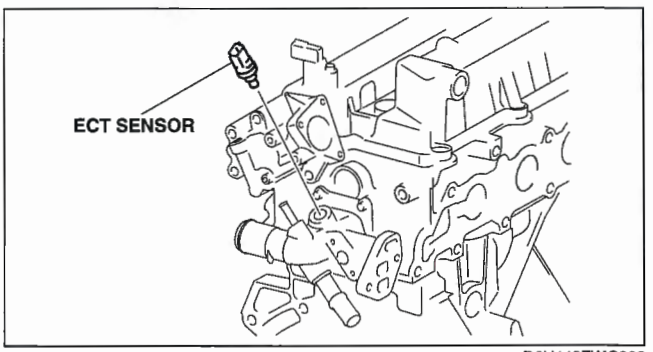
Warning

- **A hot engine can cause severe burns. Turn off the engine and wait until it is cool before removin the ECT sensor.**

1. Remove the charge air cooler cover.
2. Drain the engine coolant. (See 01–12B–2 COOLING SYSTEM SERVICE WARNINGS [L3 WITH TC].)
3. Disconnect the ECT sensor connector.
4. Remove the ECT sensor.
5. Install in the reverse order of removal.

Tightening torque
10—14 N·m
{1.02—1.42 kgf·m, 7.38—10.32 ft·lbf}

6. Refill the engine coolant. (See 01–12B–2 COOLING SYSTEM SERVICE WARNINGS [L3 WITH TC].)



D6U140ZWC002

ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [L3 WITH TC]

E6U014018840W08

Note

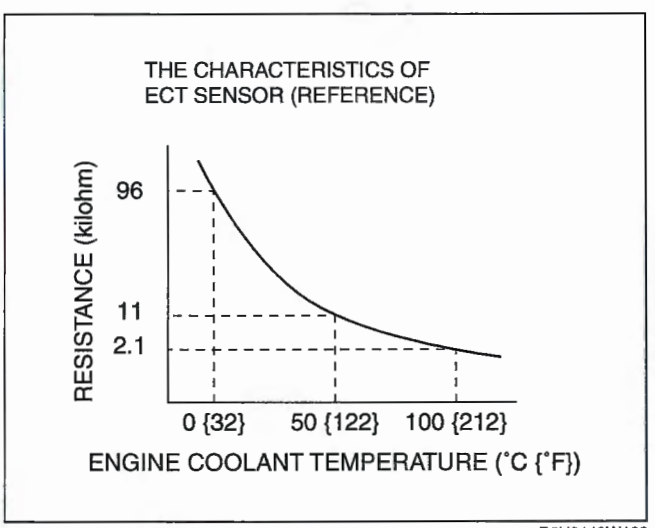
- Perform the following inspection only when directed.

ECT Sensor Resistance Inspection

1. Drain the engine coolant. (See 01–12B–2 COOLING SYSTEM SERVICE WARNINGS [L3 WITH TC].)
2. Remove the ECT sensor (located above the starter).
3. Place the ECT sensor in water with a thermometer, and heat the water gradually.
4. Measure the resistance between the ECT sensor terminals A and B using a tester.
   - If not as specified, replace the ECT sensor.
   - If the ECT sensor is normal, but PID value is out of specification, perform the "Circuit Open/Short Inspection".

Specification

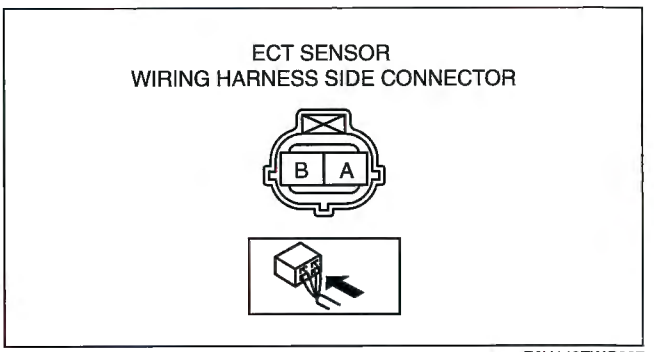
Water temperature (°C {°F})	Resistance (kilohm)
20 {68}	35.48—39.20
70 {158}	5.07—5.60
80 {176}	3.65—4.02



B6U0140W102

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harnesses for an open or short circuit. (Continuity check)



E6U140ZWC027

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — ECT sensor terminal A and PCM terminal 1M
  - — ECT sensor terminal B and PCM terminal 2H

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — ECT sensor terminal A and power supply
  - — ECT sensor terminal A and body ground
  - — ECT sensor terminal B and power supply

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR INSPECTION [L3 WITH TC]

E6U014018212W02

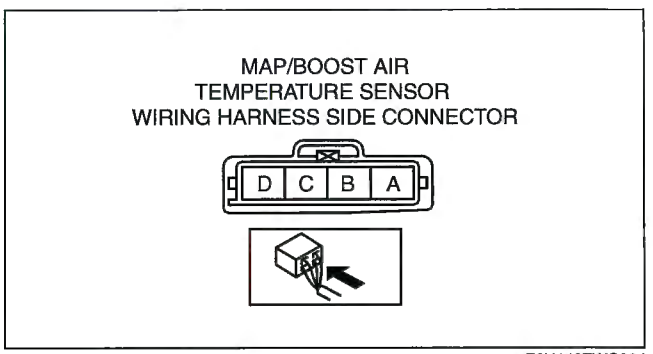
Note

- Perform the following inspection only when directed.
- The following vacuum values are indicated by relative pressure from the MAP sensor.

1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to ON (Engine off).
3. Select MAP PID on the WDS or equivalent.
4. Verify that the MAP PID (pressure) and barometric pressure are practically equal.
   - If not as verified, perform the "Circuit Open/Short Inspection".
     - — If there is no open or short circuit, replace the MAP sensor.
   - If as verified, go to next step.
5. Apply vacuum of **–25.0 kPa {–187 mmHg, –7.38 inHg}** to the MAP sensor, and verify that the MAP variation from that of Step 4 is approx. **25.0 kPa {187 mmHg, 7.38 inHg}**.
   - If not as verified, perform the "Circuit Open/Short inspection".
     - — If there is no open or short circuit, replace the barometric pressure sensor. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harnesses for an open or short circuit. (Continuity check)



E6U140ZWC024

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — MAP/boost air temperature sensor terminal A and PCM terminal 2H
  - — MAP/boost air temperature sensor terminal D and PCM terminal 1J
  - — MAP/boost air temperature sensor terminal C and PCM terminal 2K

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — MAP/boost air temperature sensor terminal C and power supply.
  - — MAP/boost air temperature sensor terminal C and body ground.
  - — MAP/boost air temperature sensor terminal D and power supply.
  - — MAP/boost air temperature sensor terminal D and body ground

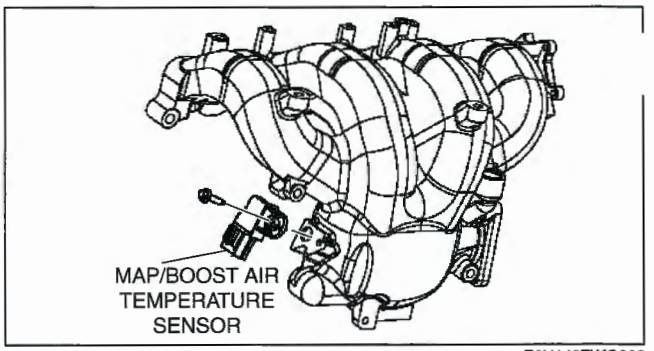
MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR/BOOST AIR TEMPERATURE SENSOR REMOVAL/INSTALLATION [L3 WITH TC]

E6U014018212W03

1. Disconnect the negative battery cable.

2. Remove the charge air cooler cover.
3. Disconnect the MAP sensor connector.
4. Remove MAP sensor from the intake manifold.
5. Install in the reverse order of removal.

Tightening torque
5—7 N·m {51—71 kgf·cm, 45—61 in·lbf}



E6U140ZWC003

BOOST AIR TEMPERATURE SENSOR INSPECTION [L3 WITH TC]

E6U014018842W04

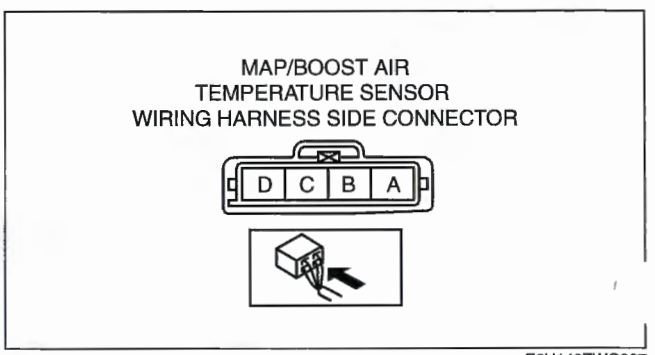
Resistance Inspection

Note
- Perform the following inspection only when directed.

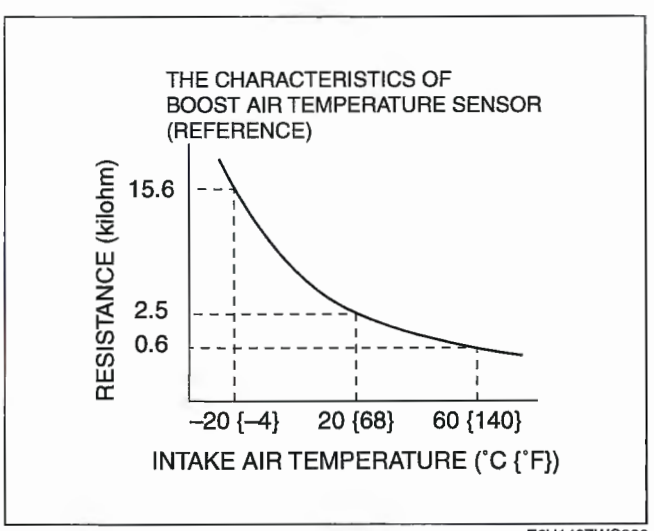
1. Disconnect MAP/boost air temperature sensor.
2. Measure the resistance between the MAP/boost air temperature sensor terminals A and B using a tester.
   - If not as specified, replace the MAP/boost air temperature sensor. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
   - If the MAP/boost air temperature sensor is normal, but PID are out of specification, perform the "Circuit Open/Short Inspection".

Specification

Ambient temperature (°C {°F})	Resistance (kilohm)
–20 {–4}	14.04—17.33
20 {68}	2.31—2.72
60 {140}	0.572—0.655



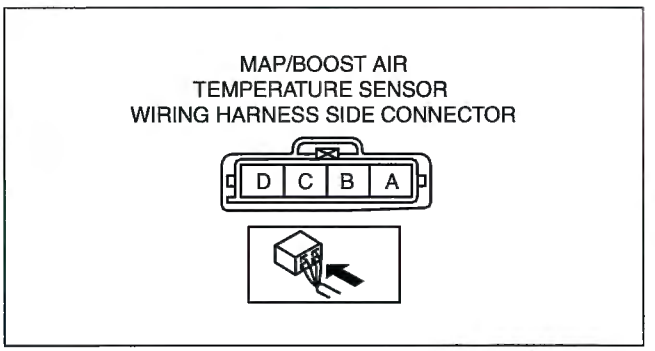
E6U140ZWC307



E6U140ZWC306

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harnesses for an open or short circuit. (Continuity check)



E6U140ZWC307

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — MAP/boost air temperature sensor terminal A and PCM terminal 2H
  - — MAP/boost air temperature sensor terminal B and PCM terminal 1S
  - — MAP/boost air temperature sensor terminal C and PCM terminal 2K

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — MAP/boost air temperature sensor terminal A and power supply
  - — MAP/boost air temperature sensor terminal B and power supply
  - — MAP/boost air temperature sensor terminal B and body ground
  - — MAP/boost air temperature sensor terminal C and body ground

INTAKE AIR TEMPERATURE (IAT) SENSOR INSPECTION [L3 WITH TC]

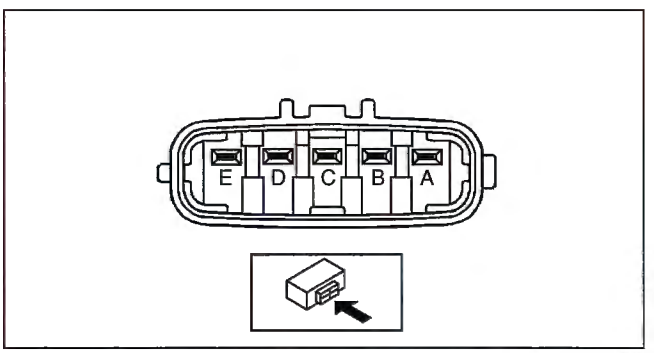
E6U014018842W05

Resistance Inspection

Note

- Perform the following inspection only when directed.

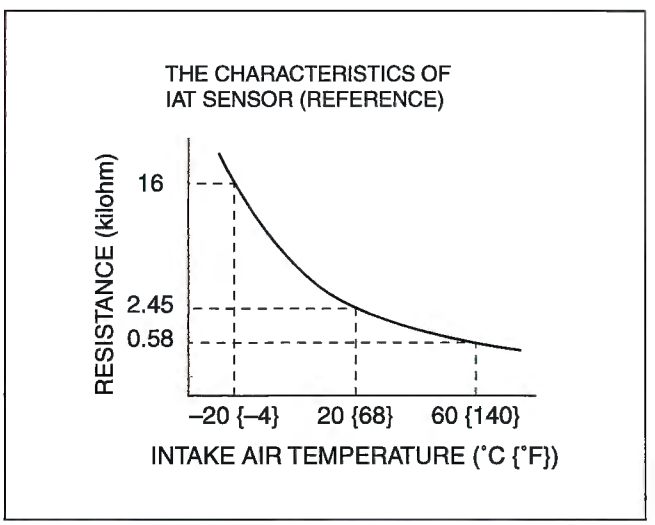
1. Disconnect the MAF/IAT sensor.
2. Measure the resistance between the MAF/IAT sensor terminals D and E using a tester.
   - If not as specified, replace the MAF/IAT sensor. (See 01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
   - If the MAF/IAT sensor is normal, but the PID is out of specification, perform the "Circuit Open/Short Inspection".



A6E3940W005

Specification

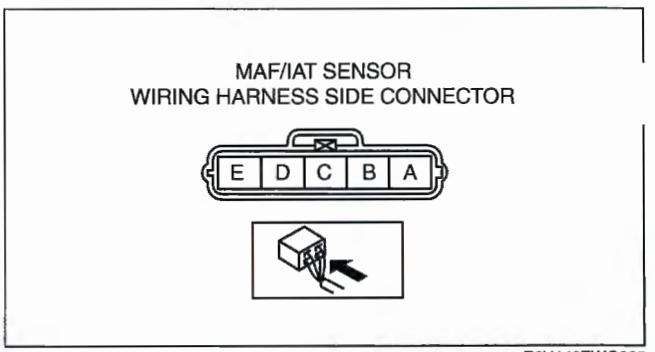
Ambient temperature (°C {°F})	Resistance (kilohm)
–20 {–4}	13.6—18.4
20 {68}	2.21—2.69
60 {140}	0.493—0.667



B6U0140W092

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harnesses for an open or short circuit. (Continuity check)



E6U140ZWC025

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — MAF/IAT sensor terminal D and PCM terminal 2V
  - — MAF/IAT sensor terminal E and PCM terminal 2H

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — MAF/IAT sensor terminal E and power supply
  - — MAF/IAT sensor terminal D and power supply
  - — MAF/IAT sensor terminal D and body ground

BAROMETRIC PRESSURE (BARO) SENSOR INSPECTION [L3 WITH TC]

E6U014018213W01

Note

- Perform the following inspection only when directed.
- The following vacuum values are indicated by relative pressure from the PCM. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)

1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to the ON position.
3. Select BARO on the WDS or equivalent.
4. Verify that the BARO PID (pressure) and barometric pressure are practically equal.
   - If not as verified, perform the "Circuit Open/Short Inspection".
     - — If there is no open or short circuit, replace the BARO sensor.
   - If as verified, go to next step.

FUEL PRESSURE SENSOR REMOVAL/INSTALLATION [L3 WITH TC]

E6U014018213W02

Note

- If the fuel pressure sensor is removed, do not reuse the fuel pressure sensor and the fuel delivery pipe. When you replace the fuel pressure sensor, replace a new fuel delivery pipe with a new fuel pressure sensor. 01–14B–25 FUEL INJECTOR REMOVAL/INSTALLATION [L3 WITH TC]

FUEL PRESSURE SENSOR INSPECTION [L3 WITH TC]

E6U014018213W03

Note

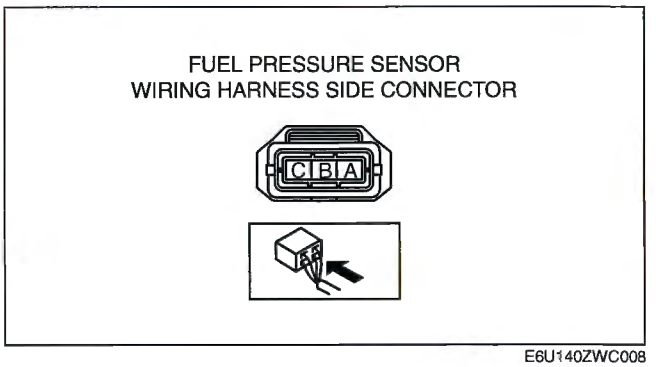
- Perform the following inspection only when directed.
- The following vacuum values are indicated by relative pressure from the fuel pressure sensor.

1. Remove the charge air cooler cover.
2. Connect the WDS or equivalent to the DLC-2.
3. Turn the ignition switch to the ON position (Engine off).
4. Select the FUEL_PRES PID on the WDS or equivalent.
5. After warming up the engine, verify that the FUEL_PRES PID is at the standard value under the following conditions.
   - — If not as verified, replace the fuel delivery pipe.

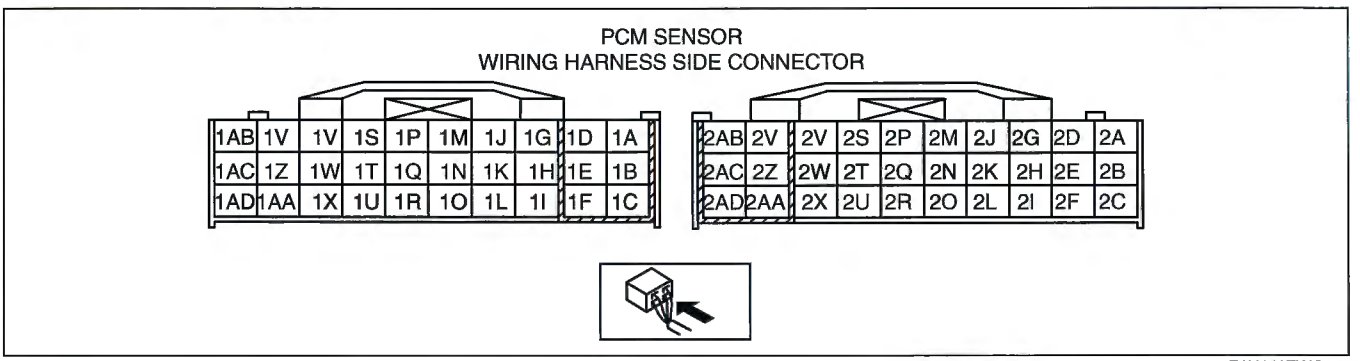
Step	Condition	FUEL_PRES PID
1	• Idle • **90 s** after engine is started	**Approx. 3 MPa**
2	• Idle • Spill valve solenoid valve connector is disconnected	**Approx. 530 kPa**

6. After connecting the spill valve control solenoid valve connector, clear the DTC.

Circuit Open/Short Inspection



E6U140ZWC008



E6U140ZWC004

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harnesses for an open or short circuit. (Continuity check)

Open circuit

If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
- — Fuel pressure sensor terminal A and PCM terminal 2H
- — Fuel pressure sensor terminal B and PCM terminal 1V
- — Fuel pressure sensor terminal C and PCM terminal 2K

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — Fuel pressure sensor terminal A and power supply.
  - — Fuel pressure sensor terminal B and power supply.
  - — Fuel pressure sensor terminal B and body ground.
  - — Fuel pressure sensor terminal C and body ground

KNOCK SENSOR (KS) INSPECTION [L3 WITH TC]

E6U014018920W07

Note
- Perform the following test only when directed.

Resistance Inspection

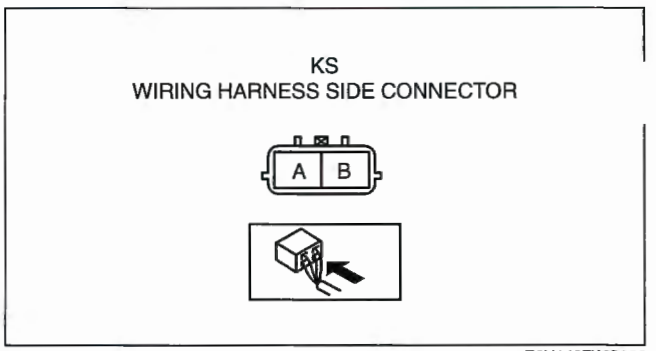
1. Turn the ignition switch to the LOCK position.
2. Disconnect the KS connector.
3. Measure the resistance between the KS terminals A and B using a tester.
   - If not as specified, replace the KS. (See01–40B–36 KNOCK SENSOR (KS) REMOVAL/INSTALLATION [L3 WITH TC].)
   - If the KS is normal, but PID value is out of specification, perform the “Circuit Open/Short Inspection”.

Specification

Approx. 4.87 megohms

Circuit Open/Short Inspection

1. Disconnect the PCM connector. (See 01–40B–6 PCM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Inspect the following wiring harnesses for an open or short circuit. (Continuity check)



E6U140ZWC026

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — KS terminal A and PCM terminal 2S
  - — KS terminal B and PCM terminal 2P

Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  - — KS terminal A and power supply
  - — KS terminal A and body ground
  - — KS terminal B and power supply
  - — KS terminal B and body ground

KNOCK SENSOR (KS) REMOVAL/INSTALLATION [L3 WITH TC]

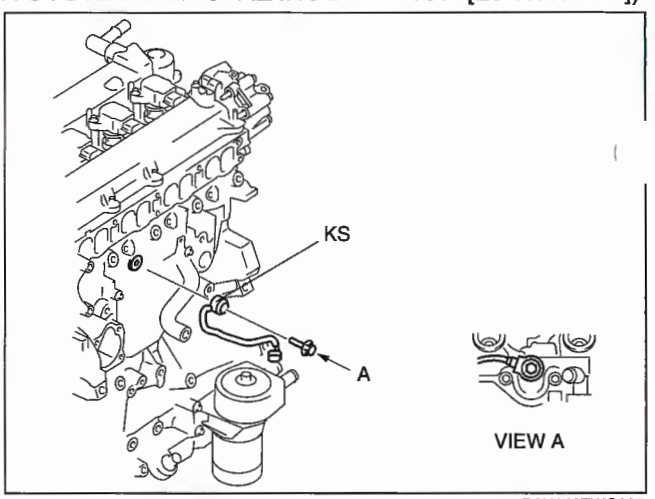
E6U014018920W08

Caution

- **Be careful not to impact the sensor.**
- **Verify that there is no debris between the sensor and the cylinder block before installing.**

1. Remove the intake manifold. (See01–13B–4 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [L3 WITH TC])
2. Remove the KS attachment bolt to remove the KS.
3. Install in the reverse order of removal.

Tightening torque
16—24 N·m {1.7—2.4 kgf·m, 12—17 ft·lbf}



D6U140ZWC005

CAMSHAFT POSITION (CMP) SENSOR INSPECTION [L3 WITH TC]

E6U014018230W11

Note

- Perform the following inspection according to the DATA MONITOR function (indicated by monitor item from here onwards).

Visual Inspection

1. Disconnect the negative battery cable.
2. Remove the CMP sensor. (See 01–40B–38 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/ INSTALLATION [L3 WITH TC].)
3. Verify that there are no metal shavings on the sensor.
   - If the monitor item condition/specification (reference) is not within the specification even though there is no malfunction, carry out the “Circuit Open/Short Inspection”.

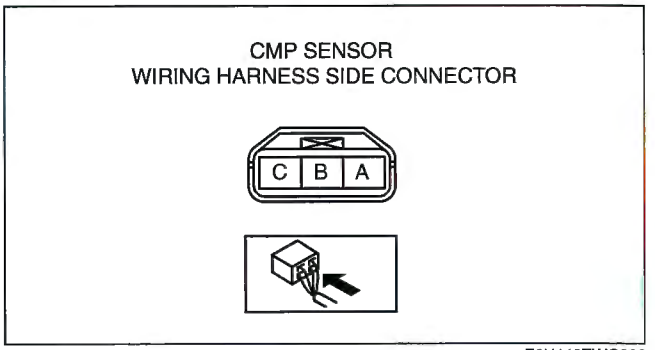
Voltage inspection

1. Idle the engine.

Caution

- **Water penetrating the connector will cause sensor malfunction. To prevent this, be careful not to damage the wiring harnesses or the waterproof connector so as to cause water penetration.**

2. Measure the output voltage using an oscilloscope.
   - If not within the specification, replace the CMP sensor.
   - If the monitor item condition/specification (reference) is not within the specification, even though the voltage is within the specification, carry out the "Circuit Open/ Short Inspection".



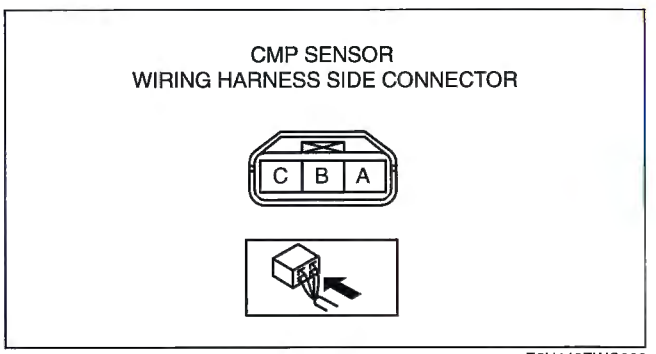
E6U140ZWC308

Voltage

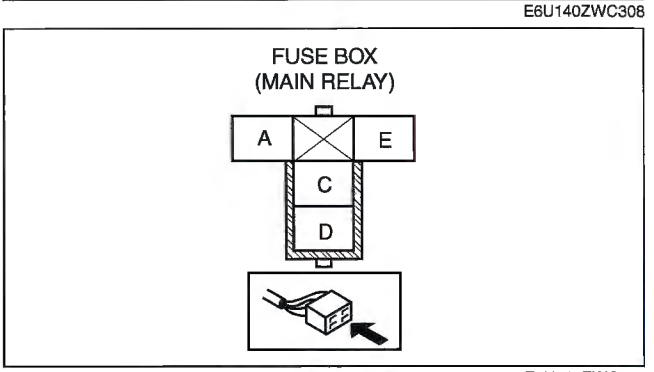
Terminal	Voltage (V)	Condition
A	B+	Under any condition
C	4.8 or more	High output*
	0.8 or less	Low output*
B	0	Under any condition

* : Output voltage varies with camshaft rotation.

Circuit Open/Short Inspection



E6U140ZWC308

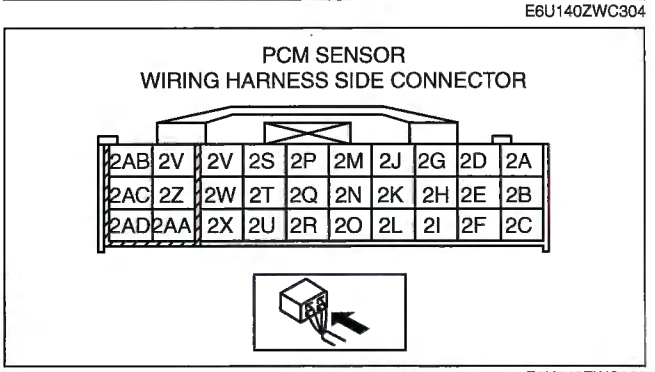


E6U140ZWC304

1. Inspect the following wiring harnesses for an open or short circuit. (Continuity check)

Open circuit
- If there is no continuity, the circuit is open. Repair or replace the wiring harness.
  - — CMP sensor terminal A and main relay terminal C
  - — CMP sensor terminal B and PCM terminal 2H
  - — CMP sensor terminal C and PCM terminal 2E

Short circuit
- If there is continuity, the circuit is shorted. Repair or replace the wiring harness.
  - — CMP sensor terminal A and body ground
  - — CMP sensor terminal B and power supply
  - — CMP sensor terminal B and body ground
  - — CMP sensor terminal C and power supply



E6U140ZWC309

CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC]

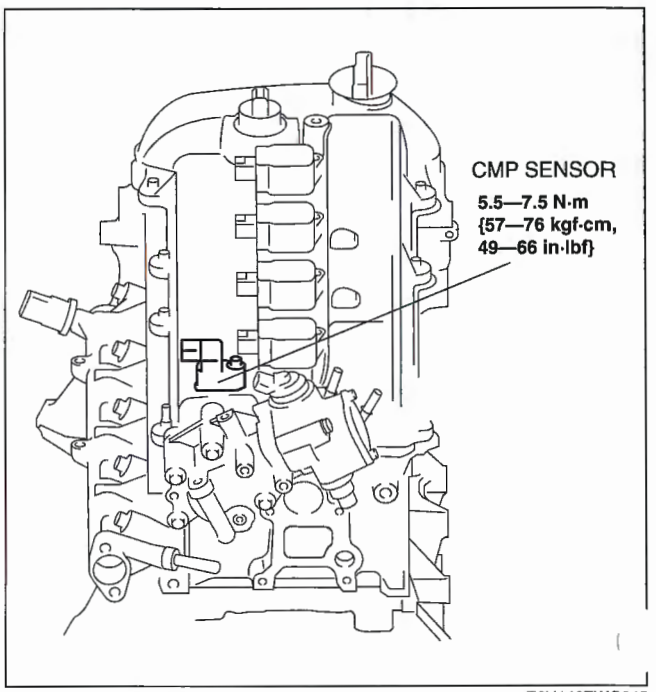
E6U014018230W12

1. Remove the battery cover.
2. Disconnect the negative battery cable.
3. Remove the charge air cooler cover.

Caution
- **When replacing the CMP sensor, make sure there is no foreign material on it such as metal shavings. If it is installed with foreign material, the sensor output signal will malfunction resulting from fluctuation in magnetic flux and cause a deterioration in engine control.**

4. Disconnect the CMP sensor connector.
5. Remove the CMP sensor installation bolt.
6. Remove the CMP sensor from the cylinder head cover.
7. Install in the reverse order of removal.

Tightening torque
5.5—7.5 N·m {56—76 kgf·cm, 49—66 in·lbf}



E6U140ZWC015

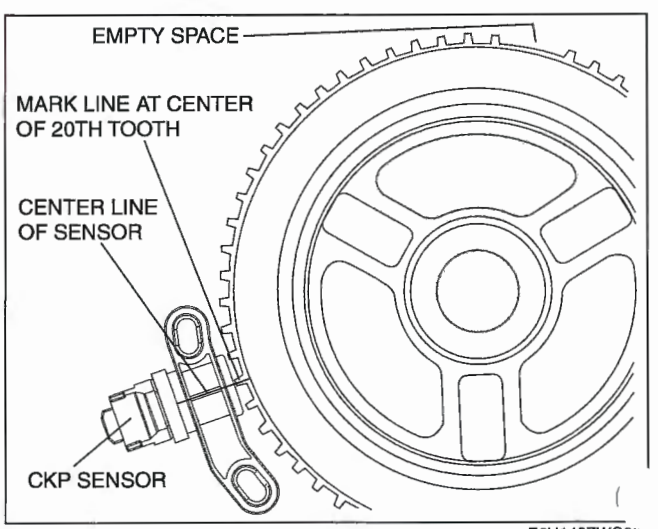
CRANKSHAFT POSITION (CKP) SENSOR INSPECTION [L3 WITH TC]

E6U014011431W01

Note
- Perform the following inspection according to the DATA MONITOR function (indicated by monitor item from here onwards).

Air Gap Inspection
1. Verify that the CKP sensor is securely installed.
2. Using a thickness gauge, measure the air gap between the plate projections at the back of crankshaft pulley and the CKP sensor.
   - If not within the specification, inspect the plate projections for cracks or bending.
     — If there is any malfunction, replace the plate.
     — If the monitor item condition/specification (reference) is not within the specification, even though there is no malfunction, carry out the "Circuit Open/Short Inspection".

Air gap
0.5—1.5 mm {0.02—0.05 in}



E6U140ZWC009

Visual inspection

1. Disconnect the negative battery cable.
2. Remove the CKP sensor. (See 01–40B–41 CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/ INSTALLATION [L3 WITH TC].)
   Verify that there are no metal shavings on the sensor.
   - If the monitor item condition/specification (reference) is without the specification even though there is no malfunction, carry out the "Circuit Open/Short Inspection".

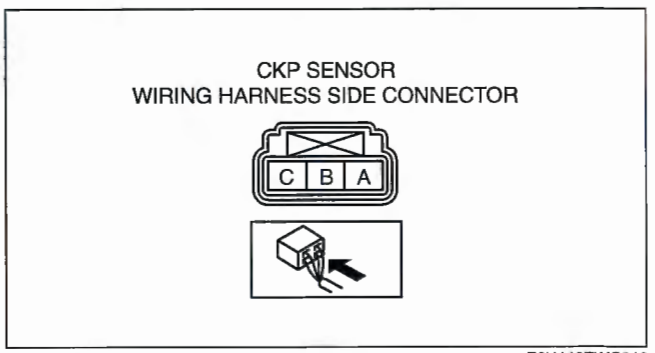
Voltage Inspection

1. Idle the engine.

Caution

- **Water penetrating the connector will cause sensor malfunction. To prevent this, be careful not to damage the wiring harnesses or the waterproof connector so as to cause water penetration.**

2. Measure the output voltage using an oscilloscope.
   - If not within the specification, replace the CKP sensor.
   - If the monitor item condition/specification (reference) is without the specification, even though the voltage is within the specification, carry out the "Circuit Open/Short Inspection".



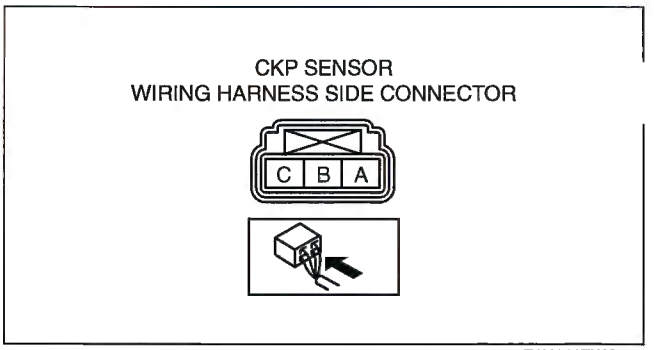
E6U140ZWC310

Voltage

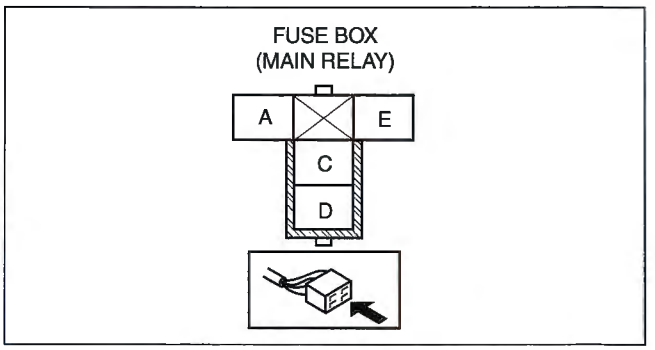
Terminal	Voltage (V)	Condition
A	B+	Under any condition
B	4.8 or more	High output*
	0.8 or less	Low output*
C	0	Under any condition

* : Output voltage varies with crankshaft rotation.

Circuit Open/Short Inspection



E6U140ZWC310



E6U140ZWC304

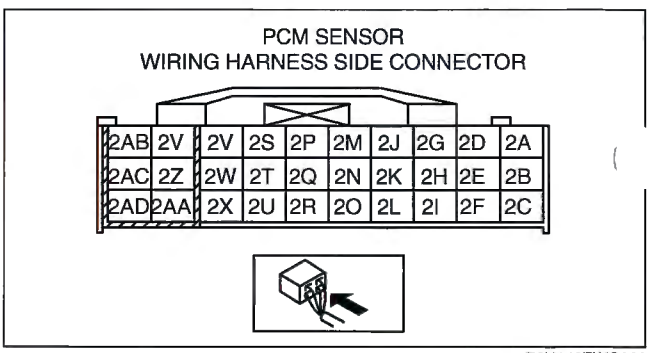
1. Inspect the following wiring harnesses for an open or short circuit. (Continuity check)

Open circuit

- If there is no continuity, the circuit is open. Repair or replace the wiring harness.
  - — CKP sensor terminal A and PCM terminal 2H
  - — CKP sensor terminal B and PCM terminal 2C
  - — CKP sensor terminal C and main relay terminal C

Short circuit

- If there is continuity, the circuit is shorted. Repair or replace the wiring harness.
  - — CKP sensor terminal A and power supply
  - — CKP sensor terminal B and power supply
  - — CKP sensor terminal B and body ground
  - — CKP sensor terminal C and body ground



E6U140ZWC309

CRANKSHAFT POSITION (CKP) SENSOR REMOVAL/INSTALLATION [L3 WITH TC]

E6U014011431W02

Removal

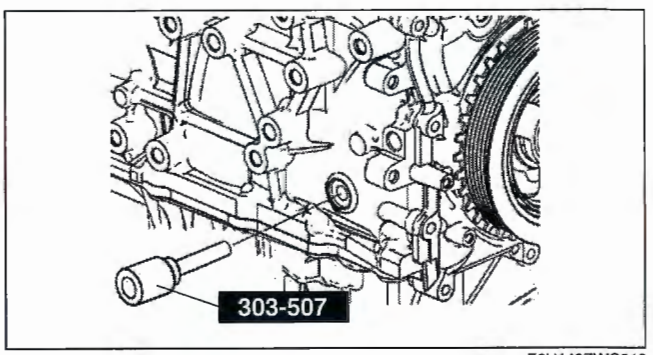
1. Perform the following procedure to allow for enough working space.
   (1) Remove the Front wheel (RH).
   (2) Remove the splash shield.
2. Disconnect the CKP sensor connector.
3. Remove the installation bolts to remove the CKP sensor.

Installation

Caution

- **When foreign material, such as an iron chips, gets on the CKP sensor, it can cause abnormal output from the sensor because of flux turbulence and adversely affect engine control. Be sure there is no foreign material on the CKP sensor when replacing.**

1. Perform the following procedure so that piston No.1 is at the top dead center.
   (1) Remove the drive shaft (RH). (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC].)
   (2) Remove the cylinder block lower blind plug and install the **SST**.
   (3) Turn the crankshaft pulley to the clockwise until it stops.

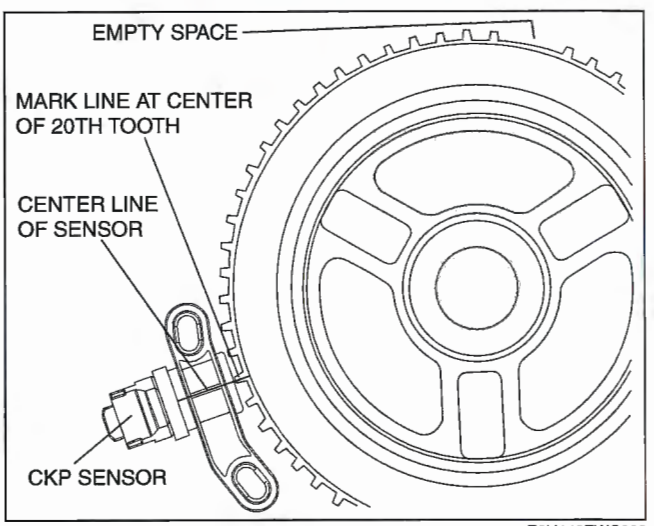


E6U140ZWC010

Using a straight edge, draw a straight line directly in the center of the twentieth tooth of the crankshaft pulley pulse wheel (counting counterclockwise from the empty space).

Caution

- **If the line is not accurately drawn, ignition timing, fuel injection and other engine control systems will be adversely effected. Draw the straight line carefully using a straight edge.**



E6U140ZWC009

3. Align the center line of the crankshaft position sensor and the line drawn in Step 2, then install the sensor.
4. Install the CKP sensor fitting bolts.

Tightening torque
5.5—7.5 N·m {56—76 kgf·cm, 49—66 in·lbf}

5. Remove the **SST** then install the cylinder block lower blind plug.

Tightening torque
18—22 N·m {1.9—2.2 kgf·m, 14—16 ft·lbf}

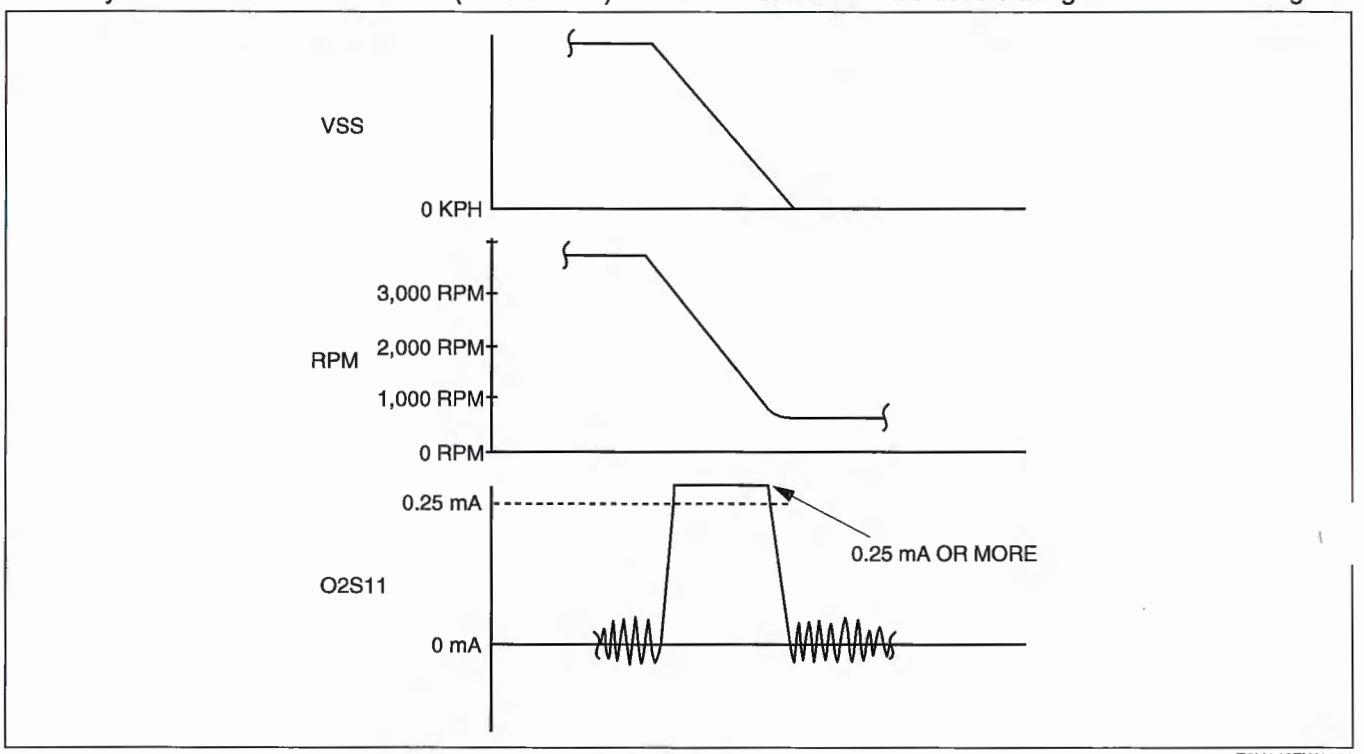
6. Install the front drive shaft (RH). (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC].)

HEATED OXYGEN SENSOR (HO2S) INSPECTION [L3 WITH TC]

E6U014018860W04

Note
- Before performing the following inspection, make sure to follow the troubleshooting flowchart.

Front HO2S Current Inspection
1. Warm up the engine to normal operating temperature.
2. Using the WDS or equivalent, monitor the following:
   — Vehicle speed (PID: VSS)
   — Engine speed (PID: RPM)
   — Front HO2S current (PID: O2S11)
3. Drive the vehicle and decelerate the engine speed by releasing the accelerator pedal fully when the engine speed is **3,000 rpm or more**.
4. Verify that the front HO2S current (PID: O2S11) is **0.25 mA or more** while decelerating as shown in the figure.

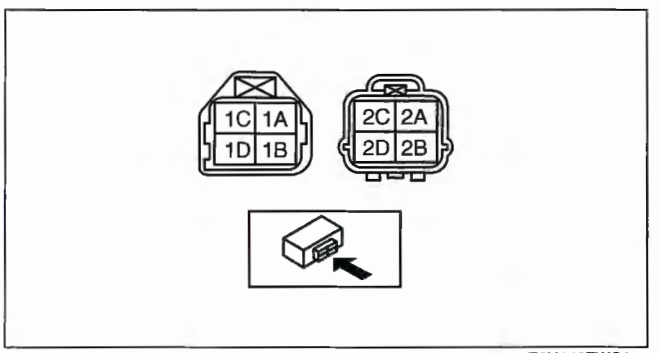


E6U140ZW1001

- If not within the specification, inspect the HO2S for an open or short circuit. (See 01–40B–43 Front HO2S circuit open/short inspection (sensor).) Then if there is no malfunction in the wiring harness, replace the front HO2S.

Front HO2S heater resistance inspection
1. Disconnect the front HO2S connector.
2. Measure the resistance between front HO2S terminals 2B and 2D.
   - If not within the specification, replace the front HO2S. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)

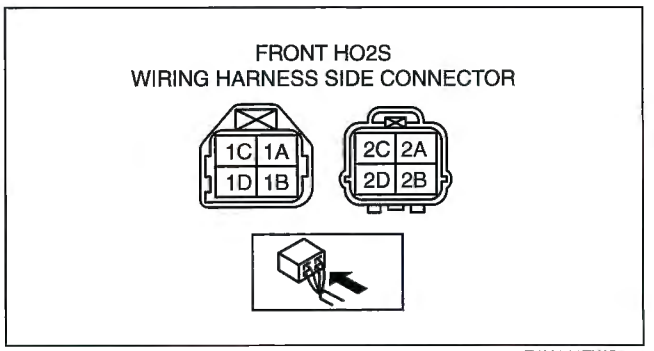
Front HO2S heater resistance
1—10 ohms



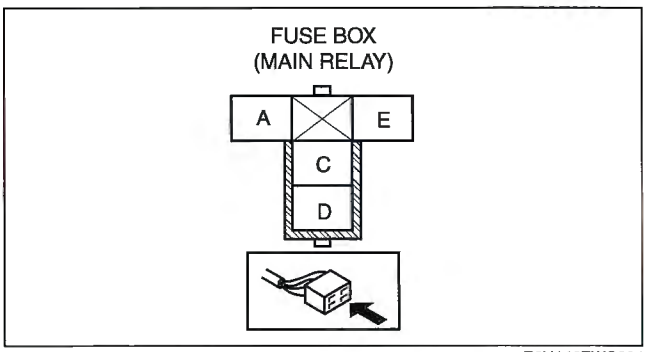
E6U140ZWC

Front HO2S circuit open/short inspection (sensor)

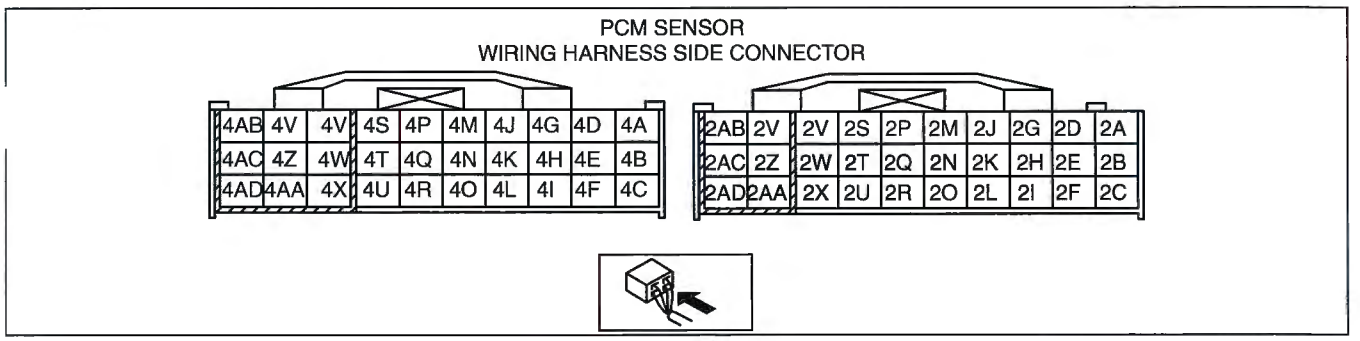
1. Disconnect the PCM connector.
2. Disconnect the front HO2S connector.
   Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)



E6U140ZWC312



E6U140ZWC304



E6U140ZWC313

Open circuit

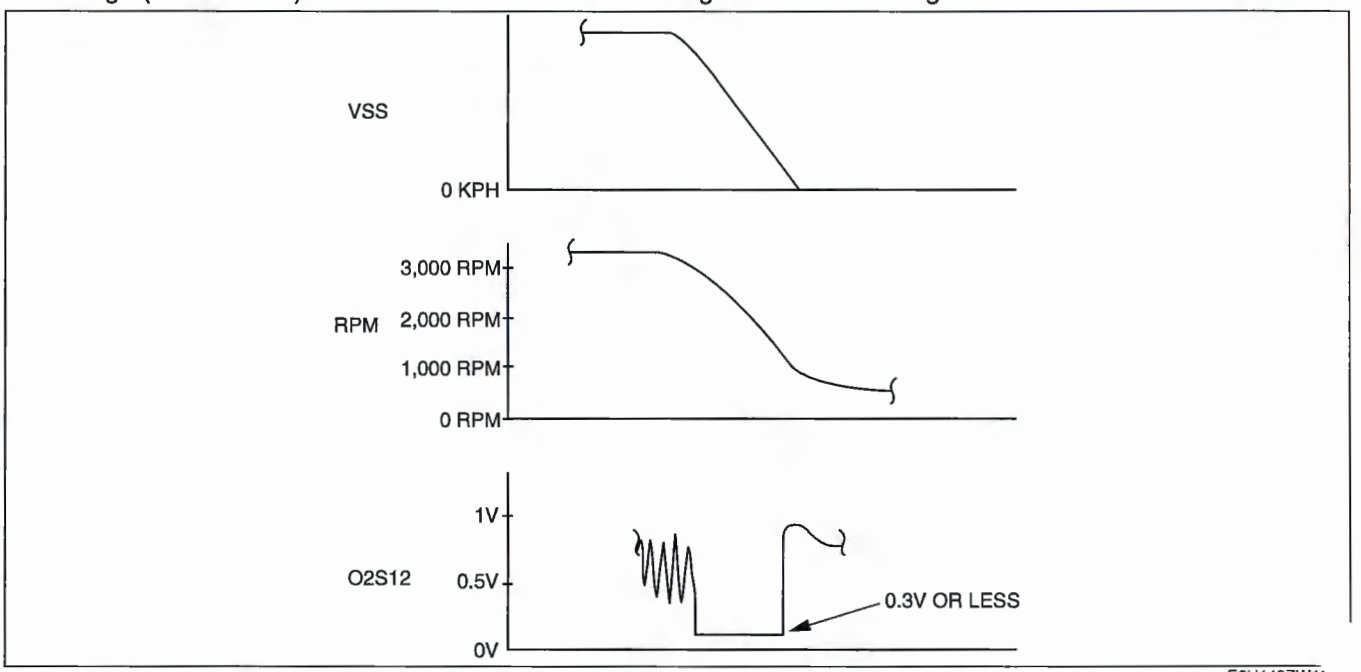
- If there is no continuity in the following wiring harnesses, there is an open circuit. Repair or replace the wiring harness.
  - — Front HO2S terminal 1A and PCM terminal 2D
  - — Front HO2S terminal 1B and PCM terminal 2G
  - — Front HO2S terminal 1C and PCM terminal 2J
  - — Front HO2S terminal 2A and PCM terminal 2H
  - — Front HO2S terminal 2B and main relay terminal C
  - — Front HO2S terminal 2C and PCM terminal 2M
  - — Front HO2S terminal 2D and PCM terminal 4AD

Short circuit

- If there is continuity in the following wiring harnesses, there is a short circuit. Repair or replace the wiring harness.
  - — Front HO2S terminal 1A and body ground
  - — Front HO2S terminal 1A and power supply
  - — Front HO2S terminal 1B and body ground
  - — Front HO2S terminal 1B and power supply
  - — Front HO2S terminal 1C and body ground
  - — Front HO2S terminal 1C and power supply
  - — Front HO2S terminal 2A and power supply
  - — Front HO2S terminal 2B and body ground
  - — Front HO2S terminal 2C and body ground
  - — Front HO2S terminal 2C and power supply
  - — Front HO2S terminal 2D and body ground
  - — Front HO2S terminal 2D and power supply

Rear HO2S voltage inspection

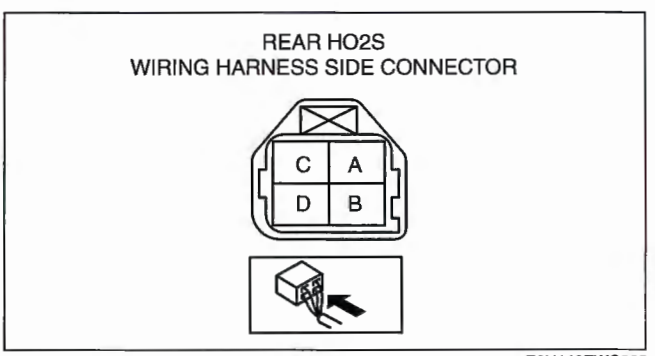
1. Warm up the engine to normal operating temperature.
2. Using the WDS or equivalent, monitor the following:
   — Vehicle speed (PID: VSS)
   — Engine speed (PID: RPM)
   — Rear HO2S voltage (PID: O2S12)
3. Drive the vehicle and decelerate the engine speed by releasing the accelerator pedal fully when the engine speed is **3,000 rpm or more**.
4. Verify that the rear HO2S outputs a voltage of **0.6 V or more**, one time or more, then verify that the rear HO2S voltage (PID: O2S12) is **0.3 V or less** while decelerating as shown in the figure.



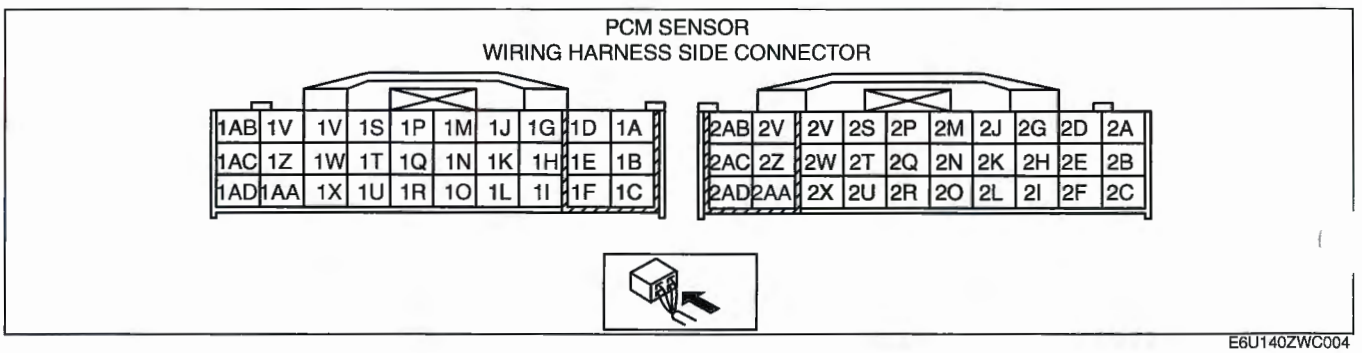
E6U140ZW1

- If not within the specification, inspect the HO2S for an open or short circuit. (See 01–40B–44 Rear HO2S circuit open/short inspection (sensor).) Then if there is no malfunction in the wiring harness, replace the rear HO2S.

Rear HO2S circuit open/short inspection (sensor)



E6U140ZWC005



E6U140ZWC004

1. Disconnect the PCM connector.
2. Disconnect the rear HO2S connector.
3. Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)

`en circuit

If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
— Rear HO2S terminal A and PCM terminal 1Y
— Rear HO2S terminal B and PCM terminal 2H

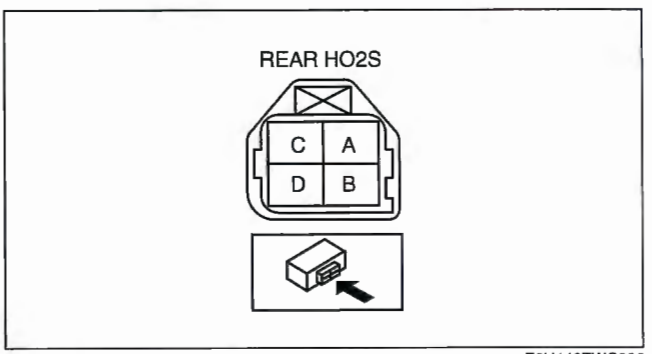
Short circuit

- If there is continuity, there is a short circuit. Repair or replace the wiring harness.
  — Rear HO2S terminal A and body ground
  — Rear HO2S terminal A and power supply
  — Rear HO2S terminal B and power supply

Rear HO2S heater resistance inspection

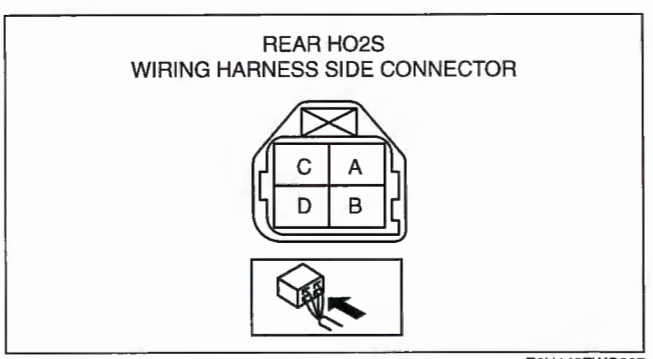
1. Disconnect the rear HO2S connector.
2. Measure the rear HO2S resistance between terminals C and D.
   - If not within the specification, replace the HO2S.

Rear HO2S heater resistance
2—50 ohms



E6U140ZWC006

Rear HO2S circuit open/short inspection (heater)



E6U140ZWC007

1. Disconnect the PCM connector.
2. Disconnect the rear HO2S connector.
3. Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  — Rear HO2S terminal C and ignition switch
  — Rear HO2S terminal D and PCM terminal 4Z

Short circuit

- If there is no continuity, there is a short circuit. Repair or replace the wiring harness.

Rear

— Rear HO2S terminal C and body ground
— Rear HO2S terminal D and power supply
— Rear HO2S terminal D and body ground

PCM REMOVAL/INSTALLATION [AJ]

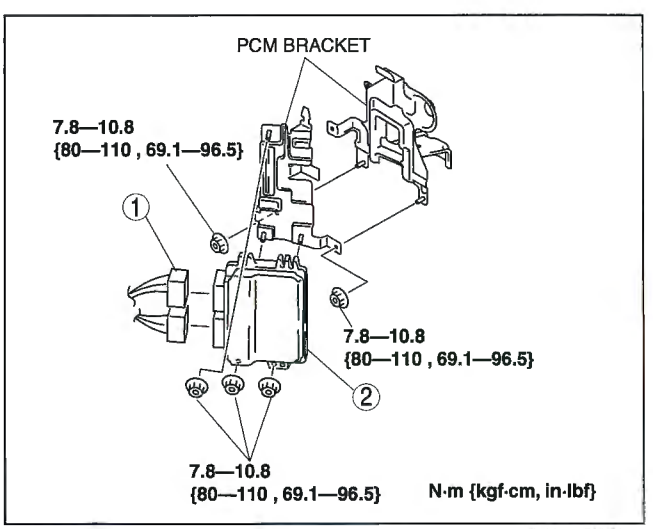
E6U014018880W01

Note

- To replace the PCM, connect the WDS and perform the PCM configuration. (See 01–40C–23 PCM REPLACEMENT [AJ].)

1. Disconnect the negative battery cable.
2. Remove in the order indicated in the table.
3. Install in the reverse order of removal.

1	PCM connector
2	PCM

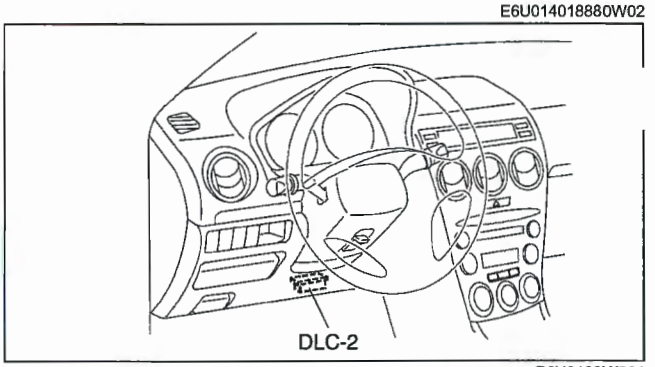


E6U140BW5L03

PCM INSPECTION [AJ]

1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to ON position.
3. Measure the PID value.
   - If PID value is not within the specification, follow the instructions in Action column.

E6U014018880W02



B6U0102W501

PID/DATA MONITOR table (Reference)

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Inspection item (s)	PCM terminal
AAT (Ambient air temperature)	°C or °F	Ignition switch at ON position: Indicate the ambient air temperature	• IAT sensor (See 01–40C–31 INTAKE AIR TEMPERATURE (IAT) SENSOR INSPECTION [AJ].)	—
AC REQ (A/C switch)	On/Off	A/C switch and fan switch ON at ignition switch ON: On A/C switch OFF at ignition switch ON: Off	• A/C switch (See 07–40–33 CLIMATE CONTROL UNIT INSPECTION [L3, AJ].) • Refrigerant pressure switch (See 07–10–4 REFRIGERANT PRESSURE CHECK [L3, AJ].)	1AN
ACCS (A/C relay)	On/Off	A/C is operating: On Ignition switch is ON: Off	• Inspect following PIDs: ECT, RPM, TP REL • A/C switch (See 07–40–33 CLIMATE CONTROL UNIT INSPECTION [L3, AJ].)	1AW
ALTF (Generator field coil control duty value)	%	Ignition switch is ON: 0% Idling, E/L is operating: Duty value rises	• Inspect following PIDs: ALTT V, ECT, IAT, RPM	2AP
ALTT V (Generator output voltage)	V	Ignition switch is ON: 0 V Idling: 14—16 V	• Generator (See 01–17A–5 GENERATOR INSPECTION [L3, AJ].)	2AU
APP (Accelerator pedal position)	%	CTP: Approx. 0% WOT: Approx. 99.2%	• Inspect following PIDs: APP1, APP2 • APP sensor (See 01–40C–26 ACCELERATOR PEDAL POSITION (APP) SENSOR INSPECTION [AJ].)	1AP, 1AO
APP1 (APP sensor No.1)	%	AP is released: 31.0—32.4% AP is depressed: 69.8—81.8%	• APP sensor (See 01–40C–26 ACCELERATOR PEDAL POSITION (APP) SENSOR INSPECTION [AJ].)	1AO
	V	AP is released: 1.55—1.62 V AP is depressed: 3.49—4.09 V		
APP2 (APP sensor No.2)	%	AP is released: 20.2—21.4% AP is depressed: 58.8—70.8%	• APP sensor (See 01–40C–26 ACCELERATOR PEDAL POSITION (APP) SENSOR INSPECTION [AJ].)	1AP
	V	AP is released: 1.01—1.07 V AP is depressed: 2.94—3.54 V		

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Inspection item (s)	PCM terminal
ARPMDES (Target engine speed)	RPM	Idling (no load): 700—800 RPM	• Inspect following PIDs: ALTT V, ECT, IAT, INGEAR, MAF, MAP, RPM, PSP, TP REL • CKP sensor (See 01–40C–41 CRANKSHAFT POSITION (CKP) SENSOR INSPECTION [AJ].)	—
BARO (Barometric pressure)	kPa, Bar, psi	Ignition switch is ON at sea level: Approx. 101 kPa {1.01 Bar, 14.6 psi}	• EGR boost sensor (See 01–40C–37 EGR BOOST SENSOR INSPECTION [AJ].)	1AL
	V	Ignition switch is ON at sea level: Approx. 4.1 V		
BARO/EGR (EGR boost sensor solenoid valve)	On/Off	Ignition switch is ON: Off Idling: Off	• EGR boost sensor solenoid valve (See 01–16A–20 EGR BOOST SENSOR SOLENOID VALVE INSPECTION [AJ].)	1AX
BOO (Brake switch No.1)	On/Off	Brake pedal is depressed: On Brake pedal is released: Off	• Brake switch (See 04–11–9 BRAKE SWITCH INSPECTION.)	1AJ
BPA (Brake switch No.2)	On/Off	Brake pedal is depressed: Off Brake pedal is released: On	• Brake switch (See 04–11–9 BRAKE SWITCH INSPECTION.)	1AF
CATT11_DSD (Estimated catalytic converter temperature)	°C or °F	Idling after warm-up: indicate the WU-TWC (RH) forecast temperature	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
CATT21_DSD (Estimated catalytic converter temperature)	°C or °F	Idling after warm-up: indicate the WU-TWC (LH) forecast temperature	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
CHRGLP (Generator warning light)	On/Off	Ignition switch is ON: On Idling: Off	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
COLP (Refrigerant pressure switch (middle))	On/Off	Idling, refrigerant pressure switch (middle) is on: On Idling, refrigerant pressure switch (middle) is off: Off	• Refrigerant pressure switch (See 07–10–4 REFRIGERANT PRESSURE CHECK [L3, AJ].)	1AH
CPP*1 (Clutch pedal position)	On/Off	Clutch pedal is depressed: On Clutch pedal is released: Off	• Clutch switch (See 01–40C–23 CLUTCH PEDAL POSITION (CPP) SWITCH INSPECTION [AJ].)	1AB
CPP/PNP*1 (Shift lever position)	Neutral/ Drive	Gear is neutral position: Neutral Gear is not neutral position: Drive	• Neutral switch (See 01–40C–24 NEUTRAL SWITCH INSPECTION [AJ].)	2X
DTCCNT (Number of DTC detected)	—	—	• Perform applicable DTC troubleshooting. (See 01–02C–13 DTC TABLE [AJ].)	—
ECT (Engine coolant temperature)	°C or °F	Indicate the engine coolant temperature	• ECT sensor (See 01–40C–29 ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [AJ].)	2AQ
	V	ECT is 20 °C {68 °F}: 2.9—3.1 V After warm-up: 0.2—1.0 V		
)_RAT11_DSD (Front oxygen sensor)	—	Idling after warm-up: Approx. 1	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Inspection item (s)	PCM terminal
ETC_ACT (Electronic throttle control actual)	°	Accelerator pedal is released: Approx. 7.4° Accelerator pedal is released: Approx. 74.3°	• TP sensor (See 01–40C–28 THROTTLE POSITION (TP) SENSOR INSPECTION [AJ].)	2AI, 2AM
ETC_DSD (Electronic throttle control desired)	%	Throttle valve is closed → open: PID value changes smoothly	• Inspect following PIDs: APP1, APP2, ETC ACT • TP sensor (See 01–40C–28 THROTTLE POSITION (TP) SENSOR INSPECTION [AJ].)	2AI, 2AM
	°	Accelerator pedal is released: Approx. 0° Accelerator pedal is released: Approx. 74°		
EVAPCP (Purge solenoid valve duty value)	%	Ignition switch is ON: 0%	• Inspect following PIDs: BARO, ECT, IAT, MAF, O2S11, O2S21, RPM, TP REL	1BF
FAN_DUTY (Fan control signal)	%	ECT is below 100 °C {212 °F}: 0% ECT is above 100 °C {212 °F}: 50—100%	• Inspect following PIDs: COLP, ECT	1U
FLI (Fuel level)	%	—	—	—
FP (Fuel pump relay)	On/Off	Ignition switch is ON: Off Idling: On Cranking: On	• Inspect following PID: RPM • Fuel pump relay (See 09–21–7 RELAY INSPECTION.)	1V
FUELPW (Fuel injection duration)	ms	Ignition switch is ON: 0 ms Idling: 1.5—3.0 ms	• Inspect following PIDs: ACSW, ALTT V, ECT, IAT, INGEAR, MAF, MAP, O2S11, O2S12, O2S21, O2S22, PSP, RPM, TP REL, VBAT • Fuel injector (See 01–14A–32 FUEL INJECTOR INSPECTION [AJ].)	2G, 2E, 2J, 2F, 2K, 2I
FUEL SYS1 (Fuel system status)	OL/CL/ OL-Drive/ OL-Fault/ CL-Fault	Ignition switch is ON: CL Idling after warm-up: CL	• Inspect following PIDs: ALTT V, ECT, IAT, INGEAR, MAF, MAP, O2S11, O2S12, O2S21, O2S22, PSP, RPM, TP REL • Fuel injector (See 01–14A–32 FUEL INJECTOR INSPECTION [AJ].)	—
FUEL SYS2 (Fuel system status)	OL/CL/ OL-Drive/ OL-Fault/ CL-Fault	Ignition switch is ON: CL Idling after warm-up: CL	• Inspect following PIDs: ALTT V, ECT, IAT, INGEAR, MAF, MAP, O2S11, O2S12, O2S21, O2S22, PSP, RPM, TP REL • Fuel injector (See 01–14A–32 FUEL INJECTOR INSPECTION [AJ].)	—
GENVDSD (Generator voltage desired)	V	Ignition switch is ON: 0 V Idling, E/L is not operating: Approx. 14.9 V	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
HTR11 (HO2S heater (RF))	On/Off	Idle after warm-up: On and Off	• Inspect following PIDs: ECT, MAF, RPM, TP REL	2AW
HTR12 (HO2S heater (RR))	On/Off	Idling: On Engine speed is above 4,000 rpm: Off	• Inspect following PIDs: ECT, MAF, RPM, TP REL	2AT
HTR21 (HO2S heater (LF))	On/Off	Idle after warm-up: On and Off	• Inspect following PIDs: ECT, MAF, RPM, TP REL	2AS
HTR22 (HO2S heater (LR))	On/Off	Idling: On Engine speed is above 4,000 rpm: Off	• Inspect following PIDs: ECT, MAF, RPM, TP REL	2AO

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Inspection item (s)	PCM terminal
.SV (VAD control solenoid valve)	On/Off	TP opening angle is less than 60% and engine speed is 6,000 rpm or above: On TP opening angle is 60% or above and engine speed is 4,800 rpm or above: On Others: Off	• Inspect following PIDs: ECT, RPM, TP REL	1BB
IAT (Intake air temperature)	°C or °F	Indicate the intake-air temperature	• IAT sensor (See 01–40C–31 INTAKE AIR TEMPERATURE (IAT) SENSOR INSPECTION [AJ].)	1AT
	V	IAT is 20 °C {68 °F}: 2.4—2.6 V IAT is 30 °C {86 °F}: 1.7—1.9 V		
INGEAR*1 (Load/no load condition)	On/Off	Gear is not neutral position and clutch pedal is released: On Gear is neutral position: Off Clutch pedal is depressed: Off	• Inspect following PIDs: CPP, CPP/PNP • Perform applicable DTC troubleshooting. (See 01–02C–13 DTC TABLE [AJ].)	1AB, 2X
IVS (CTP condition)	Idle/Off Idle	CTP: Idle Others: Off Idle	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	2AI, 2AM
KNOCKR (Knocking retard)	°	Ignition switch is ON: 0 ° Idling: 0 °	• KS (See 01–40C–38 KNOCK SENSOR (KS) INSPECTION [AJ].)	2AF, 2AC
LDP_EVAPCP (EVAP system leak detection pump detect incorrect ·rge flow)	mA	Indicate the EVAP control system incorrect purge flow detection value	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
·P_IDL (EVAP system leak detection pump idle current)	mA	Indicate the EVAP system leak detection pump idle current	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
LDP_MON (EVAP system leak detection pump monitoring current)	mA	Indicate the EVAP system leak detection pump monitoring current	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
LDP_REF (EVAP system leak detection pump reference current)	mA	Indicate the EVAP system leak detection pump reference current	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
LDP_SLDV (EVAP system small leak detection value)	mA	Indicate the EVAP control system small leak detection value	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
LDP_VSL_FV*2 (EVAP system small leak detection value)	mA/sec	Indicate the EVAP control system vary small leak detection value	• Perform applicable DTC troubleshooting. (See 01–02C–13 DTC TABLE [AJ].)	—
LDP_VSL_SV*2 (EVAP system small leak detection value)	mA/sec	Indicate the EVAP control system vary small leak detection value	• Perform applicable DTC troubleshooting. (See 01–02C–13 DTC TABLE [AJ].)	—
LDP_VSLDV*2 (EVAP system small leak detection value)	mA/sec	Indicate the EVAP control system vary small leak detection value	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Inspection item (s)	PCM terminal
LOAD (Engine load)	%	**MTX** Idling: Approx. 16.8% Engine speed is 2,500 rpm: Approx. 14.6% **ATX** Idling: Approx. 17.5% Engine speed is 2,500 rpm: Approx. 15.2%	• Inspect following PIDs: ECT, IAT, MAF, MAP, RPM, TP REL	—
LONGFT1 (Long term fuel trim (RH))	%	Idling: –20—20%	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
LONGFT2 (Long term fuel trim (LH))	%	Idling: –20—20%	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
MAF (Mass airflow)	g/s	**MTX** Idling: 3.6—3.8 g/s Engine speed is 2,500 rpm: 10.5—11.2 g/s **ATX** Idling: 3.8—4.0 g/s Engine speed is 2,500 rpm: 10.6—11.4 g/s	• MAF sensor 01–40C–32 MASS AIR FLOW (MAF) SENSOR INSPECTION [AJ].)	1AK
	V	Idling: Approx. 1.3 V Engine speed is 2,500 rpm: Approx. 1.9 V		
MIL (Malfunction indicator light)	On/Off	Ignition switch is ON: On Idling: Off	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
MIL_DIS (Travelled distance since the MIL illuminated)	km or mile	No DTC: 0 km {0 mile} DTC detected: Not 0 km {0 mile}	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
NUMKEYS (Number of keys stored in module)	—	Indicate the number of keys stored in module	—	—
O2S11 (HO2S (RF))	V	Idling after warm-up: 0—1.0 V Acceleration: 0.5—1.0 V Deceleration: 0—0.5 V	• HO2S (RF) (See 01–40C–33 HEATED OXYGEN SENSOR (HO2S) INSPECTION [AJ].)	2AK
O2S12 (HO2S (RR))	V	Ignition switch is ON: 0—1.0 V Idling after warm-up: 0—1.0 V Acceleration: 0.5—1.0 V Deceleration: 0—0.5 V	• HO2S (RR) (See 01–40C–33 HEATED OXYGEN SENSOR (HO2S) INSPECTION [AJ].)	2AG
O2S21 (HO2S (LF))	V	Idling after warm-up: Approx. 0.6 V	• HO2S (LF) (See 01–40C–33 HEATED OXYGEN SENSOR (HO2S) INSPECTION [AJ].)	2AL
O2S22 (HO2S (LR))	V	Idling after warm-up: Approx. 0.6 V	• HO2S (LR) (See 01–40C–33 HEATED OXYGEN SENSOR (HO2S) INSPECTION [AJ].)	2AH
PSP (PSP switch)	High/Low	Steering wheel is in straight ahead position: Low Steering wheel is turned: High	• PSP switch (See 01–40C–25 POWER STEERING PRESSURE (PSP) SWITCH INSPECTION [AJ].)	2T
RFCFLAG (Readiness Function Code)	Learnt/Not Learnt	RFC exists: Learnt No RFC: Not Learnt	• Perform DRIVE MODE 1 (See 01–02C–8 OBD-II DRIVE MODE [AJ].)	—

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Inspection item (s)	PCM terminal
RO2FT1 (RO2S (RR) fuel trim)	—	Idling after warm-up: Approx. –0.03—0.03	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
RO2FT2 (HO2S (RL) fuel trim)	—	Idling after warm-up: Approx. –0.03—0.03	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
RPM (Engine speed)	RPM	Idling (no load): 700—800 RPM	• CKP sensor (See 01–40C–41 CRANKSHAFT POSITION (CKP) SENSOR INSPECTION [AJ].)	2Z, 2Y
SCCS (Cruise control switch)	V	Press ON/OFF: Approx. 0 V Press CALCEL: Approx. 1.2 V Press SET/COAST: Approx. 3.2 V Press RES/ACCEL: Approx. 4.2 V Others: Approx. 5.0 V	• Cruise control switch (See 01–20A–1 CRUISE CONTROL SWITCH INSPECTION [L3, AJ].)	1AS
SEGRP (EGR valve position)	No. of step	Ignition switch is ON: 0 step Idling: 0 step Cranking: 0—60 steps	• Inspect following PIDs: ECT, IAT, MAF, RPM, VSS • EGR valve (See 01–16A–18 EGR VALVE INSPECTION [AJ].)	—
SEGRP DSD (Desired EGR valve position)	%	Ignition switch is ON: 0% Idling: 0% Cranking: 0—100%	• Inspect following PIDs: ECT, IAT, MAF, RPM, VSS	—
SHRTFT1 (Short term fuel trim (RH))	%	Idling: –20—20%	• Perform applicable DTC troubleshooting. (See 01–02C–13 DTC TABLE [AJ].)	—
SHRTFT11 (Short term fuel trim (RF))	%	Idling: –20—20%	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
SHRTFT12 (Short term fuel trim (LF))	%	Idling: –20—20%	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
SHRTFT2 (Short term fuel trim (LH))	%	Idling: –20—20%	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
SHRTFT21 (Short term fuel trim (RR))	%	Idling: –20—20%	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
SHRTFT22 (Short term fuel trim (LR))	%	Idling: –20—20%	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
SPARKADV (Ignition timing)	° (BTDC)	Ignition switch is ON: 0° (BTDC) Idling: Approx. 10° (BTDC)	• Inspect following PIDs: ALTTV, CPP, CPP/PNP, ECT, KNOCKR, MAF, PSP, RPM, TP REL, VSS • Perform engine tune-up (See 01–10C–39 ENGINE TUNE-UP [AJ].)	—
test (Test mode)	On/Off	—	—	—
TIRESIZE (Tire revolution per mile)	rev/mile	Indicate the tire revolution per a mile	—	—

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Inspection item (s)	PCM terminal
TP REL (Relative throttle position)	%	Throttle valve is closed → open: PID value changes smoothly	• TP sensor (See 01–40C–28 THROTTLE POSITION (TP) SENSOR INSPECTION [AJ].)	2AI, 2AM
TP1 (TP sensor No.1 signal voltage)	%	Ignition switch is ON and accelerator pedal not depressed: 13—24% Ignition switch is ON and WOT: Approx. 78%	• TP sensor (See 01–40C–28 THROTTLE POSITION (TP) SENSOR INSPECTION [AJ].)	2AM
	V	Ignition switch is ON and accelerator pedal not depressed: 3.8—4.35 V Ignition switch is ON and WOT: Approx. 1.1 V		
TP2 (TP sensor No.2 signal voltage)	%	Ignition switch is ON and accelerator pedal not depressed: 15—36% Ignition switch is ON and WOT: Approx. 88%	• TP sensor (See 01–40C–28 THROTTLE POSITION (TP) SENSOR INSPECTION [AJ].)	2AI
	V	Ignition switch is ON and accelerator pedal not depressed: 0.75—1.8 V Ignition switch is ON and WOT: Approx. 4.4 V		
TPCT (Relative throttle position)	V	Ignition switch is ON: 0 V	• TP sensor (See 01–40C–28 THROTTLE POSITION (TP) SENSOR INSPECTION [AJ].)	2AI, 2AM
VPWR (Battery positive voltage)	V	Ignition switch is ON: B+	• Battery (See 01–17B–2 BATTERY INSPECTION [L3 WITH TC].)	—
VSS (Vehicle speed)	KPH or MPH	Vehicle speed is 20 km/h {12 mph}: 20 KPH {12 MPH} Vehicle speed is 40 km/h {25 mph}: 40 KPH {25 MPH}	• Perform applicable DTC troubleshooting (See 01–02C–13 DTC TABLE [AJ].)	—
VT ACT1 (Actual valve timing (RH))	°	Idling: 0°	• Inspect following PIDs: ECT, RPM, TP REL • OCV (RH) (See 01–10C–42 OIL CONTROL VALVE (OCV) INSPECTION [AJ].)	2AE, 2AD
VT ACT2 (Actual valve timing (LH))	°	Idling: 0°	• Inspect following PIDs: ECT, RPM, TP REL • OCV (LH) (See 01–10C–42 OIL CONTROL VALVE (OCV) INSPECTION [AJ].)	2AB, 2AA
VT DIFF1 (Difference between actual and target valve timing (RH))	°	Idling: 0°	• Inspect following PIDs: ECT, RPM, TP REL • OCV (RH) (See 01–10C–42 OIL CONTROL VALVE (OCV) INSPECTION [AJ].)	2AE, 2AD
VT DIFF2 (Difference between actual and target valve timing (LH))	°	Idling: 0°	• Inspect following PIDs: ECT, RPM, TP REL • OCV (LH) (See 01–10C–42 OIL CONTROL VALVE (OCV) INSPECTION [AJ].)	2AB, 2AA

Monitor item (Definition)	Unit/ Condition	Condition/Specification (Reference)	Inspection item (s)	PCM terminal
DUTY1 (OCV control signal (RH))	%	Idling: 0%	• Inspect following PIDs: ECT, RPM, TP REL • OCV (RH) (See 01–10C–42 OIL CONTROL VALVE (OCV) INSPECTION [AJ].)	2AE, 2AD
VT DUTY2 (OCV control signal (LH))	%	Idling: 0%	• Inspect following PIDs: ECT, RPM, TP REL • OCV (LH) (See 01–10C–42 OIL CONTROL VALVE (OCV) INSPECTION [AJ].)	2AB, 2AA

*1 : MTX
*2 : California emission regulation applicable model

Freeze Frame Data Monitor Table

- Retrieve the following FFD.

Note

- FFD is a snapshot of the conditions that are present when DTC or PENDING CODE is stored. Once FFD is stored, this data will remain in PCM memory even if another emission related DTC or PENDING CODE is stored additionally, except for Misfire or Fuel System related DTC or PENDING CODE. Once Misfire or Fuel System related DTC or PENDING CODE is stored, it will overwrite any previous data and the FFD will not be further overwritten. When DTC associated with the FFD is erased or PCM is reset, new FFD can be stored.

Support item	Condition/Unit	
DTC that caused required FFD storage	—	
el system loop status	Refer to list below	
ngine load calculated value	%	
Engine coolant temperature	°C	°F
Short fuel trim	%	
Long fuel trim	%	
Engine speed	rpm	
Vehicle speed	km/h	mph
Spark advance	BTDC	
Intake air temperature	°C	°F
Mass air flow	g/s	
Throttle position (sensor No.1)	%	
Time since engine start	sec.	
Desired EGR valve opening angle	%	
Desired purge solenoid valve control duty	%	
Fuel level	%	
Number of warm-ups since DTCs cleared	—	
Distance travelled since DTCs cleared	km	miles
Barometric pressure	kPa	
Estimated catalyst converter temperature	°C	°F
PCM power supply voltage	V	
Absolute load value	%	
Relative throttle position	%	
Throttle position (sensor No.2)	%	
ccelerator pedal position (sensor No.1)	%	
celerator pedal position (sensor No.2)	%	
Desired throttle valve opening angle	%	
Desired Equivalence Ratio	—	
Ambient air temperature	deg. C	

Meaning of fuel system loop status

- The following information is displayed on the tester.
  - — Feedback stops: ECT is lower than the determined feedback zone.
  - — Feedback operating: HO2S being used for feedback is normal.
  - — Feedback stops: Open loop due to driving condition
  - — Feedback stops: Open loop due to detected system fault
  - — Feedback operating: Malfunction occurred in HO2S (rear) system

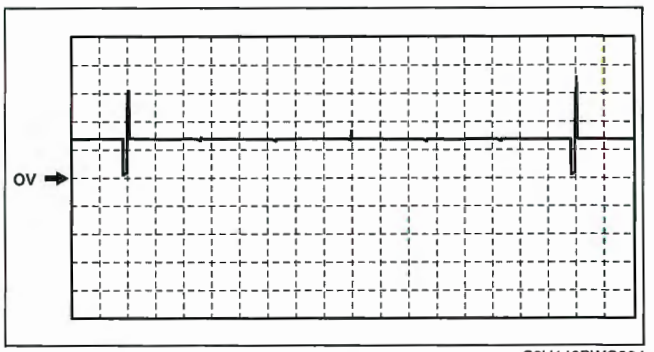
Inspection Using An Oscilloscope (Reference)
Ignition coil control signals
PCM terminals
- No.1 cylinders: 2BE (+) — body ground (–)
- No.2 cylinders: 2BF (+) — body ground (–)
- No.3 cylinders: 2BG (+) — body ground (–)
- No.4 cylinders: 2BB (+) — body ground (–)
- No.5 cylinders: 2BC (+) — body ground (–)
- No.6 cylinders: 2BD (+) — body ground (–)

Oscilloscope setting
- 5 V/DIV (Y), 20 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load)

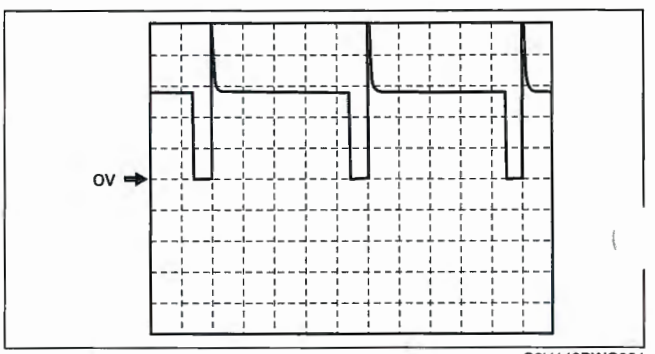


C6U140BWC004

Purge solenoid valve control signal
PCM terminals
- 1BF (+) — body ground (–)

Oscilloscope setting
- 2.5 V/DIV (Y), 20 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load, during purge control)



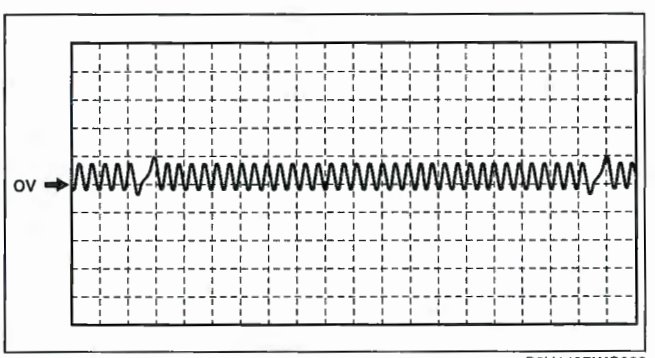
C6U140BWC001

CKP sensor signal
(+)
PCM terminals
- 2Y (+)—body ground (–)

Oscilloscope setting
- 2 V/DIV (Y), 10 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load)

(–)

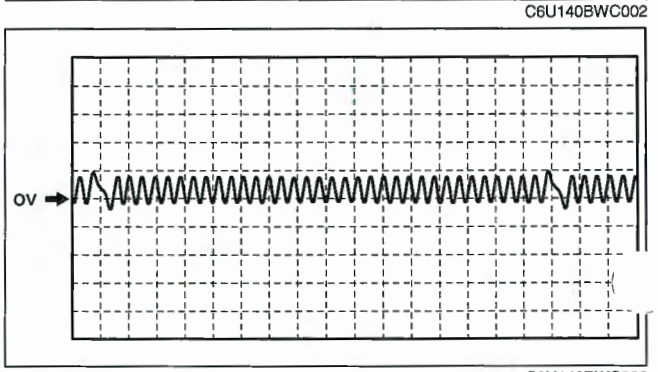


C6U140BWC002

PCM terminals
- 2Z (+)—body ground (–)

Oscilloscope setting
- 5 V/DIV (Y), 5 ms/DIV (X), DC range

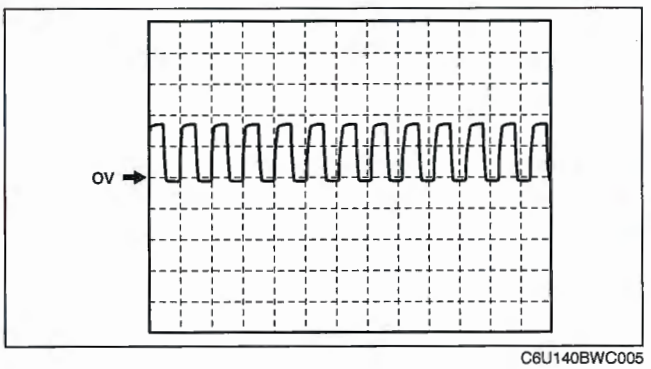
Vehicle condition
- Idle after warm up (no load)



C6U140BWC003

Generator output voltage signal
PCM terminals
- 2AU (+)—body ground (–)

Oscilloscope setting
5V/DIV (Y), 5ms/DIV (X), DC range
Vehicle condition
- Idle after warm up (no load)

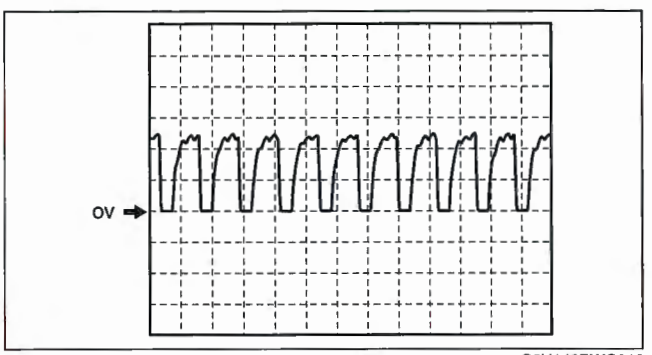


C6U140BWC005

Fan control signal
PCM terminals
- 1U (+)—body ground (–)

Oscilloscope setting
- 2 V/DIV (Y), 0.2ms/DIV (X), DC range

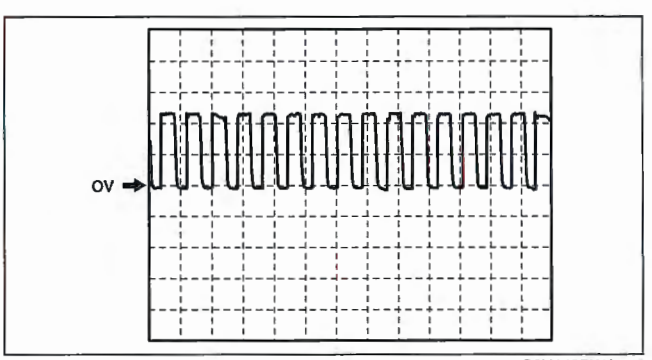
Vehicle condition
- Idle after warm up (no load)



C6U140BWC013

Field coil control signal
PCM terminals
2AP (+)—body ground (–)
Oscilloscope setting
- 0.5V/DIV (Y), 5ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load)

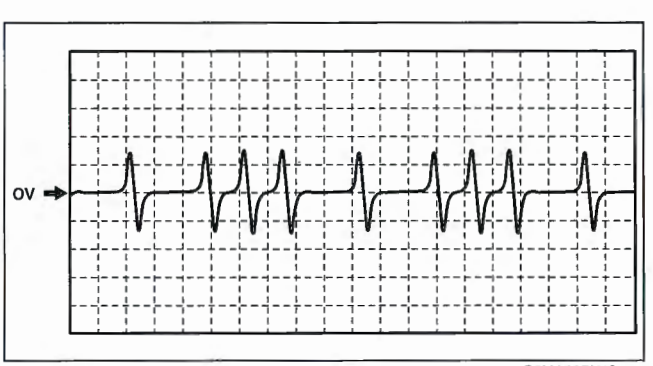


C6U140BWC006

CMP sensor signal
(+)
PCM terminals
- CMP sensor (left bank): 2AA (+)—body ground (–)
- CMP sensor (right bank): 2AD (+)—body ground (–)

Oscilloscope setting
- 1 V/DIV (Y), 20 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load)



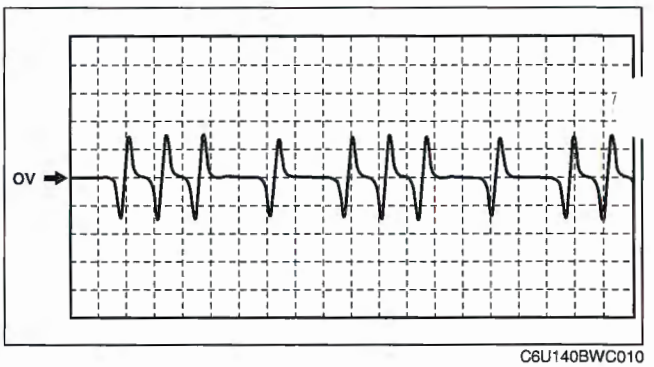
C6U140BWC009

(–)

PCM terminals
- CMP sensor (left bank): 2AB (+)—body ground (–)
- CMP sensor (right bank): 2AE (+)—body ground (–)

Oscilloscope setting
- 1 V/DIV (Y), 20 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load)



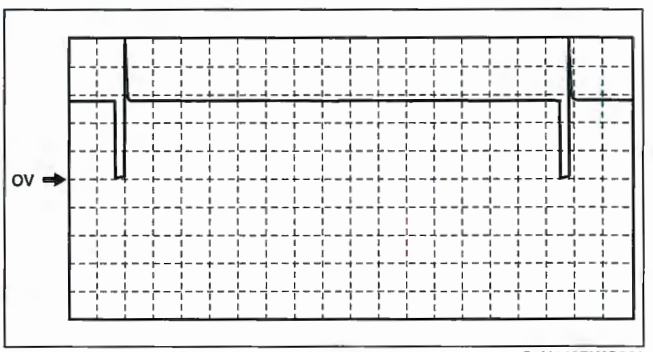
C6U140BWC010

Fuel injection signals

PCM terminals
- No.1: 2I (+) — body ground (–)
- No.2: 2J (+) — body ground (–)
- No.3: 2K (+) — body ground (–)
- No.4: 2E (+) — body ground (–)
- No.5: 2F (+) — body ground (–)
- No.6: 2G (+) — body ground (–)

Oscilloscope setting
- 2.5 V/DIV (Y), 10 ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load)



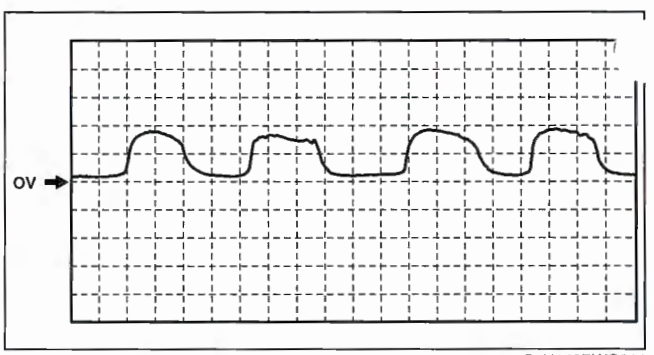
C6U140BWC008

HO2S signals

PCM terminals
- Front HO2S (right bank): 2AK (+)—body ground (–)
- Front HO2S (left bank): 2AL (+)—body ground (–)
- Rear HO2S (right bank): 2AG (+)—body ground (–)
- Rear HO2S (left bank): 2AH (+)—body ground (–)

Oscilloscope setting
- 0.5V/DIV (Y), 500ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load)



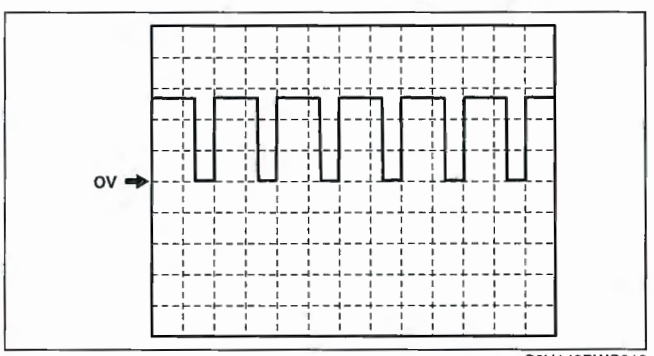
C6U140BWC011

HO2S heater control signal

PCM terminals
- Front HO2S heater (right bank): 2AW (+)—body ground (–)
- Front HO2S heater (left bank): 2AS (+)—body ground (–)
- Rear HO2S heater (right bank): 2AT (+)—body ground (–)
- Rear HO2S heater (left bank): 2AO (+)—body ground (–)

Oscilloscope setting
- 5V/DIV (Y), 500ms/DIV (X), DC range

Vehicle condition
- Idle after warm up (no load)



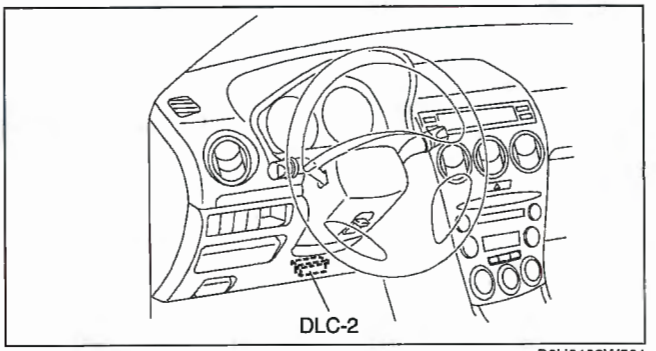
C6U140BWC012

PCM REPLACEMENT [AJ]

1. Connect the WDS or equivalent to the DLC-2.
2. Set up the WDS or equivalent (including the vehicle recognition).
3. Select "Module Programming".
4. Select "Programmable Module Installation".
5. Select "PCM" and perform procedures according to directions on the WDS or equivalent screen.

Note
- If the PCM is replaced with a new one, the PCM stores DTC P0602 and illuminates the MIL even though no malfunction is detected. When the configuration is completed, DTC P0602 is cleared.

E6U014018880W10



B6U0102W501

6. Retrieve DTC's by the WDS or equivalent, then verify that there in no DTC present.
   - If DTC is present, perform applicable DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)

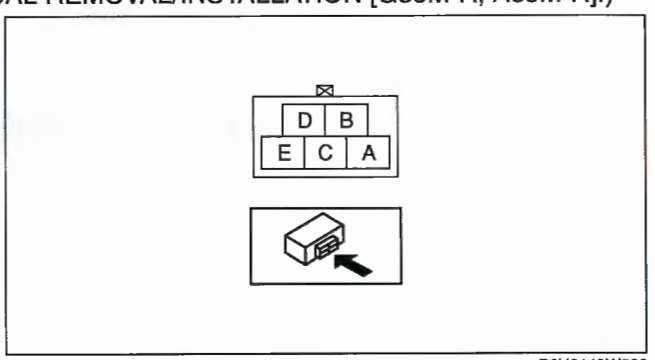
CLUTCH PEDAL POSITION (CPP) SWITCH INSPECTION [AJ]

E6U014018660W01

Note
- Perform the following inspection only when directed.

Continuity Inspection

1. Disconnect the negative battery cable.
2. Remove the clutch switch. (See 05–10–7 CLUTCH PEDAL REMOVAL/INSTALLATION [G35M-R, A65M-R].)
3. Inspect for continuity between the clutch switch terminals B and D using an ohmmeter.
   - If the clutch switch is okay, but the PID value is out of specification, perform the "Circuit Open/Short Inspection".
   - If not as specified, replace the clutch switch. (See 05–10–7 CLUTCH PEDAL REMOVAL/INSTALLATION [G35M-R, A65M-R].)



B6U0140W502

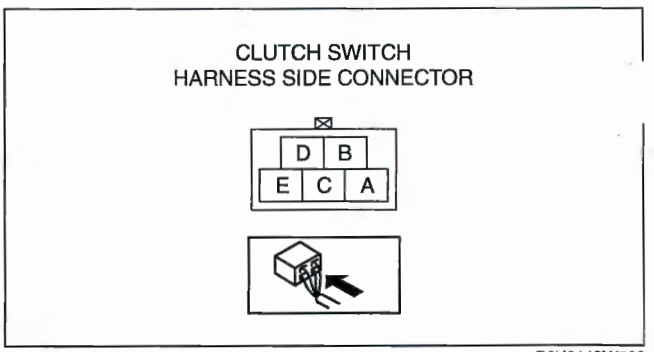
Specification

O—O : Continuity

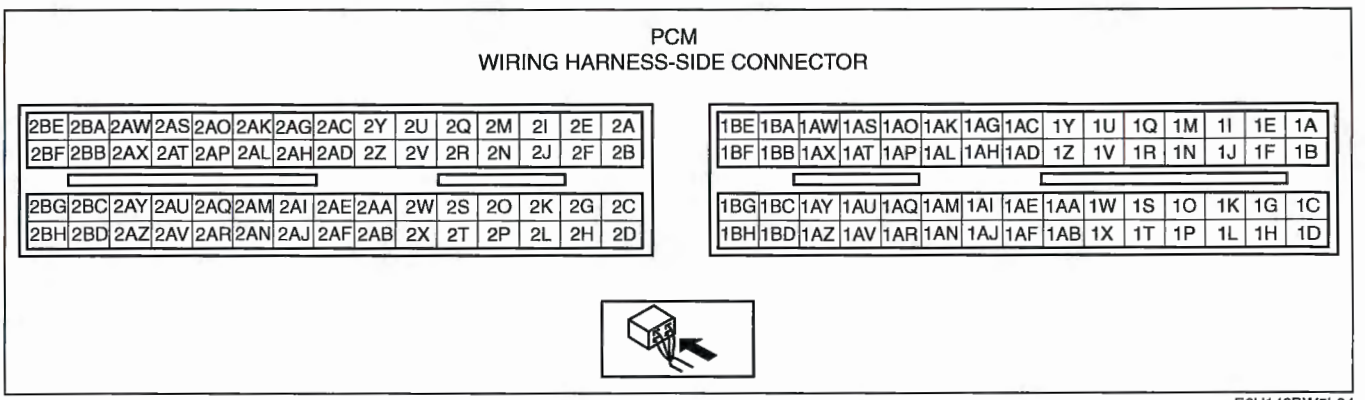
Condition	Terminal	
	B	D
Rod pushed		
Except above	O	O

B6U0140W523

Circuit Open/Short Inspection



B6U0140W503



E6U140BW5L04

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following harness for open or short circuit. (Continuity check)

Open circuit
- Clutch switch terminal B and PCM terminal 1AB
- Clutch switch terminal D and body ground

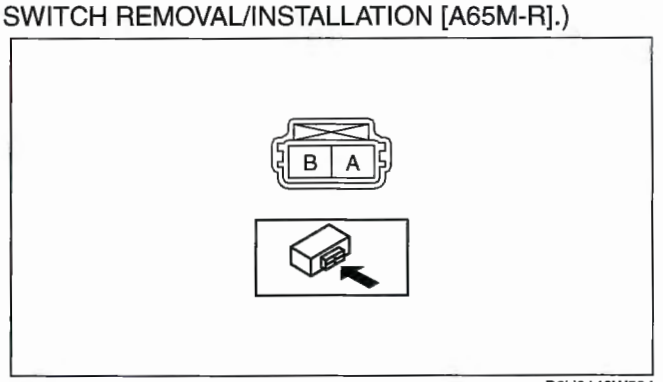
Short circuit
- Clutch switch terminal B and power supply
- Clutch switch terminal B and body ground

NEUTRAL SWITCH INSPECTION [AJ]

E6U014017640W01

Note
- Perform the following inspection only when directed.

Continuity Inspection
1. Disconnect the negative battery cable.
2. Remove the neutral switch. (See 05–15B–4 NEUTRAL SWITCH REMOVAL/INSTALLATION [A65M-R].)
3. Inspect for continuity between the neutral switch terminals A and B using an ohmmeter.
   - If the neutral switch is okay, but the PID value is out of specification, perform the "Circuit Open/Short Inspection".
   - If not as specified, replace the neutral switch. (See 05–15B–4 NEUTRAL SWITCH REMOVAL/INSTALLATION [A65M-R].)



B6U0140W504

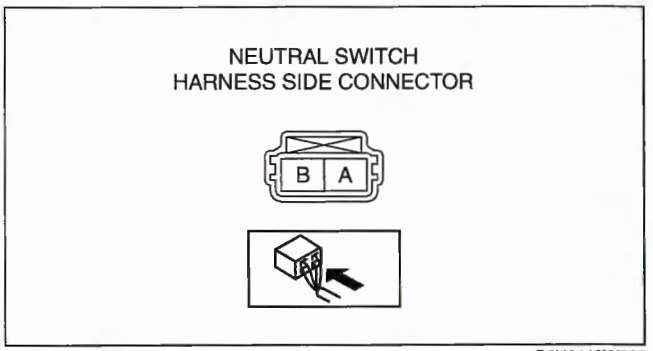
Specification

O—O : Continuity

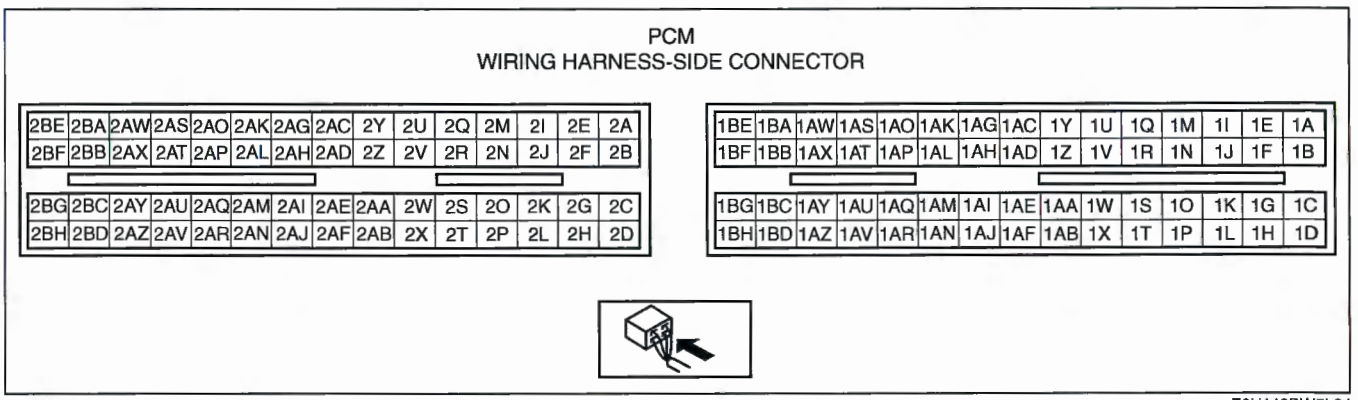
Condition	Transmission	Terminal	
		A	B
Rod pushed	In neutral	O	O
Except above	Other		

B6U0140W524

Circuit Open/Short Inspection



B6U0140W505



E6U140BW5L04

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following harness for open or short circuit. (Continuity check)

Open circuit

Neutral switch terminal A and PCM terminal 2X
Neutral switch terminal B and body ground

Short circuit

- Neutral switch terminal A and power supply
- Neutral switch terminal A and body ground

POWER STEERING PRESSURE (PSP) SWITCH INSPECTION [AJ]

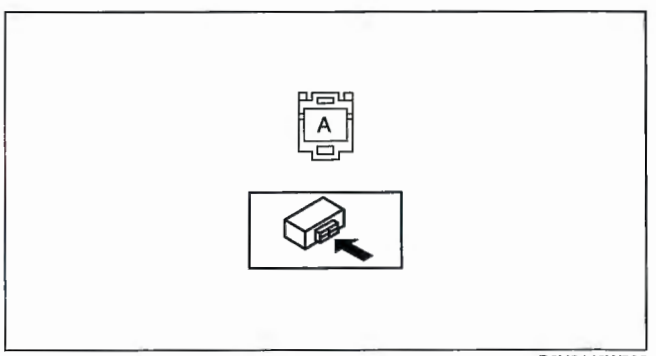
E6U014032230W01

Note

- Perform the following inspection only when directed.

Continuity Inspection

1. Inspect the following if the power steering is inoperative:
   - Power steering fluid level
   - Power steering fluid leakage
   - Power steering fluid pressure
2. Disconnect the PSP switch connector.
3. Start the engine.
4. Inspect for continuity between PSP switch terminal A and body ground using an ohmmeter.
   - If the PSP switch is okay, but the PID value is out of specification, perform the "Circuit Open/Short Inspection".
   - If not as specified, replace the PSP switch. (See 06–12–28 POWER STEERING OIL PUMP REMOVAL/INSTALLATION [AJ].)



B6U0140W506

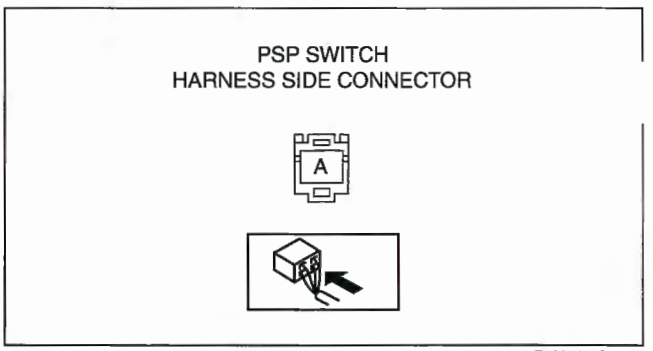
Specification

O—O : Continuity

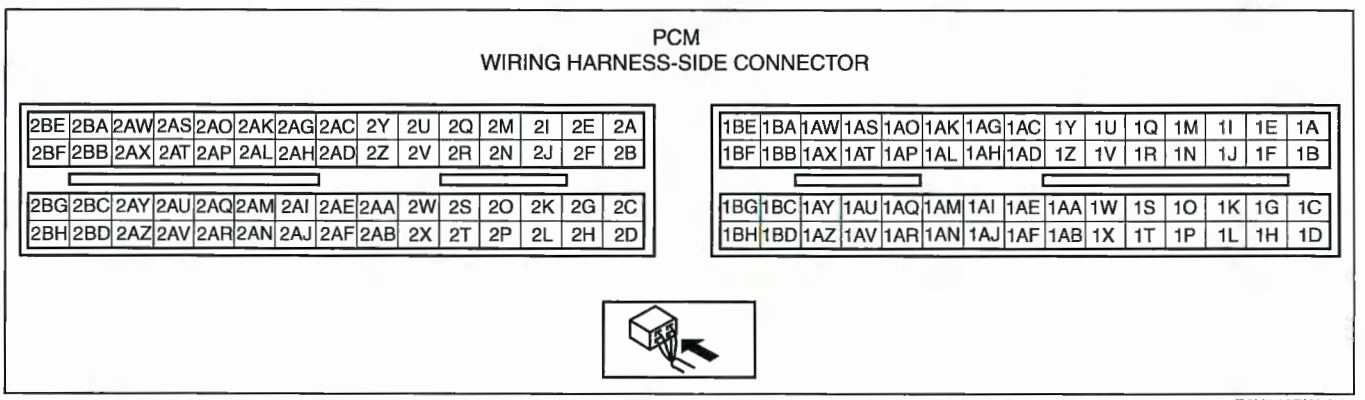
Condition	Terminal A	Body GND
Steering wheel in straight ahead position		
While turning steering wheel	O——O	

C6U0140W525

Circuit Open/Short Inspection



B6U0140W507



E6U140BW5L04

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following harnesses for open or short circuit. (Continuity check)

Open circuit
- PSP switch terminal A and PCM terminal 2T

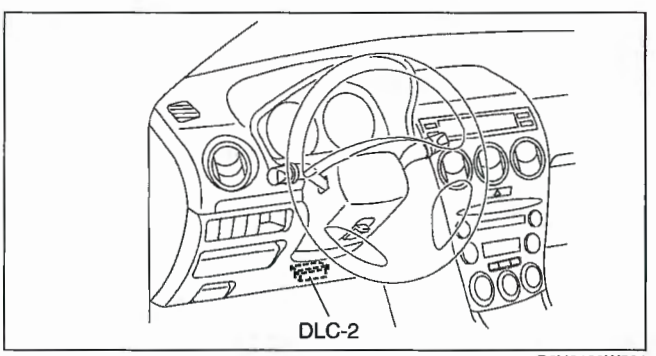
Short circuit
- PSP switch terminal A and power supply
- PSP switch terminal A and body ground

ACCELERATOR PEDAL POSITION (APP) SENSOR INSPECTION [AJ]

E6U014041609W01

Note
- Perform the following inspection only when directed.

1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to ON position.
3. Select APP1 or APP2 PID (percentage) on the WDS or equivalent.
4. Verify that the APP1 or APP2 PID (percentage) changes smoothly while accelerator pedal is gradually depressed.
   - If as verified, go to next step.
   - If not as verified, perform the "Circuit Open/ Short Inspection".



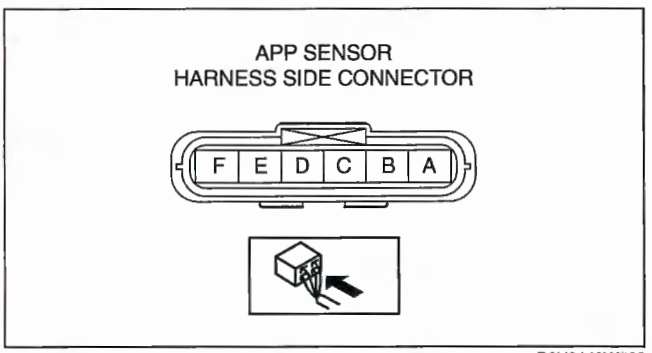
B6U0102W501

5. Verify that the APP1 or APP2 PID (percentage) is as indicated in the table below according to the condition of the accelerator pedal.
   - If not verified, perform the "Circuit Open/Short Inspection".
     — If there is no open or short circuit, replace the APP sensor. (See 01–13C–7 ACCELERATOR PEDAL REMOVAL/INSTALLATION [AJ].)

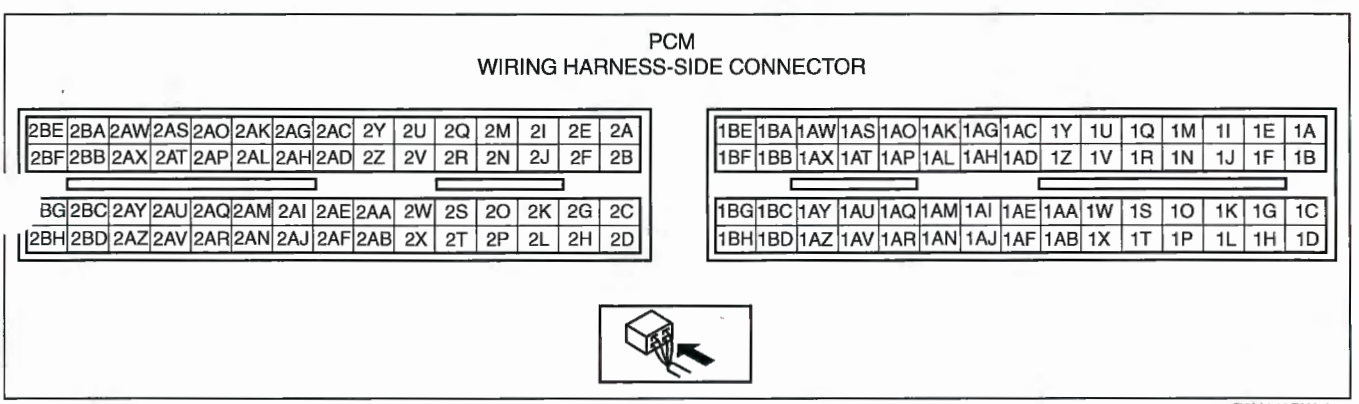
Specification

Condition	APP1 PID (%)	APP1 PID (V)	APP2 PID (%)	APP2 PID (V)
Accelerator pedal is released	31.0—32.4	1.55—1.62	20.2—21.4	1.01—1.07
Accelerator pedal is depressed	69.8—81.8	3.49—4.09	58.8—70.8	2.94—3.54

Circuit Open/Short Inspection



B6U0140W508



E6U140BW5L04

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following harness for open or short circuit. (Continuity check)

Open circuit
- APP sensor terminal A and PCM terminal 1AV
- APP sensor terminal B and PCM terminal 1T
- APP sensor terminal C and PCM terminal 1AP
- APP sensor terminal D and PCM terminal 1AR
- APP sensor terminal E and PCM terminal 1X
- APP sensor terminal F and PCM terminal 1AO

Short circuit
- APP sensor terminal A and power supply
- APP sensor terminal A and body ground
- APP sensor terminal B and power supply
- APP sensor terminal C and power supply
- APP sensor terminal C and body ground
- APP sensor terminal D and power supply
- APP sensor terminal D and body ground
- APP sensor terminal E and power supply
- APP sensor terminal F and power supply
- APP sensor terminal F and body ground

THROTTLE POSITION (TP) SENSOR INSPECTION [AJ]

E6U014018910W01

Note
- Perform the following inspection only when directed.

1. Verify that no DTC related to APP sensor has been detected.
   - If any DTCs related to APP sensor have been detected, perform the DTC inspection. (See 01–02C–13 DTC TABLE [AJ].)
2. Connect the WDS or equivalent to the DLC-2.
3. Turn the ignition switch to ON position.
4. Select TP1 or TP2 PID (percentage) on the WDS or equivalent.
5. Verify that the TP1 or TP2 PID is within the specification when the accelerator pedal not depressed. (See 01–40C–6 PCM INSPECTION [AJ].)
6. Operate the accelerator pedal and verify that the TP1 or TP2 PID (percentage) changes as shown in the following graph.
   - If not verified, perform the "Circuit Open/Short Inspection".
     — If there is no open or short circuit, replace the throttle body. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)

E6U140BW5L04

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following harnesses for open or short circuit. (Continuity check)

Open circuit

Throttle body terminal C and PCM terminal 2AI
- Throttle body terminal D and PCM terminal 2AR
- Throttle body terminal E and PCM terminal 2AN
- Throttle body terminal F and PCM terminal 2AM

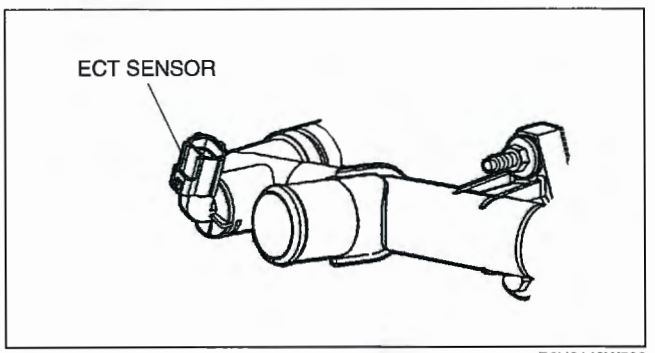
Short circuit
- Throttle body terminal C and power supply
- Throttle body terminal C and body ground
- Throttle body terminal D and power supply
- Throttle body terminal D and body ground
- Throttle body terminal E and power supply
- Throttle body terminal F and power supply
- Throttle body terminal F and body ground

ENGINE COOLANT TEMPERATURE (ECT) SENSOR REMOVAL/INSTALLATION [AJ]

E6U014018840W01

Warning
- **A hot engine can cause severe burns. Turn off the engine and wait until it is cool before removing the ECT sensor.**

1. Disconnect the negative battery cable.
2. Drain the engine coolant.
3. Disconnect the ECT sensor connector.
4. Remove the ECT sensor.
5. Replace the gasket.
6. Install in the reverse order of removal.
7. Refill the engine coolant.



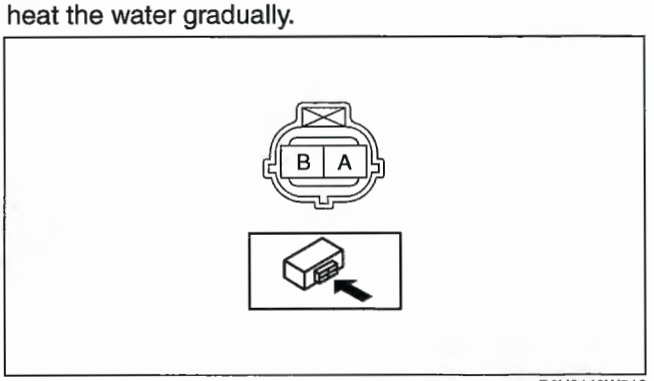
B6U0140W530

ENGINE COOLANT TEMPERATURE (ECT) SENSOR INSPECTION [AJ]

E6U014018840W02

Note
- Perform the following inspection only when directed.

Resistance Inspection
1. Remove the ECT sensor. (See 01–40C–29 ENGINE COOLANT TEMPERATURE (ECT) SENSOR REMOVAL/INSTALLATION [AJ].)
2. Place the ECT sensor in water with a thermometer, and heat the water gradually.
3. Measure the resistance between ECT sensor terminals A and B using an ohmmeter.
   - If the ECT sensor is okay, but the PID value is out of specification, perform the "Circuit Open/Short Inspection".
   - If not as specified, replace the ECT sensor. (See 01–40C–29 ENGINE COOLANT TEMPERATURE (ECT) SENSOR REMOVAL/INSTALLATION [AJ].)

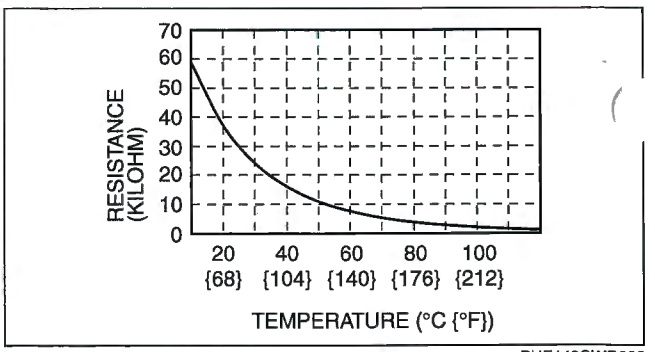


B6U0140W510

Measure the ECT sensor resistance.

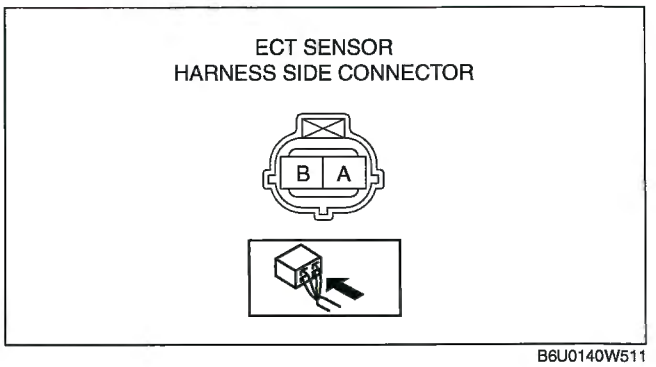
ECT (°C {°F})	Resistance (kilohm)
20 {68}	35—40
80 {176}	3.6—4.1

ECT sensor characteristics graph (reference)

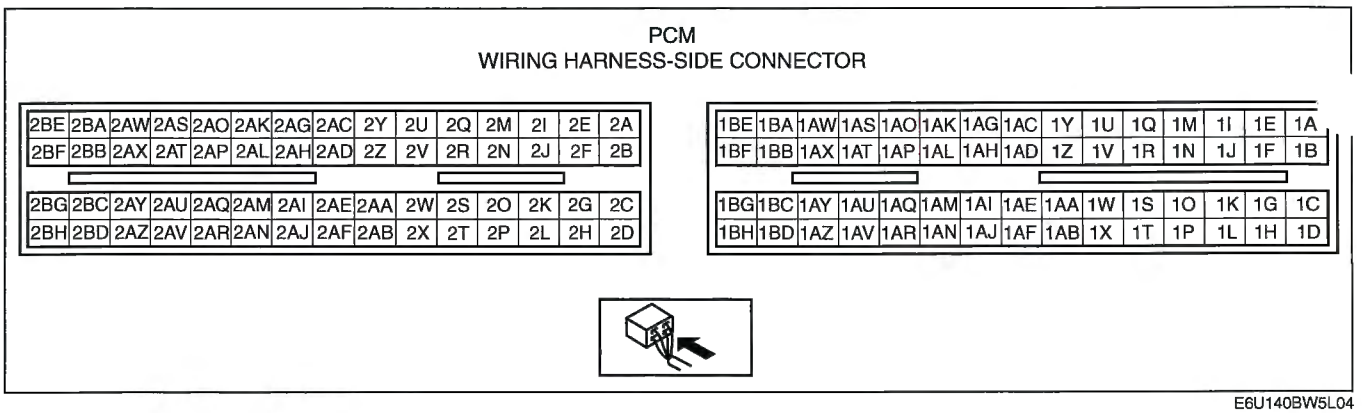


BUE140CWB002

Circuit Open/Short Inspection



B6U0140W511



E6U140BW5L04

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following harnesses for open or short circuit. (Continuity check)

Open circuit
- ECT sensor terminal A and PCM terminal 2AQ
- ECT sensor terminal B and PCM terminal 2AJ

Short circuit
- ECT sensor terminal A and power supply
- ECT sensor terminal A and body ground
- ECT sensor terminal B and power supply

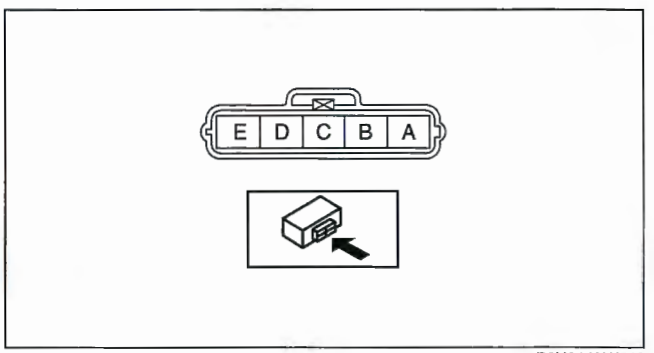
INTAKE AIR TEMPERATURE (IAT) SENSOR INSPECTION [AJ]

E6U014018842W01

Note
- Perform the following inspection only when directed.

Resistance Inspection

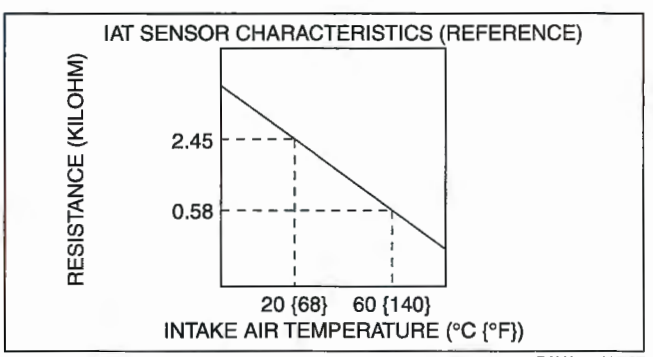
1. Disconnect the negative battery cable.
2. Disconnect the MAF/IAT sensor connector.
3. Measure the resistance between the MAF/IAT sensor terminals D and E using an ohmmeter.
   - If the IAT sensor is okay, but the PID value is out of specification, perform the "Circuit Open/ Short Inspection".
   - If not as specified, replace the MAF/IAT sensor. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)



B6U0140W512

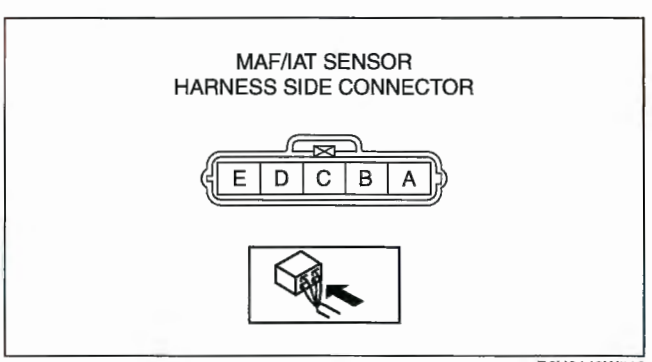
Specification

Ambient temperature (°C {°F})	Resistance (kilohm)
–20 {–4}	13.6—18.4
20 {68}	2.21—2.69
60 {140}	0.493—0.667

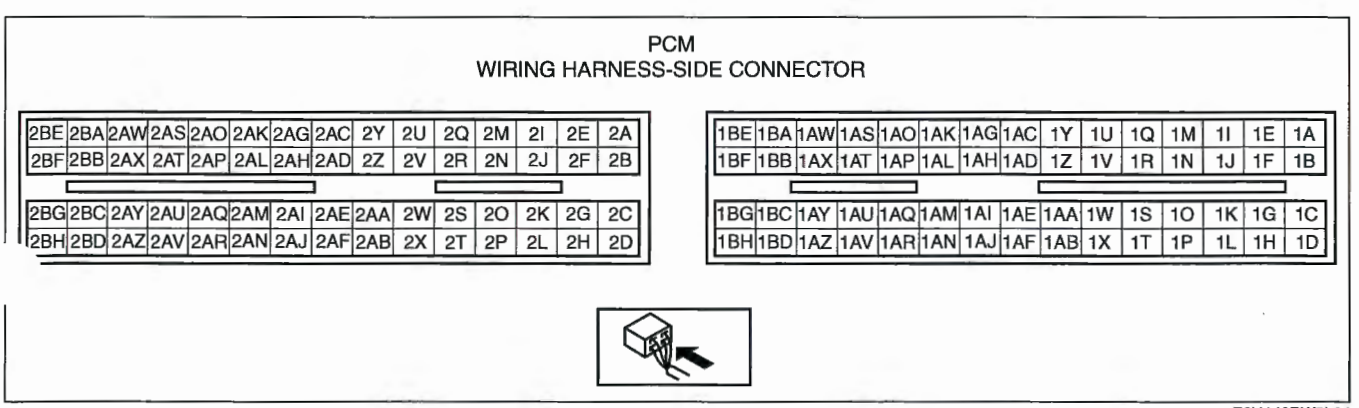


B6U0140W527

Circuit Open/Short Inspection



B6U0140W513



E6U140BW5L04

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following harnesses for open or short circuit. (Continuity check)

Open circuit
- MAF/IAT sensor terminal D and PCM terminal 1AT
- MAF/IAT sensor terminal E and PCM terminal 1BH

Short circuit
- MAF/IAT sensor terminal D and power supply
- MAF/IAT sensor terminal D and body ground
- MAF/IAT sensor terminal E and power supply

MASS AIR FLOW (MAF) SENSOR INSPECTION [AJ]

E6U014018210W01

Note
- Perform the following inspection only when directed.

Visual Inspection
1. Visually inspect for the following on the MAF/IAT sensor.
   - Damage
   - Cracks
   - Bent terminals
   - Terminal rust
     — If any of the above are found, replace the MAF/IAT sensor. (See 01–13C–2 INTAKE AIR SYSTEM REMOVAL/INSTALLATION [AJ].)

MAF Rate and Load Value

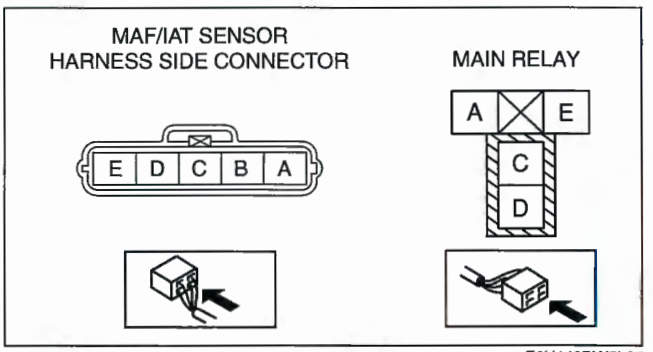
Note
- The scan tool shows the MAF rate and load value.

Specification

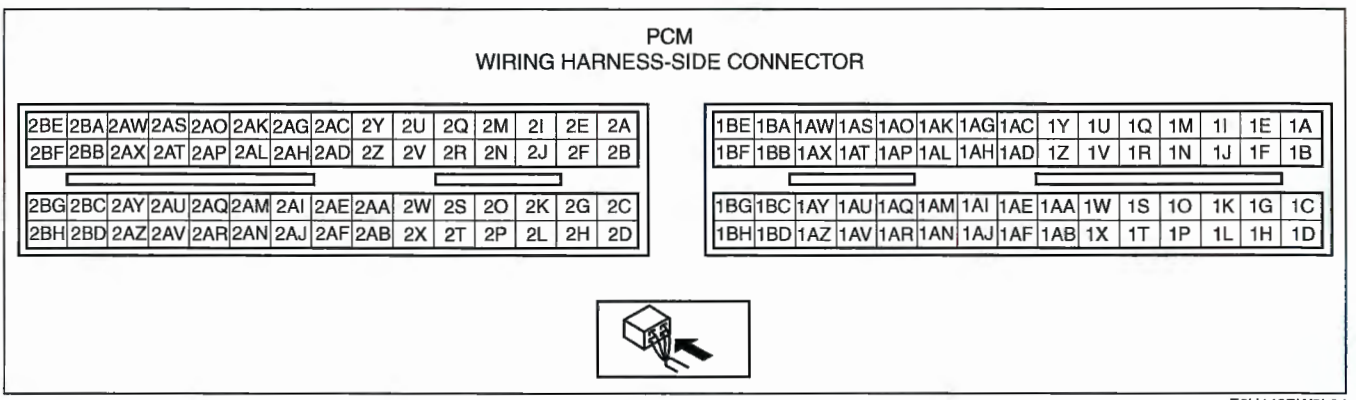
Item	Intake MAF (g/s)		Engine load calculated value (%)	
	MTX	ATX	MTX	ATX
Idle*1	3.6—3.8	3.8—4.0	Approx. 16.8	Approx. 17.5
Engine speed 2,500 rpm*2	10.5—11.2	10.6—11.4	Approx. 14.6	Approx. 15.2

*1 : 700—800 rpm
*2 : No load, N position or P position

Circuit Open/Short Inspection



E6U140BW5L05



E6U140BW5L04

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following harnesses for open or short circuit. (Continuity check)

en circuit
- MAF/IAT sensor terminal A and main relay terminal C
- MAF/IAT sensor terminal B and PCM terminal 1P
- MAF/IAT sensor terminal C and PCM terminal 1AK

Short circuit
- MAF/IAT sensor terminal A and body ground
- MAF/IAT sensor terminal B and power supply
- MAF/IAT sensor terminal C and power supply
- MAF/IAT sensor terminal C and body ground

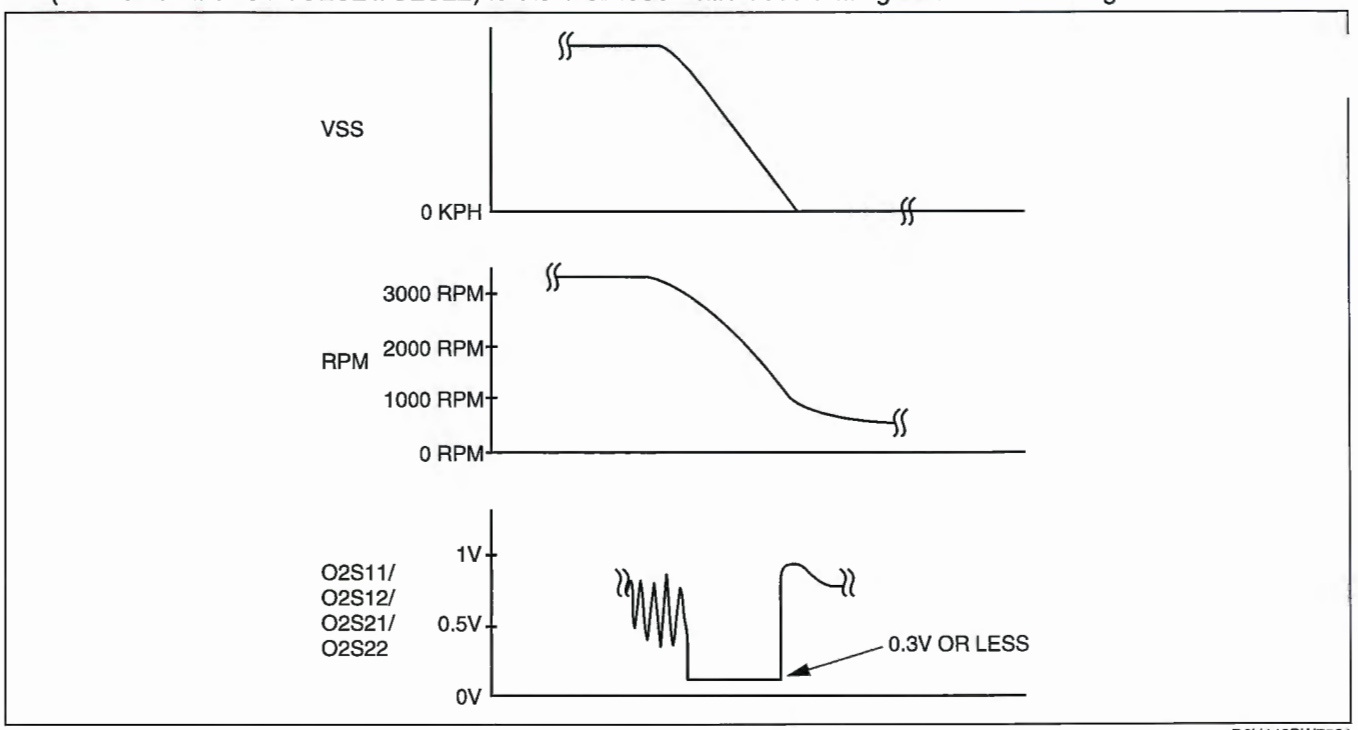
HEATED OXYGEN SENSOR (HO2S) INSPECTION [AJ]

E6U014018860W01

Note
- Before performing the following inspection, make sure to follow the troubleshooting flowchart. (See 01–03C–5 FOREWORD [AJ].)

HO2S voltage inspection
1. Warm up the engine to normal operating temperature.
2. Using the WDS or equivalent, monitor the following:
   — Vehicle speed (PID: VSS)
   — Engine speed (PID: RPM)
   — HO2S voltage (PID: O2S11/O2S12/O2S21/O2S22)
3. Drive the vehicle and decelerate the engine speed by releasing the accelerator pedal fully when the engine speed is **3,000 rpm or more**.

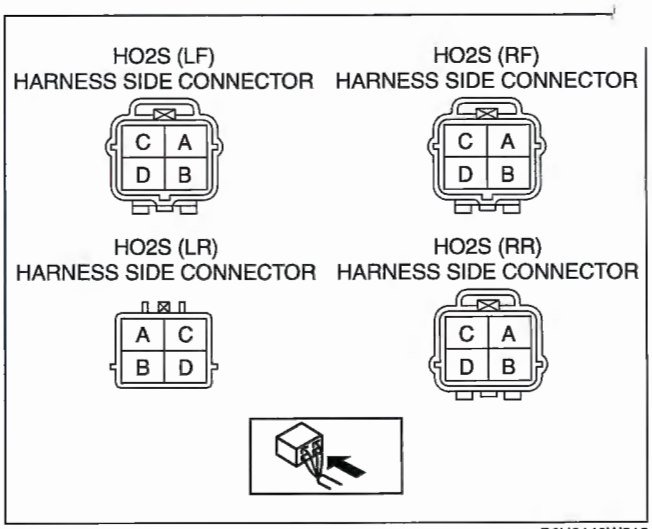
4. Verify that the HO2S outputs a voltage of **0.6 V or more**, one time or more, then verify that the HO2S voltage (PID: O2S11/O2S12/O2S21/O2S22) is **0.3 V or less** while decelerating as shown in the figure.



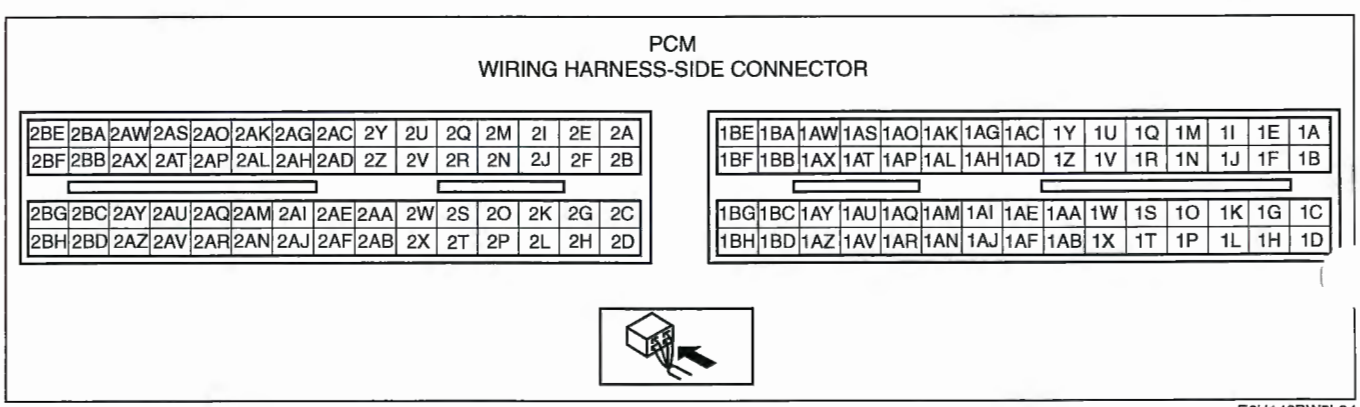
D6U140BW7501

- If not within the specification, inspect the HO2S for an open or short circuit. (See 01–40C–34 HO2S circuit open/short inspection (sensor).) Then if there is no malfunction in the wiring harness, replace the HO2S.

HO2S circuit open/short inspection (sensor)



B6U0140W515



E6U140BW5L04

1. Disconnect the PCM connector.
2. Disconnect the HO2S connector.
3. Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)

Open circuit

If there is no continuity, there is an open circuit. Repair or replace the wiring harness.

— HO2S (RF) terminal A and PCM terminal 2AK
— HO2S (RF) terminal B and PCM terminal 2AV
— HO2S (LF) terminal A and PCM terminal 2AL
— HO2S (LF) terminal B and PCM terminal 2AX
— HO2S (RR) terminal A and PCM terminal 2AG
— HO2S (RR) terminal B and PCM terminal 2AY
— HO2S (LR) terminal A and PCM terminal 2AH
— HO2S (LR) terminal B and PCM terminal 2BA

Short circuit

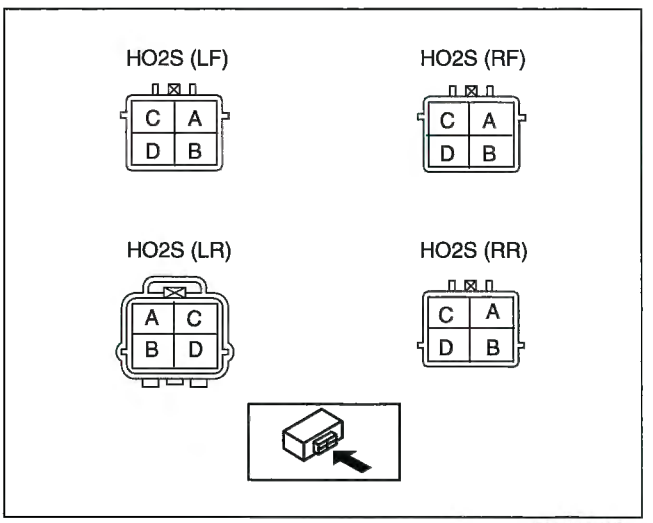
- If there is continuity, there is a short circuit. Repair or replace the wiring harness.

— HO2S (RF) terminal A and power supply
— HO2S (RF) terminal A and body ground
— HO2S (RF) terminal B and power supply
— HO2S (LF) terminal A and power supply
— HO2S (LF) terminal A and body ground
— HO2S (LF) terminal B and power supply
— HO2S (RR) terminal A and power supply
— HO2S (RR) terminal A and body ground
— HO2S (RR) terminal B and power supply
— HO2S (LR) terminal A and power supply
— HO2S (LR) terminal A and body ground
— HO2S (LR) terminal B and power supply

HO2S heater resistance inspection

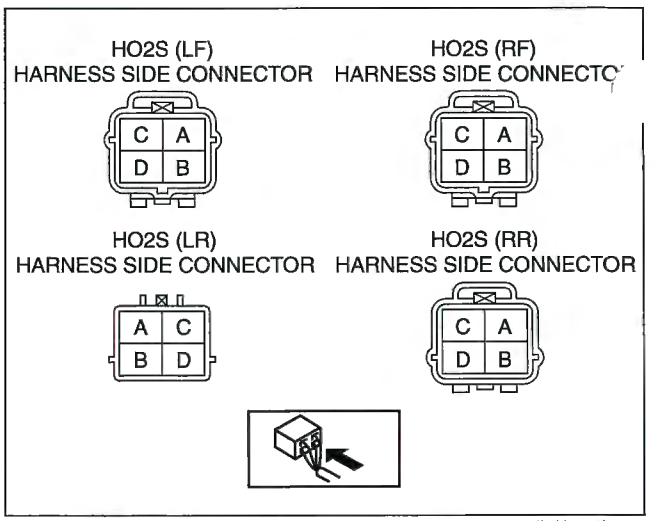
1. Disconnect the HO2S connector.
2. Measure the HO2S resistance between terminals C and D.
   - If not within the specification, replace the HO2S.

HO2S heater resistance
HO2S (RF, LF) heater: 2—50 ohms
HO2S (RR, LR) heater: 2—50 ohms

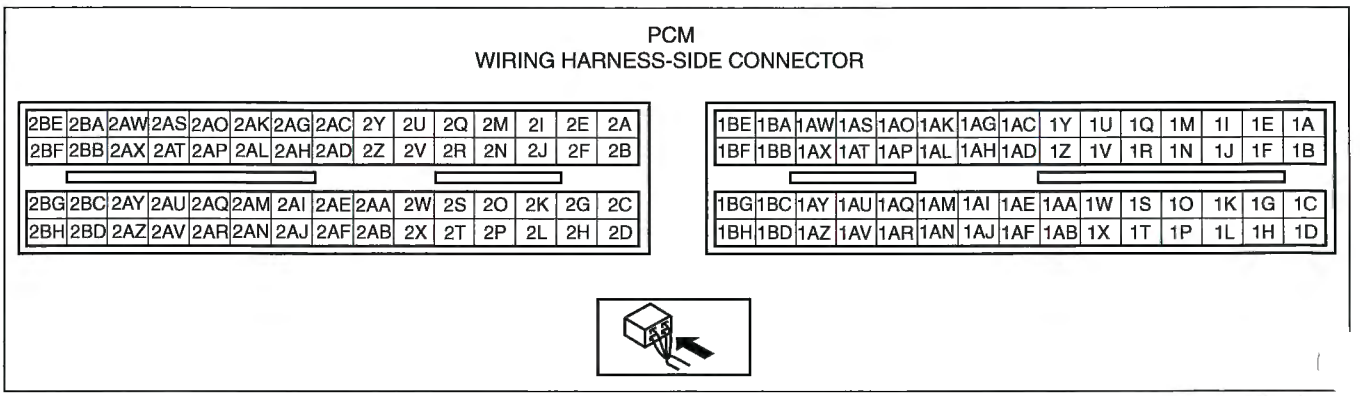


B6U0140W514

HO2S circuit open/short inspection (heater)



B6U0140W515



E6U140BW5L04

1. Disconnect the PCM connector.
2. Disconnect the HO2S connector.
3. Inspect the following wiring harnesses for an open or short circuit. (Continuity inspection)

Open circuit

- If there is no continuity, there is an open circuit. Repair or replace the wiring harness.
  - — HO2S (RF) terminal C and ignition switch
  - — HO2S (RF) terminal D and PCM terminal 2AW
  - — HO2S (LF) terminal C and ignition switch
  - — HO2S (LF) terminal D and PCM terminal 2AS
  - — HO2S (RR) terminal C and ignition switch
  - — HO2S (RR) terminal D and PCM terminal 2AT
  - — HO2S (LR) terminal C and ignition switch
  - — HO2S (LR) terminal D and PCM terminal 2AO

Short circuit

- If there is no continuity, there is a short circuit. Repair or replace the wiring harness.
  - HO2S (RF) terminal C and body ground
  - HO2S (RF) terminal D and power supply
  - HO2S (RF) terminal D and body ground
  - HO2S (LF) terminal C and body ground
  - HO2S (LF) terminal D and power supply
  - HO2S (LF) terminal D and body ground
  - HO2S (RR) terminal C and body ground
  - HO2S (RR) terminal D and power supply
  - HO2S (RR) terminal D and body ground
  - HO2S (LR) terminal C and body ground
  - HO2S (LR) terminal D and power supply
  - HO2S (LR) terminal D and body ground

EGR BOOST SENSOR INSPECTION [AJ]

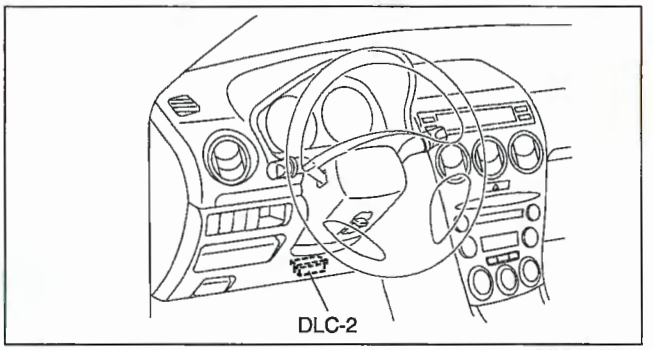
E6U014018211W01

Note
- Perform the following inspection only when directed.
- The following vacuum values are indicated by relative pressure from the EGR boost sensor.

Voltage Inspection

1. Connect the WDS or equivalent to the DLC-2.
2. Turn the ignition switch to the ON position.
3. Select BARO PID on the WDS or equivalent.
4. Verify that the BARO PID (pressure) and barometric pressure are practically equal.
   - If verified, go to next step.
   - If not verified, perform the "Circuit Open/Short Inspection".

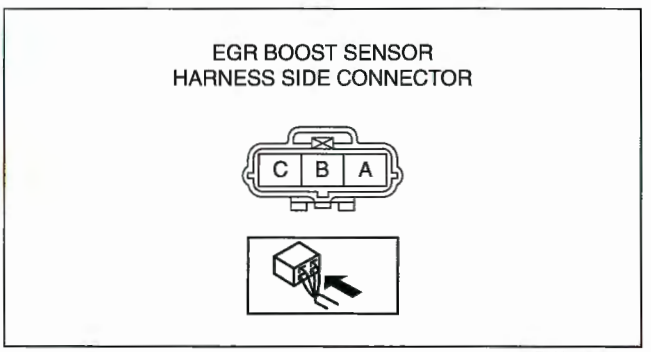
   Caution
   - **Do not apply vacuum out of specification. Doing so will damage the EGR boost sensor.**



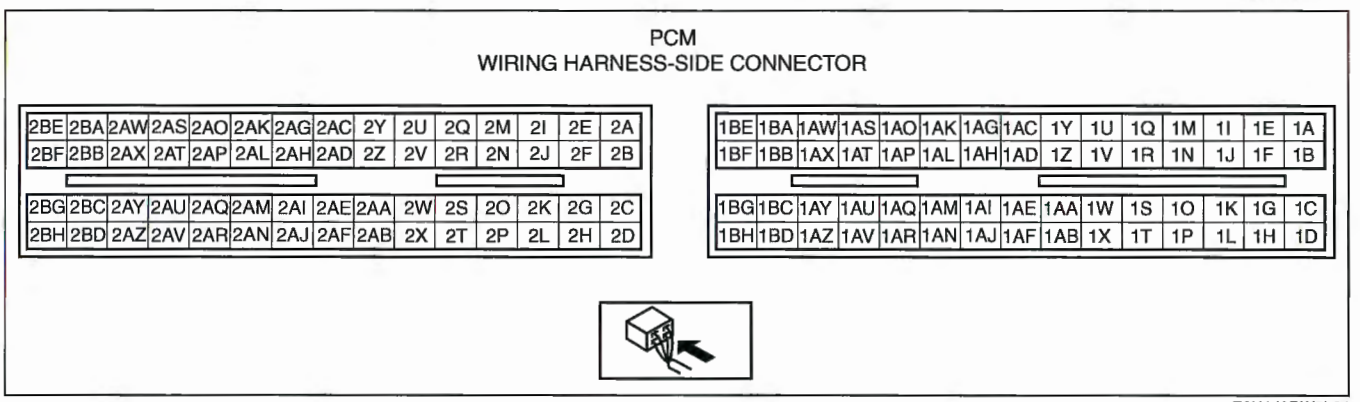
B6U0102W501

5. Apply vacuum of **–25.0 kPa {–187 mmHg, –7.38 inHg}** to the EGR boost sensor, and verify that the BARO PID variation from that of Step 4 is **approx. 25.0 kPa {187 mmHg, 7.38 inHg}**.
   - If verified, replace the EGR boost sensor.
   - If not verified, perform the "Circuit Open/Short inspection".

Circuit Open/Short Inspection



B6U0140W516



E6U140BW5L04

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following harnesses for open or short circuit. (Continuity check)

Open circuit
- EGR boost sensor terminal A and PCM terminal 1AL
- EGR boost sensor terminal B and PCM terminal 1BD
- EGR boost sensor terminal C and PCM terminal 1AZ

ort circuit
- EGR boost sensor terminal A and power supply
- EGR boost sensor terminal A and body ground
- EGR boost sensor terminal B and power supply
- EGR boost sensor terminal C and power supply
- EGR boost sensor terminal C and body ground

KNOCK SENSOR (KS) REMOVAL/INSTALLATION [AJ]

E6U014018920W01

1. Disconnect the negative battery cable.
2. Disconnect the KS connector.
3. Remove the KS.
4. Install in the reverse order of removal.

Tightening torque
21.2—28.8 N·m {2.17—2.93 kgf·m, 15.7—21.2 ft·lbf}

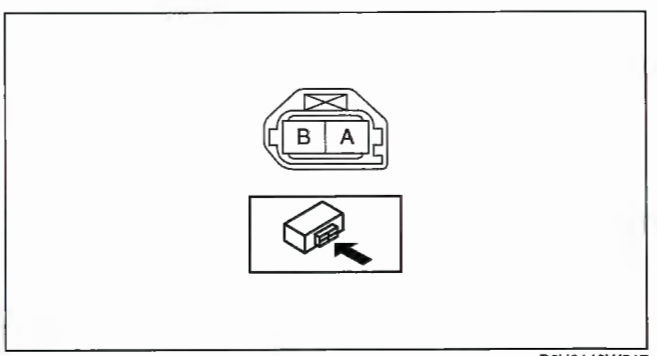
KNOCK SENSOR (KS) INSPECTION [AJ]

E6U014018920W02

Note
- Perform the following inspection only when directed.

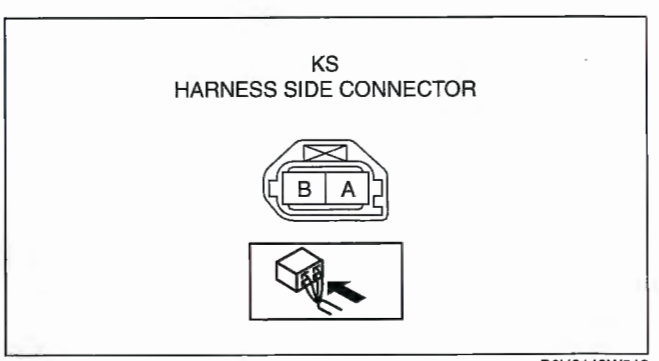
Resistance Inspection
1. Disconnect the negative battery cable.
2. Disconnect the KS connector.
3. Measure the resistance between KS terminals A and B using an ohmmeter.
   - If the KS is okay, but the PID value is out of specification, perform the "Circuit Open/Short Inspection".
   - If not as specified, replace the KS. (See 01–40C–38 KNOCK SENSOR (KS) REMOVAL/INSTALLATION [AJ].)

Specification
Approx. 4.87 megohms (20°C {68°F})



B6U0140W517

Circuit Open/Short Inspection



B6U0140W518

1. Disconnect the PCM connector. (See 01–40C–5 PCM REMOVAL/INSTALLATION [AJ].)
2. Inspect the following harness for open or short circuit. (Continuity check)

Open circuit
KS terminal B and PCM terminal 2AC
- KS terminal A and PCM terminal 2AF

Short circuit
- KS terminal A and power supply
- KS terminal A and body ground
- KS terminal B and power supply
- KS terminal B and body ground

CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [AJ]

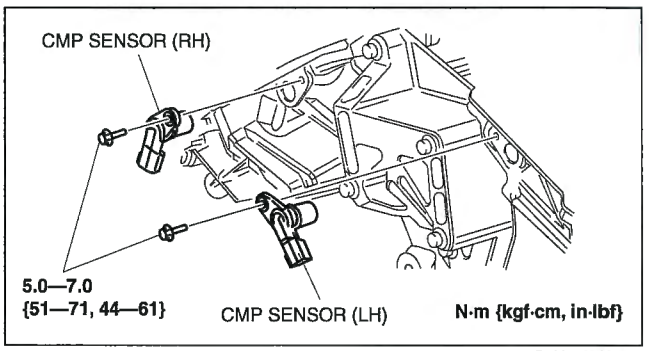
E6U014018230W01

Caution
- **Do not forcefully pull the wiring harness of the CMP sensor. Doing so will break the harness.**

1. Disconnect the negative battery cable.
2. Disconnect the CMP sensor connector.
3. Remove the CMP sensor.

Caution
- **When foreign material such as an iron chip is on the CMP sensor, it can cause abnormal output from the sensor because of flux turbulence and adversely affect the engine control. Be sure there is no foreign material on the CMP sensor when replacing.**

Install in the reverse order of removal.



B6U0140W536

CAMSHAFT POSITION (CMP) SENSOR INSPECTION [AJ]

E6U014018230W02

Note
- Perform the following inspection only when directed.

Resistance Inspection
1. Disconnect the negative battery cable.
2. Disconnect the CMP sensor connector.
3. Measure the resistance between the CMP sensor terminals A and B using an ohmmeter.
   - If the CMP sensor is okay, but the PID value is out of specification, perform the "Circuit Open/ Short Inspection".
   - If not as specified, replace the CMP sensor. (See 01–40C–39 CAMSHAFT POSITION (CMP) SENSOR REMOVAL/INSTALLATION [AJ].)

Engine oil specification

Item	U.S.A. and CANADA	Except U.S.A. and CANADA
Engine oil grade	(ILSAC)	API SL or ILSAC
Engine oil viscosity	5W-20	

*1 : Excludes temporary idle speed drop just after the electrical loads (E/L) are turned on.
*2 : Headlight is on, Fan switch is above 1st, Cooling fan is operating, Rear window defroster is on.
*3 : A/C switch and fan switch are turned on.
*4 : Steering wheel fully turned.
*5 : Back-up current is the constant flow of current present (for the audio unit, clock, PCM, etc.) when the ignition switch is off and with the ignition key removed.
*6 : Lower limit of the current must be more than 0 A.
*7 : Turn the following electrical loads on and verify that the voltage reading increases.

- Headlights
- Blower motor
- Rear window defroster

Item	Specification
Standard valve clearance [Engine cold]	IN: 0.22—0.28 mm {0.0087—0.0110 in} EX: 0.27—0.33 mm {0.0107—0.0129 in}
Compression	Standard:1,280 kPa {13.1 kgf/cm^2, 185.65 psi} [250rpm] Minimum:896 kPa {9.14 kgf/cm^2, 129.96 psi} [250rpm] Maximum difference between cylinders:196.1 kPa {2.0 kgf/cm^2, 28.5 psi}
Cylinder head bolt length	Standard 144.7—145.3 mm {5.700—5.720 in} Maximum: 146 mm {5.748 in}
Front oil seal press-in amount	0—0.5 mm {0—0.019 in}
Oil control valve resistance	6.9—7.9 ohms [20°C {68°F}]
Ignition timing (BTDC)	10°
Idle speed	No load 650—750
Idle-up speed (rpm)	Electrical load on *1 650—750 P/S operation 650—750 A/C operation (medium-pressure switch off) 700—800 A/C operation (medium-pressure switch on) 725—825
Idle mixture	HC concentration: Within the regulation CO concentration: Within the regulation
Engine oil capacity (approx. quantity)	Oil replacement: 5.3 L {5.6 US qt, 4.7 Imp qt} Oil and oil filter replacement: 5.7 L {6.0 US qt, 5.0 Imp qt} Total (dry engine): 6.4 L {6.8 US qt, 5.6 Imp qt}
Oil pressure (reference value) [oil temperature: 100 °C {212 °F}]	297—551 kPa {3.03—5.61 kgf/cm^2, 43.1—79.9 psi} [3,000 rpm]
Engine coolant capacity (approx. quantity)	8.0 L {8.5 US qt, 7.0 Imp qt}
Cooling system cap valve opening pressure	112.8—142.2 kPa {1.15—1.45 kgf/cm^2, 16.4—20.6 psi}
Thermostat initial-opening temperature	80—84 °C {176—183 °F}
Thermostat full-open temperature	97 °C {206 °F}
Thermostat full-open lift	More than 8.0 mm {0.31 in}
Cooling fan motor No.2 current	12.8—16.8 A
Fuel line pressure	410—490 kPa {4.2—4.9 kgf/cm^2, 60—71 psi}
Fuel pump hold pressure	More than 230 kPa {2.3 kgf/cm^2, 33 psi}
Fuel injector resistance	1.0—1.2 ohms [20 °C {68 °F}]
Battery electrolyte specific gravity [20 °C {68 °F}]	1.22—1.29
Battery load test current	55D23L (48): 180 A 80D26L (55): 195 A
Battery back-up current	Vehicles with immobilizer system: 25—45 mA Vehicles without immobilizer system: 30 mA or less
Battery slow charge current	55D23L (48): 4.5—5.5 A 80D26L (55): 5.5—6.5 A
Battery quick charge current [30 min]	55D23L (48): 30 A 80D26L (55): 35 A
Generator standard voltage [IG-ON]	Terminal B: B+ Terminal P: Approx. 1 V Terminal D: Approx. 0 V

Item	Specification
Generator standard voltage [Idle, 20 °C {68 °F}]	Terminal B: 13—15 V Terminal P: Approx. 3—8 V Terminal D: Turn the electrical loads (headlights, blower motor, rear window defroster) on and verify that the voltage reading increases.
Generator rotor resistance (between slip rings) [20 °C {68 °F}]	2.0—2.3 ohm
Generator brush length	Standard: 22.5 mm {0.89 in} Minimum: 5.0 mm {0.20 in}
Generator brush spring force	Standard: 4.1—5.3 N {0.42—0.54 kgf, 0.92—1.19 lbf} Minimum: 1.7 N {0.17 kgf, 0.38 lbf}
Firing order	1-3-4-2 Spark plug type	L3K9 18 110A, L3Y3 18 110
Spark plug gap	0.7—0.8 mm {0.028—0.031 in}
Spark plug resistance [25°C {77 °F}]	3.0—7.5 kilohms
Starter no load test voltage	11 V
Starter no load test current	90 A or less
Starter pinion gap	0.5—2.0 mm {0.02—0.07 in}
Starter armature runout	0.05 mm {0.002 in} max.
Starter commutator diameter	Standard: 29.4 mm {1.16 in} Minimum: 28.8 mm {1.13 in}
Segment groove depth of starter commutator	Standard: 0.4—0.6 mm {0.016—0.023 in} Minimum: 0.2 mm {0.008 in}
Starter brush length	Standard: 12.3 mm {0.48 in} Minimum: 7.0 mm {0.28 in}
Starter brush spring force	Standard: 18.3—24.9 N {1.87—2.53 kgf, 4.12—5.59 lbf} Minimum: 5.9 N {0.6 kgf, 1.3 lbf}

*1 : When the following electrical loads are on: Headlights, rear defroster, cooling fan No.1, cooling fan No.2, and the blower motor (2-step or more.)

Generator generated current (reference value) [Conditions] Ambient temperature: 20 °C {68 °F}, Voltage: 13.5 V, Engine hot

Engine speed (rpm)	Terminal B current (Lower limit of current must be more than 0 A.)
1,000	0—80 A

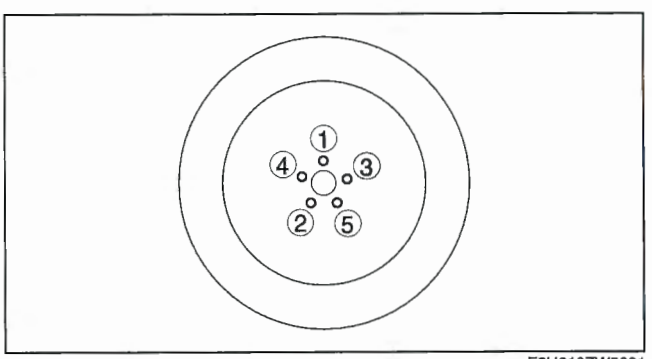
Suspension Links
Removal/Installation 02–10–1
Brake Lines
Disconnection/Connection 02–10–1
Power Steering Components
Removal/Installation 02–10–1

PRECAUTION (SUSPENSION)

E6U021000000W01

Wheels and Tires Removal/Installation

1. When a wheel is installed, tighten it to **88—118 N·m {9.0—12.0 kgf·m, 65.0—87.0 ft·lbf}**.



E5U610ZW5001

Suspension Links Removal/Installation

1. Tighten any part of the suspension that uses rubber bushings only after the vehicle has been lowered to the ground and unloaded.

Note
- Unloaded: Fuel tank is full. Engine coolant and engine oil are at specified levels. Spare tire, jack and tools are in designated position.

Brake Lines Disconnection/Connection

Caution
- **Brake fluid will damage painted surfaces. If brake fluid does get on a painted surface, wipe it off immediately.**

1. Tighten the brake pipe flare nut using the **SST** (49 0259 770B). Be sure to modify the brake pipe flare nut tightening torque to allow for use of a torque wrench-**SST** combination. (See 00–00–17 Torque Formulas.)
2. If any brake line has been disconnected anytime during the procedure, add brake fluid, bleed the brakes, and inspect for leakage after the procedure has been completed.

Power Steering Components Removal/Installation

1. If any power steering fluid line has been disconnected anytime during the procedure, add ATF M-III, M-V, or equivalent (e.g. Dexron®III), bleed the fluid line, and inspect for leakage after the procedure has been completed.

02–11 WHEEL ALIGNMENT

Specification (Unloaded)*1 02–11–3
Camber Adjustment..... 02–11–4
Total Toe-in Adjustment..... 02–11–4

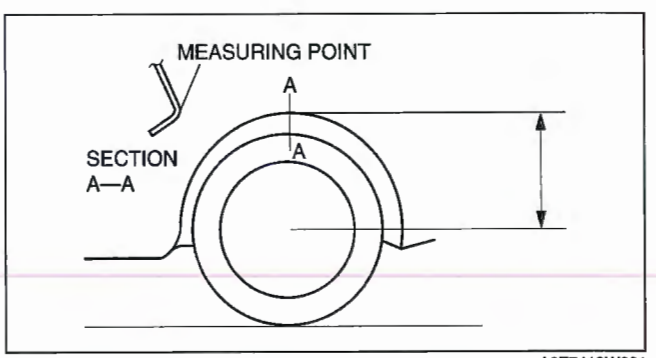
WHEEL ALIGNMENT PRE-INSPECTION

E6U021100000W01

1. Inspect the tire inflation, and adjust to the recommended pressure as necessary.
2. Inspect the front wheel bearing play and correct it if necessary. (See 03–11–1 Wheel Bearing Play Inspection.)
3. Inspect the wheel and tire runouts. (See 02–50–1 SUSPENSION TECHNICAL DATA.)
4. Inspect the ball joints and steering linkage for excessive looseness.
5. Shake the vehicle up and down to inspect the operation of the shock absorbers.

Note
- The vehicle must be on level ground and unloaded.
- Unloaded: Fuel tank is full. Engine coolant and engine oil are at specified level. Spare tire, jack and tools are in designated position.

6. Measure the height from the center of the wheel to the fender brim. The difference between the left and right measurement must not exceed **10 mm {0.39 in}**.



A6E7412W001

FRONT WHEEL ALIGNMENT

E6U021100000W02

Specification (Unloaded)*1

Front wheel alignment [4SD, 5HB]

Item		Specification				
Fuel gauge indication		Empty	1/4	1/2	3/4	Full
Maximum steering angle	Inner	34°±3°				
	Outer	29°±3°				
Total toe-in	(mm {in})	Tire: 2±4 {0.08±0.16}, Rim inner: 1.4±2.8 {0.06±0.12}				
	(degree)	0°11′±0°22′				
Caster angle*2 (Reference value)		3°37'±1°	3°39'±1°	3°41'±1°	3°44'±1°	3°47'±1°
Camber angle*2 (Reference value)	L3	–0°16′±1°			–0°17′±1°	
	AJ	–0°17′±1°			–0°18′±1°	
Steering axis inclination (Reference value)	L3	5°26'			5°28'	
	AJ	5°30'			5°29'	

Front wheel alignment [WGN]

Item		Specification				
Fuel gauge indication		Empty	1/4	1/2	3/4	Full
Maximum steering angle	Inner	34°±3°				
	Outer	29°±3°				
Total toe-in	(mm {in})	Tire: 2±4 {0.08±0.16}, Rim inner: 1.4±2.8 {0.06±0.12}				
	(degree)	0°11′±0°22′				
Caster angle*2 (Reference value)		3°29'±1°	3°32'±1°	3°34'±1°	3°37'±1°	3°39'±1°
Camber angle*2 (Reference value)		–0°16′±1°			–0°17′±1°	
Steering axis inclination (Reference value)		5°28'			5°27'	

*1 : Engine coolant and engine oil are at specified level. Spare tire, jack and tools are in designated position.
*2. Difference between left and right must not exceed **1°30'** .

Front wheel alignment [4SD AWD]

Item		Fuel gauge indication				
		Empty	1/4	1/2	3/4	Full
Maximum steering angle	Inner	36°±3°				
	Outer	30°±3°				
Total toe-in	(mm {in})	Tire: 2±4 {0.08±0.16}, Rim inner: 1±3 {0.04±0.12}				
	(degree)	0°11′±0°22′				
Caster angle*2 (reference value)		3°46'±1°	3°48'±1°	3°50'±1°	3°51'±1°	3°53'±1°
Camber angle*2(reference value)		-0°16'±1°			-0°17'±1°	
Steering axis inclination (reference value)		5°28'			5°30'	

*1 : Engine coolant and engine oil are at specified level. Spare tire, jack and tools are in designated position.
*2. Difference between left and right must not exceed 1°30'.

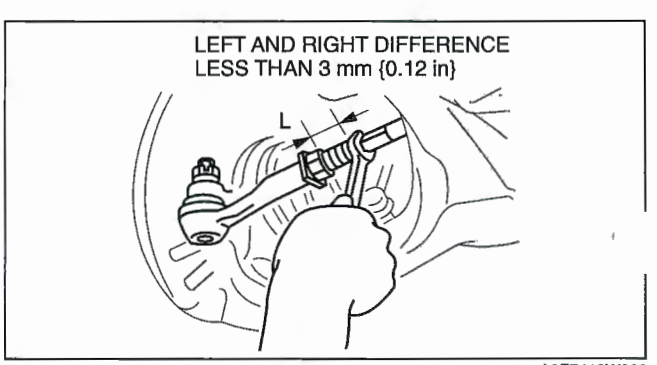
Maximum Steering Angle Adjustment

1. Loosen the tie-rod end locknuts.
2. Remove the steering gear boot clamp.
3. Turn the tie rods to equalize the length L.

   Maximum left/right difference
   3 mm {0.12 in}

4. Turn the tie rods equally to provide the correct maximum steering angle.
5. Tighten the tie-rod end locknuts.

   Tightening torque
   68.6—98.0 N·m {7.00—9.99 kgf·m, 50.6—72.2 ft·lbf}



A6E7412W002

6. Verify that the boot is not twisted, and install the boot clamp.
7. Adjust the toe-in after adjusting the steering angle.

tal Toe-in Adjustment

1. Center the steering wheel and confirm that the vehicle wheels/tires are pointing straight.
2. Loosen the left and right tie-rod end locknuts and turn the tie-rods equally. Both tie rods are right threaded, so turning the right tie-rod toward the front of the vehicle and the left toward the rear increases toe-in.

Note
- Turning both tie-rods one complete turn changes toe-in by **about 6 mm {0.24 in} (0°36')**.

3. Tighten the tie-rod end locknuts to the specified torque.

Tightening torque
68.6—98.0 N·m {7.00—9.99 kgf·m, 50.6—72.2 ft·lbf}

4. Verify that the boot is not twisted, and install the boot clamp.

REAR WHEEL ALIGNMENT

E6U021100000W03

Specification (Unloaded)*1

Rear wheel alignment [4SD, 5HB]

Item		Specification				
Fuel gauge indication		Empty	1/4	1/2	3/4	Full
Total toe-in	(mm {in})	Tire: 2±4 {0.08±0.16}, Rim inner: 1.4±2.8 {0.06±0.12}				
	(degree)	0°11′±0°22′				
Camber angle*2		−1°05′±1°	−1°07′±1°	−1°09′±1°	−1°11′±1°	−1°13′±1°
Thrust angle		0°±0°48′				

Rear wheel alignment [WGN]

Item		Specification				
Fuel gauge indication		Empty	1/4	1/2	3/4	Full
Total toe-in	(mm {in})	Tire: 2±4 {0.08±0.16}, Rim inner: 1.4±2.8 {0.06±0.12}				
	(degree)	0°11′±0°22′				
Camber angle*2		−0°59′±1°	−1°00′±1°	−1°02′±1°	−1°04′±1°	−1°06′±1°
Thrust angle		0°±0°48′				

Rear wheel alignment [4SD AWD]

Item		Fuel gauge indication				
		Empty	1/4	1/2	3/4	Full
Total toe-in	(mm {in})	Tire: 2±4 {0.08±0.16}, Rim inner: 1±3 {0.04±0.12}				
	(degree)	0°11′±0°22′				
Camber angle*2		−1°28′±1°	−1°30′±1°	−1°33′±1°	−1°35′±1°	−1°37′±1°
Thrust angle	(degree)	0°±0°48′				

*1 : Engine coolant and engine oil are at specified level. Spare tire, jack and tools are in designated position.
*2 : Difference between left and right must not exceed **1°30'** .

Note
- Adjust the toe-in after adjusting the camber.

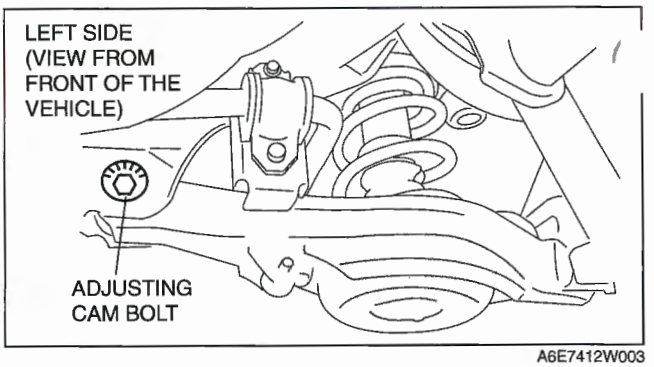
Camber Adjustment

1. Loosen the cam nut on the lower arm.
2. Turn the adjusting cam bolt to provide the correct camber angles as indicated.

	Left wheel	Right wheel
Positive direction	Clockwise	Counter-clockwise
Negative direction	Counter-clockwise	Clockwise

3. Tighten the cam nut.

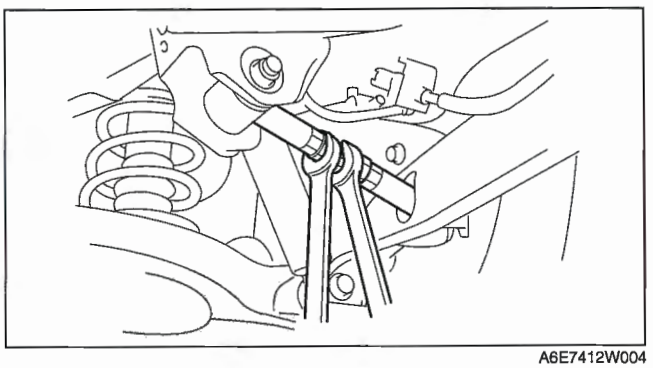
Tightening torque
86.2—116.6 N·m {8.79—11.88 kgf·m, 63.58—85.99 ft·lbf}



A6E7412W003

Total Toe-in Adjustment

1. Loosen the locknut of the lateral link.

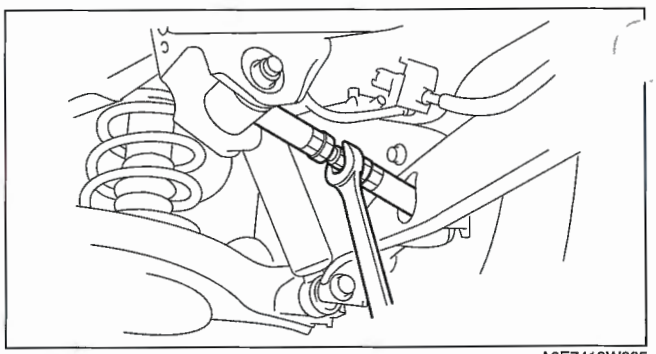


A6E7412W004

2. Adjust the toe-in turning the adjusting link.

Specification
Total Toe-in: 2±4 mm {0.08±0.16 in}

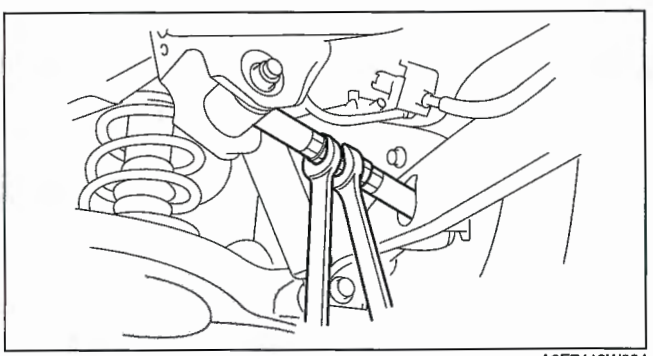
Note
- Toe change amount: **0°43′** / one rotation



A6E7412W005

3. Tighten the locknut.

Tightening torque
68.0—98.1 N·m {7.0—10.0 kgf·m, 50.2—72.3 ft·lbf}



A6E7412W004

02–12 WHEEL AND TIRES

WHEEL AND TIRE SPECIFICATION . . . 02–12–1
WHEEL BALANCE ADJUSTMENT (ALUMINUM ALLOY WHEEL) 02–12–2
Adhesive-type Balance Weight (Outer) **02–12–2**
Knock-type Balance Weight (Inner) **02–12–3**
Remaining Amount of Unbalance Confirmation **02–12–3**

WHEEL AND TIRE SPECIFICATION

E6U021200000W02

Item			Specification		
Standard tire and wheel					
Wheel	Size		16 × 6 1/2JJ	17 × 7JJ	18 × 7J
	Offset	(mm {in})	55 {2.17}	60 {2.36}	55 {2.17}
	Pitch circle diameter	(mm {in})	114.3 {4.50}		
	Material		Steel	Aluminum alloy	
Tire	Size		P205/50R16 91V	P215/50R17 93V	L3 with TC: 215/45R18 93Y Except L3 with TC: 215/45R18 93W
	Air pressure (kPa {kgf/cm^2, psi})	Front	220 {2.2, 32}	220 {2.2, 32}	L3 with TC: 260 {2.6, 38} Except L3 with TC: 240 {2.4, 35}
		Rear			
	Remaining tread	(mm {in})	1.6 {0.06}		
Wheel and tire	Wheel and tire runout (mm {in})	Radial direction	1.5 {0.06} max.		
		Lateral direction	2.5 {0.10} max.	2.0 {0.08} max.	
	Wheel imbalance	(g {oz})	8 {0.28} max.	Adhesive-type*1: 11 {0.39} max. Knock-type*2: 7 {0.25} max.	Adhesive-type*1: 10 {0.35} max. Knock-type*2: 6 {0.21} max.
Temporary spare tire					
Wheel	Size		16×4T		L3 with TC: 17×4T Except L3 with TC: 16×4T
	Offset	(mm {in})	40 {1.57}		
	Pitch circle diameter	(mm {in})	114.3 {4.50}		
	Material		Steel		
Tire	Size		T115/70 D16		L3 with TC: T145/70D 17 Except L3 with TC: T115/70 D16
	Air pressure	(kPa {kgf/cm^2, psi})	420 {4.2, 60}		
Wheel and tire	Wheel and tire runout (mm {in})	Radial direction	2.0 {0.08} max.		
		Lateral direction	2.5 {0.10} max.		

*1 : Total weight exceeds **160 g {5.65 oz}**.
*2 : One balance weight: **60 g {2.12 oz}** max. If the total weight exceeds **100 g {3.53 oz}** on one side, rebalance after moving the tire around on the rim. Do not use three or more balance weights.

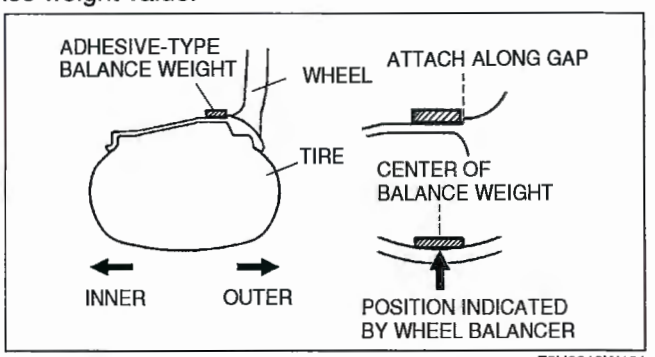
WHEEL BALANCE ADJUSTMENT (ALUMINUM ALLOY WHEEL)

E6U021200000W01

Caution
- **Adjust the outer wheel balance first, then the inner wheel balance.**
- **Be careful not to scratch the wheels.**

Adhesive-type Balance Weight (Outer)

1. Remove the old balance weight from the wheel.
2. Remove the double-sided adhesive tape remaining on the wheel, then clean and degrease the bonding area.
3. Set the wheel on a wheel balancer, measure the amount of unbalance and the position with the mode set for knock-type balance weight.
4. Multiply the amount of unbalance by **1.6** to get the balance weight value.
5. Select a balance weight closest to the weight value and attach the balance weight on the position (outer) indicated by the wheel balancer.



Z5U0212W101

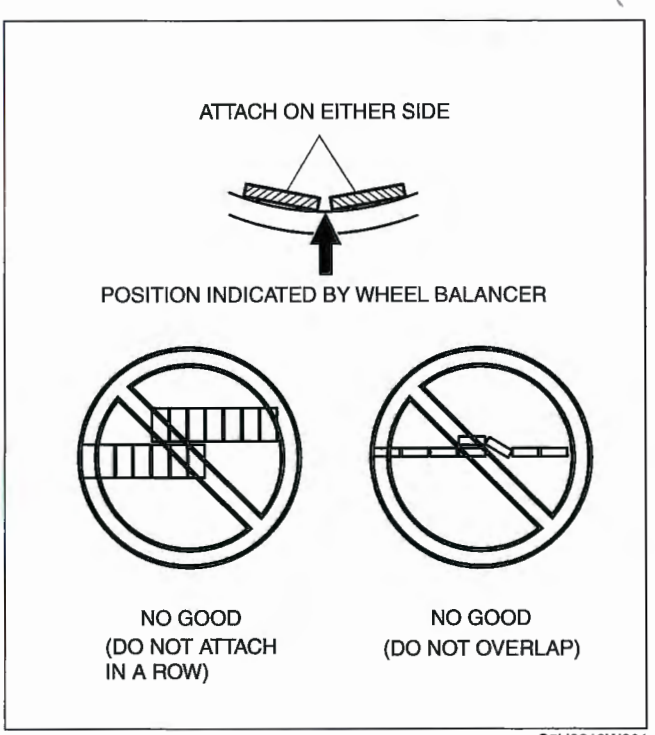
Example calculation of balance weight value
Indicated amount of unbalance: 23 g {0.81 oz}
23 g {0.81 oz}×1.6 = 36.8 g {1.30 oz}
Selected balance weight value: 35 g {1.24 oz}

Note
- When selecting a balance weight, select one closest to the calculated value.
  Example: **32.4 g {1.14 oz}= 30 g {1.06 oz}, 32.5 g {1.15 oz}= 35 g {1.24 oz}**

Caution
- **Use a genuine balance weight or equivalent (steel).**
- **When attaching the weight balance, press the balance weight with a force of 25 N {2.5 kgf, 5.5 lbf} per 5 g for 2 seconds or more.**

6. If attaching 2 balance weights, position them so that each is on either side of the position indicated by the wheel balancer.

Caution
- **Do not attach weight balances in a row.**
- **Do not overlap the balance weights.**
- **Total weight must not exceed 160 g {5.65 oz}.**



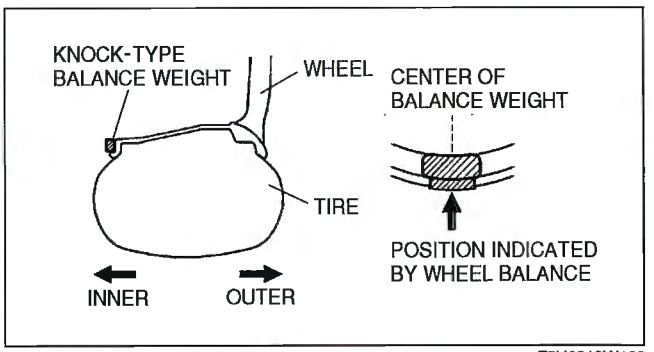
C5U0212W001

Knock-type Balance Weight (Inner)

1. Measure the amount of unbalance with a wheel balancer.
2. Attach a balance weight corresponding to the measured weight value on the position (inner) indicated by the wheel balancer.

Caution

- **Do not attach 3 or more balance weights.**
- **One balance weight must not exceed 60 g {2.12 oz}, and a total of 2 balance weights must not exceed 100 g {3.53 oz}.**



Z5U0212W103

Remaining Amount of Unbalance Confirmation

1. After installing the outer and inner balance weights, operate the wheel balancer again.
2. Confirm that the remaining unbalance does not exceed the following on either side.
   - If the remaining unbalance exceeds the specifications, adjust the wheel balance again.

Specifications

	Outer (Adhesive-type)	Inner (Knock-type)
16 inch wheel	13 g {0.46 oz}	8 g {0.28 oz}
17 inch wheel	11 g {0.39 oz}	7 g {0.25 oz}
18 inch wheel	10 g {0.35 oz}	6 g {0.21 oz}

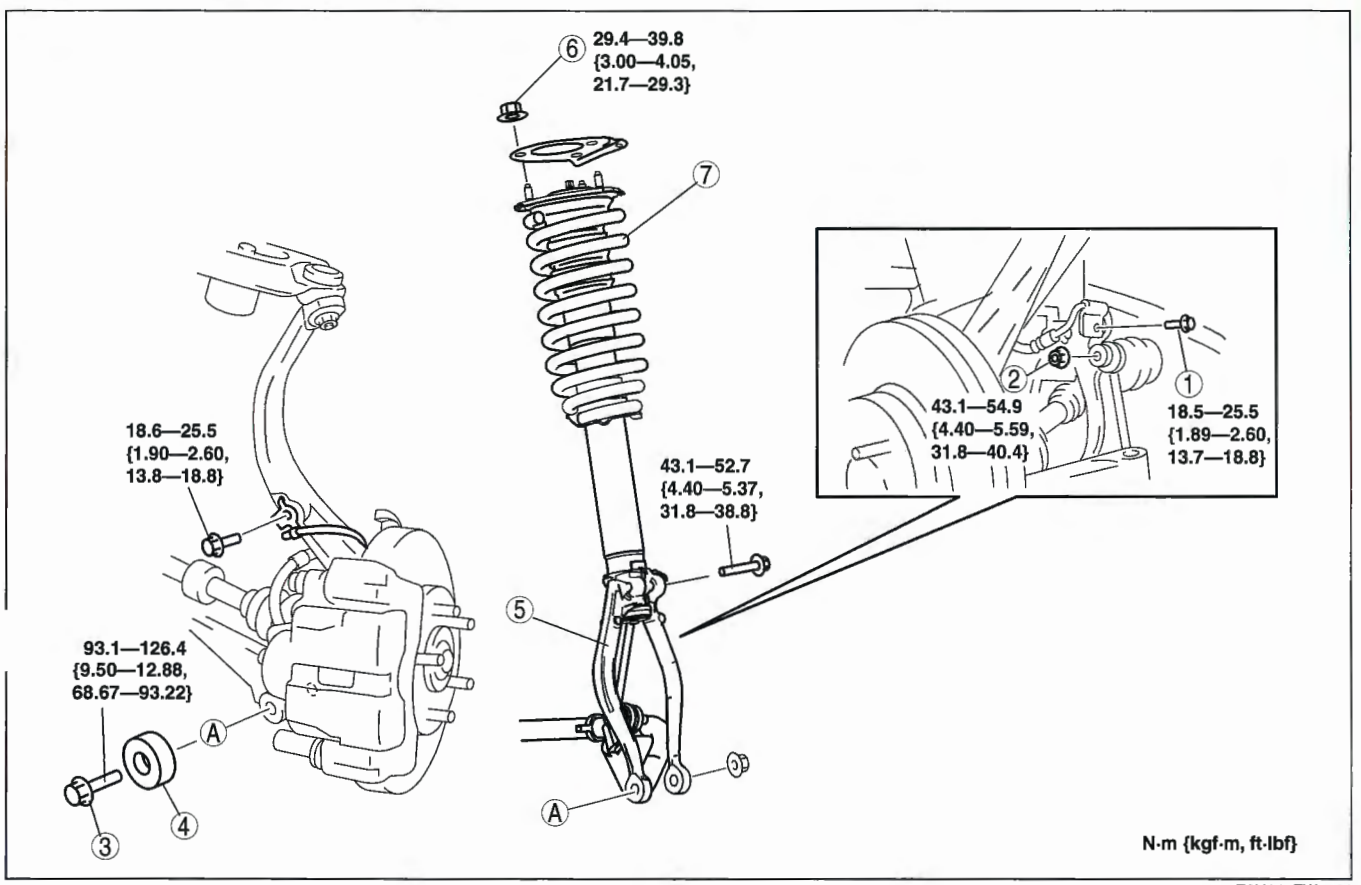
FRONT SHOCK ABSORBER AND SPRING REMOVAL/INSTALLATION

E6U021304910W01

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while servicing the vehicle.**

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.



E6U213ZW5001

1	Bolt (brake hose bracket)
2	Nut (front stabilizer control link)
3	Bolt (front shock absorber lower side) (See 02–13–4 Bolt (Front Shock Absorber Lower Side) Removal Note)
4	Dynamic damper

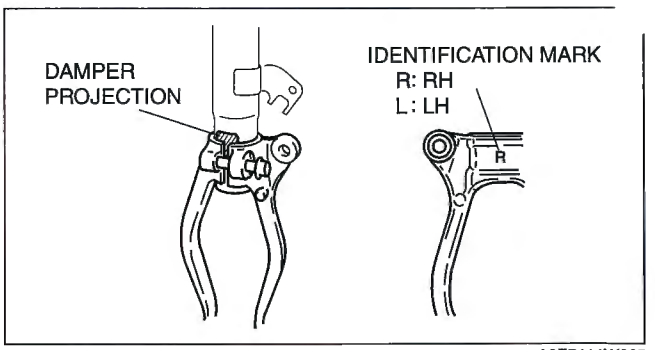
5	Damper fork (See 02–13–4 Damper Fork Installation Note)
6	Nut (front shock absorber upper side)
7	Front shock absorber and coil spring (See 02–13–4 Front Shock Absorber and Coil Spring Installation Note)

Bolt (Front Shock Absorber Lower Side) Removal Note

1. Support the knuckle with a jack to prevent it from falling.

Damper Fork Installation Note

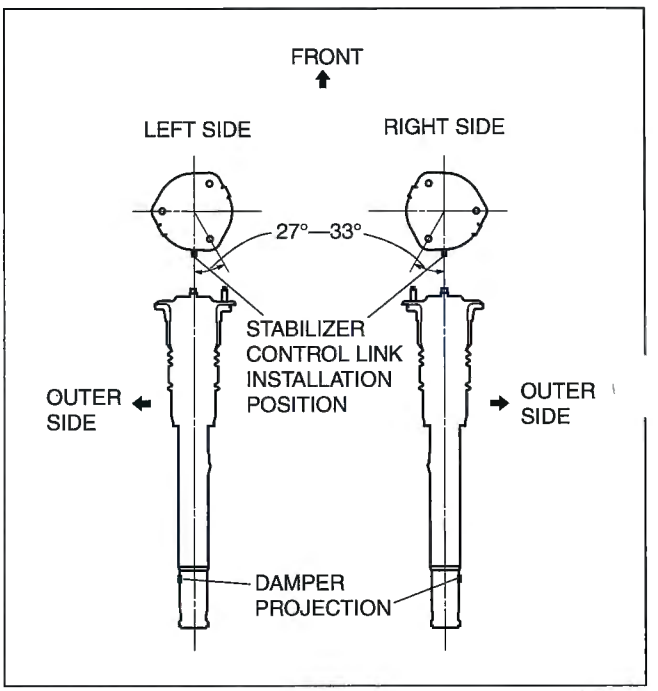
1. Align the gap of the damper fork with the projections of the damper
2. Tighten the bolt.



A6E7414W005

Front Shock Absorber and Coil Spring Installation Note

1. Install the stud bolts at a 27°—33° angle from where the stabilizer control link is installed (center line), towards the inner side of the vehicle.



A6E7414W004

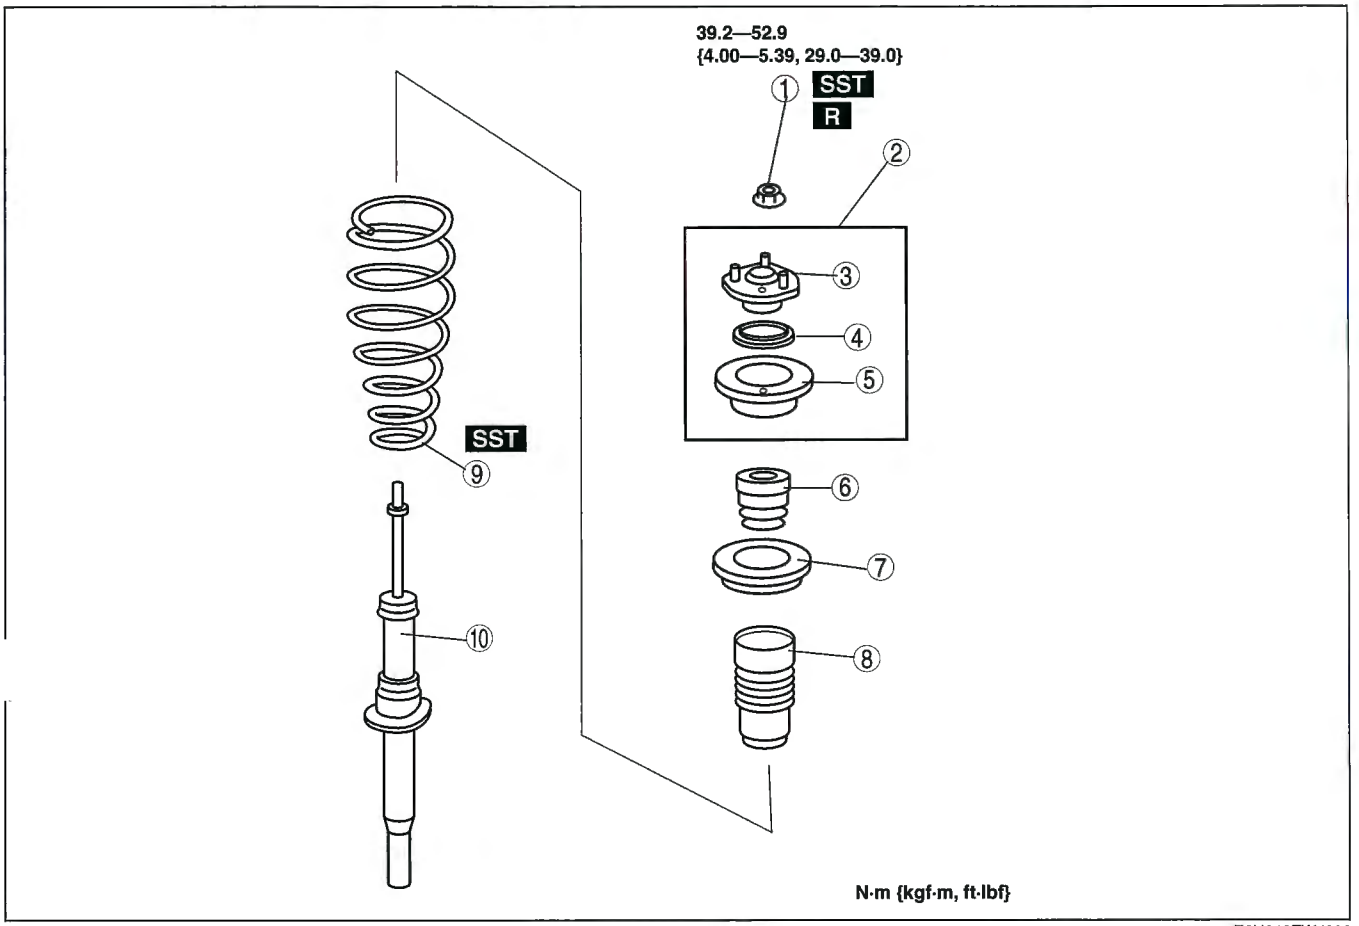
FRONT SHOCK ABSORBER AND SPRING DISASSEMBLY/ASSEMBLY

E6U021304910W02

Warning

- **Removing/installing the piston rod nut is dangerous. The shock absorber and spring could fly off under tremendous pressure and cause serious injury or death. Secure the shock absorber in the SSTs before removing the piston rod nut.**

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.



E6U213ZW5002

1	Piston rod nut (See 02–13–6 Piston Rod Nut Removal Note)
2	Mounting rubber assy
3	Mounting rubber
4	Bearing
5	Spring seat

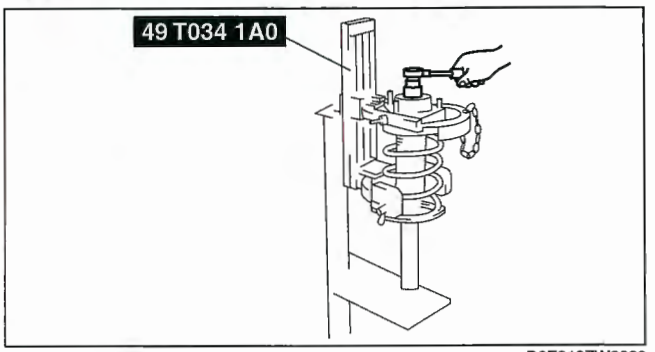
6	Bound stopper
7	Spring seat rubber
8	Dust boot
9	Coil spring (See 02–13–6 Coil Spring Installation Note)
10	Front shock absorber

Piston Rod Nut Removal Note

Warning

- **Removing the piston rod nut is dangerous. The shock absorber and spring could fly off under tremendous pressure and cause serious injury or death. Secure the shock absorber in the SSTs before removing the piston rod nut.**

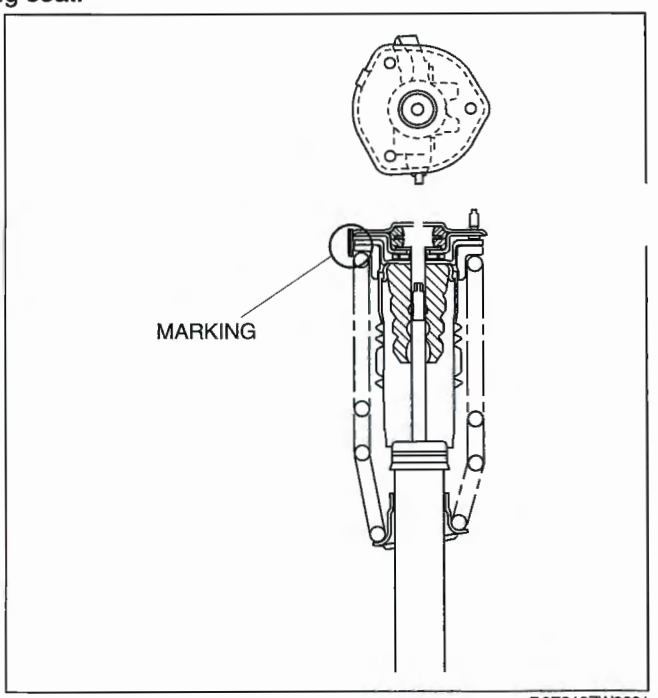
1. Protect the coil spring using a piece of cloth, then set the **SSTs**.
2. Compress the coil spring using the **SSTs**, and remove the piston rod nut.



D6E213ZW3020

Coil Spring Installation Note

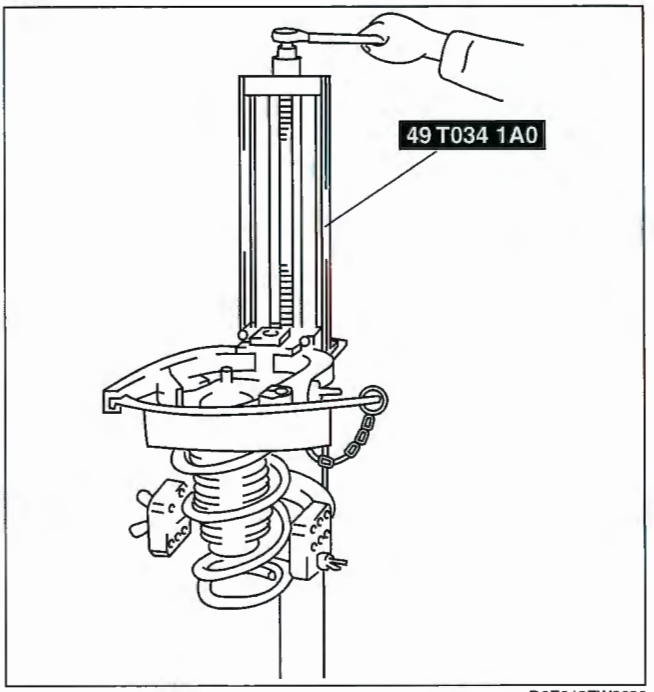
1. Temporarily install the coil spring, dust boot and mounting rubber on the shock absorber so that the lower end of the coil spring is seated on the step of the lower spring seat.
2. Mark the coil spring, dust boot and mounting rubber for proper installation as shown in the figure.
3. Align the marks of the coil spring and dust boot. Protect the coil spring and dust boot using a piece of cloth, then set the **SSTs**.



D6E213ZW3201

4. Compress the coil spring using the **SSTs**.
5. Install the shock absorber so that the lower end of the coil spring is seated on the step of the lower spring seat.
   Make sure that the marks on the shock absorber and dust boot are aligned.
7. Install the mounting rubber and piston rod nut, then remove the **SSTs**.

Piston rod nut tightening torque
39.2—52.9 N·m {4.00—5.39 kgf·m, 29.0—39.0 ft·lbf}



D6E213ZW3020

FRONT SHOCK ABSORBER INSPECTION

E6U021334700W01

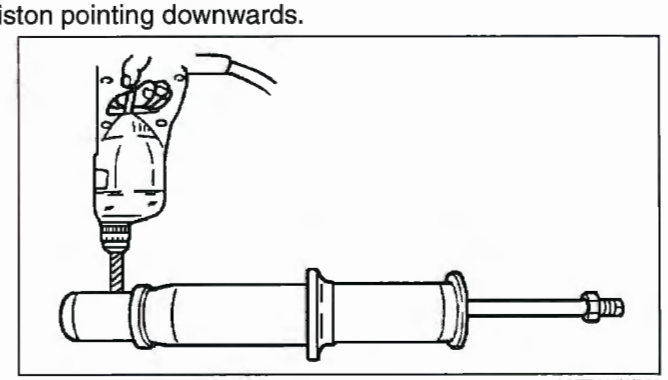
1. Remove the front shock absorber. (See 02–13–3 FRONT SHOCK ABSORBER AND SPRING REMOVAL/INSTALLATION.) (See 02–13–5 FRONT SHOCK ABSORBER AND SPRING DISASSEMBLY/ASSEMBLY.)
2. Inspect for damage and oil leakage.
3. Inspect the rubber bushing for deterioration and wear.
4. Compress and extend the shock piston at least three times. Verify that the operational force does not change and that there is no unusual noise.
   - If not as specified, replace the shock absorber.
   (1) Compress the shock absorber piston and release it.
   (2) Verify that the piston extends fully at a normal speed.

FRONT SHOCK ABSORBER DISPOSAL

E6U021334700W02

Warning
- **Whenever drilling into a shock absorber, wear protective eye wear. The gas in the shock absorber is pressurized, and could spray metal chips into the eyes and face when drilling.**

1. Clamp a shock absorber on a flat surface or with the piston pointing downwards.
2. Drill a **2—3 mm {0.08—0.12 in}** hole at a point **20—30 mm {0.8—1.2 in}** from the bottom of the tube, so that the gas can escape.
3. Turn the hole downwards.
4. The oil can be collected by moving the piston rod several times up and down and cutting the tube at the end.
5. Dispose of waste oil according to the waste disposal law.



A6E7414W022

Note
- Shock absorber gas is nitrogen gas.
- Shock absorber oil is mineral oil.

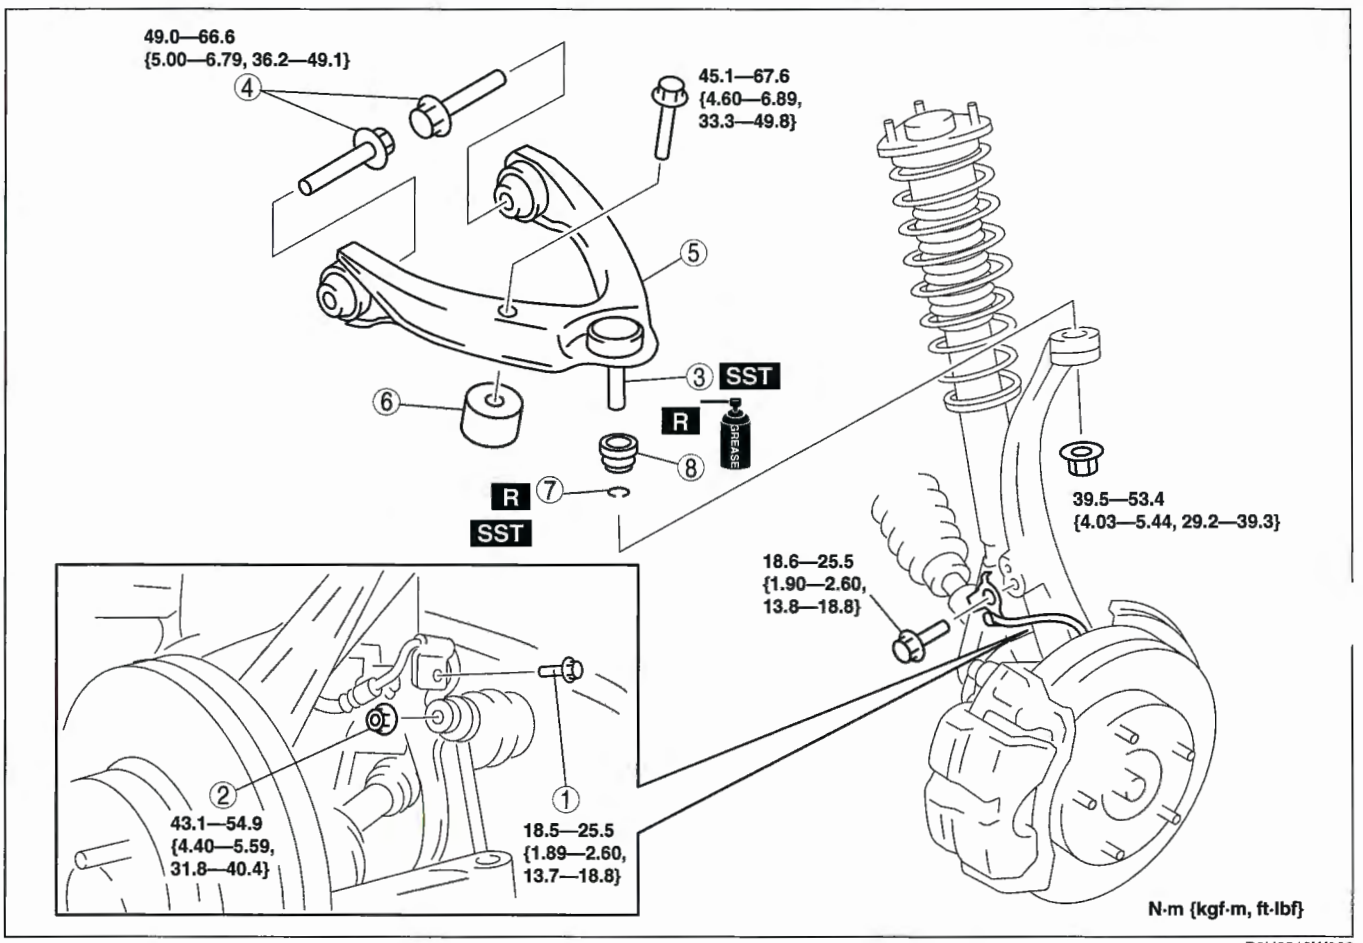
FRONT UPPER ARM REMOVAL/INSTALLATION

E6U021334200W01

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while servicing the vehicle.**

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.
3. Inspect the front wheel alignment. (See 02–11–2 FRONT WHEEL ALIGNMENT.)



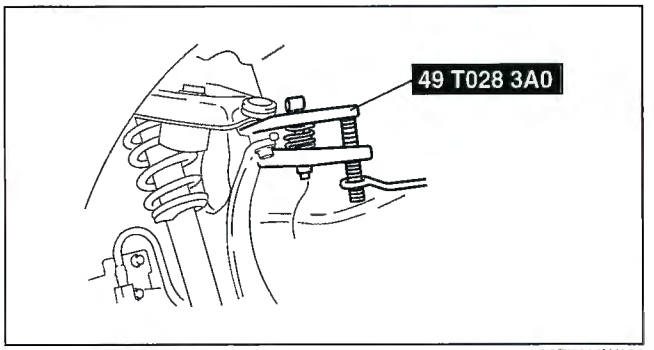
B6U0213W002

1	Bolt (brake hose bracket)
2	Nut (stabilizer control link)
3	Front upper arm ball joint (See 02–13–9 Front Upper Arm Ball Joint Removal Note)
4	Bolt (front upper arm) (See 02–13–9 Bolt (Front Upper Arm) Removal Note)

5	Front upper arm
6	Dynamic Damper
7	Clip (See 02–13–9 Clip Installation Note)
8	Dust boot

Front Upper Arm Ball Joint Removal Note

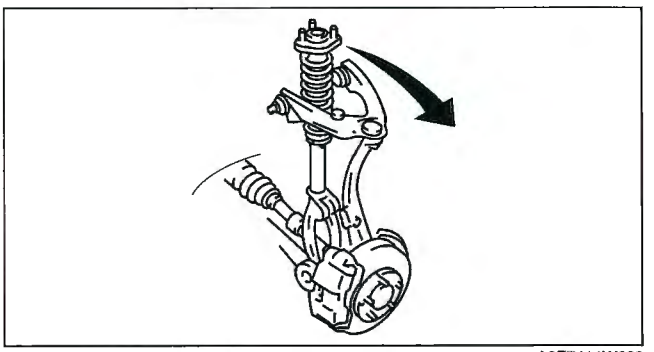
1. Support the knuckle using the jack.
2. Separate the ball joint from the knuckle using the **SST**.



A6E7414W006

Bolt (Front Upper Arm) Removal Note

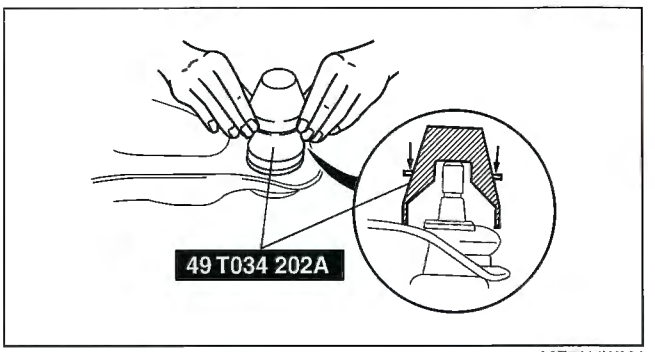
1. Remove the nuts (3 locations) from the upper part of the front shock absorber.
2. Pull the front shock absorber and coil spring out of the way, towards the outer side of the vehicle.
3. Remove the bolts.



A6E7414W023

Clip Installation Note

1. Wipe the grease off the ball stud.
   Fill the inside of the new dust boot with grease.
3. Install the boot on the ball joint.
4. Install the new clip using the **SST**.
5. Verify that the clip is installed securely to the groove.
6. Wipe away the excess grease.



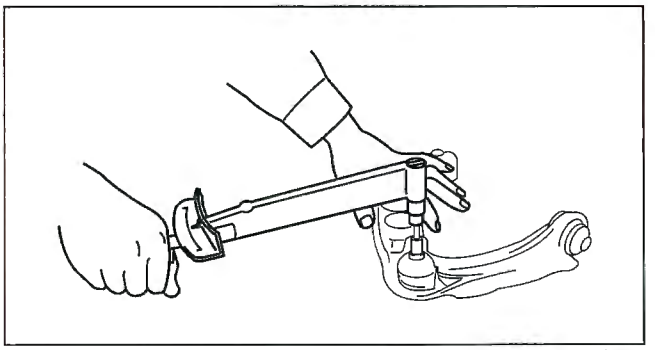
A6E7414W024

FRONT UPPER ARM INSPECTION

E6U021334200W02

1. Remove the upper arm from the vehicle. (See 02–13–8 FRONT UPPER ARM REMOVAL/INSTALLATION.)
2. Inspect for damage, cracks, and bending.
3. Inspect the ball joint rotational torque.
   (1) Rotate the ball joint five times.
   (2) Measure the rotational torque using a suitable allen socket and a torque wrench.
   - If not within the specification, replace the lower arm component.

Front upper arm ball joint rotation torque
1.5 N·m {15.0 kgf·cm, 13.2 in·lbf} max.

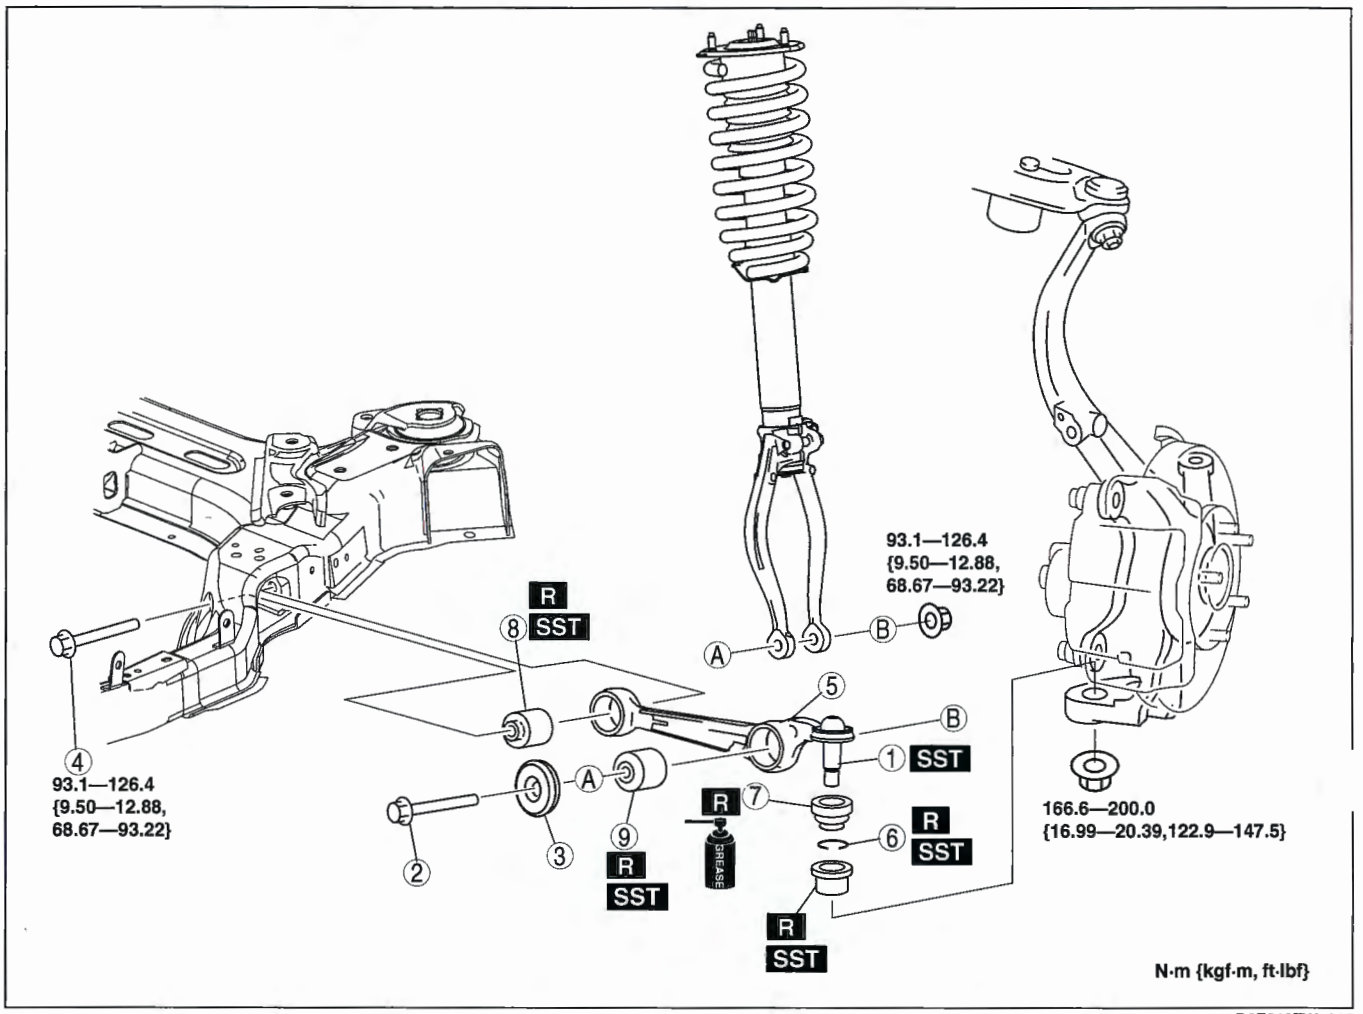


A6E7414W043

FRONT LOWER ARM (FRONT) REMOVAL/INSTALLATION

E6U021334300W05

1. Remove the TWC (AJ) (only when removing/installing the right side front lower arm (front)). (See 01–15C–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [AJ].)
2. Remove in the order indicated in the table.
3. Install in the reverse order of removal.



D6E213ZW7003

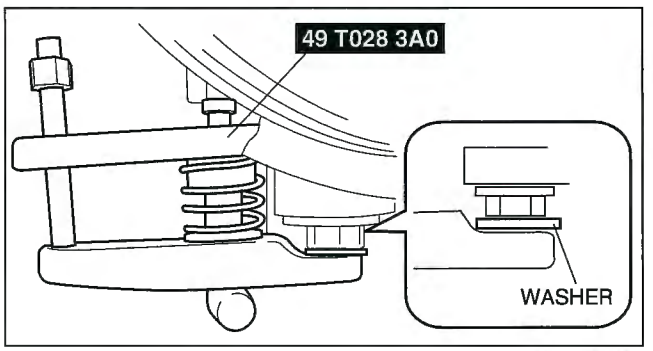
1	Front lower arm (front) ball joint (See 02–13–11 Front Lower Arm (Front) Ball Joint Removal Note.)
2	Bolt (front shock absorber lower side)
3	Dynamic damper
4	Bolt (front lower arm inner side)
5	Front lower arm (front) component
6	Clip (See 02–13–14 Clip Installation Note.)
7	Dust boot

8	Front lower arm (front) bushing (inner side) (See 02–13–12 Front Lower Arm (Front) Bushing (Inner Side) Removal Note.) (See 02–13–14 Front Lower Arm (Front) Bushing (Inner Side) Installation Note.)
9	Front lower arm (front) bushing (outer side) (See 02–13–13 Front Lower Arm (Front) Bushing (Outer Side) Removal Note.) (See 02–13–13 Front Lower Arm (Front) Bushing (Outer Side) Installation Note.)

Front Lower Arm (Front) Ball Joint Removal Note

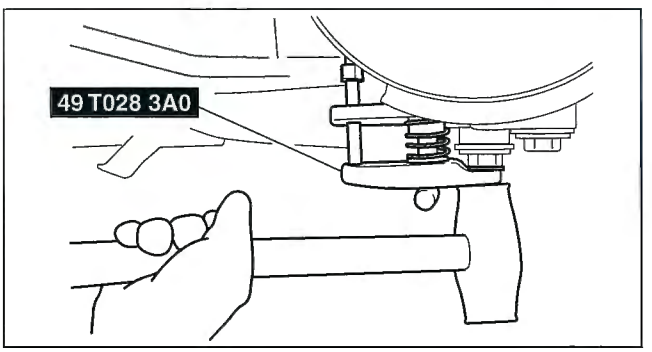
Caution
- **Do not tap the steering knuckle with a hammer. The steering knuckle may be damaged.**
- **If the steering knuckle is tapped with a hammer, the steering knuckle must be replaced with a new one.**
- **If the steering knuckle bushing is raised during the ball joint disconnecting operation, remove the knuckle bushing and replace it with a new one.**

1. Insert a washer between the **SST** and the nut to prevent damage to the locknut.
2. Disconnect the ball joint using the **SST**.



D6E213ZW3001

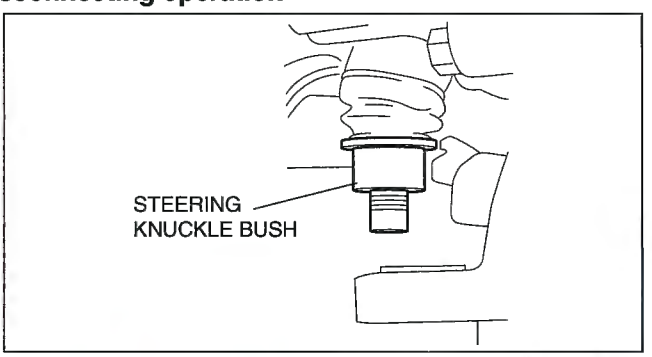
3. If the ball joint cannot be disconnected in Step 2, tap the **SST** from the bottom using a copper hammer.



D6E213ZW3002

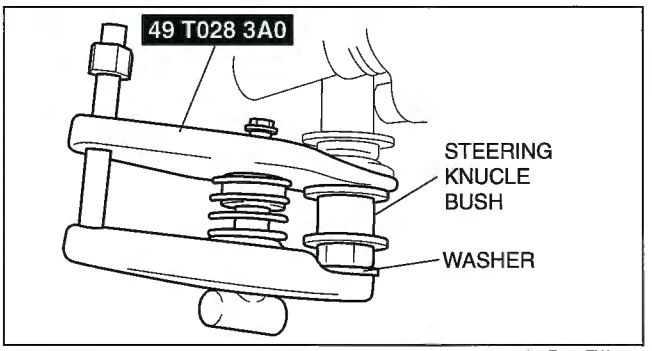
If steering knuckle bushing is raised during ball joint disconnecting operation

1. With the steering knuckle bushing installed to the ball joint, remove the front lower arm (front) from the steering knuckle.



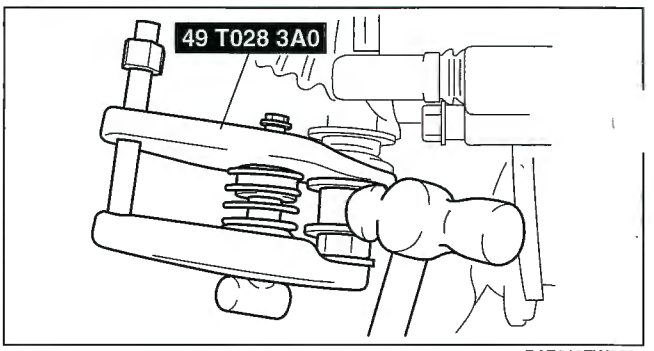
D6E213ZW3003

2. Install the nut to the front lower arm (front) ball joint and remove the steering knuckle bushing using the **SST**. At this time, insert a washer between the **SST** and the locknut to prevent damage to the locknut.



D6E213ZW3004

3. If the steering knuckle bushing cannot be removed in Step 2, tap the steering knuckle bushing with a hammer and remove the steering knuckle bushing.

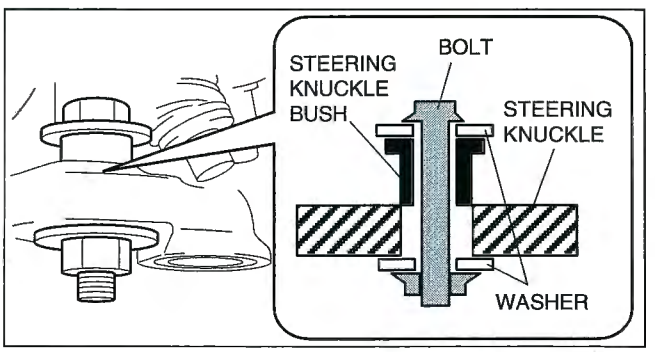


D6E213ZW3005

Caution
- **If you tap the steering knuckle bushing with a hammer to remove it, replace the steering knuckle bushing with a new one to avoid excessive play.**

Steering Knuckle Bushing Installation Note

1. Install the steering knuckle bushing to the steering knuckle using a multi-purpose bolt and nut, and washers.

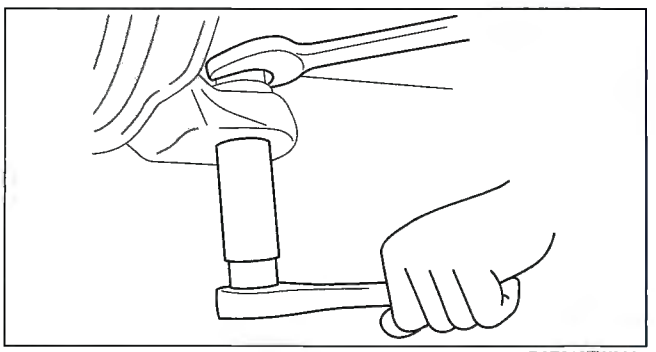


D6E213ZW3006

Caution
- **Press-in the steering knuckle bushing vertically to the steering knuckle.**
- **When pressing the steering knuckle bushing in the steering knuckle, be careful not to damage the steering knuckle bushing upper surface where it contacts the dust boot.**

Note
- Bolt diameter: 16 mm {0.63 in}
- Bolt stem length: 65 mm {2.56 in} or more
- Washer outer diameter: Approx. 45 mm {1.77 in}
- Washer thickness: Approx. 3 mm {0.12 in}

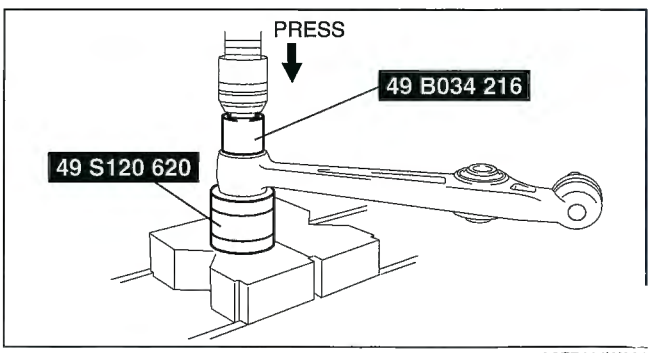
2. Tighten the bolt and nut to press-in the steering knuckle bushing to the steering knuckle.



D6E213ZW3007

Front Lower Arm (Front) Bushing (Inner Side) Removal Note

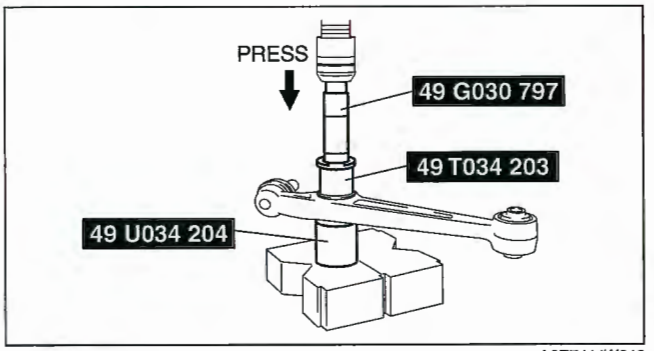
1. Press the bushing (inner side) out using the **SSTs**.



A6E7414W001

Front Lower Arm (Front) Bushing (Outer Side) Removal Note

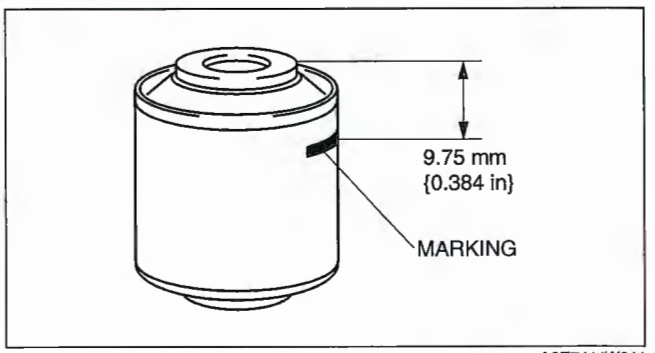
1. Press the bushing (outer side) out using the **SSTs**.



A6E7414W010

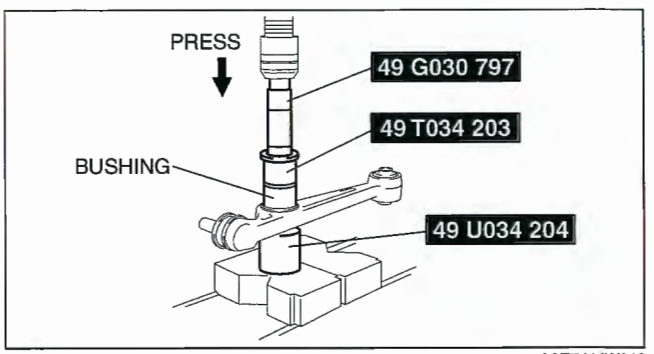
Front Lower Arm (Front) Bushing (Outer Side) Installation Note

1. Mark the new bushing as shown in the figure.



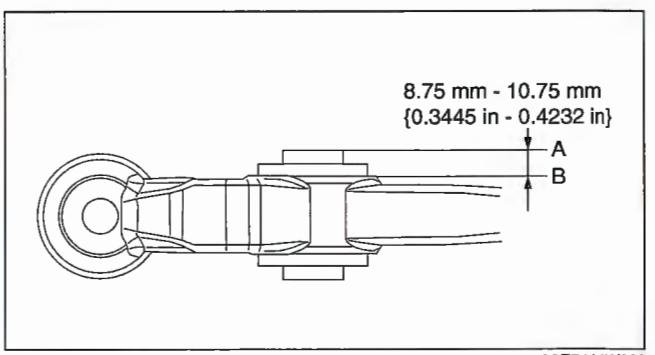
A6E7414W011

2. Press the bushing in to the marking using the **SSTs**.



A6E7414W012

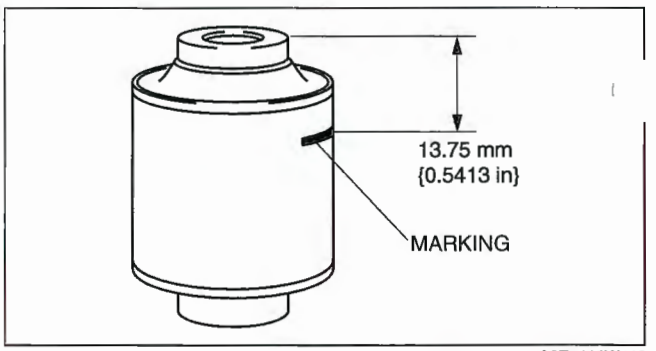
3. Verify that clearance distance A—B is **8.75 mm—10.75 mm {0.3445 in—0.4232 in}**.



A6E7414W003

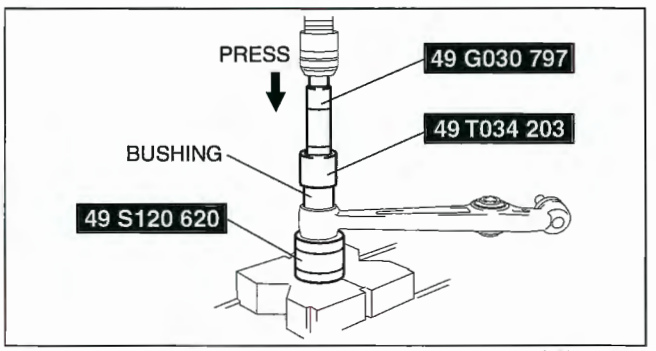
Front Lower Arm (Front) Bushing (Inner Side) Installation Note

1. Mark the new bushing as shown in the figure.



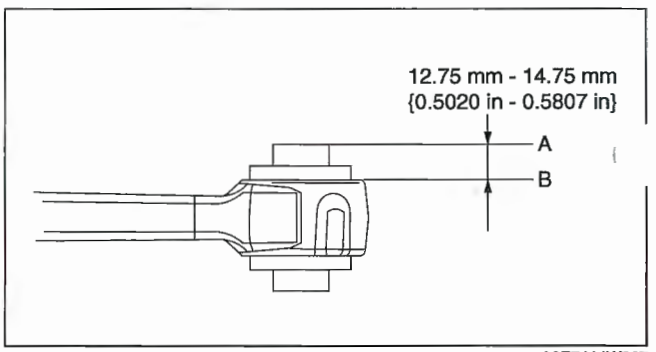
A6E7414W013

2. Press the bushing in to the marking using the **SSTs**.



A6E7414W002

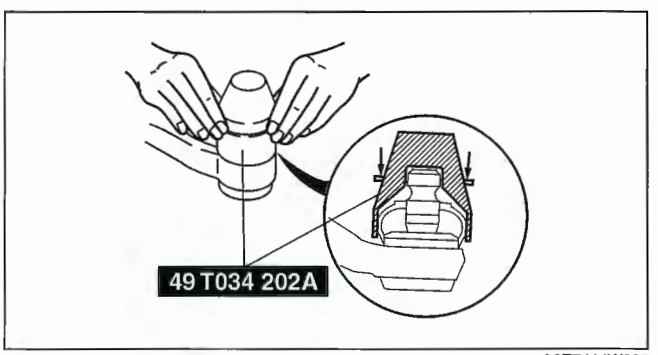
3. Verify that clearance distance A—B is **12.75 mm—14.75 mm {0.5020 in—0.5807 in}**.



A6E7414W007

Clip Installation Note

1. Wipe the grease off the ball stud.
2. Fill the inside of the new dust boot with grease.
3. Install the boot on the ball joint.
4. Install the new clip using the **SST**.
5. Verify that the clip is installed securely to the groove.
6. Wipe away the excess grease.



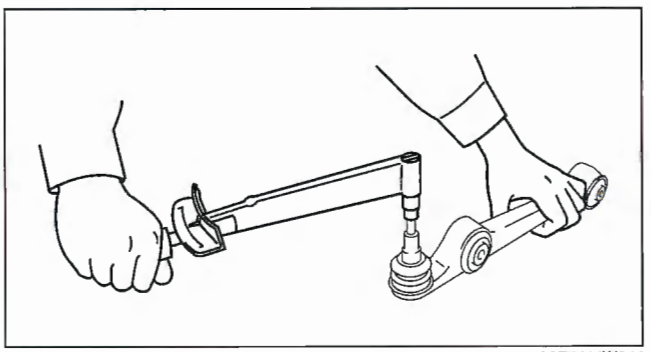
A6E7414W025

FRONT LOWER ARM (FRONT) INSPECTION

E6U021334300W02

1. Remove the lower arm (front) from the vehicle. (See 02–13–10 FRONT LOWER ARM (FRONT) REMOVAL/INSTALLATION.)
   Inspect for damage, cracks, and bending.
2. Inspect the ball joint rotational torque.
   (1) Rotate the ball joint five times.
   (2) Measure the rotational torque using a suitable allen socket and a torque wrench.
   - If not within the specification, replace the lower arm component.

Front lower arm (front) ball joint rotation torque
1.18—2.23 N·m {12.1—22.7 kgf·cm, 10.5—19.7 in·lbf}



A6E7414W044

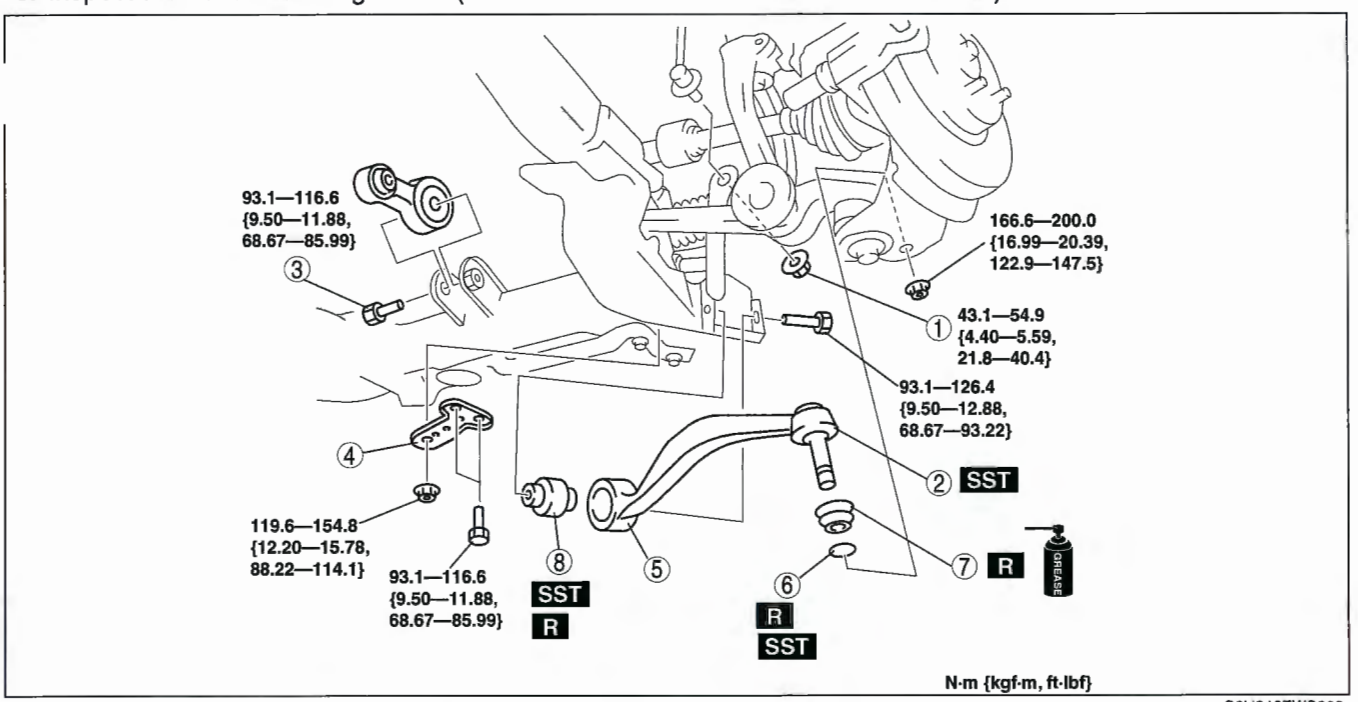
FRONT LOWER ARM (REAR) REMOVAL/INSTALLATION

E6U021334300W03

1. Remove the under cover.
2. Remove the splash shield.
3. Remove the steering gear and linkage installation bolts, and pipe component installation bolts from the front crossmember, then suspend the steering gear and linkage with a cable.

Tightening torque
- **Steering gear and linkage: 74.4—104.8 N·m {7.857—10.68 kgf·m, 54.88—77.29 ft·lbf}**
- **Pipe component: 7.8—10.8 N·m {79.6—110.0 kgf·cm, 69.1—95.5 in·lbf}**

4. Remove in the order indicated in the table.
5. Install in the reverse order of removal.
6. Inspect the front wheel alignment. (See 02–11–2 FRONT WHEEL ALIGNMENT.)



C6U213ZWC002

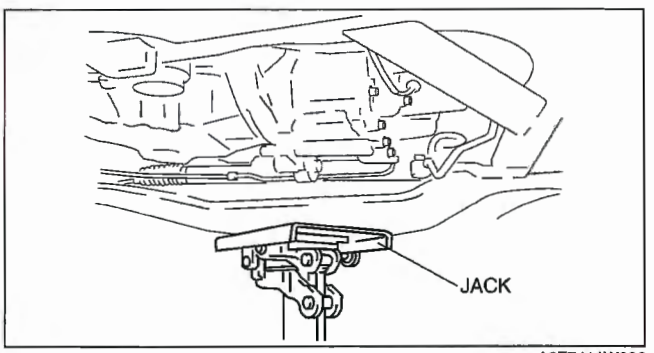
1	Nut (stabilizer control link lower side)
2	Front lower arm (rear) ball joint (See 02–13–11 Front Lower Arm (Front) Ball Joint Removal Note)
3	No.1 engine mount center bolt
4	Crossmember bracket (See 02–13–16 Crossmember Bracket Removal Note)
5	Front lower arm (rear) (See 02–13–16 Front Lower Arm (Rear) Removal Note)
6	Clip (See 02–13–17 Clip Installation Note)
7	Dust boot
8	Front lower arm (rear) bushing (See 02–13–16 Front Lower Arm (Rear) Bushing Removal Note) (See 02–13–17 Front Lower Arm (Rear) Bushing Installation Note)

Crossmember Bracket Removal Note

Warning

- **Removing the crossmember is dangerous. The crossmember component could fall and cause serious injury or death. Verify that the jack securely supports the crossmember component befo. removing the crossmember bracket.**

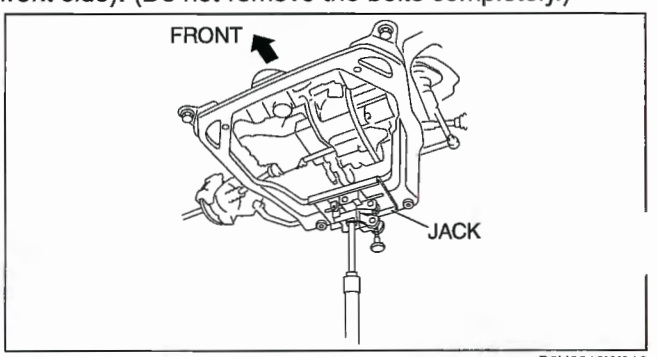
1. Support the crossmember component with a jack and remove the nuts.
2. Remove the crossmember bracket.



A6E7414W036

Front Lower Arm (Rear) Removal Note

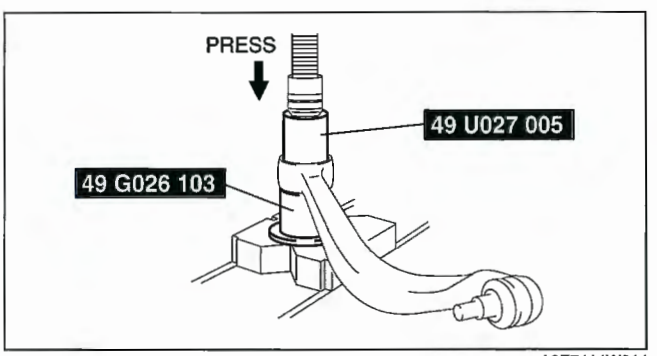
1. Support the crossmember component with a jack.
2. Loosen the crossmember component installation bolts (front side). (Do not remove the bolts completely.)
3. Remove the crossmember component installation bolts (rear side).
4. Remove the front lower arm (rear).



B6U0213W012

Front Lower Arm (Rear) Bushing Removal Note

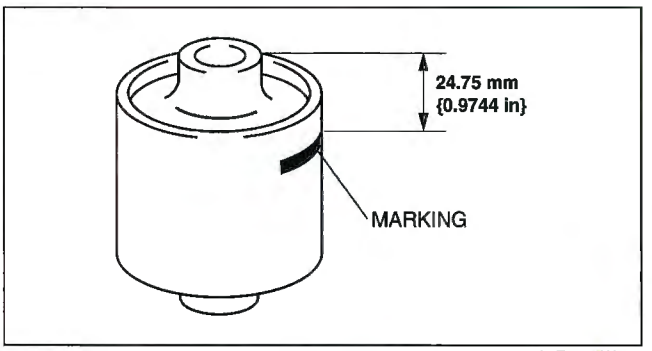
1. Press the bushing out using the **SSTs**.
2. Remove the front lower arm (rear) from the press and tap the bushing out with a hammer.



A6E7414W014

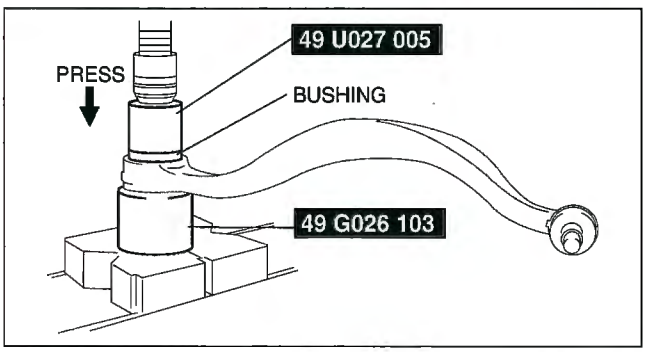
Front Lower Arm (Rear) Bushing Installation Note

1. Mark the new bushing as shown in the figure.



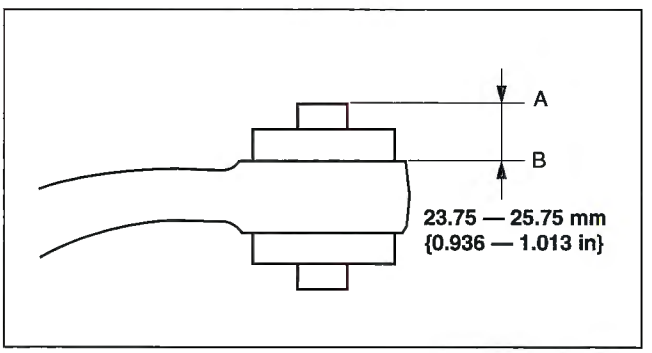
A6E7414W026

2. Press the bushing in to the marking using the **SSTs**.



A6E7414W027

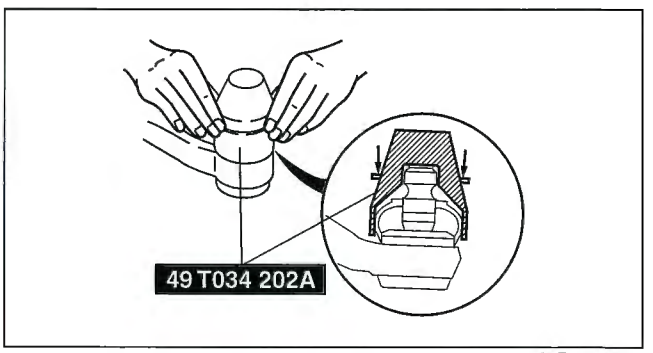
3. Verify that clearance distance A—B is **23.75—25.75 mm {0.936—1.013 in}**.



B6U0213W008

Clip Installation Note

1. Wipe the grease off the ball stud.
2. Fill the inside of the new dust boot with grease.
3. Install the boot on the ball joint.
4. Install the new clip using the **SST**.
5. Verify that the clip is installed securely to the groove.
6. Wipe away the excess grease.



A6E7414W025

nt Lower Arm (Rear) Installation Note

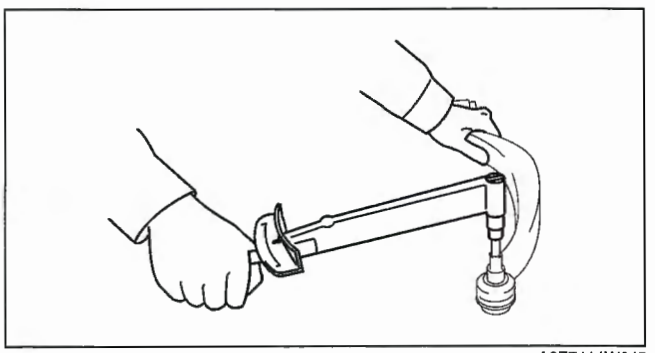
1. Install the lower arm (rear) so that identification mark (L or R) faces toward the front of the vehicle.

FRONT LOWER ARM (REAR) INSPECTION

E6U021334300W04

1. Remove the lower arm (rear) from the vehicle. (See 02–13–15 FRONT LOWER ARM (REAR) REMOVAL/INSTALLATION.)
2. Inspect for damage, cracks, and bending.
3. Inspect the ball joint rotational torque.
   (1) Rotate the ball joint five times.
   (2) Measure the rotational torque using a suitable allen socket and a torque wrench.
   - If not within the specification, replace the lower arm component.

Front lower arm (rear) ball joint rotation torque
1.00—2.22 N·m {10.2—22.6 kgf·cm, 8.86—19.6 in·lbf}



A6E7414W045

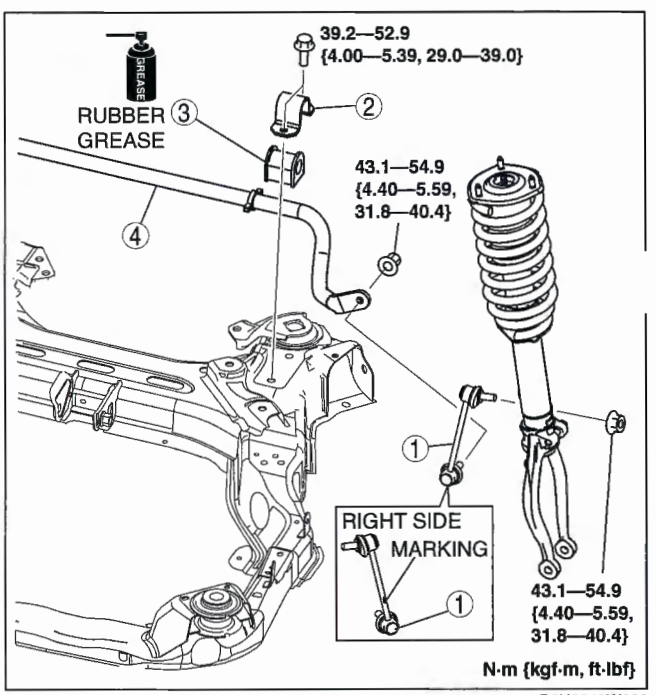
FRONT STABILIZER REMOVAL/INSTALLATION

E6U021334100W01

1. Remove the front crossmember component. (See 02–13–20 FRONT CROSSMEMBER REMOVAL/INSTALLATION.)
2. Remove in the order indicated in the table.

1	Stabilizer control link
2	Stabilizer bracket (See 02–13–18 Stabilizer Bracket Installation Note)
3	Stabilizer bushing
4	Front stabilizer

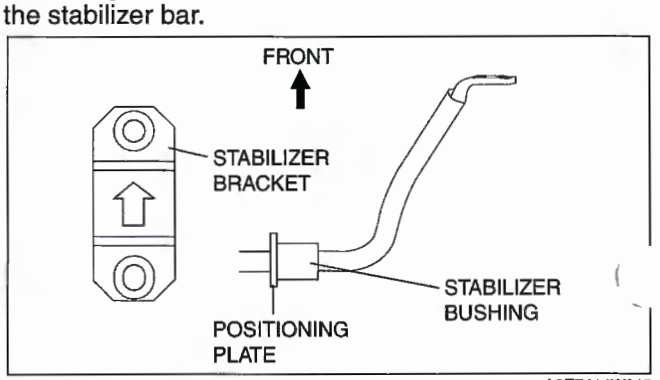
3. Install in the reverse order of removal.
4. Inspect the front wheel alignment. (See 02–11–2 FRONT WHEEL ALIGNMENT.)



B6U0213W003

Stabilizer Bracket Installation Note

1. Apply rubber grease to the inside surface of the stabilizer bushing.
2. Align the bushing with the inside of positioning plate on the stabilizer bar.
3. Install the stabilizer bracket.



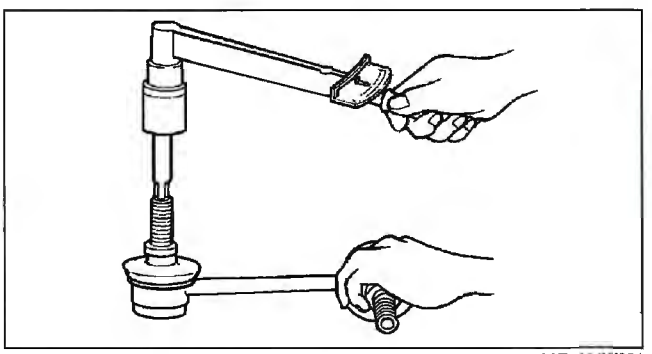
A6E7414W015

STABILIZER CONTROL LINK INSPECTION

E6U021334150W01

1. Remove the stabilizer control link from the vehicle. (See 02–13–18 FRONT STABILIZER REMOVAL/INSTALLATION.)
   Inspect for bending and damage.
2. Measure the ball joint starting torque.
   (1) Rock the ball joint stud side to side 10 times.
   (2) Rotate the ball joint stud 10 times.
   (3) Measure the starting torque using a suitable allen socket and a torque wrench.

   Front stabilzier control link ball joint starting torque
   0.2—0.8 N·m {2.1—8.1 kgf·cm, 1.8—7.0 in·lbf}



A6E7414W021

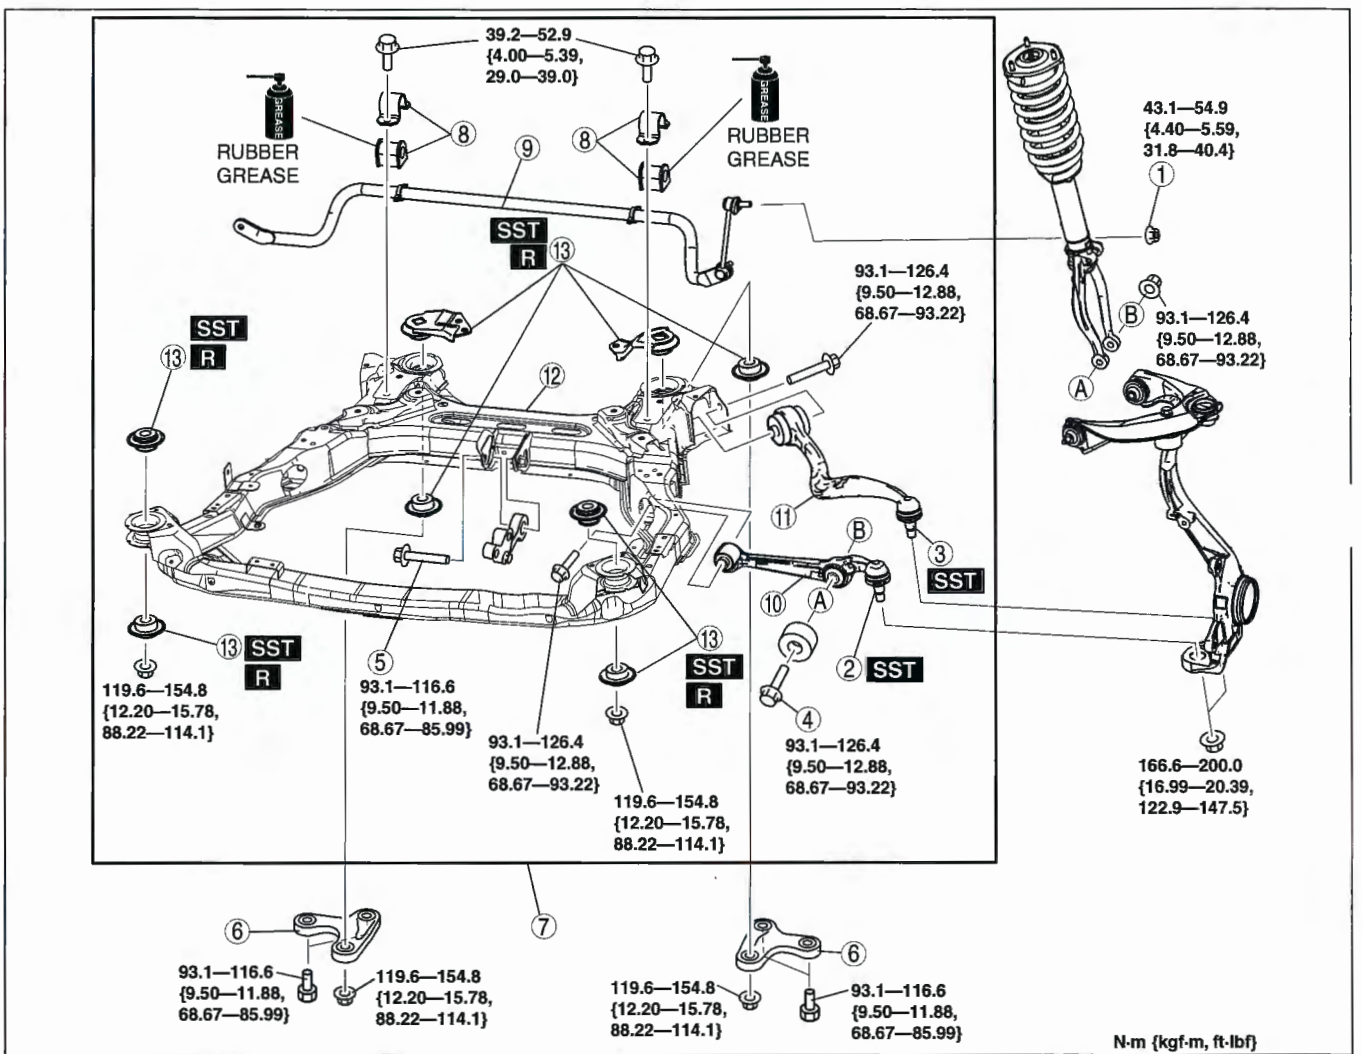
FRONT CROSSMEMBER REMOVAL/INSTALLATION

E6U021334800W01

1. Remove the under cover.
2. Remove the splash shield.
3. Remove the transverse member.
   (See 02–13–23 TRANSVERSE MEMBER REMOVAL/INSTALLATION.)
4. Remove the steering gear and linkage, and pipe component installation bolts from the front crossmember, then suspend the steering gear and linkage with a cable.

   Tightening torque
   - **Steering gear and linkage: 74.4—104.8 N·m {7.857—10.68 kgf·m, 54.88—77.29 ft·lbf}**
   - **Pipe component: 7.8—10.8 N·m {79.6—110.0 kgf·cm, 69.1—95.5 in·lbf}**

5. Remove in the order indicated in the table.
6. Install in the reverse order of removal.
7. Inspect the front wheel alignment. (See 02–11–2 FRONT WHEEL ALIGNMENT.)



B6U0213W004

1	Nut (stabilizer control link)
2	Front lower arm (front) ball joint (See 02–13–11 Front Lower Arm (Front) Ball Joint Removal Note)
3	Front lower arm (rear) ball joint (See 02–13–15 FRONT LOWER ARM (REAR) REMOVAL/INSTALLATION)
4	Bolt (front shock absorber lower side)

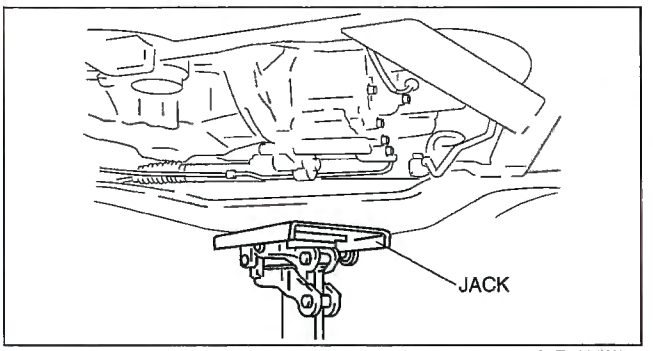
Crossmember Bracket Removal Note

Warning

- **Removing the crossmember is dangerous. The crossmember component could fall and cause serious injury or death. Verify that the jack securely supports the crossmember component before removing the crossmember bracket.**

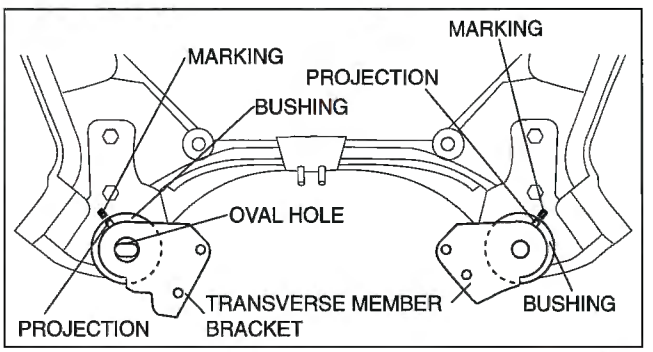
1. Support the crossmember component with a jack and remove the nuts.
2. Remove the crossmember bracket.



A6E7414W036

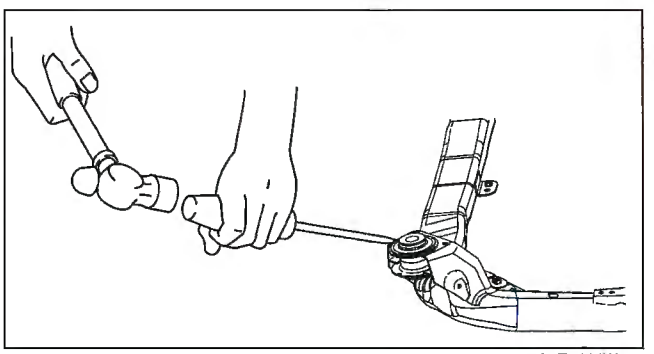
Front Crossmember Bushing Removal Note

1. Mark the crossmember as shown in the figure (rear upper side only).



A6E7414W040

2. Remove the bushings using flathead screwdriver, being careful not to damage the front crossmember.



A6E7414W032

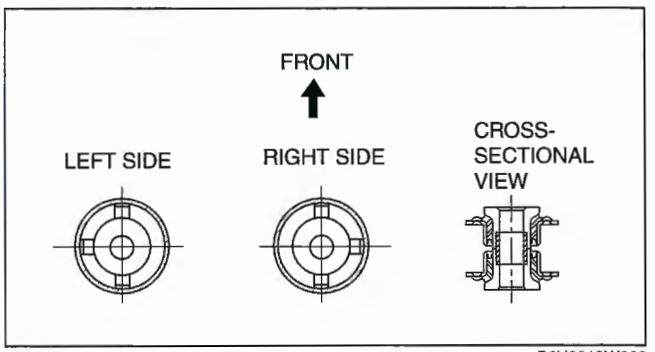
Front Crossmember Bushing Installation Note

1. Set the bushings as shown in the figure.

Note

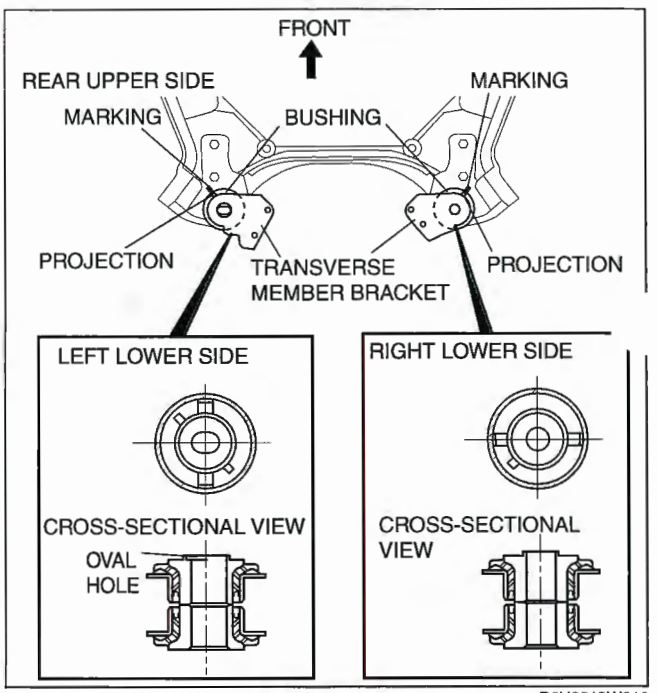
- The bushings must be installed with correct orientation as shown below, or increased noise and vibratic may result.

Front Side



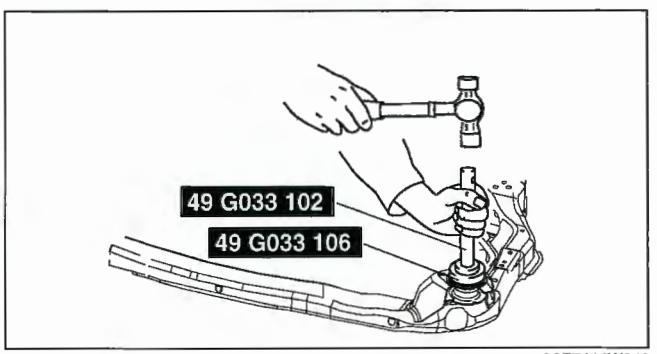
B6U0213W009

Rear Side



B6U0213W010

2. Install the bushing onto the crossmember using the **SSTs**.



A6E7414W042

TRANSVERSE MEMBER REMOVAL/INSTALLATION

1. Remove the transverse member.
2. Install the transverse member.

REAR SHOCK ABSORBER REMOVAL/INSTALLATION

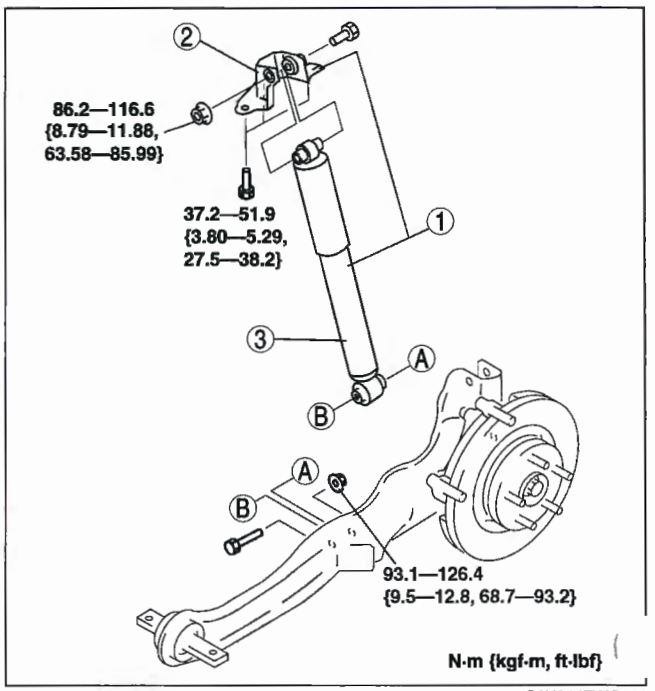
E6U021428700W01

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while servicing the vehicle.**

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.

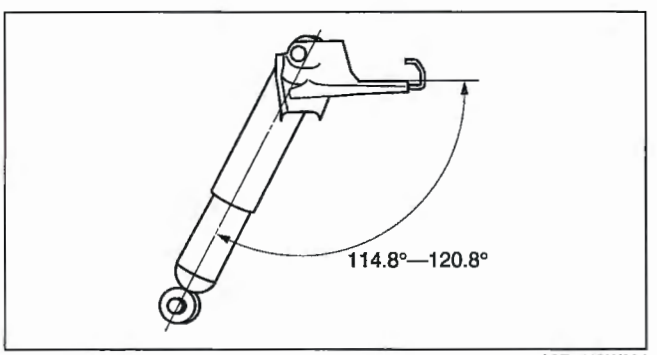
1	Rear shock absorber and bracket
2	Bracket (See 02–14–4 Bracket Installation Note)
3	Rear shock absorber



C6U214ZWC001

Bracket Installation Note

1. Install the bracket as shown in the figure.



A6E7416W024

REAR SHOCK ABSORBER INSPECTION

E6U021428700W02

1. Inspect the rear shock absorber in the same way as the front shock absorber. (See 02–13–7 FRONT SHOCK ABSORBER INSPECTION.)

REAR SHOCK ABSORBER DISPOSAL

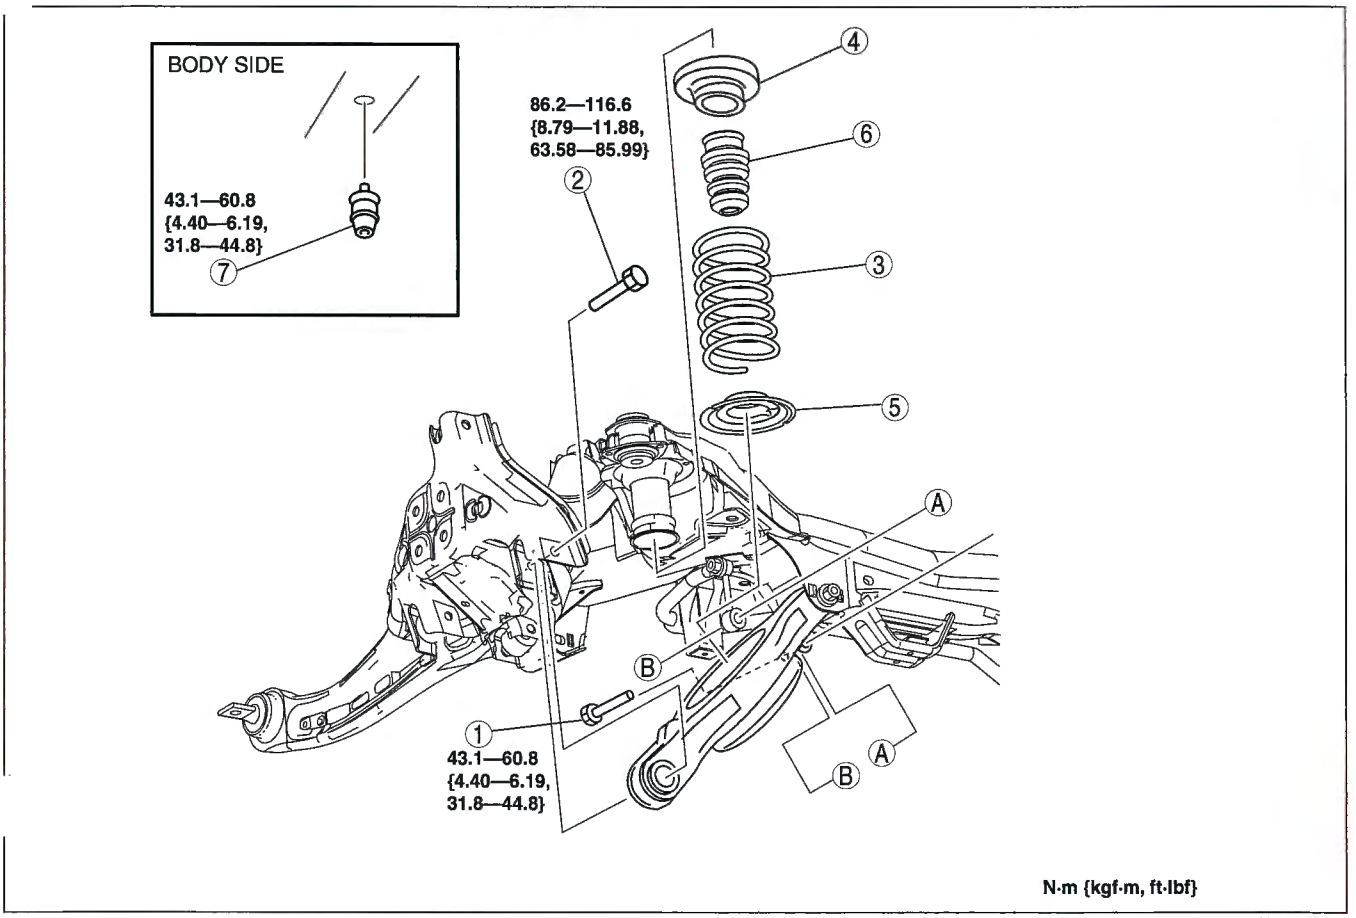
E6U021428700W03

1. Dispose the rear shock absorber in the same way as the front shock absorber. (See 02–13–7 FRONT SHOCK ABSORBER DISPOSAL.)

REAR COIL SPRING REMOVAL/INSTALLATION

E6U021428110W01

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.
   Inspect the rear wheel alignment. (See 02–11–3 REAR WHEEL ALIGNMENT.)



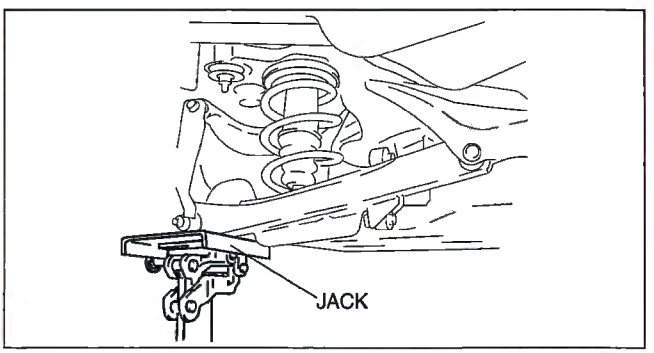
B6U0214W001

1	Bolt (stabilizer control link lower side)
2	Bolt (rear lower arm outer side) (See 02–14–5 Bolt (Rear Lower Arm Outer Side) Removal Note)
3	Rear coil spring (See 02–14–6 Rear Coil Spring Installation Note)

4	Upper spring seat rubber
5	Lower spring seat
6	Bound stopper (spring side)
7	Bound stopper (body side) (See 02–14–5 Bound Stopper (Body Side) Removal/Installation Note)

Bolt (Rear Lower Arm Outer Side) Removal Note

1. Support the lower arm with a jack.
2. Loosen the inner bolt of the lower arm.
3. Remove the outer bolt of the lower arm.



A6E7416W019

Bound Stopper (Body Side) Removal/Installation Note

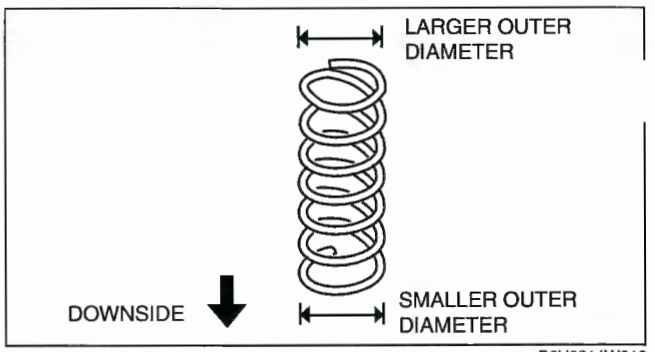
1. Remove or/and install the bound stopper (body side) using the extension bar.

Rear Coil Spring Installation Note

1. Install the coil spring so that the small outer diameter faces downside.
2. Position the jack under the lower arm and jack up slowly.

   Warning
   - **Installing the coil spring is dangerous. The coil spring could fly off, and cause serious injury or death.**

3. Install the lower arm (outer side) bolt.

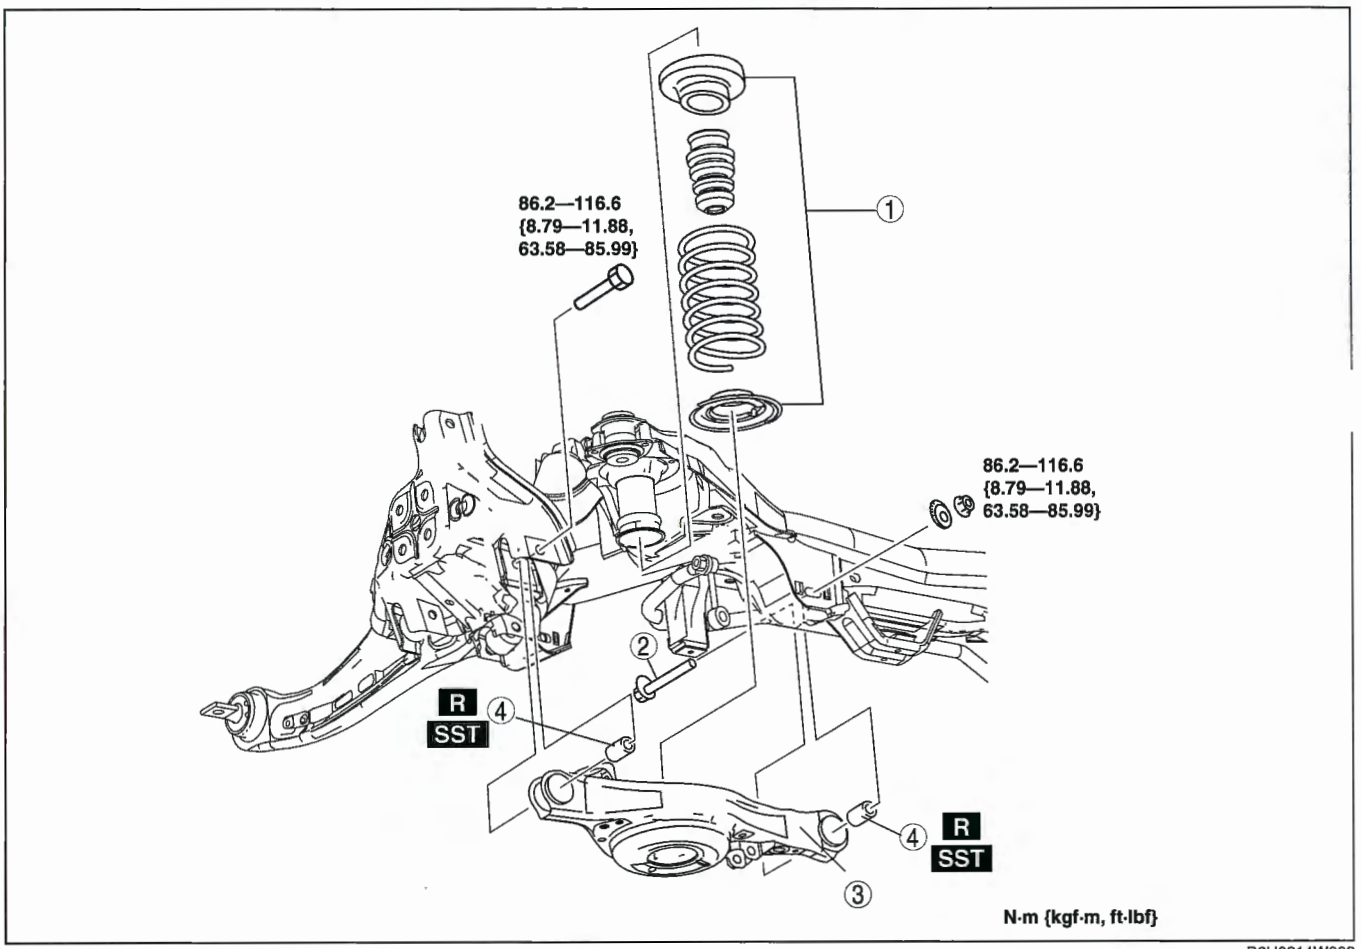


B6U0214W013

REAR LOWER ARM REMOVAL/INSTALLATION

E6U021428310W01

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.
3. Inspect the rear wheel alignment. (See 02–11–3 REAR WHEEL ALIGNMENT.)



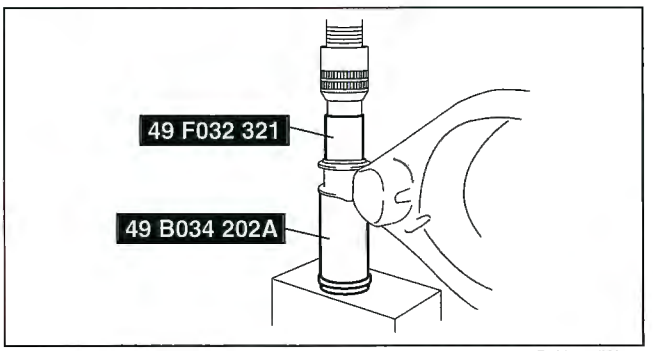
B6U0214W002

1	Rear coil spring component (See 02–14–5 REAR COIL SPRING REMOVAL/ INSTALLATION)
2	Bolt (rear lower arm inner side)
3	Rear lower arm

4	Rear lower arm bushing (See 02–14–7 Rear Lower Arm Bushing Removal Note) (See 02–14–7 Rear Lower Arm Bushing Installation Note)

Rear Lower Arm Bushing Removal Note

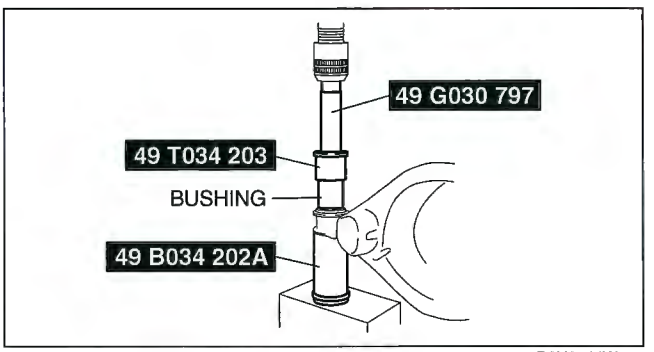
1. Press the rear lower arm bushing out using the **SSTs**.



B6U0214W006

Rear Lower Arm Bushing Installation Note

1. Press the rear lower arm bushing in using the **SSTs**.



B6U0214W008

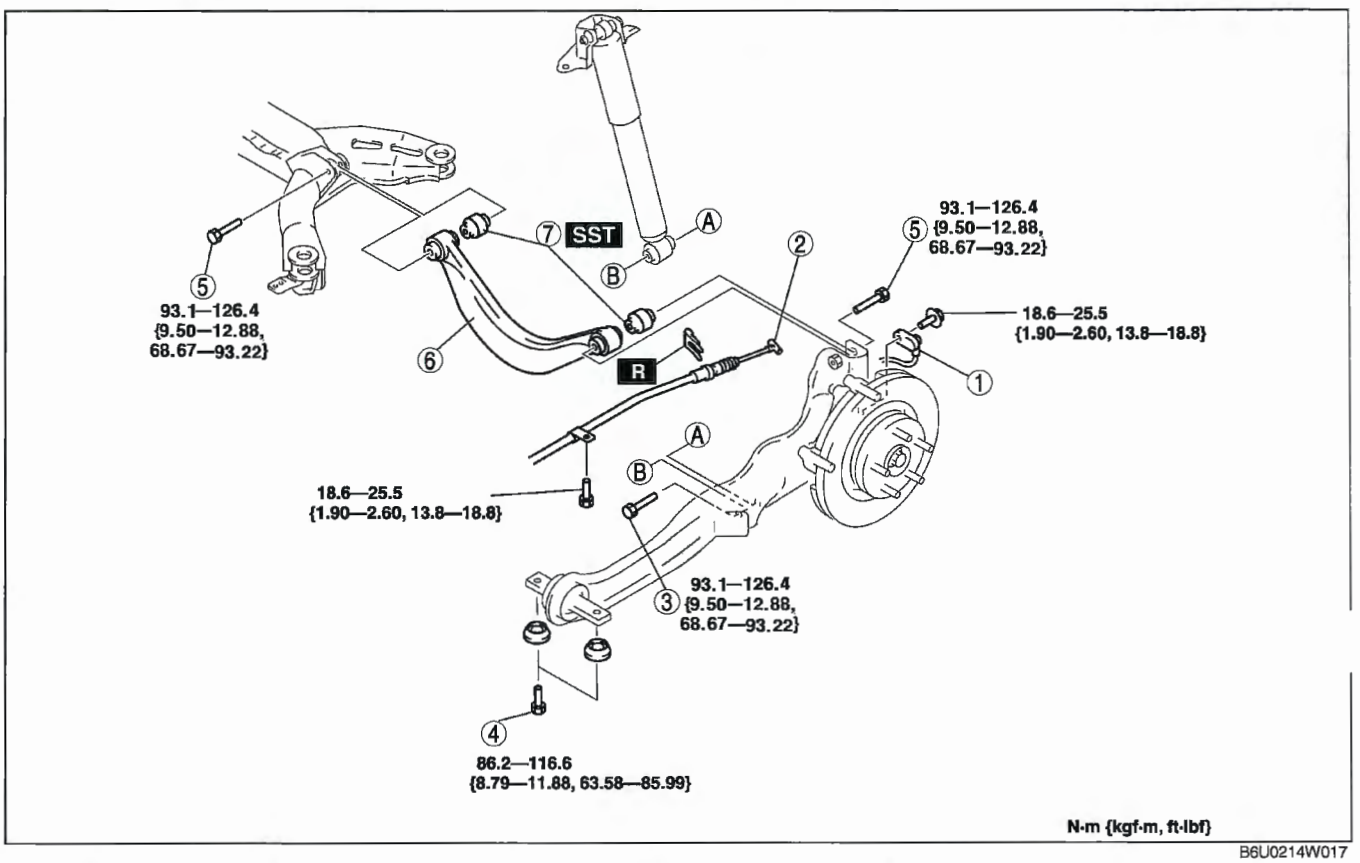
REAR UPPER ARM REMOVAL/INSTALLATION

E6U021428210W01

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while servicing the vehicle.**

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.
3. Inspect the rear wheel alignment. (See 02–11–3 REAR WHEEL ALIGNMENT.)

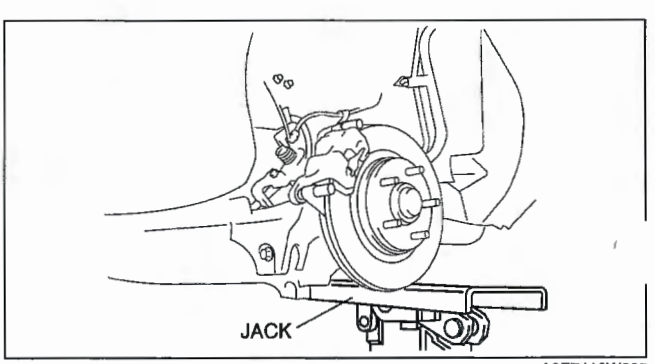


B6U0214W017

1	ABS wheel-speed sensor
2	Parking brake cable
3	Bolt (rear shock absorber lower side) (See 02–14–8 Bolt (Rear Shock Absorber Lower Side) Removal Note)
4	Bolt (trailing link front side)
5	Bolt (rear upper arm) (See 02–14–9 Bolt (Rear Upper Arm) Removal Note)
6	Rear upper arm
7	Rear upper arm bushing (See 02–14–9 Rear Upper Arm Bushing Removal Note) (See 02–14–9 Rear Upper Arm Bushing Installation Note)

Bolt (Rear Shock Absorber Lower Side) Removal Note

1. Support the trailing link with a jack.



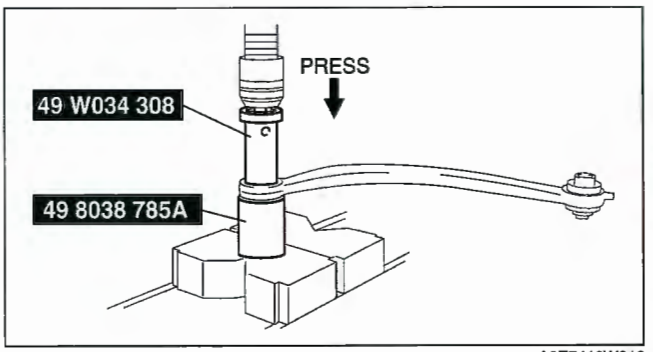
A6E7416W005

Bolt (Rear Upper Arm) Removal Note

1. Loosen the bolts on the inner and outer side of the lateral link.

ar Upper Arm Bushing Removal Note

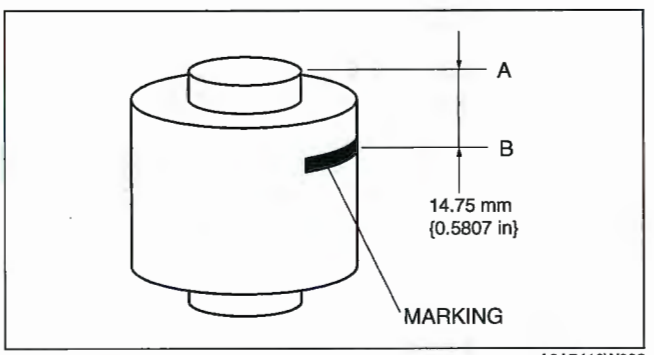
Press the upper arm bushing out using the **SSTs.**



A6E7416W010

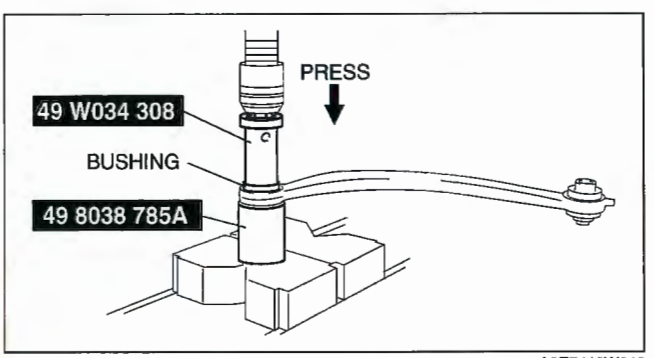
Rear Upper Arm Bushing Installation Note

1. Mark the new bushing as shown in the figure.



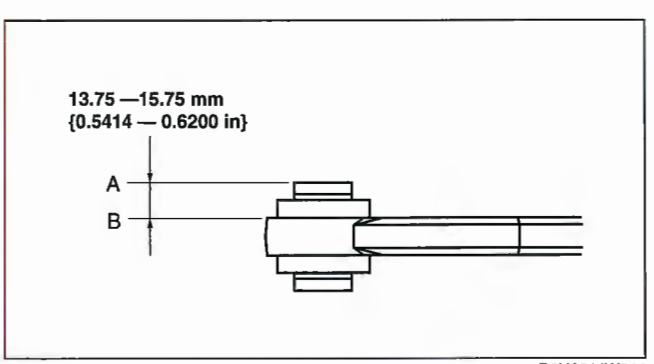
A6A7416W002

Press the bushing in to the marking using the **SSTs.**



A6E7416W012

3. Verify that clearance distance A—B is **13.75—15.75 mm {0.5414—0.6200 in}**.

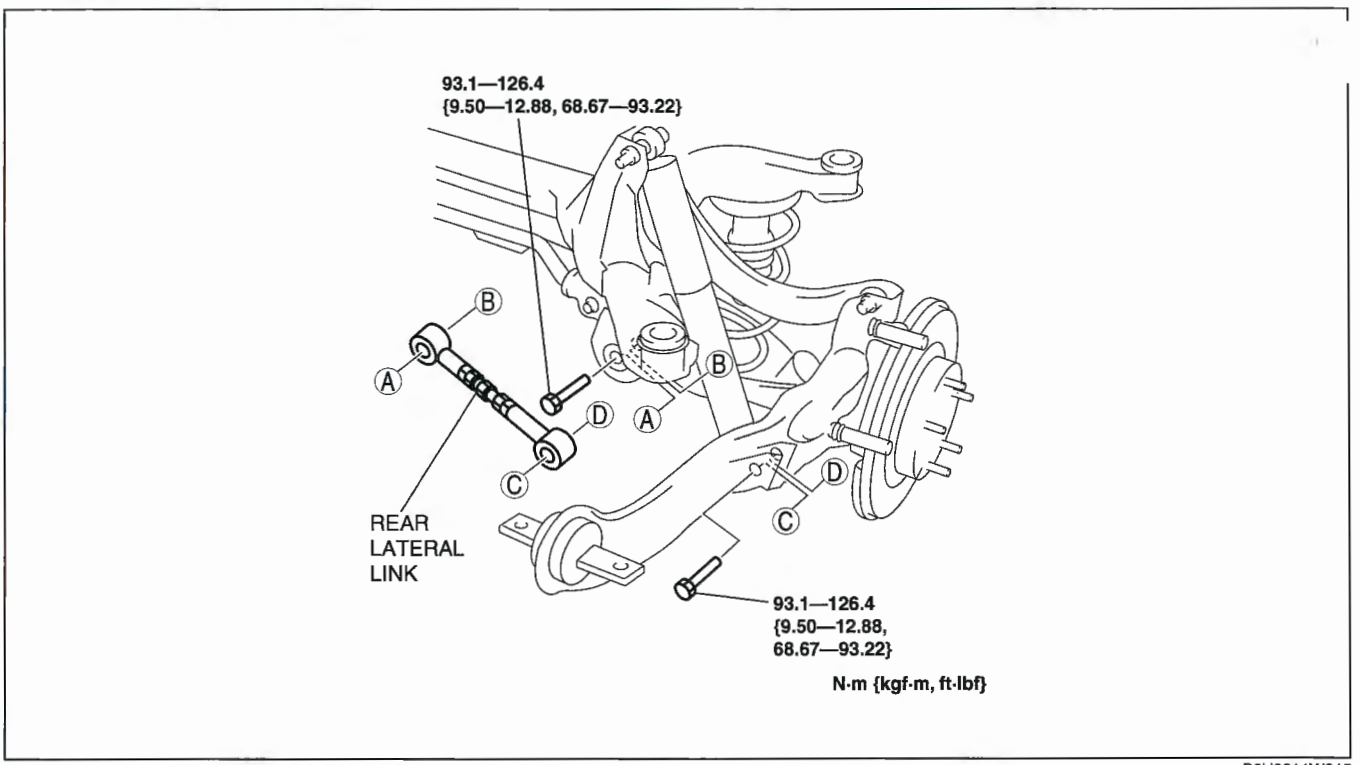


B6U0214W011

REAR LATERAL LINK REMOVAL/INSTALLATION

E6U021428600W01

1. Remove the rear lateral link.

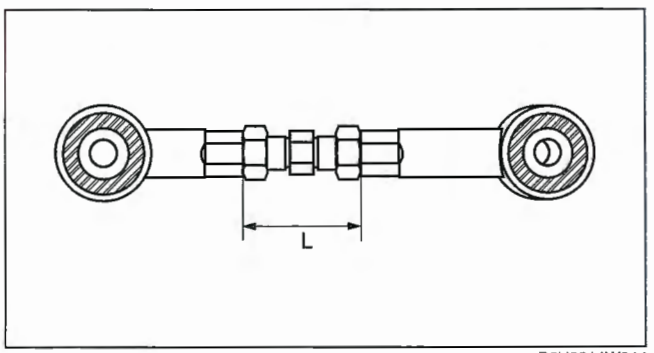


B6U0214W015

Caution

- **When working near left rear suspension, avoid any impact to the fuel tank.**

2. Measure the length L shown in the figure for proper installation.
3. Temporarily loosen a locknut of the rear lateral link.
4. Install the rear lateral link.
5. Inspect the rear wheel alignment. (See 02–11–3 REAR WHEEL ALIGNMENT.)

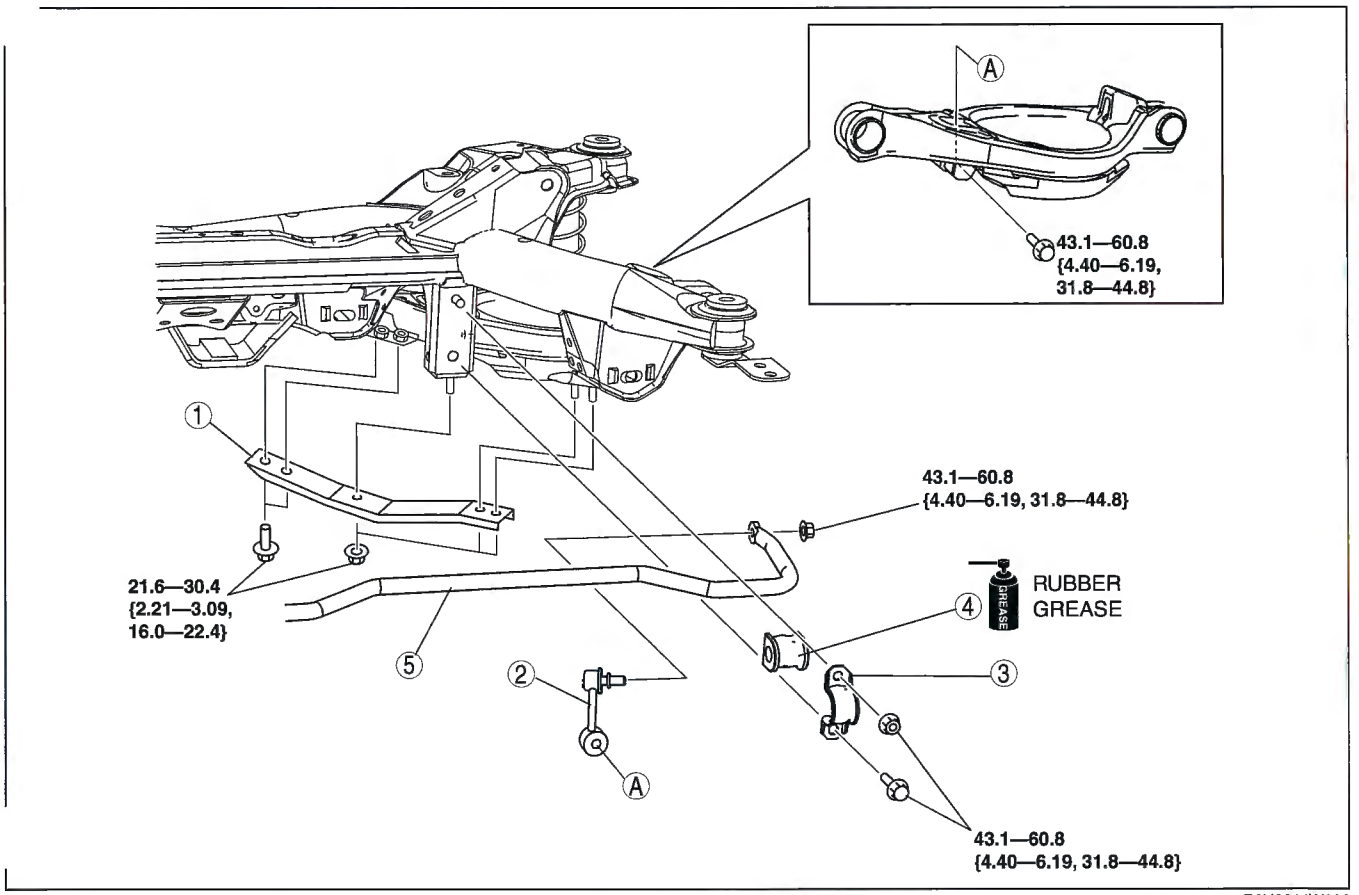


B6U0214W014

REAR STABILIZER REMOVAL/INSTALLATION

E6U021428100W01

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.



B6U0214W003

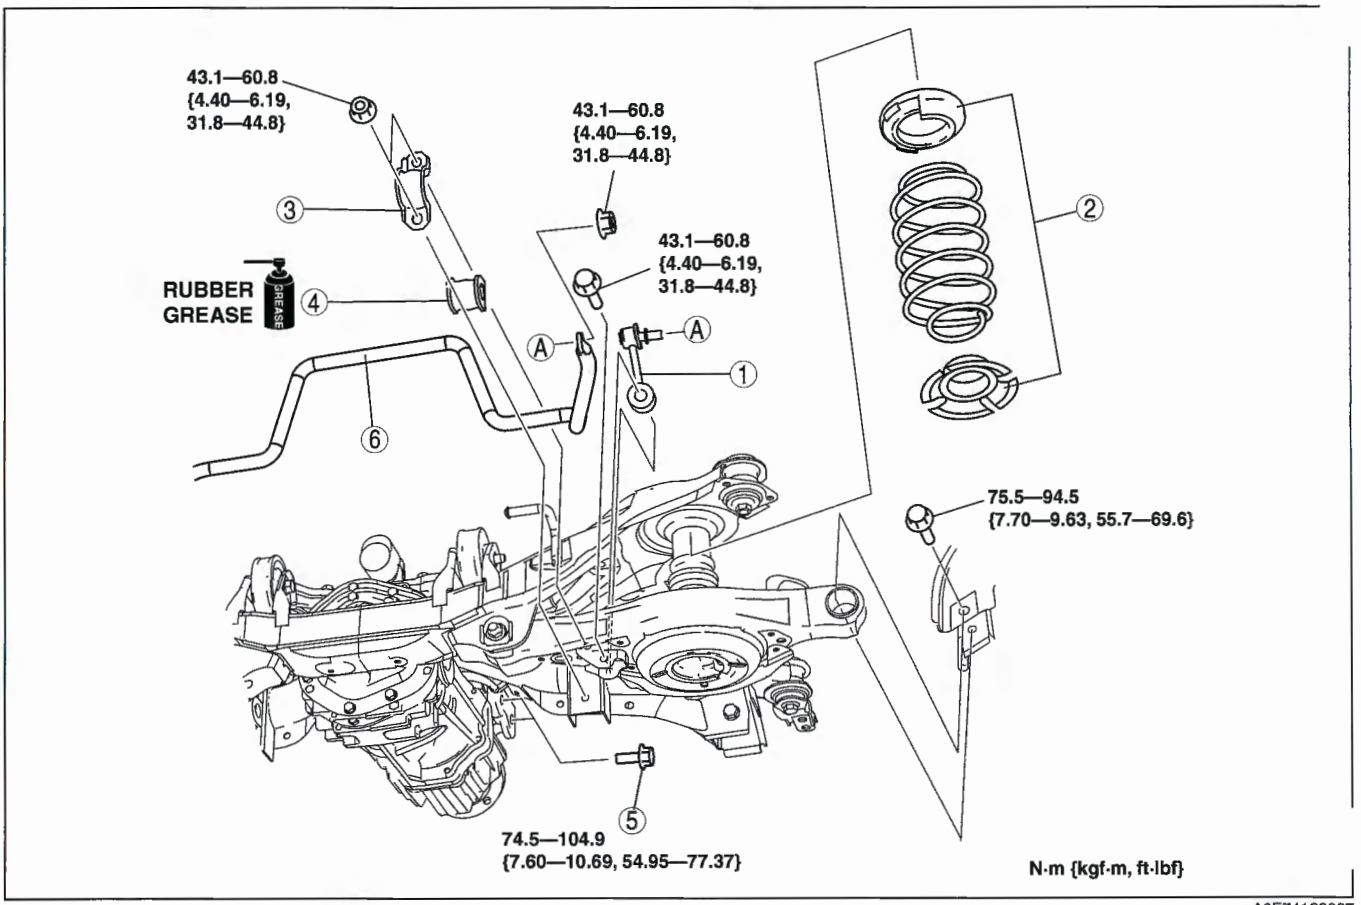
1	Side bracket member
2	Stabilizer control link
3	Stabilizer bracket

4	Bushing
5	Rear stabilizer

REAR STABILIZER REMOVAL/INSTALLATION [AWD]

E6U021428100W02

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.



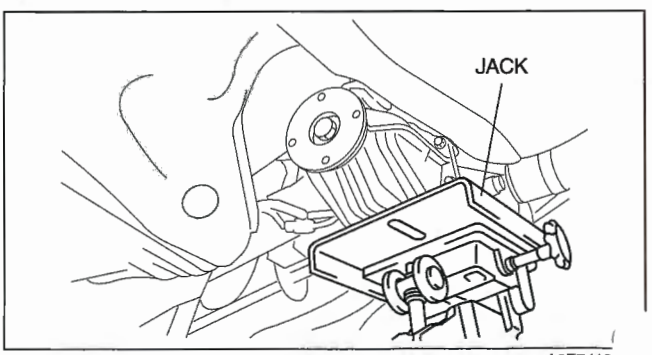
A6E74162007

1	Stabilizer control link
2	Coil spring component (One side only)
3	Stabilizer bracket
4	Bushing

5	Bolt (Differential front side) (See 02–14–12 Bolt (Differential Front Side) Removal Note.) (See 02–14–13 Bolt (Differential Front Side) Installation Note.)
6	Rear stabilizer

Bolt (Differential Front Side) Removal Note

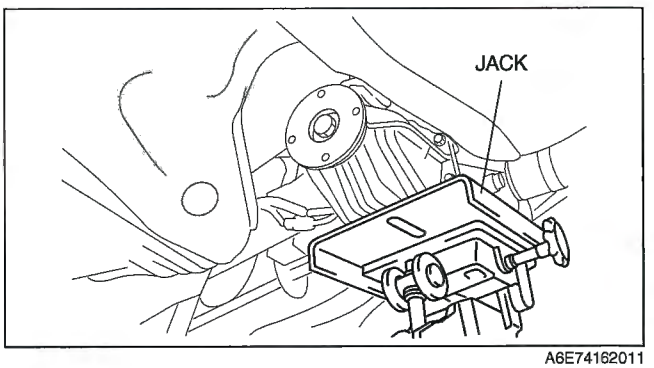
1. Disconnect differential oil temperature sensor connector and 4WD solenoid connector.
2. Support the differential with a jack as shown in the figure.
3. Remove the bolt.



A6E7416

Bolt (Differential Front Side) Installation Note

1. Support the differential with a jack, and then install the bolt.
   Connect differential oil temperature sensor connector and 4WD solenoid connector.



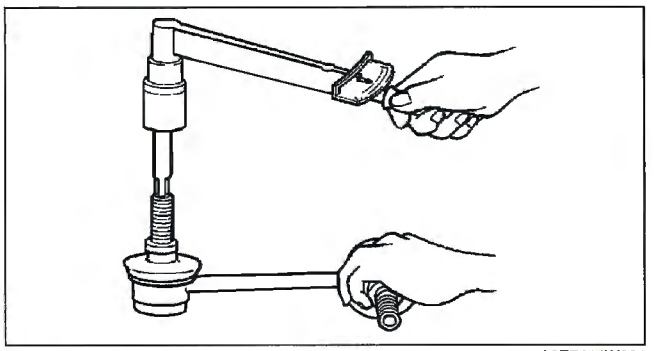
A6E74162011

STABILIZER CONTROL LINK INSPECTION

E6U021434150W01

1. Remove the stabilizer control link from the vehicle. (See 02–14–11 REAR STABILIZER REMOVAL/INSTALLATION.)
2. Inspect for bending and damage.
3. Measure the ball joint starting torque.
   (1) Rock the ball joint stud side to side 10 times.
   (2) Rotate the ball joint stud 10 times.
   (3) Measure the starting torque using a suitable Allen socket and a torque wrench.

   Rear stabilzier control link ball joint starting torque
   0.2—0.8 N·m {2.1—8.1 kgf·cm, 1.8—7.0 in·lbf}



A6E7414W021

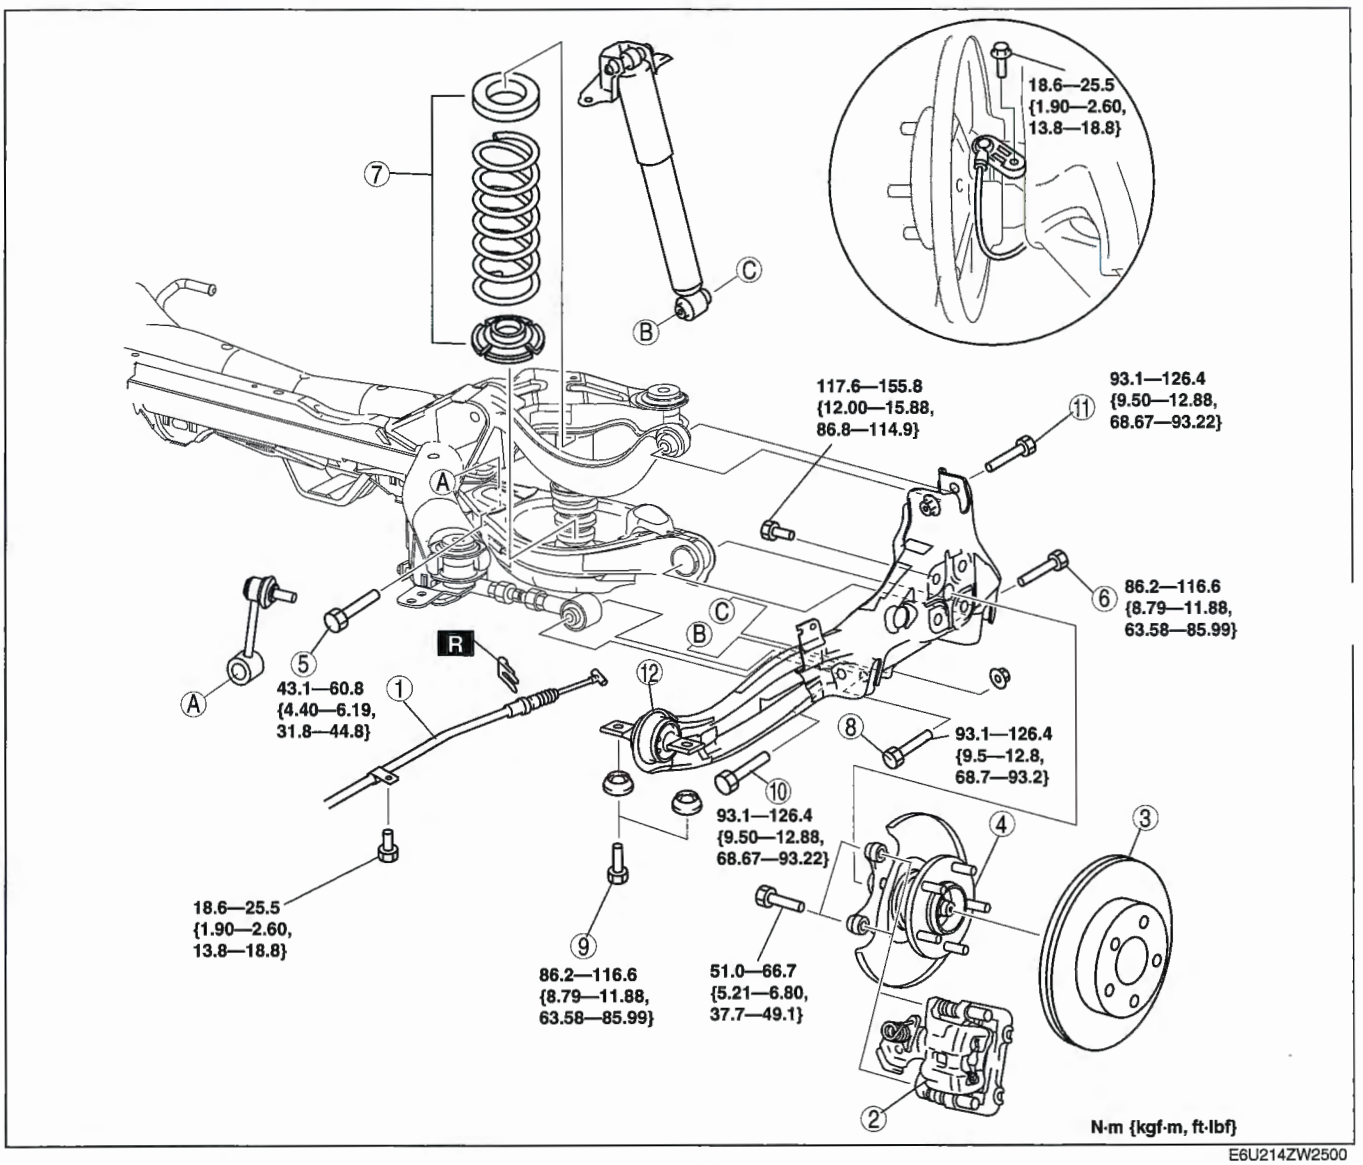
TRAILING LINK REMOVAL/INSTALLATION

E6U021428200W01

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while servicing the vehicle.**

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.
3. Inspect the rear wheel alignment. (See 02–11–3 REAR WHEEL ALIGNMENT.)



E6U214ZW2500

1	Parking brake cable
2	Caliper component (See 02–14–15 Caliper Component Removal Note)
3	Disc plate
4	Spindle and hub component (See 03–12–2 WHEEL HUB, HUB SPINDLE REMOVAL/INSTALLATION)
5	Bolt (stabilizer control link lower side)
6	Bolt (rear lower arm outer side) (See 02–14–5 Bolt (Rear Lower Arm Outer Side) Removal Note)

7	Spring component
8	Bolt (rear shock absorber lower side)
9	Bolt (trailing link front side) (See 02–14–15 Bolt (Trailing Link Front Side) Removal Note) (See 02–14–15 Bolt (Trailing Link Front Side) Installation Note)
10	Bolt (rear lateral link outer side) (See 02–14–15 Bolt (Rear Lateral Link Outer Side Removal Note)
11	Bolt (rear upper arm outer side)
12	Trailing link

Caliper Component Removal Note

1. Suspend the caliper aside with cable.

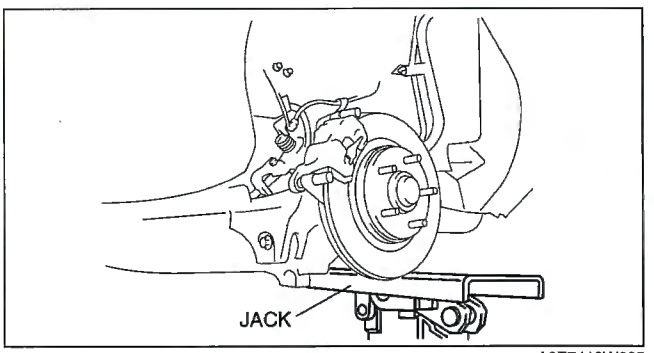
lt (Trailing Link Front Side) Removal Note

. Support the trailing link with a jack.

Caution

- **Removing the trailing link is dangerous. The trailing link could fall and cause serious injury or death. Verify that the jack securely supports the trailing link.**

2. Remove the bolts (trailing link front side).



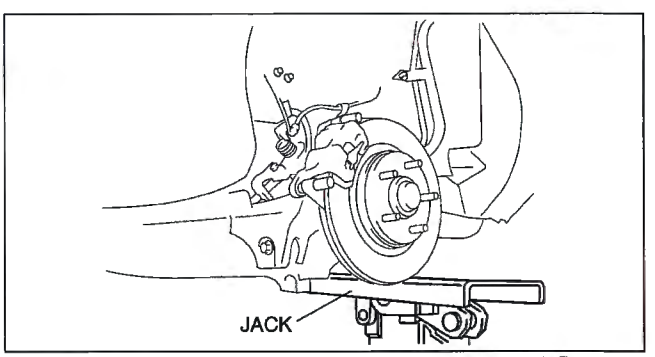
A6E7416W005

Bolt (Rear Lateral Link Outer Side) Removal Note

1. Loosen the bolt (lateral link inner side).
2. Remove the bolt (lateral link outer side).

Bolt (Trailing Link Front Side) Installation Note

1. Support the trailing link with a jack.
2. Tighten the bolts (trailing link front side).



A6E7416W005

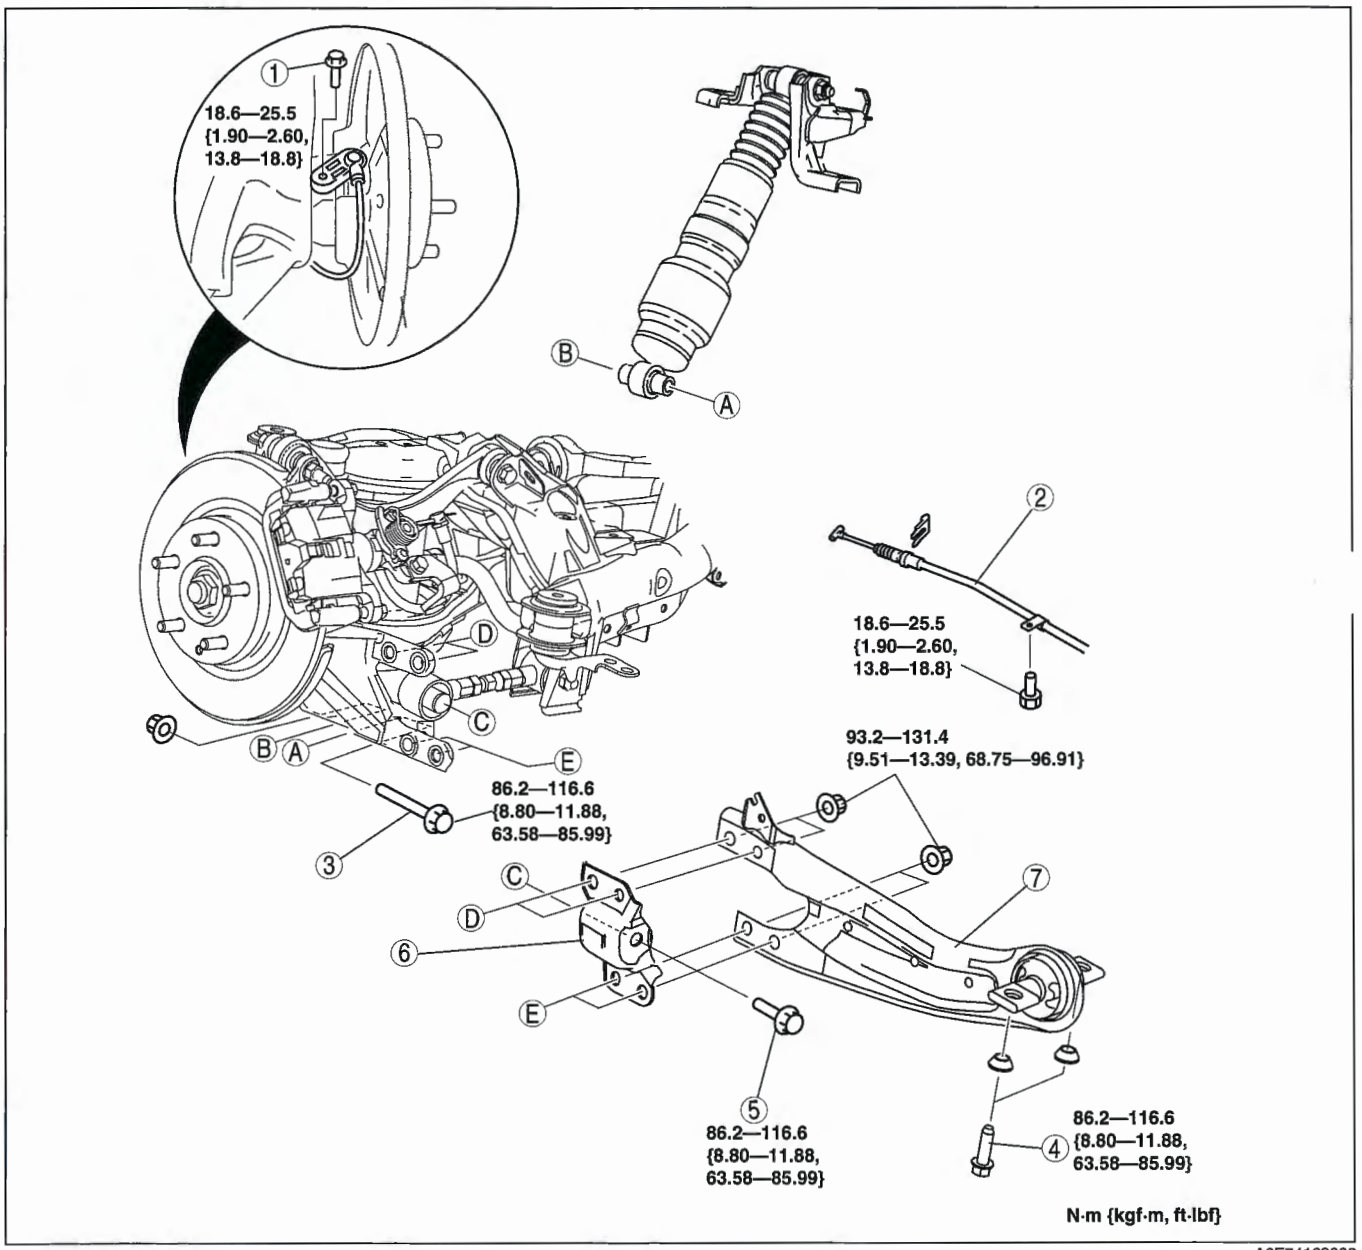
TRAILING LINK REMOVAL/INSTALLATION [AWD]

E6U021428200W02

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while servicing the vehicle.**

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.
3. Inspect the rear wheel alignment.
   (See 02–11–3 REAR WHEEL ALIGNMENT.)



A6E74162008

1	ABS wheel-speed sensor
2	Parking brake cable
3	Bolt (shock absorber lower side)
4	Bolt (trailing link front side) (See 02–14–17 Bolt (Trailing Link Front Side) Removal Note.) (See 02–14–17 Bolt (Trailing Link Front Side) Installation Note.)
5	Bolt (Lateral link outer side) (See 02–14–17 Bolt (Lateral Link Outer Side) Removal Note.) (See 02–14–17 Bolt (Lateral Link Outer Side) Installation Note.)
6	Toe link bracket
7	Trailing link

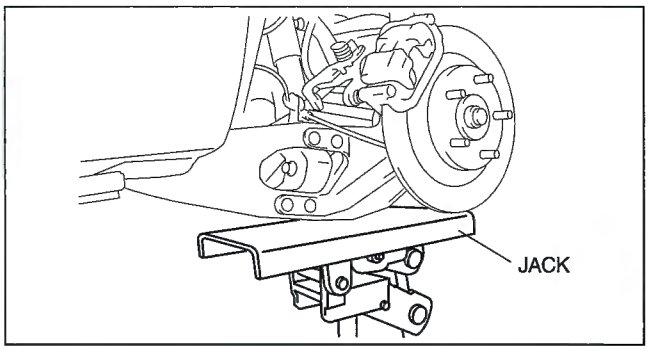
Bolt (Trailing Link Front Side) Removal Note

1. Support the trailing link with a jack.

Caution

- **Removing the trailing link is dangerous. The trailing link could fall and cause serious injury or death. Verify that the jack securely supports the trailing link.**

2. Remove the bolts (trailing link front side).



A6E74162010

Bolt (Lateral Link Outer Side) Removal Note

1. Loosen the bolt (lateral link inner side).
2. Remove the bolt (lateral link outer side).

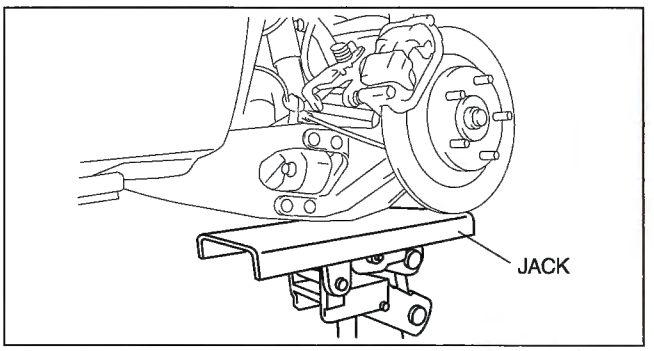
Bolt (Lateral Link Outer Side) Installation Note

1. Tighten the bolt (lateral link outer side).
2. Tighten the bolt (lateral link inner side).

Tightening torque
86.2—116.6 N·m {8.80—11.88 kgf·m, 63.58—85.99 ft·lbf}

Bolt (Trailing Link Front Side) Installation Note

1. Support the trailing link with a jack.
2. Tighten the bolts (trailing link front side).



A6E74162010

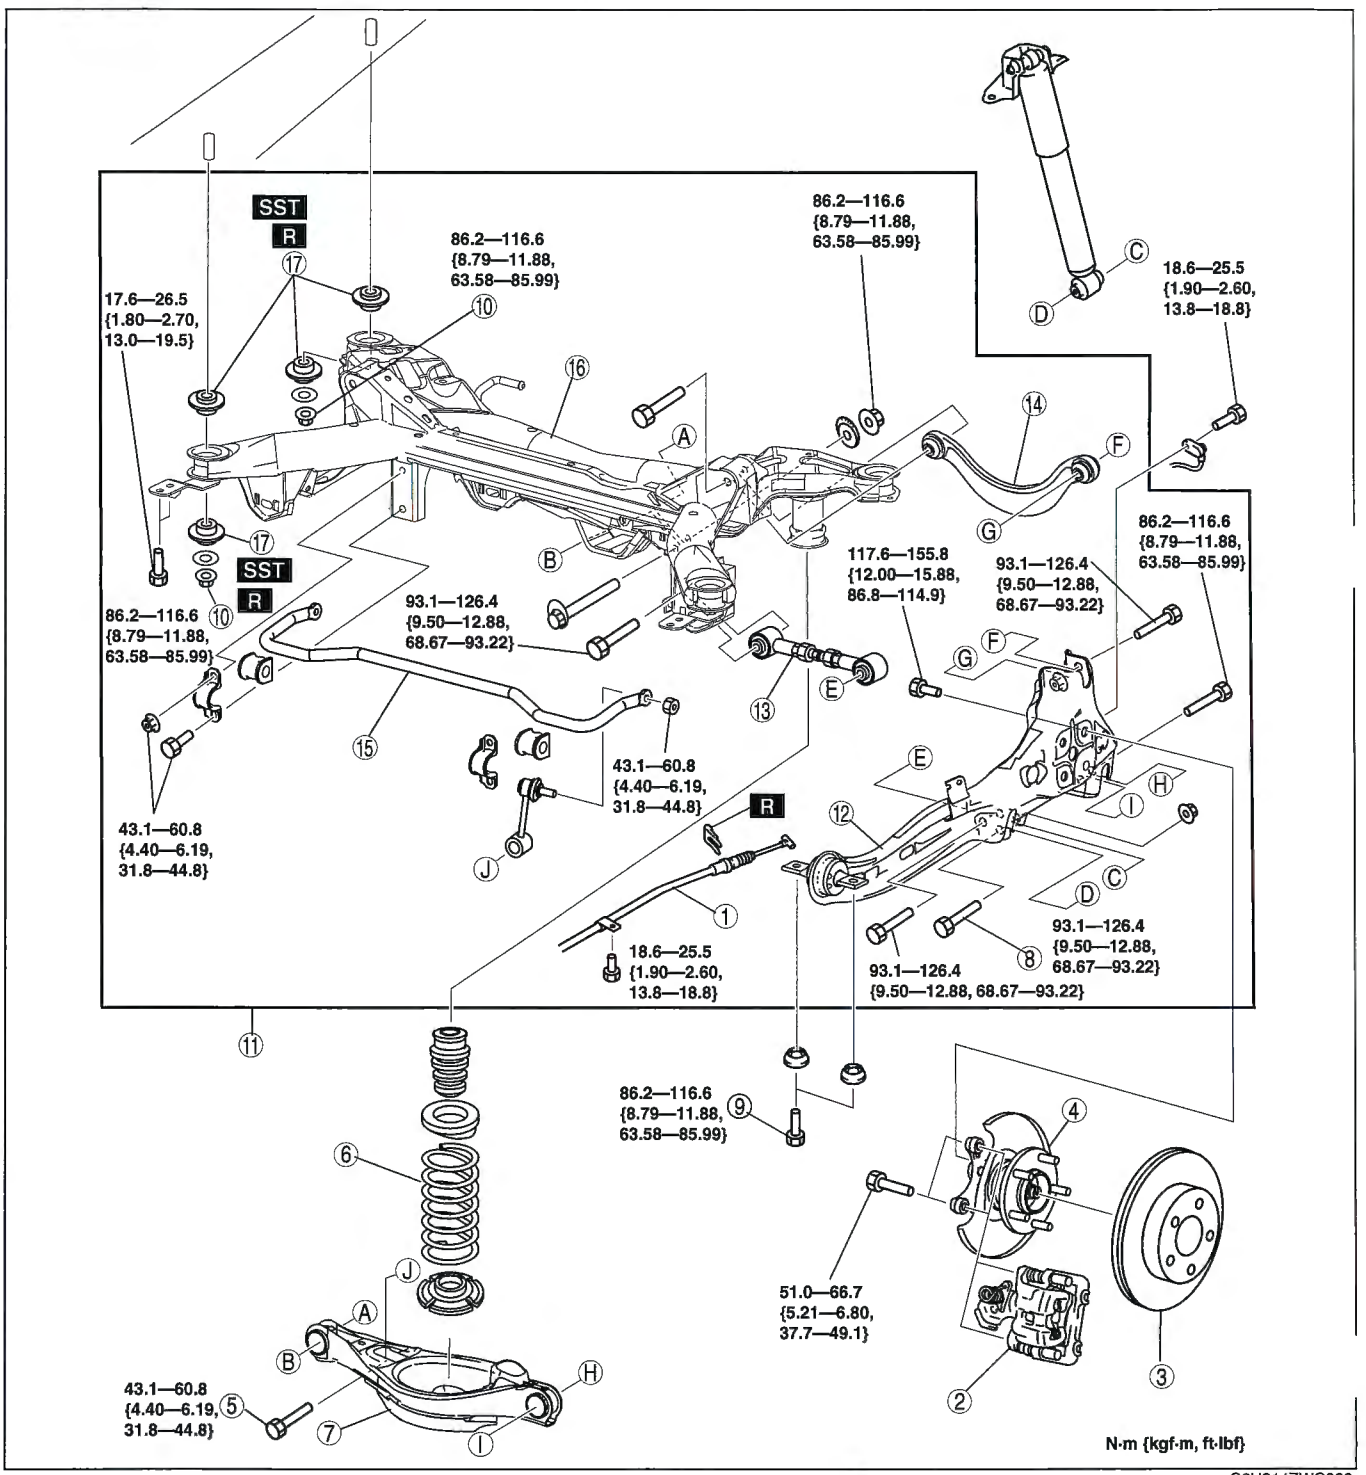
REAR CROSSMEMBER REMOVAL/INSTALLATION

E6U021428400W01

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while servicing the vehicle.**

1. Remove the pre-silencer. (See 01–15A–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3].) (See 01–15C–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [AJ].)
2. Remove in the order indicated in the table.
3. Install in the reverse order of removal.
4. Inspect the rear wheel alignment. (See 02–11–3 REAR WHEEL ALIGNMENT.)



C6U214ZWC003

1	Parking brake cable
2	Caliper component (See 02–14–19 Caliper Component Removal Note)
3	Disc plate
4	Spindle and hub component (See 03–12–2 WHEEL HUB, HUB SPINDLE REMOVAL/INSTALLATION)
5	Bolt (stabilizer control link)
6	Rear coil spring (See 02–14–5 REAR COIL SPRING REMOVAL/INSTALLATION)
7	Rear lower arm (See 02–14–6 REAR LOWER ARM REMOVAL/INSTALLATION)
8	Bolt (rear shock absorber lower side)
9	Bolt (trailing link front side) (See 02–14–19 Bolt (Trailing Link Front Side) Removal Note) (See 02–14–20 Bolt (Trailing Link Front Side) Installation Note)
10	Nut (crossmember)
11	Crossmember component (See 02–14–19 Crossmember Component Removal Note)
12	Trailing link
13	Rear lateral link

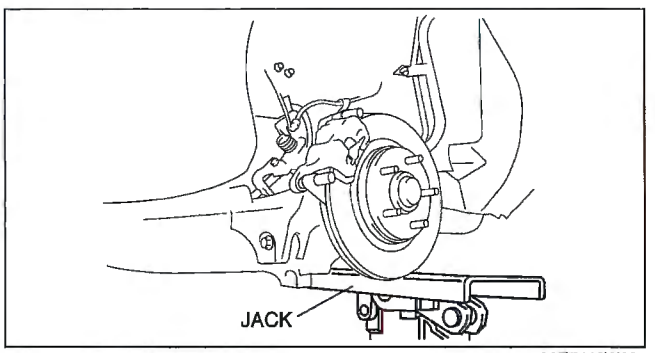
15	Rear stabilizer
16	Rear crossmember
17	Rear crossmember bushing (See 02–14–20 Rear Crossmember Bushing Removal Note) (See 02–14–20 Rear Crossmember Bushing Installation Note)

Caliper Component Removal Note

1. Remove the caliper, and suspend it aside with cable.

Bolt (Trailing Link Front Side) Removal Note

1. Support the trailing link with a jack.
2. Loosen the bolt (lateral link inner side).



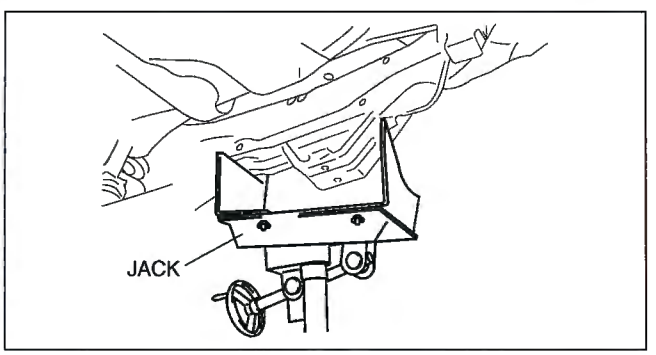
A6E7416W005

Crossmember Component Removal Note

Warning

- **Removing the crossmember is dangerous. The crossmember component could fall and cause serious injury or death. Verify that the jack securely supports the crossmember component.**

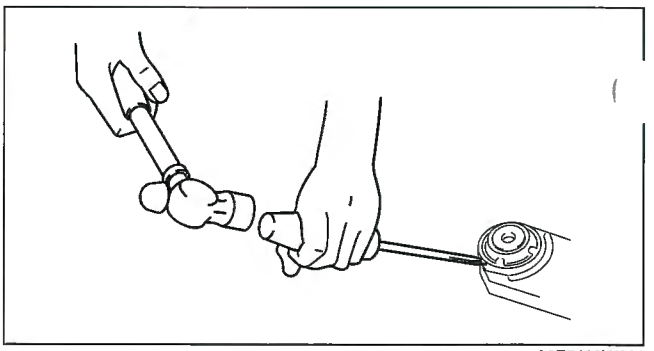
1. Support the crossmember component using a jack and remove the nuts.
2. Remove the crossmember component.



A6E7416W014

Rear Crossmember Bushing Removal Note

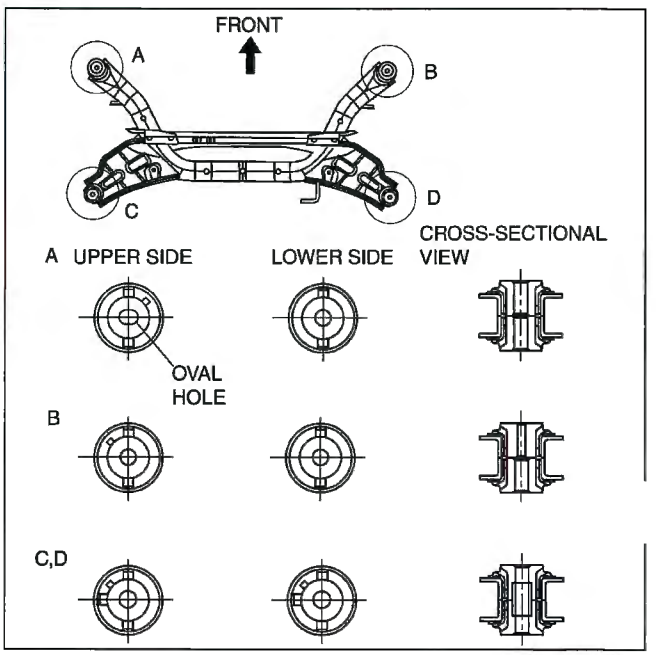
1. Remove the bushing using a flathead screwdriver, being careful not to damage the rear crossmember.



A6E7416W001

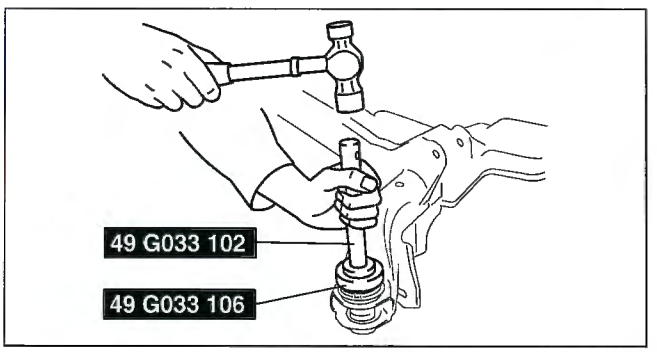
Rear Crossmember Bushing Installation Note

1. Set the bushings as shown in the figure.



A6E7416W021

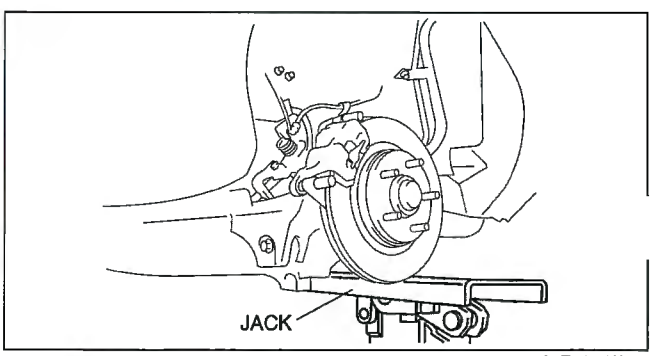
2. Tap the bushing onto the rear crossmember using the **SSTs**.



A6E7416W002

Bolt (Trailing Link Front Side) Installation Note

1. Support the trailing link with a jack.
2. Tighten the bolts (trailing link front side).



A6E7416W005

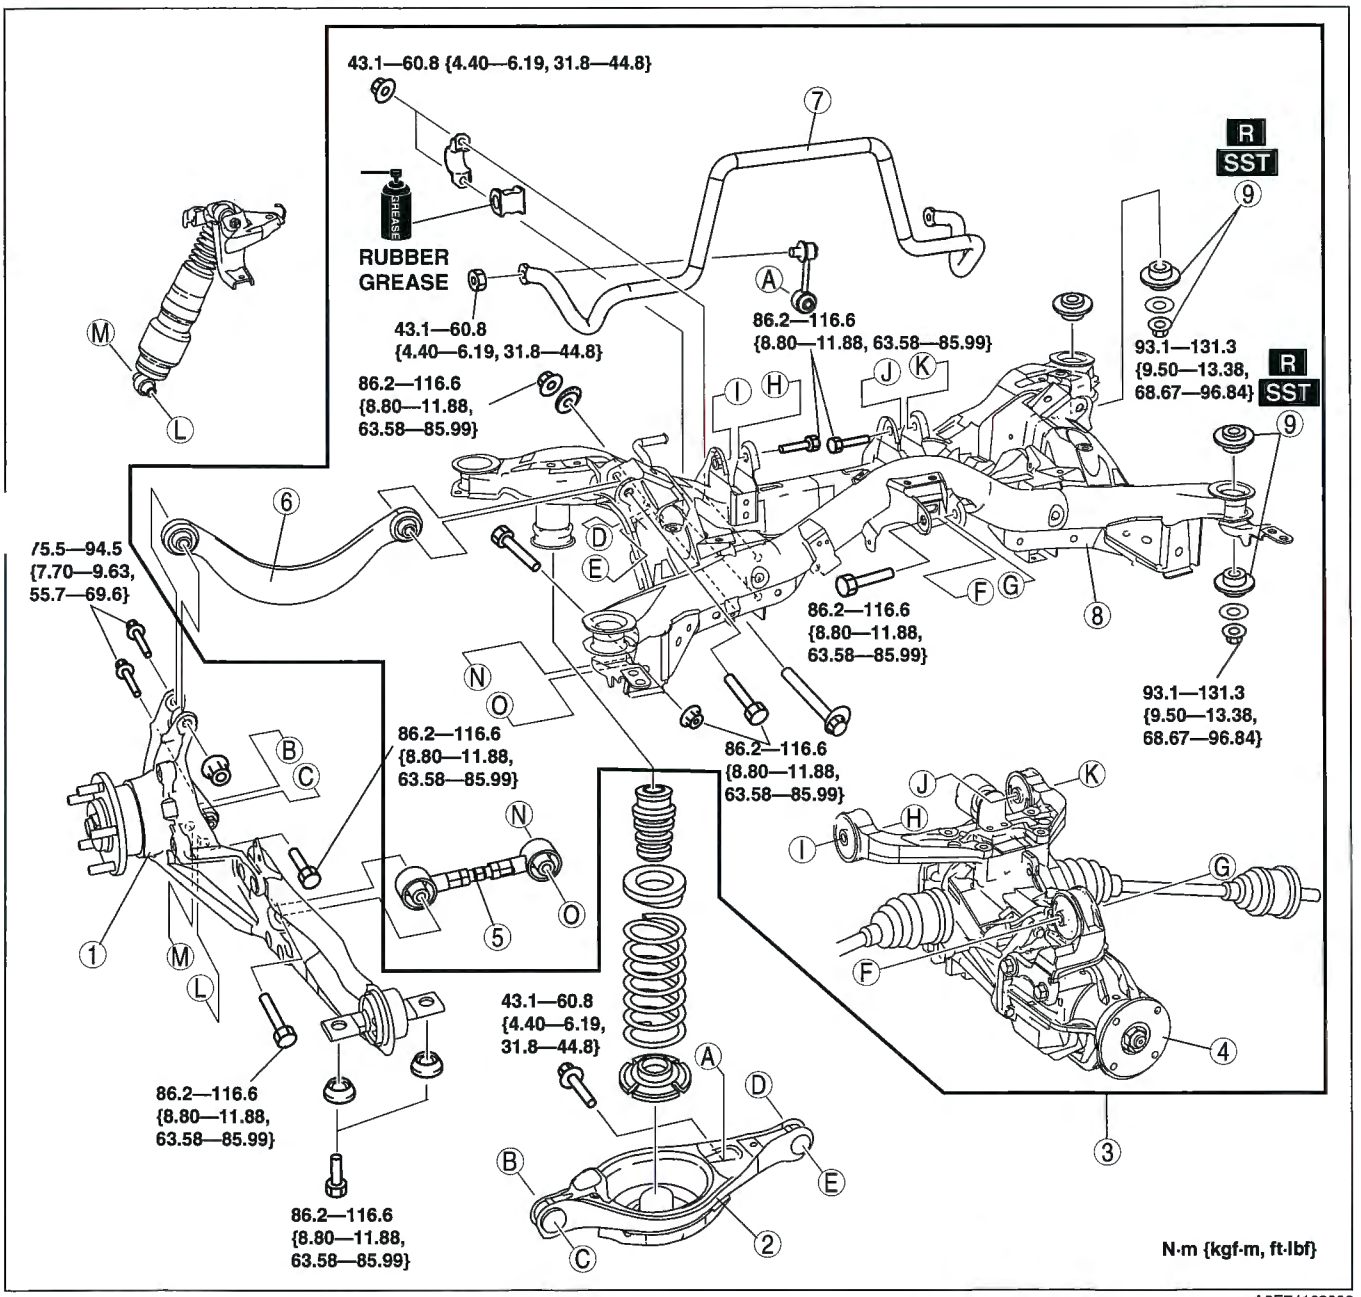
REAR CROSSMEMBER REMOVAL/INSTALLATION [AWD]

E6U021428400W02

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while servicing the vehicle.**

1. Remove the middle pipe.
   (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
2. Remove in the order indicated in the table.
3. Install in the reverse order of removal.
4. Inspect the rear wheel alignment.
   (See 02–11–3 REAR WHEEL ALIGNMENT.)



A6E74162009

1	Trailing link, knuckle component (See 03–12–5 WHEEL HUB, KNUCKLE REMOVAL/INSTALLATION [AWD].)
2	Rear lower arm

3	Crossmember component, differential and drive shaft (See 02–14–22 Crossmember component, Differential And Drive Shaft Removal Note.)
4	Differential and drive shaft

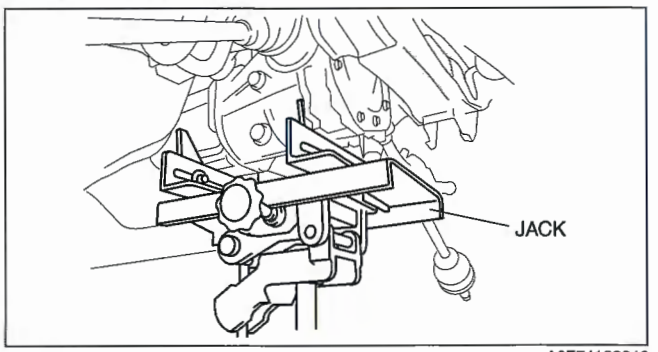
5	Rear lateral link
6	Rear upper arm
7	Rear stabilizer
8	Rear crossmember
9	Rear crossmember bushing (See 02–14–22 Rear Crossmember Bushing Removal Note.) (See 02–14–23 Rear Crossmember Bushing Installation Note.)

Crossmember component, Differential And Drive Shaft Removal Note

1. Support the differential with a jack, and remove the nut.

   Warning
   - **Removing the crossmember component, differential and drive shaft is dangerous. The crossmember component, differential and drive shaft could fall and cause serious injury or death. Verify that the jack securely supports the differential lower side.**

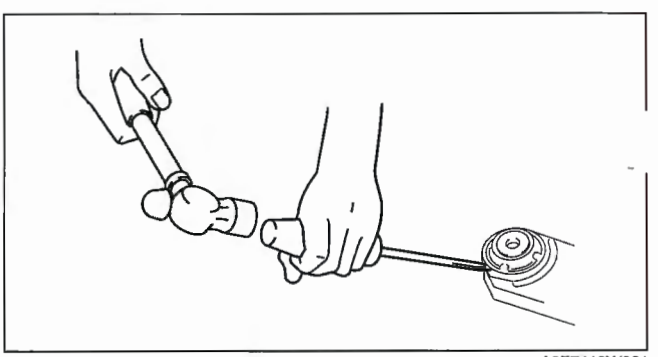
2. Remove the crossmember component, differential and drive shaft.



A6E74162012

Rear Crossmember Bushing Removal Note

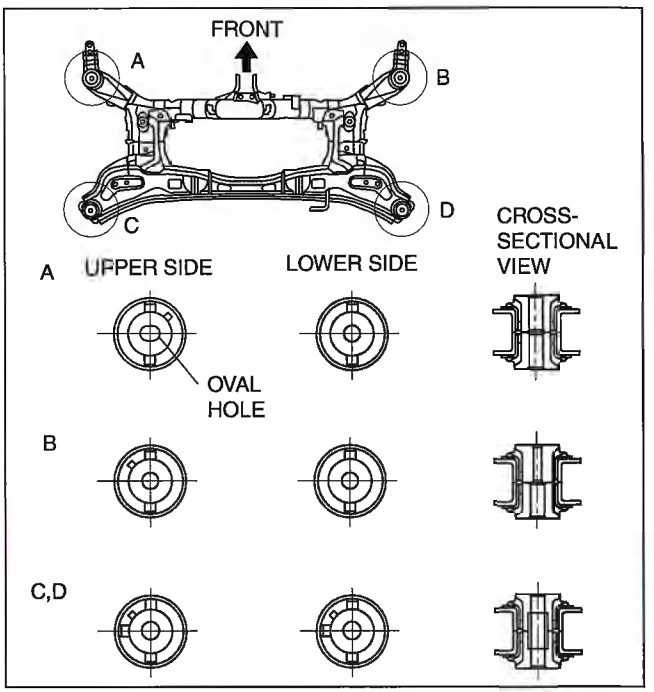
1. Remove the bushing using a screw driver (-), being careful not to damage the rear crossmember.



A6E7416W001

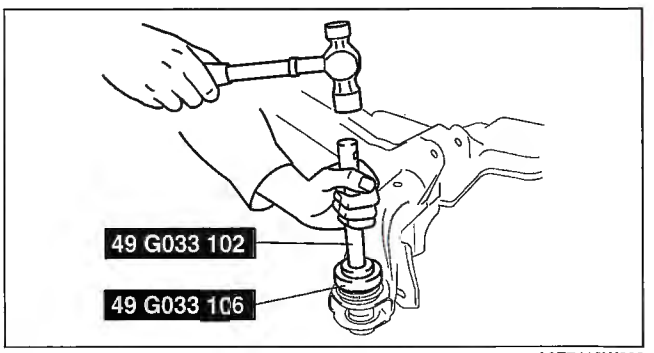
Rear Crossmember Bushing Installation Note

1. Set the bushings as shown in the figure.



A6E74162014

2. Tap the bushing onto the rear crossmember using the **SSTs**.



A6E7416W002

Suspension

Item	Specification
Front upper arm ball joint rotation torque	1.5 N·m {15.0 kgf·cm, 13.2 in·lbf} max.
Front lower arm (front) ball joint rotation torque	1.18—2.23 N·m {12.1—22.7 kgf·cm, 10.5—19.7 in·lbf}
Front lower arm (rear) ball joint rotation torque	1.00—2.22 N·m {10.2—22.6 kgf·cm, 8.86—19.6 in·lbf}
Front stabilzier control link ball joint starting torque	0.23—0.47 N·m {2.4—4.7 kgf·cm, 2.1—4.1 in·lbf}
Rear stabilzier control link ball joint starting torque	0.23—0.47 N·m {2.4—4.7 kgf·cm, 2.1—4.1 in·lbf}

Wheel and tire

Item			Specification		
Standard tire and wheel					
Wheel	Size		16 × 6 1/2JJ	17 × 7JJ	18 × 7J
	Offset	(mm {in})	55 {2.17}	60 {2.36}	55 {2.17}
	Pitch circle diameter	(mm {in})	114.3 {4.50}		
	Material		Steel	Aluminum alloy	
Tire	Size		P205/50R16 91V	P215/50R17 93V	L3 with TC: 215/45R18 93Y Except L3 with TC: 215/45R18 93W
	Air pressure (kPa {kgf/cm^2, psi})	Front	220 {2.2, 32}	220 {2.2, 32}	L3 with TC: 260 {2.6, 38} Except L3 with TC: 240 {2.4, 35}
		Rear			
	Remaining tread	(mm {in})	1.6 {0.06}		
Wheel and tire	Wheel and tire runout (mm {in})	Radial direction	1.5 {0.06} max.		
		Lateral direction	2.5 {0.10} max.	2.0 {0.08} max.	
	Wheel imbalance	(g {oz})	8 {0.28} max.	Adhesive-type*1: 11 {0.39} max. Knock-type*2: 7 {0.25} max.	Adhesive-type*1: 10 {0.35} max. Knock-type*2: 6 {0.21} max.
Temporary spare tire					
Wheel	Size		16×4T		L3 with TC: 17×4T Except L3 with TC: 16×4T
	Offset	(mm {in})	40 {1.57}		
	Pitch circle diameter	(mm {in})	114.3 {4.50}		
	Material		Steel		
Tire	Size		T115/70 D16		L3 with TC: T145/70D 17 Except L3 with TC: T115/70 D16
	Air pressure	(kPa {kgf/cm^2, psi})	420 {4.2, 60}		
Wheel and tire	Wheel and tire runout (mm {in})	Radial direction	2.0 {0.08} max.		
		Lateral direction	2.5 {0.10} max.		

*1 : Total weight exceeds **160 g {5.65 oz}** .
*2 : One balance weight: **60 g {2.12 oz} max** . If the total weight exceeds **100 g {3.53 oz}** on one side, rebalance after moving the tire around on the rim. Do not use three or more balance weights.

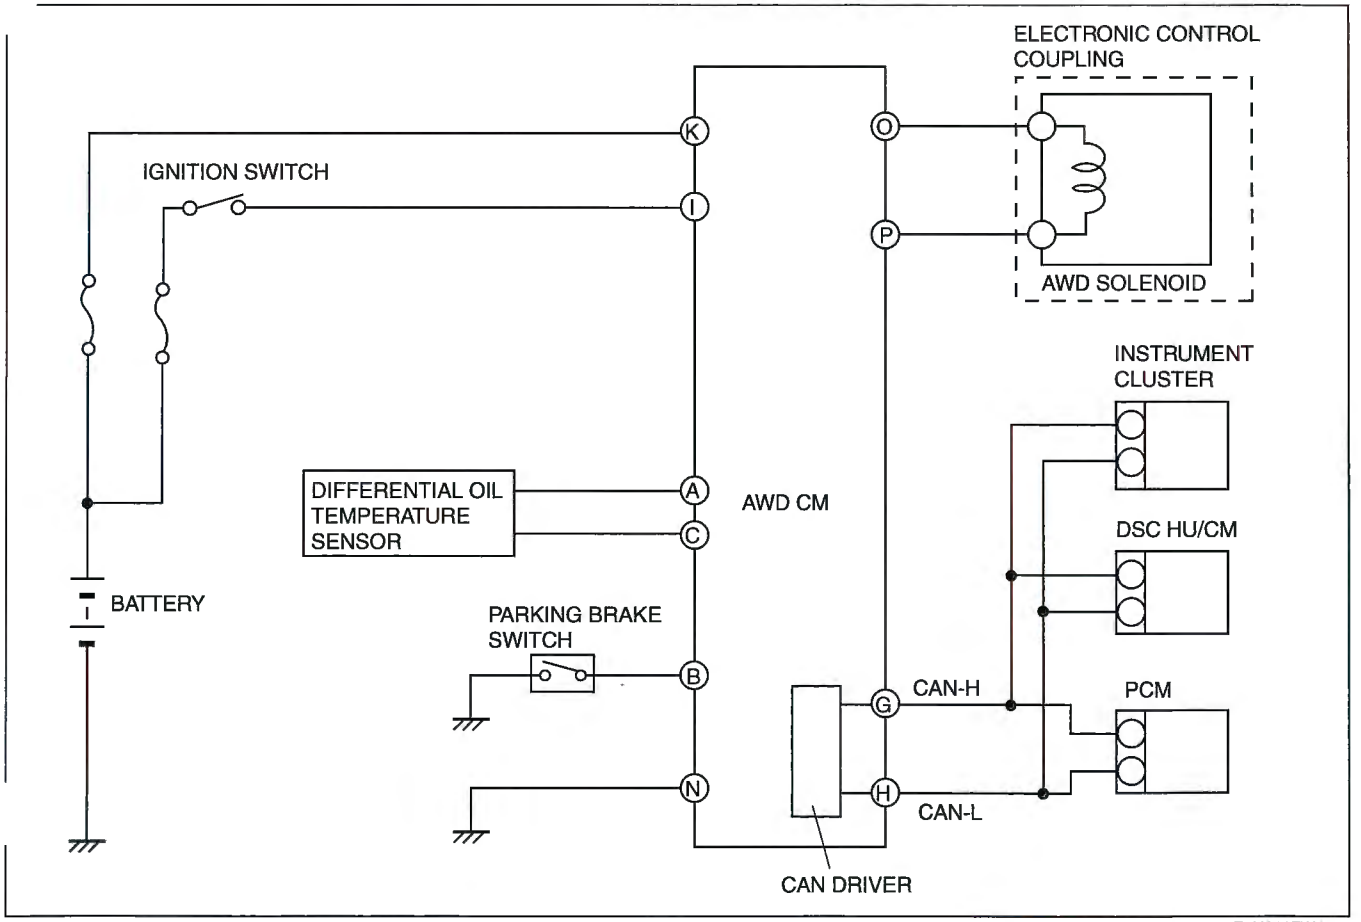
E6U030227100W01



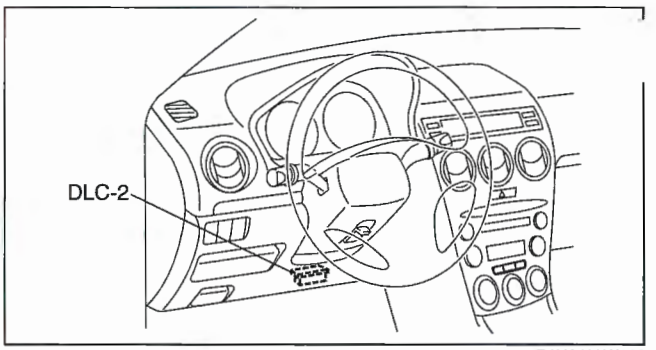
E6U302ZW7001

ELECTRONIC AWD CONTROL SYSTEM ON-BOARD DIAGNOSIS

E6U030227100W02

Reading DTCs Procedure

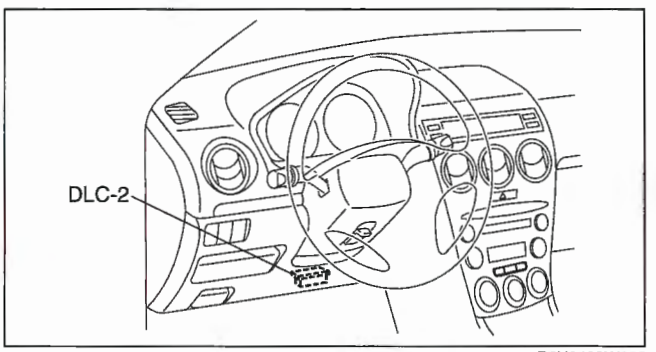
1. Connect WDS or equivalent to the vehicle DLC-2 16-pin connector.
2. Retrieve DTC by WDS or equivalent.
   - If a DTC is displayed, proceed with inspection steps for that DTC.
3. After repair, clear DTCs stored in the AWD CM by referring to the Clearing DTCs Procedure.



B6U0402W002

Clearing DTCs Procedures

1. Connect WDS or equivalent to the vehicle DLC-2 16-pin connector.
2. Clear DTCs by WDS or equivalent.
3. Turn the ignition key to OFF.
4. Perform the DTC inspection again, and verify that no DTC appears.
5. Disconnect the WDS or equivalent.



B6U0402W002

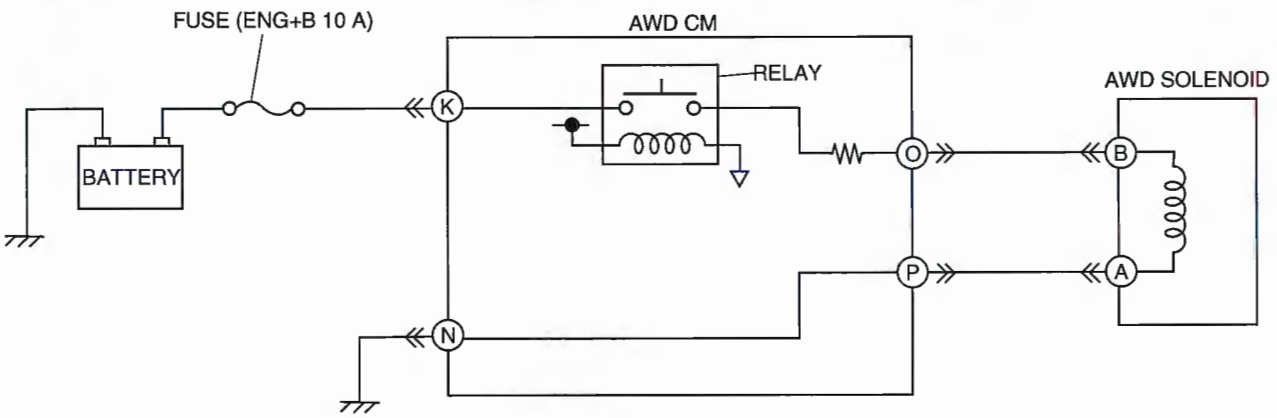
DTC Table

DTC WDS or equivalent	Diagnosis system component	Page
P1887	AWD solenoid circuit	(See 03–02–3 DTC P1887)
P1888	Differential oil temperature sensor circuit	(See 03–02–5 DTC P1888)
U0073	CAN system communication error	(See 09–02B–2 MULTIPLEX COMMUNICATION SYSTEM [L3 WITH TC])
U0100	Communication error to PCM	(See 09–02B–2 MULTIPLEX COMMUNICATION SYSTEM [L3 WITH TC])
U0121	Communication error to DSC HU/CM	(See 09–02B–2 MULTIPLEX COMMUNICATION SYSTEM [L3 WITH TC])

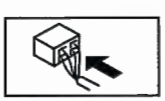
DTC P1887

E6U030227100W03

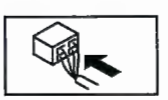
DTC P1887	AWD solenoid circuit
DETECTION CONDITION	• Current detection circuit in AWD CM detects current above specification for more than specified period. • AWD CM detects that AWD solenoid control signal differs from current detected at current detection circuit for more than specified period. • Relay voltage detection circuit detects that voltage does not concur with relay ON/OFF signal for more than specified period.
POSSIBLE CAUSE	• Open circuit or short to GND in harness between battery and AWD CM terminal K • Open circuit or short to GND between AWD CM terminal O and AWD solenoid terminal B • Open circuit or short to GND between AWD CM terminal P and AWD solenoid terminal A • Open circuit between AWD CM terminal N and body GND • Open or short circuit in AWD CM internal circuit • ENG+B (10A) fuse malfunction • AWD solenoid malfunction • AWD CM malfunction • Poor connection of connectors (female terminals)



AWD CM CONNECTOR



AWD SOLENOID CONNECTOR



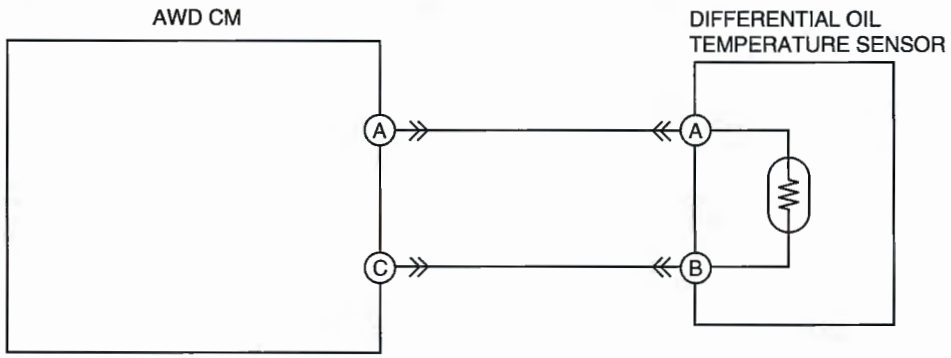
Diagnostic procedure

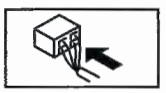
STEP	INSPECTION		ACTION
1	**INSPECT AWD SOLENOID CONDITION** • Turn ignition key to OFF. • Disconnect AWD solenoid connector. • Inspect AWD solenoid. (See 03–19–3 AWD SOLENOID INSPECTION) • Is it okay?	Yes	Go to next step.
		No	Replace AWD solenoid, then go to Step 7.
2	**INSPECT AWD SOLENOID TO AWD CM (POWER SUPPLY CIRCUIT) FOR OPEN CIRCUIT** • Disconnect AWD CM connector. • Inspect for continuity between AWD CM terminal O and AWD solenoid terminal B. • Is there continuity?	Yes	Go to next step.
		No	Repair or replace harness for open circuit between AWD CM and AWD solenoid, then go to Step 7.
3	**INSPECT AWD SOLENOID TO AWD CM (POWER SUPPLY CIRCUIT) FOR SHORT TO GROUND** • Inspect for continuity between AWD CM terminal O and ground. • Is there continuity?	Yes	Repair or replace harness for short to ground between AWD CM and AWD solenoid, then go to Step 7.
		No	Go to next step.
4	**INSPECT AWD SOLENOID TO AWD CM (GROUND CIRCUIT) FOR OPEN CIRCUIT** • Inspect for continuity between AWD CM terminal P and AWD solenoid terminal A. • Is there continuity?	Yes	Go to next step.
		No	Repair or replace harness for open circuit between AWD CM and AWD solenoid, then go to Step 7.
5	**INSPECT AWD SOLENOID TO AWD CM (GROUND CIRCUIT) FOR SHORT TO GROUND** • Inspect for continuity between AWD CM terminal P and ground. • Is there continuity?	Yes	Repair or replace harness for short to ground between AWD CM and AWD solenoid, then go to Step 7.
		No	Go to next step.
6	**INSPECT AWD CM POWER SUPPLY CIRCUIT FOR OPEN CIRCUIT** • Measure voltage between AWD CM terminal K and ground. • Is voltage B+?	Yes	Replace AWD CM, then go to Step 7.
		No	Repair or replace harness for open circuit between AWD CM and AWD solenoid, then go to next step.
7	**INSPECT FUSE CONDITION** • Turn ignition key to OFF. • Is ENG+B fuse (10A) okay?	Yes	Go to next step.
		No	Replace fuse, then go to Step 9.
8	**VERIFY TROUBLESHOOTING COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from memory. (See 03–02–2 Clearing DTCs Procedures) • Drive vehicle. • Is the same DTC present?	Yes	Replace AWD CM, then go to next step.
		No	Go to next step.
9	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to applicable DTC inspection.
		No	Troubleshooting completed.

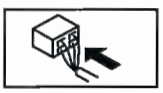
DTC P1888

E6U030227100W04

DTC P1888	Differential oil temperature sensor circuit
DETECTION CONDITION	• Differential oil temperature sensor voltage monitor circuit detects abnormal input voltage.
POSSIBLE CAUSE	• Open circuit, or short to battery or GND between AWD CM terminal A and differential oil temperature sensor terminal A • Open circuit or short to battery between AWD CM terminal C and differential oil temperature sensor terminal B • Differential oil temperature sensor malfunction • AWD CM malfunction • Poor connection of connectors (female terminals)







Diagnostic procedure

STEP	INSPECTION		ACTION
1	**INSPECT DIFFERENTIAL OIL TEMPERATURE SENSOR CONDITION** • Turn ignition key to OFF. • Disconnect differential oil temperature sensor connector. • Is it okay?	Yes	Go to next step.
		No	Replace differential oil temperature sensor, then go to Ste 7.
2	**INSPECT AWD CM TO DIFFERENTIAL OIL TEMPERATURE SENSOR FOR OPEN CIRCUIT** • Disconnect AWD CM connector. • Inspect for continuity between AWD CM terminal A and differential oil temperature sensor terminal A. • Is there continuity?	Yes	Go to next step.
		No	Repair or replace harness for open circuit between AWD CM and differential oil temperature sensor, then go to Step 7.
3	**INSPECT AWD CM TO DIFFERENTIAL OIL TEMPERATURE SENSOR FOR SHORT TO POWER** • Inspect voltage between AWD CM terminal A and ground. • Is voltage B+?	Yes	Repair or replace harness for short to power between AWD CM and differential oil temperature sensor, then go to Step 7.
		No	Go to next step.
4	**INSPECT AWD CM TO DIFFERENTIAL OIL TEMPERATURE SENSOR FOR SHORT TO GROUND** • Inspect for continuity between AWD CM terminal A and ground. • Is there continuity?	Yes	Repair or replace harness for short to ground between AWD CM and differential oil temperature sensor, then go to Step 7.
		No	Go to next step.
5	**INSPECT AWD CM TO DIFFERENTIAL OIL TEMPERATURE SENSOR FOR OPEN CIRCUIT** • Inspect for continuity between AWD CM terminal C and differential oil temperature sensor terminal B. • Is there continuity?	Yes	Go to next step.
		No	Repair or replace harness for open circuit between AWD CM and differential oil temperature sensor, then go to Step 7.
6	**INSPECT AWD CM TO DIFFERENTIAL OIL TEMPERATURE SENSOR FOR SHORT TO GROUND** • Inspect voltage between AWD CM terminal C and ground. • Is voltage B+?	Yes	Repair or replace harness for short to power between AWD CM and differential oil temperature sensor, then go to next step.
		No	Replace AWD CM, then go to next step.
7	**VERIFY TROUBLESHOOTING COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear DTC from memory. (See 03–02–2 Clearing DTCs Procedures) • Drive vehicle. • Is the same DTC present?	Yes	Replace AWD CM, then go to next step.
		No	Go to next step.
8	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to applicable DTC inspection.
		No	Troubleshooting completed.

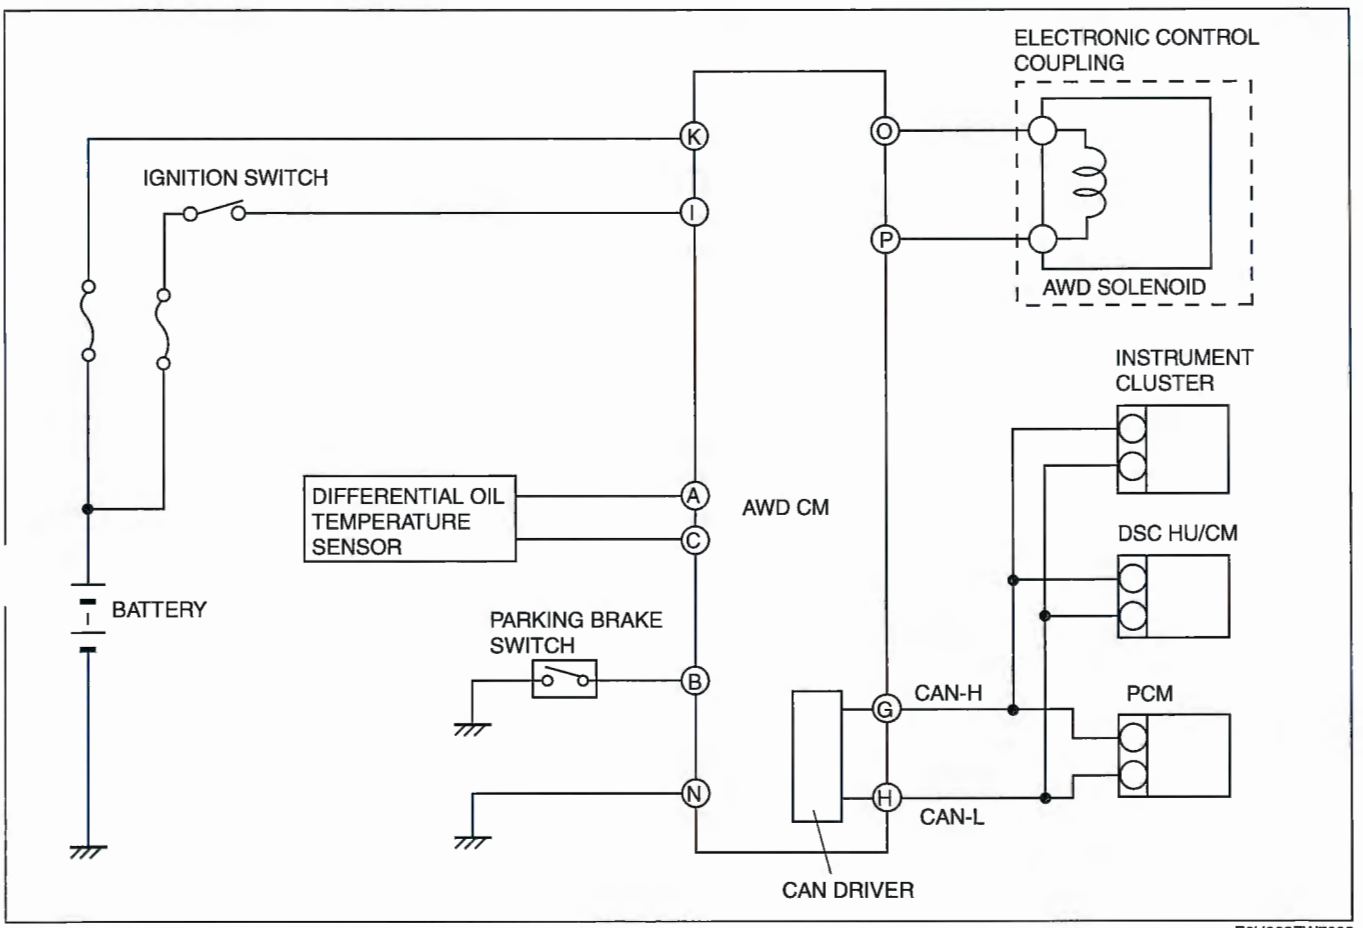
NO.1 FREQUENT FRONT
WHEEL SLIP 03–03–3
NO.2 TIGHT CORNER BRAKING 03–03–4
NO.3 ABNORMAL NOISE
AND/OR VIBRATION FROM COUPLING
COMPONENT 03–03–5

ELECTRONIC AWD CONTROL SYSTEM WIRING DIAGRAM

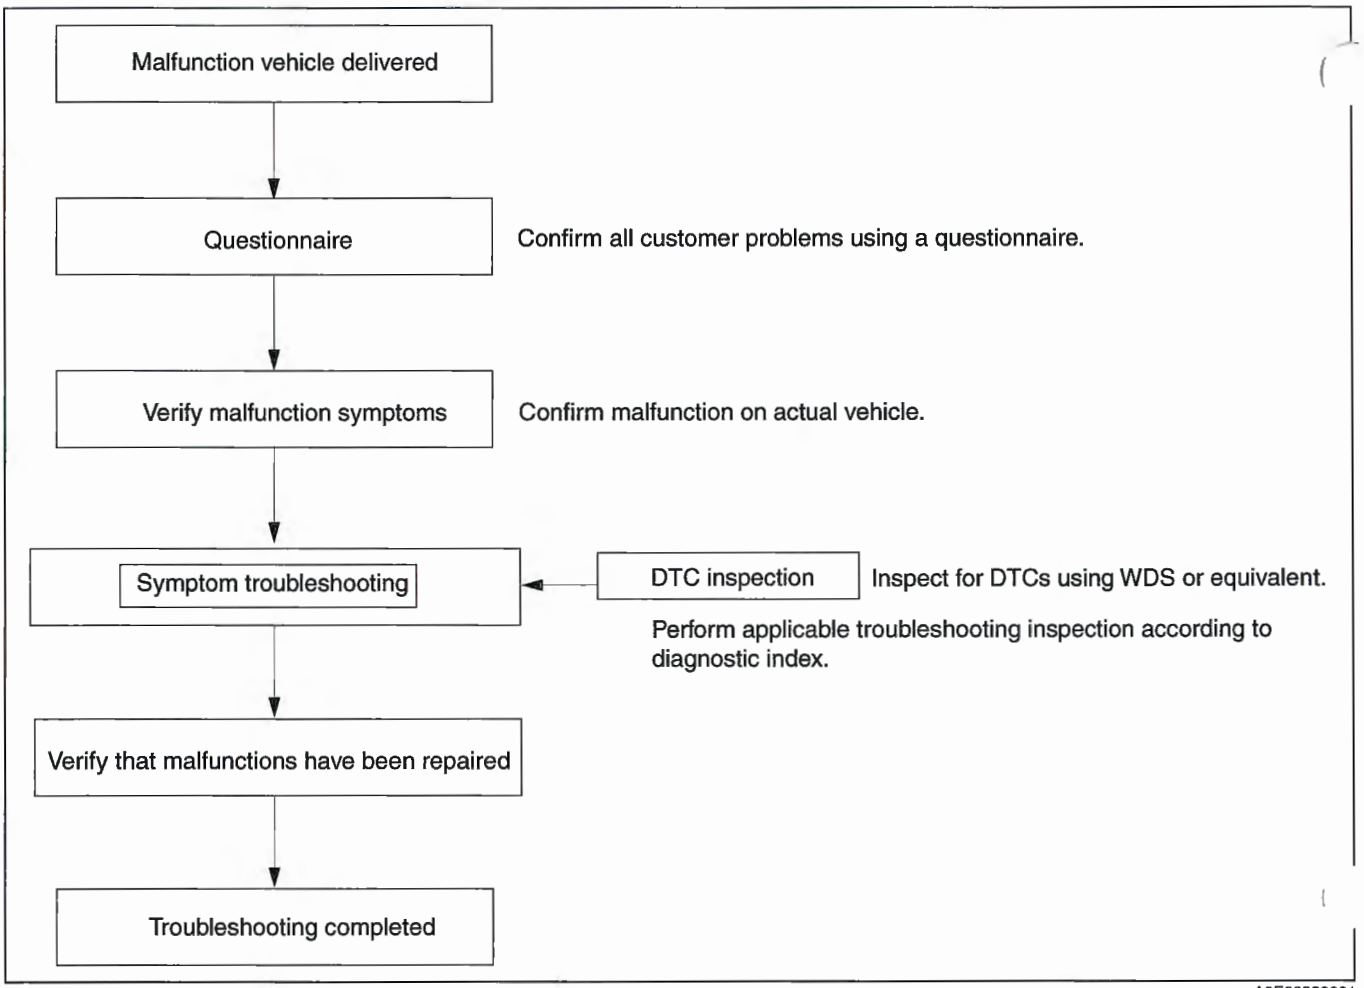
E6U030327100W02



E6U302ZW7005

FOREWORD

E6U030327100W03



A6E63802001

SYMPTOM TROUBLESHOOTING

E6U030327100W04

- Verify the symptoms, and perform troubleshooting according to the appropriate number.

No.	Symptom	Description
1	Frequent front wheel slip	Front wheels slip frequently during acceleration on low-friction road.
2	Tight corner braking effect	Brakes seem to be applied during tight cornering while driving very slowly on paved road.
3	Abnormal noise and/or vibration from coupling unit	There is abnormal noise and/or vibration from coupling unit during driving.

NO.1 FREQUENT FRONT WHEEL SLIP

E6U030327100W05

1	Frequent front wheel slip

TROUBLESHOOTING HINTS]

Tire traction performance is extremely poor for given road friction. (AWD system is normal.)

- Improper wheel alignment (AWD system is normal.)
- Rear differential oil temperature is extremely high (Fail-safe condition)
- Differential oil temperature sensor malfunction (Fail-safe condition)
- Compare slip frequency with another vehicle of the same model (under the same road conditions and tire traction performance).
- Replace tires with others of the same model and perform test under the same road conditions to determine if the malfunction was caused by tire traction performance.
- Coupling component malfunction
- AWD solenoid malfunction

Warning

- **During simulation driving, vehicle stability may decrease extremely and cause an accident. Be sure to perform the simulation test driving in a safe area.**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY DSC, PCM, AND AWD SYSTEM DTCs** • Verify DSC, PCM, and AWD system DTCs using WDS or equivalent. • Are there any DTCs present?	Yes	Go to applicable DTC inspection.
		No	Go to next step.
2	**VERIFY TIRE AIR PRESSURE** • Inspect tire air pressure. • Is it within specification?	Yes	Go to next step.
		No	Adjust tire air pressure, then go to next step.
3	**COMPARE WITH SAME MODEL TIRES** • Install tires of the same model. • Perform simulation driving. • Does malfunction recur?	Yes	Go to next step.
		No	AWD system is okay.
4	**COMPARE WITH SAME MODEL VEHICLE** • Install tires of malfunctioning vehicle to another same model vehicle. • Perform simulation driving. • Does malfunction recur?	Yes	AWD system is okay.
		No	Go to next step.
5	**INSPECT AWD SOLENOID** • Inspect AWD solenoid. (See 03–19–3 AWD SOLENOID INSPECTION) • Is coupling component solenoid okay?	Yes	Inspect harness between AWD solenoid and AWD CM, then go to next step.
		No	Replace coupling component. (See 03–19–5 COUPLING COMPONENT REMOVAL/INSTALLATION.)
6	**INSPECT WHEEL ALIGNMENT** • Inspect wheel alignment. • Is it okay?	Yes	Replace coupling component. (See 03–19–5 COUPLING COMPONENT REMOVAL/INSTALLATION.)
		No	Inspect wheel alignment, and adjust it if necessary.

NO.2 TIGHT CORNER BRAKING

E6U030327100W06

2	Tight corner braking

[TROUBLESHOOTING HINTS]

- **Because the coupling component locks up easily (similar to direct AWD), rotational difference between the front and rear wheels cannot be absorbed and brake-like phenomenon occurs.**
- **Due to the coupling component construction, slight tight corner braking effect occurs during tight cornering on a paved road. (AWD system is okay. Compare with another same model vehicle to determine malfunction.)**
- **Coupling component malfunction**
- **AWD solenoid malfunction**

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY DSC, PCM, AND AWD SYSTEM DTCS** • Verify DSC, PCM, and AWD system DTCs using WDS or equivalent. • Are there any DTCs present?	Yes	Go to applicable DTC inspection.
		No	Go to next step.
2	**VERIFY TIRE AIR PRESSURE** • Inspect tire air pressure. • Is it within specification?	Yes	Go to next step.
		No	Adjust tire air pressure, then go to next step.
3	**INSPECT ABS WHEEL-SPEED SENSOR** • Inspect ABS wheel-speed sensor. • Is it okay?	Yes	Go to next step.
		No	Repair or replace malfunctioning part.
4	**COMPARE WITH SAME MODEL VEHICLE** • Perform simulation driving with another same model vehicle. • Does malfunction recur on the same model vehicle?	Yes	AWD system is okay.
		No	Go to next step.
5	**PERFORM SIMULATION DRIVING WITH AWD SOLENOID CONNECTOR DISCONNECTED** • Turn ignition key OFF. • Disconnect AWD solenoid connector. • Perform simulation driving. (Clear DTC after simulation driving.) • Does malfunction recur?	Yes	Replace coupling component. (See 03–19–5 COUPLING COMPONENT REMOVAL/INSTALLATION.)
		No	Go to next step.
6	**INSPECT AWD SOLENOID** • Inspect AWD solenoid. (See 03–19–3 AWD SOLENOID INSPECTION) • Is it okay?	Yes	Inspect harness between AWD solenoid and AWD CM, then go to next step.
		No	Replace coupling component. (See 03–19–5 COUPLING COMPONENT REMOVAL/INSTALLATION.)

NO.3 ABNORMAL NOISE AND/OR VIBRATION FROM COUPLING COMPONENT

E6U030327100W07

3	Abnormal noise and/or vibration from coupling component

[TROUBLESHOOTING HINTS]

Abnormal noise and/or vibration from coupling component during driving

- Propeller shaft is malfunctioning or attached improperly.
- Engine mount or differential mount malfunction
- Resonance of rotating parts on vehicle (engine, propeller shaft, rear differential, tire, etc.)
- Resonance with engine vibration (mainly with exhaust system parts)
- Rear differential malfunction
- Coupling component malfunction

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY DSC, PCM, AND AWD SYSTEM DTCS** • Verify DSC, PCM, and AWD system DTCs using WDS or equivalent. • Are there any DTCs present?	Yes	Go to applicable DTC inspection.
		No	Go to next step.
2	**VERIFY INSTALLATION CONDITION OF VEHICLE PARTS** • Verify installation condition for following: — Propeller shaft (including bending and joint operation) — Center bearing — Engine mount — Differential mount — Hub bearing — Exhaust system parts — ABS wheel-speed sensor • Are they properly installed?	Yes	Go to next step.
		No	Repair or replace malfunctioning part.
3	**DETERMINE IF MALFUNCTION IS CAUSED BY REAR DIFFERENTIAL** • Install tires of another brand. **Note** • When tires of another brand are installed, the same malfunction can occur due to conditions different from customer explanation. Be careful not to confuse it with customer complaint. • Perform simulation driving at the same engine speed, gear position, and vehicle speed that customer vehicle had malfunction. • Does the same malfunction occur?	Yes	Reinstall customer's vehicle tire. Go to next step.
		No	AWD system is okay. Reinstall customer's vehicle tire.
4	**INSPECT REAR DIFFERENTIAL** • Inspect rear differential for following: — Backlash — Teeth contact (See 03–14–10 REAR DIFFERENTIAL ASSEMBLY) • Are they okay?	Yes	Replace coupling component.
		No	Inspect malfunctioning part and adjust it if necessary.

03–10 GENERAL PROCEDURES

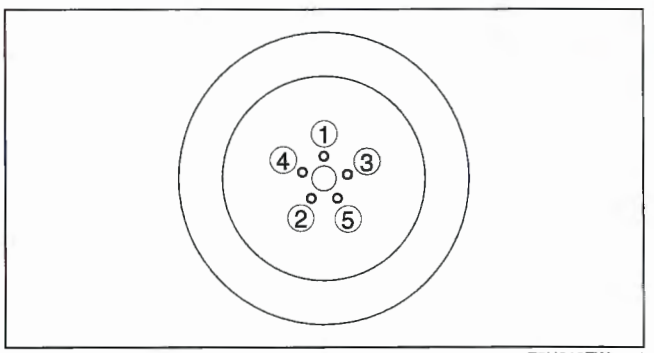
FRONT AND REAR AXLE) 03–10–1
Wheel and Tire
Removal/Installation..... 03–10–1
Brake Line
Disconnection/Connection 03–10–1
Suspension Arm
Removal/Installation 03–10–1

PRECAUTION (FRONT AND REAR AXLE)

E6U031000000W01

Wheel and Tire Removal/Installation

1. The removal and installation procedures for the wheels and tires are not mentioned in this section. When a wheel is removed, tighten it to **88—118 N·m {9.0—12.0 kgf·m, 65.0—87.0 ft·lbf}**



E5U610ZW5001

Brake Line Disconnection/Connection

Caution
- **Brake fluid will damage painted surfaces. If brake fluid gets on a painted surface, wipe it off immediately.**

Tighten the brake pipe flare nut using the **SST** (49 0259 770B). Be sure to modify the brake pipe flare nut tightening torque to allow for use of a torque wrench-**SST** combination. (See 00–00–17 Torque Formulas.)

2. If any brake line has been disconnected any time during the procedure, add brake fluid, bleed the brakes, and inspect for leakage after the procedure has been completed.

Suspension Arm Removal/Installation

1. Tighten any part of the suspension that uses rubber bushings only after vehicle has been lowered to the ground and unloaded.

Note
- Unloaded: Fuel tank is full. Engine coolant and engine oil are at specified level. Spare tire, jack, and tools are in designated position.

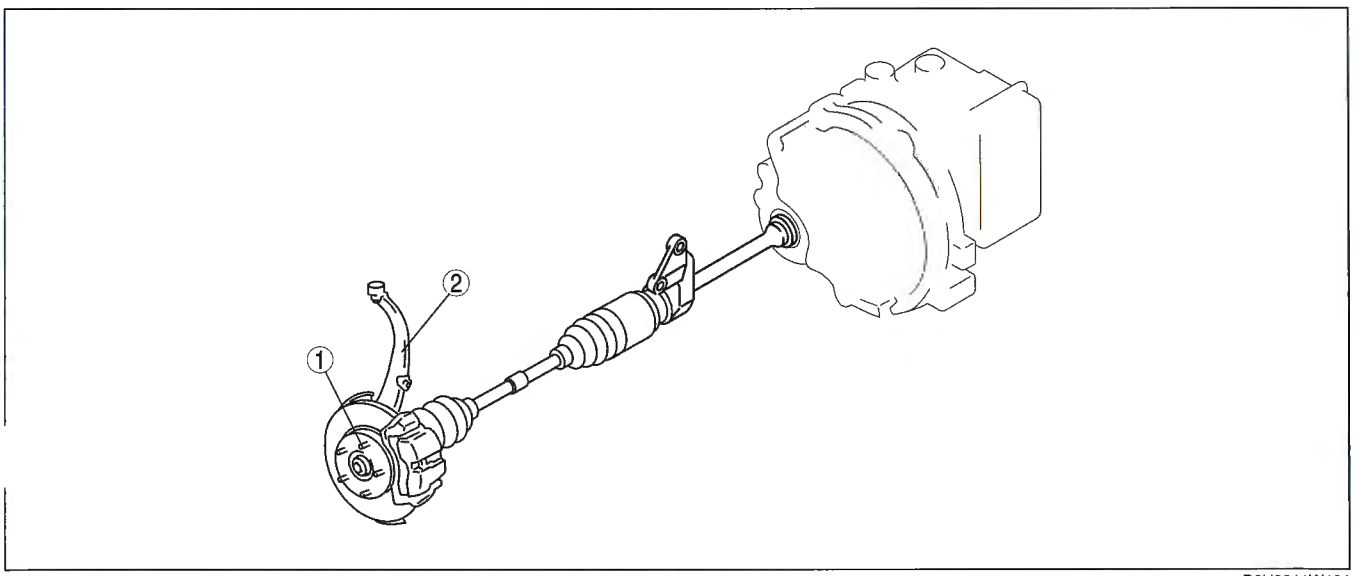
FRONT AXLE LOCATION INDEX

E6U031104000W01



B6U0311W101

1	Hub bolt (See 03–11–2 WHEEL HUB BOLT REPLACEMENT.)

2	Wheel hub, steering knuckle (See 03–11–1 WHEEL HUB, STEERING KNUCKLE PRE-INSPECTION.) (See 03–11–3 WHEEL HUB, STEERING KNUCKLE REMOVAL/INSTALLATION.)

WHEEL HUB, STEERING KNUCKLE PRE-INSPECTION

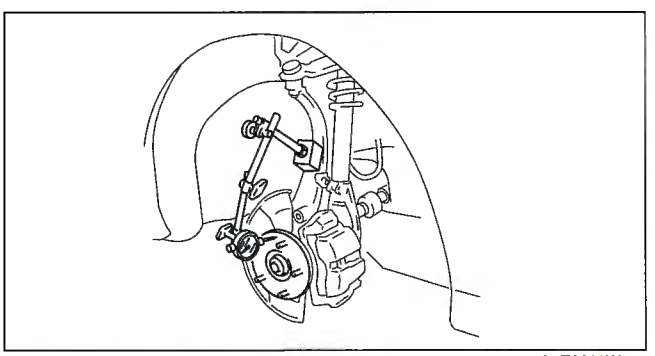
E6U031104000W02

Wheel Bearing Play Inspection

1. Position a dial indicator against the wheel hub.
2. Push and pull the wheel hub by hand in the axial direction and measure the wheel bearing play.

   Maximum front wheel bearing play
   0.05 mm {0.002 in}

3. If the bearing play exceeds the specification, replace and tighten the locknut to the specified torque and retest.
   - Replace the wheel bearing as necessary.



A6E0311W010

WHEEL HUB BOLT REPLACEMENT

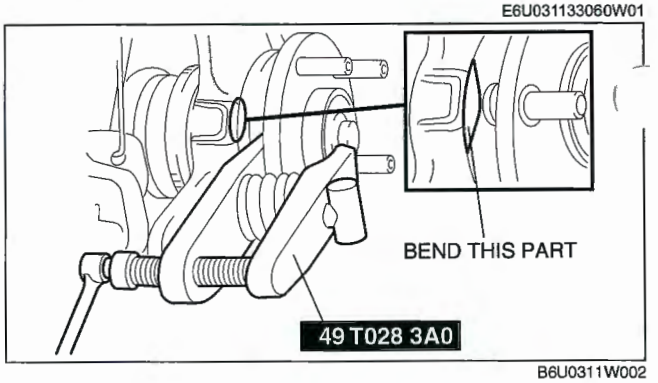
1. Remove the hub bolt using the **SSTs**.

   Note
   - If the dust cover interferes with the wheel hub bolt and the wheel hub bolt cannot be removed, tap the part shown in the figure with a chisel lightly and bend the processing point back to the steering knuckle side.

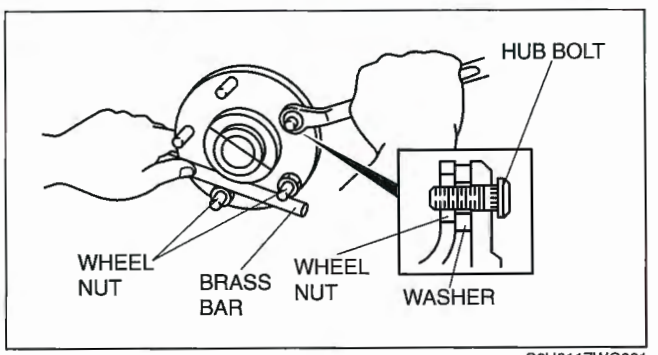
2. Install the hub bolt into the wheel hub and install a washer and hub nut on the hub bolt.

3. Tighten the hub nut while holding the wheel hub using a brass bar.

E6U031133060W01



B6U0311W002



C6U311ZWC001

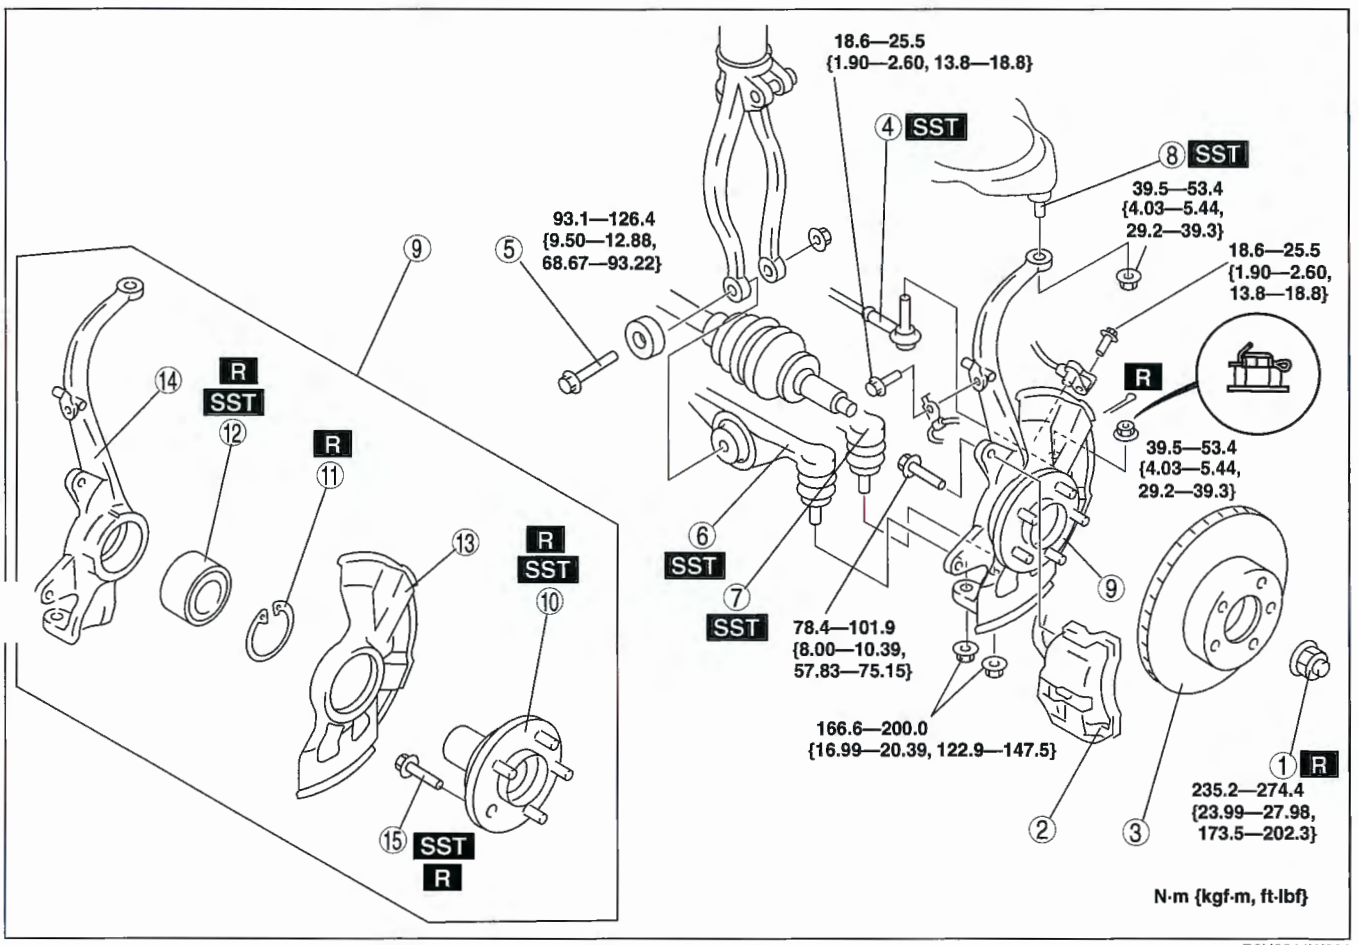
WHEEL HUB, STEERING KNUCKLE REMOVAL/INSTALLATION

E6U031104000W03

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while the vehicle is being serviced.**

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.
3. After installation, inspect the front wheel alignment. (See 02–11–2 FRONT WHEEL ALIGNMENT.)



B6U0311W001

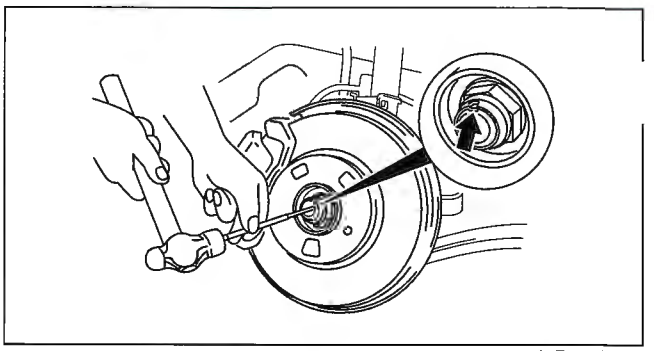
5	Bolt
6	Front lower arm (front) ball joint (See 02–13–11 Front Lower Arm (Front) Ball Joint Removal Note.)
7	Front lower arm (rear) ball joint (See 02–13–11 Front Lower Arm (Front) Ball Joint Removal Note.)
8	Front upper arm ball joint (See 02–13–9 Front Upper Arm Ball Joint Removal Note.)

9	Wheel hub, steering knuckle, dust cover
10	Wheel hub component (See 03–11–4 Wheel Hub Component Removal Note.) (See 03–11–7 Wheel Hub Component Installation Note.)
11	Retaining ring
12	Wheel bearing (See 03–11–4 Wheel Bearing Removal Note.) (See 03–11–6 Wheel Bearing Installation Note.)
13	Dust cover (See 03–11–5 Dust Cover Removal Note.) (See 03–11–6 Dust Cover Installation Note.)
14	Steering knuckle
15	Hub bolt (See 03–11–5 Hub Bolt Removal Note.) (See 03–11–6 Hub Bolt Installation Note.)

Locknut Removal Note

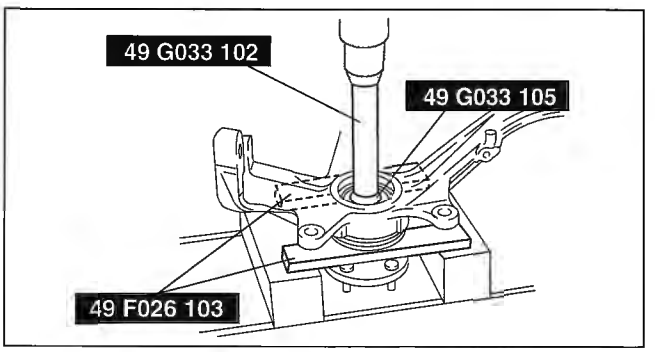
1. Knock the crimped portion of the locknut outward using a small chisel and a hammer.
2. Lock the hub by applying the brakes.
3. Remove the locknut.



A6E6321W001

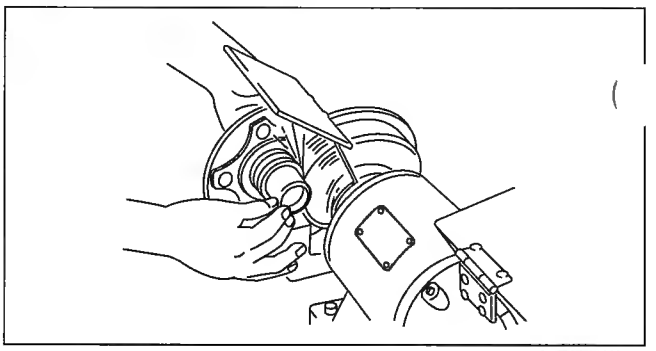
Wheel Hub Component Removal Note

1. Remove the wheel hub component using the **SSTs**.



A6E0311W015

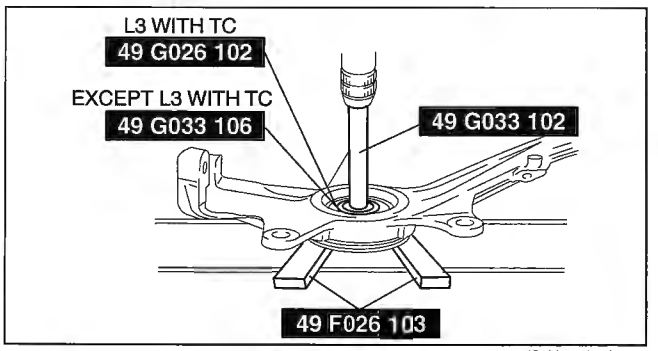
2. If the bearing inner race remains on the front wheel hub component, grind a section of the bearing inner race until **approx. 0.5 mm {0.02 in}** remains. Then remove it using a chisel.



A6E6312W002

Wheel Bearing Removal Note

1. Remove the wheel bearing using the **SSTs**.

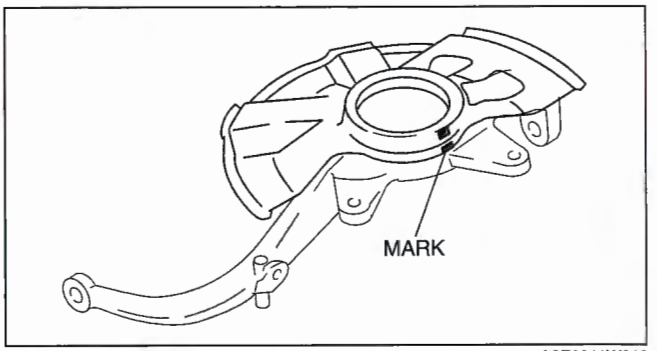


E6U311ZW7001

Dust Cover Removal Note

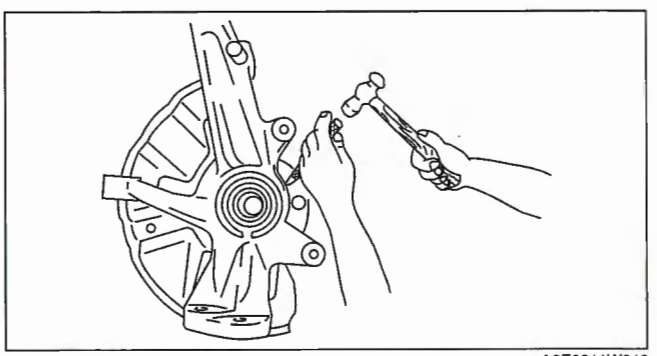
Note
- The dust cover does not need to be removed unless it is being replaced.

1. Mark the dust cover and steering knuckle for proper installation.



A6E0311W018

2. Remove the dust cover using a chisel.

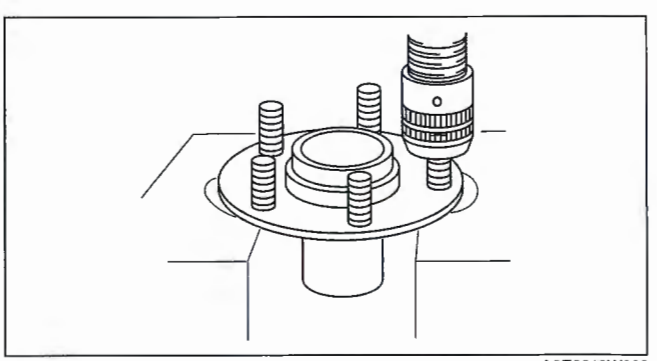


A6E0311W019

,b Bolt Removal Note

Note
- The hub bolts do not need to be removed unless they are being replaced.

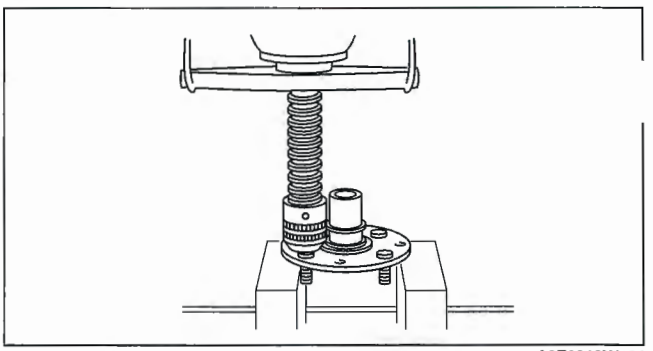
1. Remove the hub bolts using a press.



A6E6312W003

Hub Bolt Installation Note

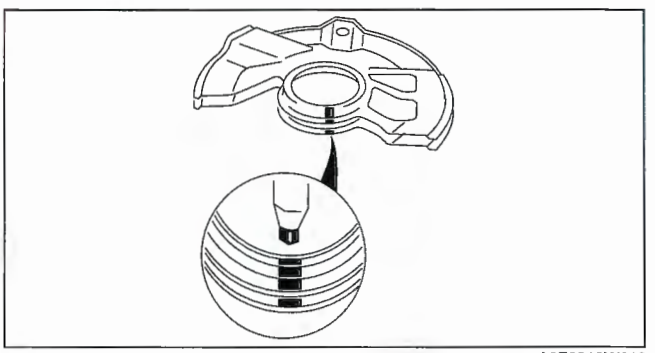
1. Install the new hub bolts using a press.



A6E6312W004

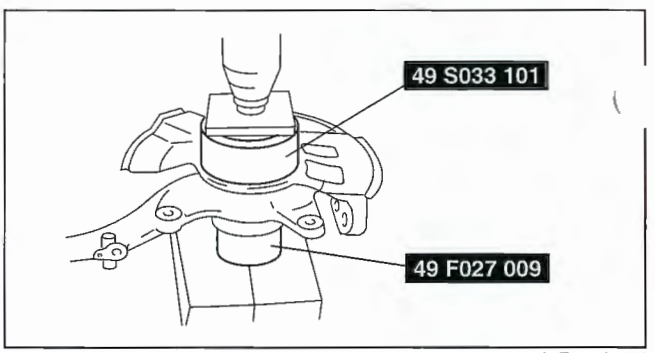
Dust Cover Installation Note

1. Mark the new dust cover in the same way as the removed one.
2. Align the marks of the new dust cover and the knuckle.



A6E0312W010

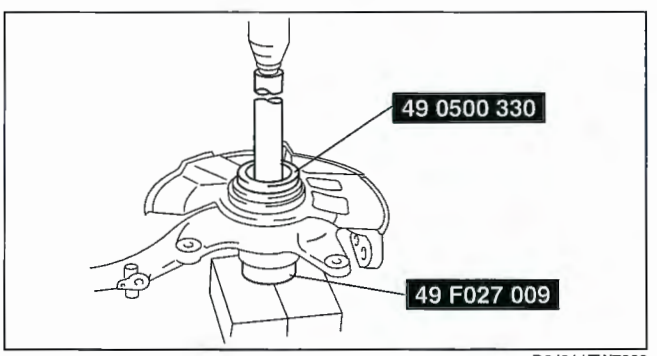
3. Install the new dust cover using the **SSTs**.



A6E0312W011

Wheel Bearing Installation Note

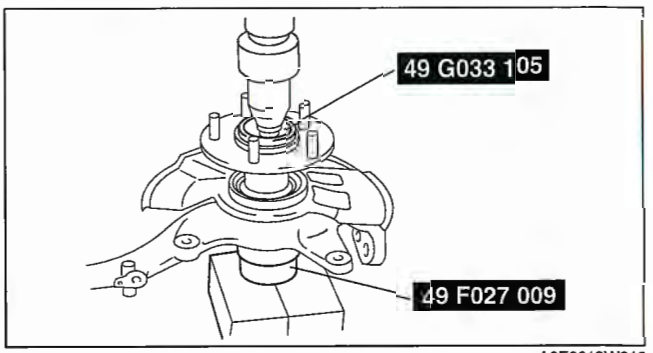
1. Install the new wheel bearing using the **SSTs**.



D6J311ZW7002

Wheel Hub Component Installation Note

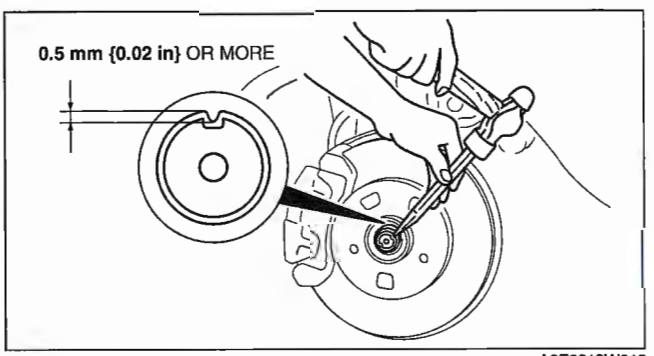
1. Install the wheel hub component using the **SSTs**.



A6E0312W013

Locknut Installation Note

1. Install a new locknut and stake it as shown.



A6E0312W015

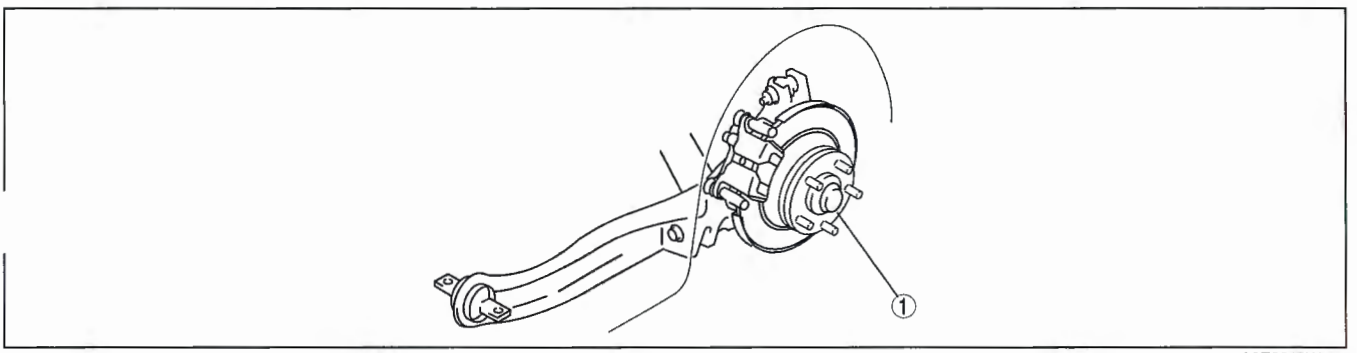
REAR AXLE LOCATION INDEX

E6U031205000W01



A6E0312W016

1	Wheel hub, hub spindle (2WD)/knuckle (AWD) (See 03–12–1 WHEEL HUB, HUB SPINDLE PRE-INSPECTION.) (See 03–12–2 WHEEL HUB BOLT REPLACEMENT [AWD]) (See 03–12–2 WHEEL HUB, HUB SPINDLE REMOVAL/INSTALLATION.) (See 03–12–5 WHEEL HUB, KNUCKLE REMOVAL/INSTALLATION [AWD])

WHEEL HUB, HUB SPINDLE PRE-INSPECTION

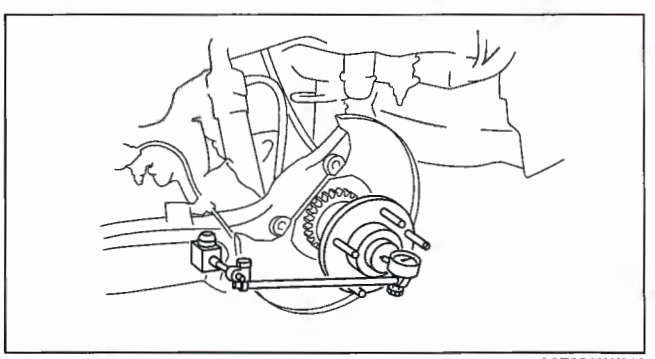
E6U031205000W02

Wheel Bearing Play Inspection

1. Position a dial indicator against the wheel hub.
2. Push and pull the wheel hub by hand in the axial direction and measure the wheel bearing play.

   Maximum rear wheel bearing play
   0.05 mm {0.002 in}

3. If the bearing play exceeds the specification, replace and tighten the locknut to the specified torque and retest.
   - Replace the wheel hub component as necessary.



A6E0312W019

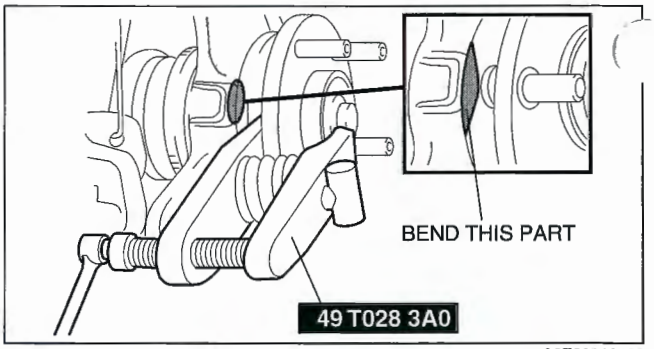
WHEEL HUB BOLT REPLACEMENT [AWD]

E6U031205000W04

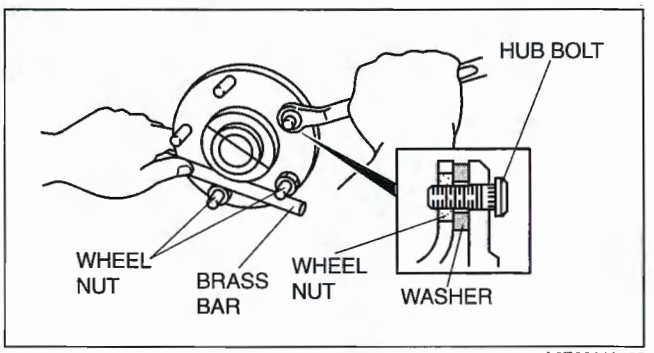
1. Remove the brake caliper component and the disc plate.
2. Remove the wheel hub bolt using the **SST** as shown in the figure.

Note
- If the dust cover interferes with the wheel hub bolt and the wheel hub bolt cannot be removed, tap the part shown in the figure with a chisel lightly and bend the process back to the knuckle side.

3. Install a new wheel hub bolt into the wheel hub and install a washer and hub nut on the hub bolt.
4. Tighten the hub nut while holding the wheel hub using a brass bar.



A6E03112001



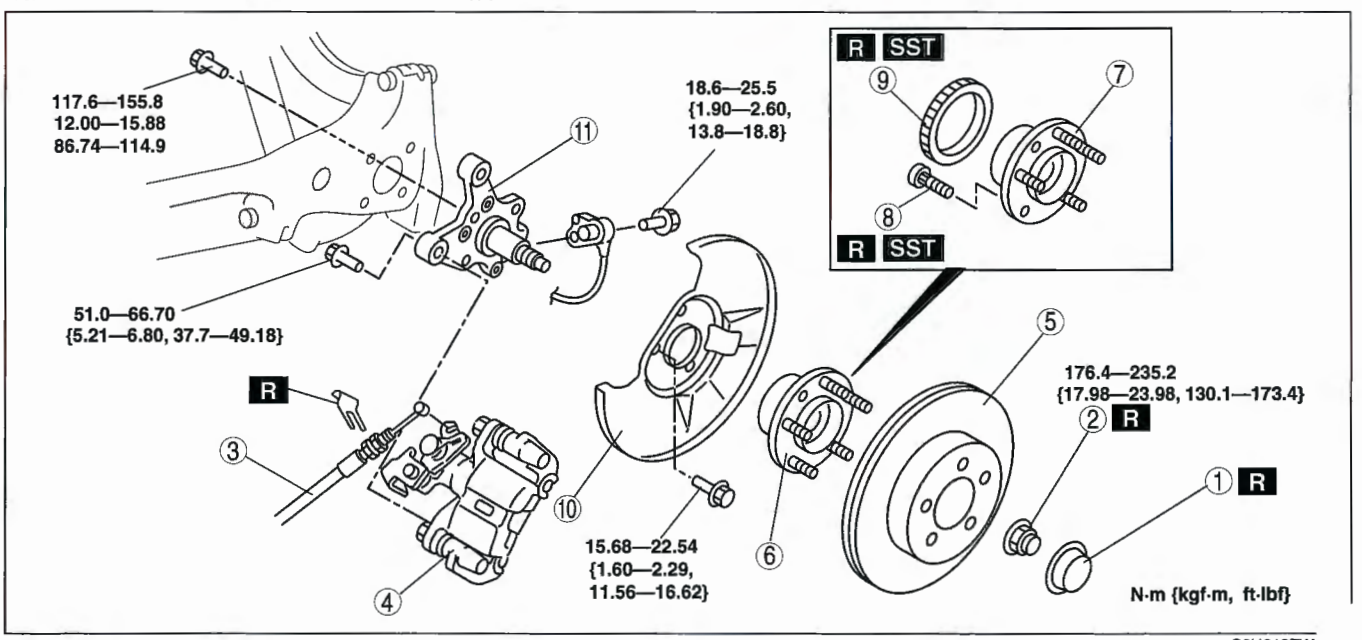
A6E03112002

WHEEL HUB, HUB SPINDLE REMOVAL/INSTALLATION

E6U031205000W03

Caution
- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while the vehicle is being serviced.**

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.



C6U312ZW(

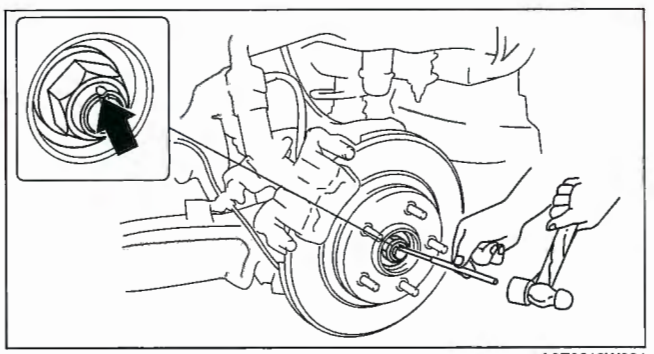
1	Hub cap

2	Locknut (See 03–12–3 Locknut Removal Note.) (See 03–12–4 Locknut Installation Note.)

3	Parking brake cable
4	Brake caliper component
5	Disc plate
6	Wheel hub component
7	Wheel hub
8	Hub bolt (See 03–11–5 Hub Bolt Removal Note.) (See 03–11–6 Hub Bolt Installation Note.)
9	ABS sensor rotor (with ABS) (See 03–12–3 ABS Sensor Rotor Removal Note.) (See 03–12–4 ABS Sensor Rotor Installation Note.)
10	Dust cover
11	Hub spindle

Locknut Removal Note

1. Knock the crimped portion of the locknut outward using a small cape chisel and a hammer.
2. Lock the hub by applying the brakes.
3. Remove the locknut.



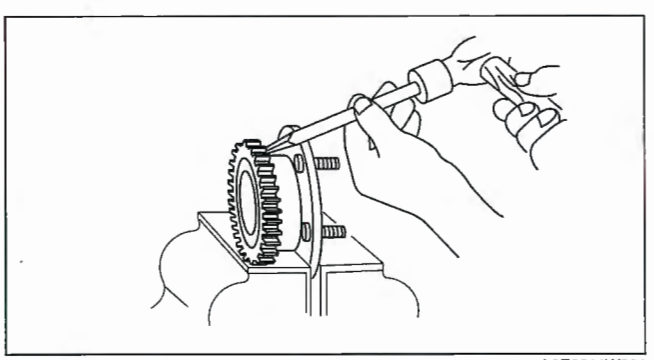
A6E0312W021

ABS Sensor Rotor Removal Note

Note

- The sensor rotor does not need to be removed unless it is being replaced.

1. Remove the sensor rotor using a chisel.



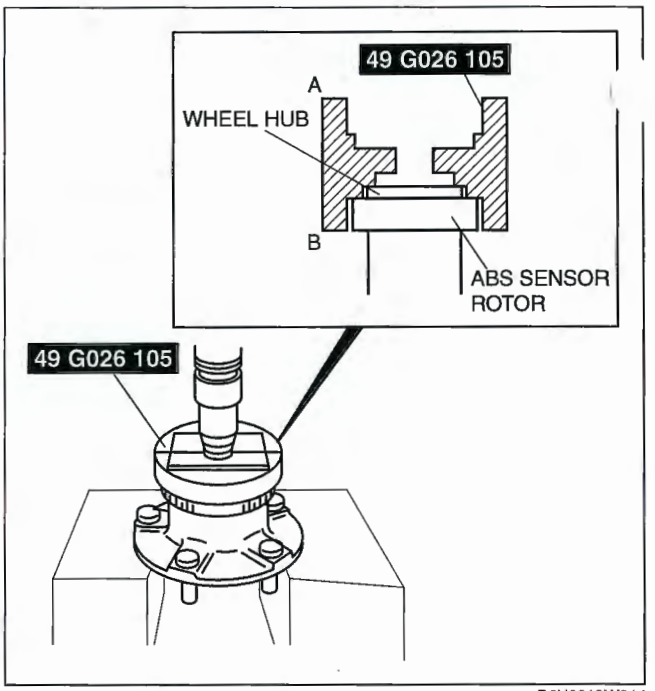
A6E6314W001

ABS Sensor Rotor Installation Note

1. Set the **SST** as shown in the figure.

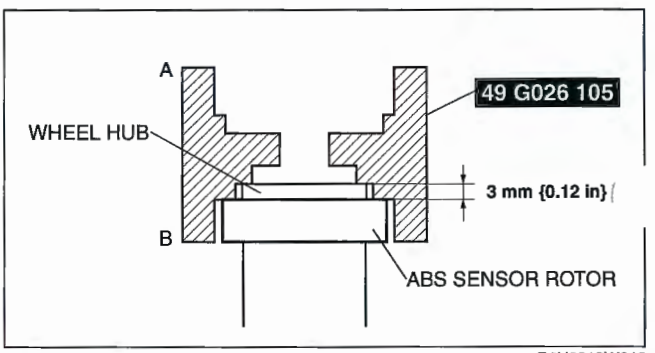
Caution

- **Position the SST so that marking B faces the bottom.**



B6U0313W014

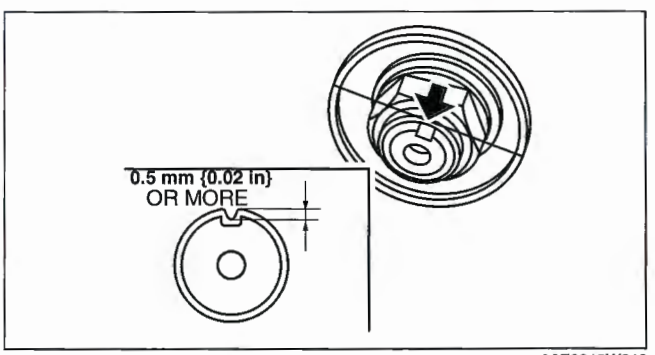
2. Press on the new sensor rotor using the **SST** and a press.



B6U0313W013

Locknut Installation Note

1. Install a new locknut and stake it as shown.



A6E0313W013

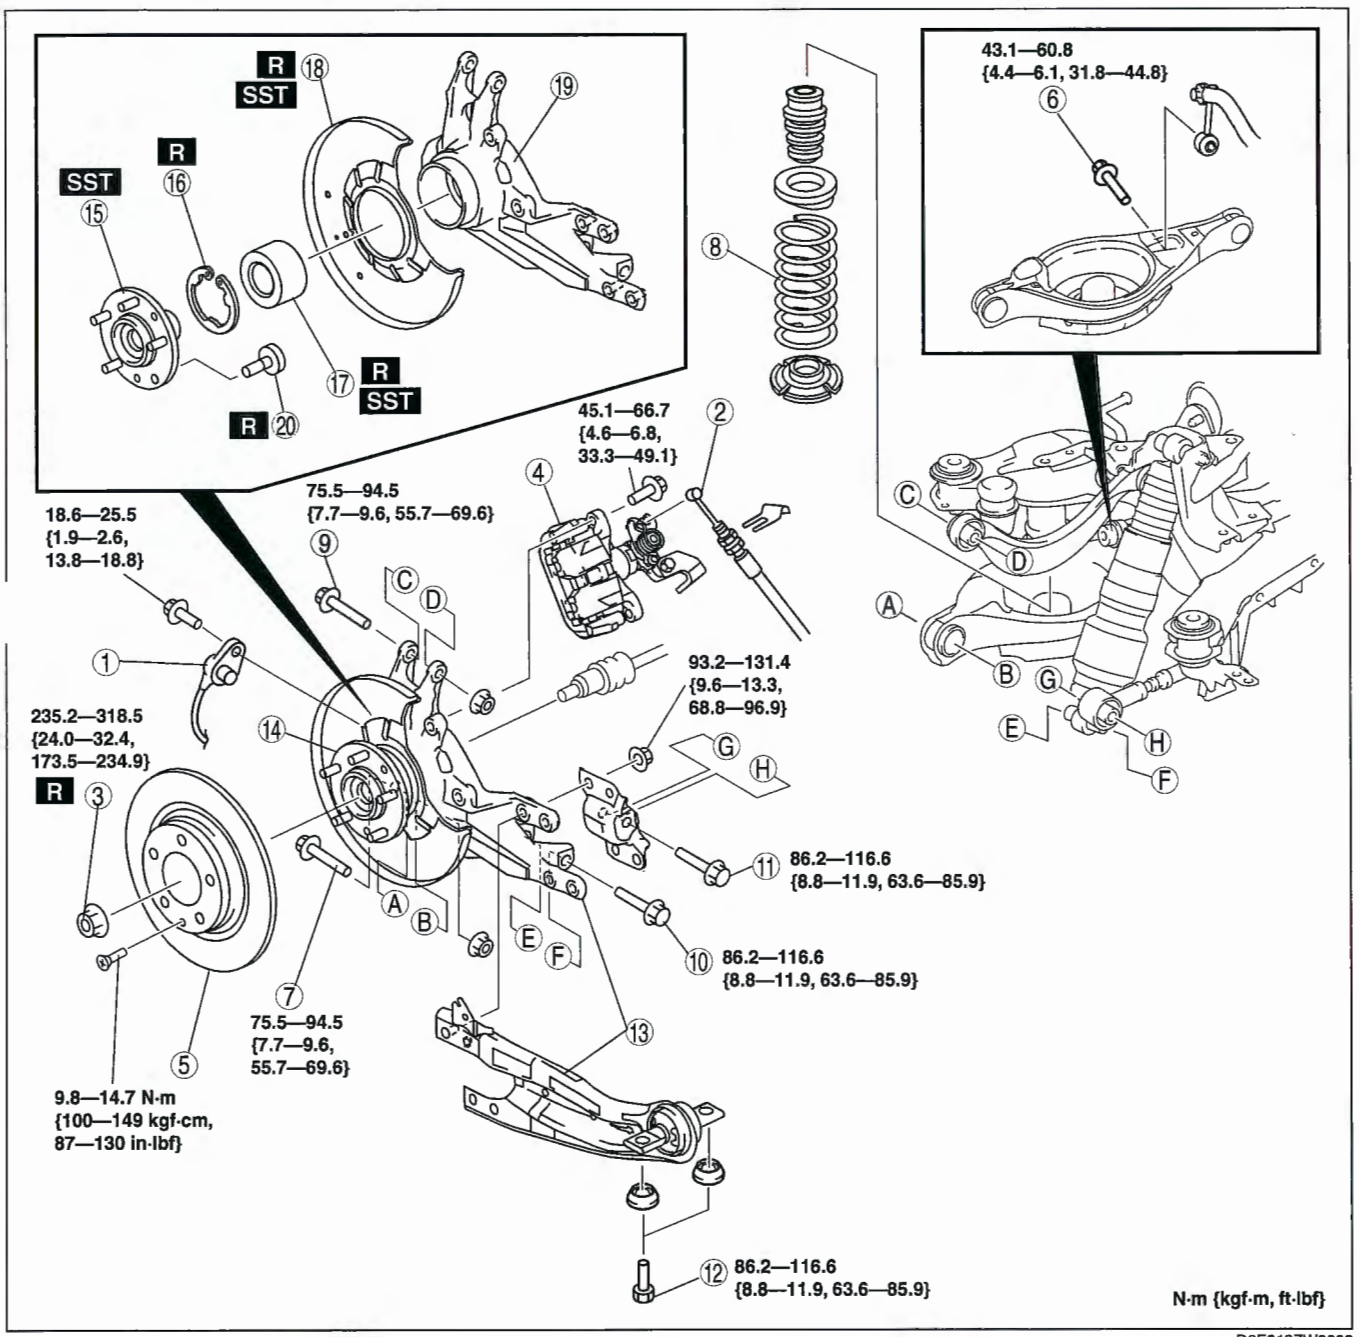
WHEEL HUB, KNUCKLE REMOVAL/INSTALLATION [AWD]

E6U031205000W05

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (wheel side) and fix it to an appropriate place where the sensor will not be pulled by mistake while the vehicle is being serviced.**

1. Remove in the order indicated in the table.
2. Install in the reverse order of removal.



D6E312ZW3002

1	ABS wheel-speed sensor
2	Parking brake cable
3	Locknut (See 03–12–6 Locknut Removal Note) (See 03–12–10 Locknut Installation Note)
4	Brake caliper component

5	Disc plate
6	Bolt (stabilizer control link (lower))
7	Bolt (rear lower arm (outer)) (See 03–12–6 Bolt (Rear Lower Arm (Outer)) Removal Note

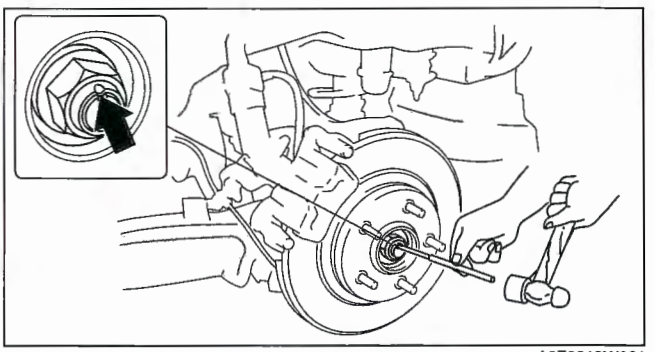
13	Trailing link, knuckle component
14	Wheel hub, knuckle component
15	Wheel hub (See 03–12–7 Wheel Hub Removal Note) (See 03–12–10 Wheel Hub Installation Note)
16	Snap ring
17	Wheel bearing (See 03–12–8 Wheel Bearing Removal Note) (See 03–12–9 Wheel Bearing Installation Note)
18	Dust cover (See 03–12–8 Dust Cover Removal Note) (See 03–12–9 Dust Cover Installation Note)
19	Knuckle
20	Wheel hub bolt (See 03–12–8 Wheel Hub Bolt Removal Note) (See 03–12–9 Wheel Hub Bolt Installation Note)

Locknut Removal Note

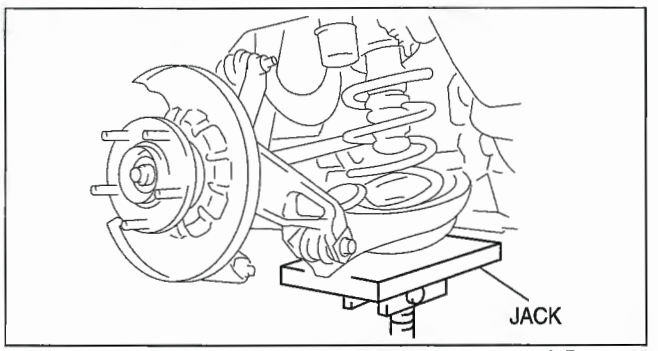
1. Knock the crimped portion of the locknut outward using a small chisel and a hammer.
2. Lock the hub by applying the brakes.
3. Remove the locknut.



A6E0312W021

Bolt (Rear Lower Arm (Outer)) Removal Note

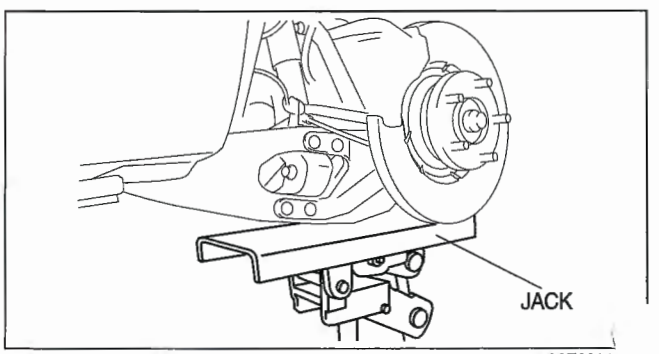
1. Support the lower arm with a jack.
2. Loosen the lower arm bolts (inner).
3. Remove the lower arm bolts (outer).
4. Gradually lower the jack and separate the lower arm (outer) from the knuckle.



A6E63142102

Bolt (Shock Absorber (Lower)) Removal Note

1. Support the trailing link and the knuckle component with a jack.
2. Remove the lower shock absorber bolts.



A6E63142.

Bolt (Lateral Link (Outer)) Removal Note

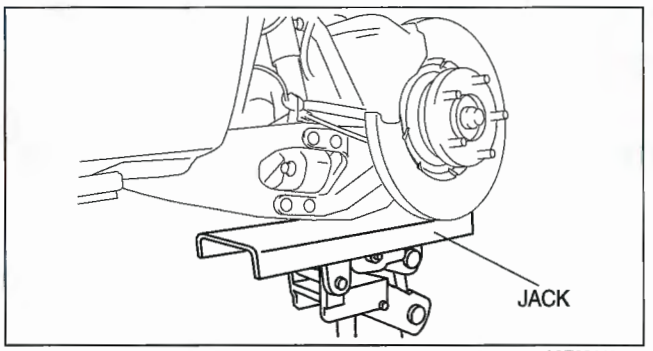
1. Loosen the lateral link bolts (inner).
2. Remove the lateral link bolts (outer), and remove the lateral link (outer) from the knuckle.

lt (Trailing Link (Front)) Removal Note

Warning

- **Be sure that the trailing link and the knuckle component are supported securely with a jack. Otherwise, the trailing link and/or the knuckle component may fall, causing death or injury, or vehicle damage.**

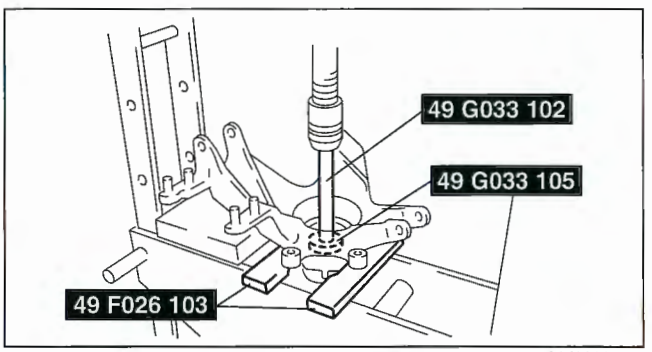
1. Verify that the trailing link and the knuckle component are supported securely with a jack, and remove the bolts at the trailing link front.



A6E63142103

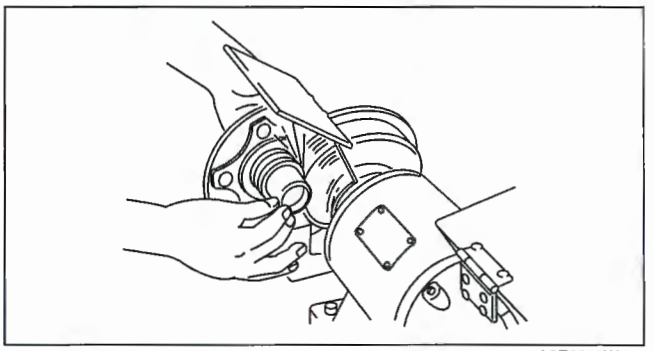
Wheel Hub Removal Note

1. Remove the wheel hub from the knuckle using the **SSTs**.



A6J63142104

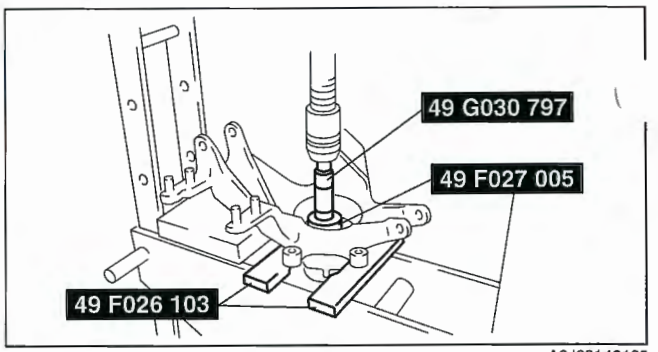
2. If the bearing inner race remains on the wheel hub, grind a section of the bearing inner race until **approx. 0.5 mm {0.02 in}** remains. Then remove it using a chisel.



A6E6312W002

Wheel Bearing Removal Note

1. Remove the wheel bearing from the knuckle using the **SSTs**.

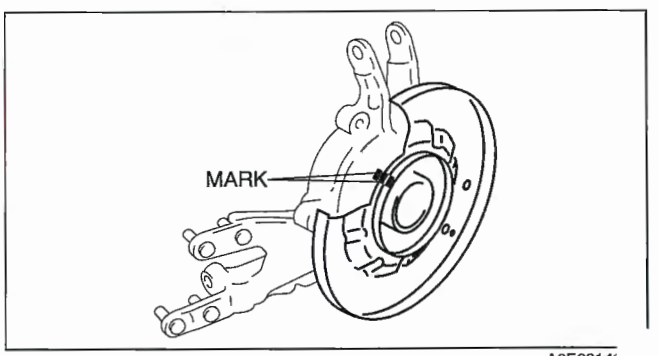


A6J63142105

Dust Cover Removal Note

Note
- The dust cover does not need to be removed unless it is being replaced.

1. Mark the dust cover and knuckle for proper installation.
2. Remove the dust cover from the knuckle using a chisel.

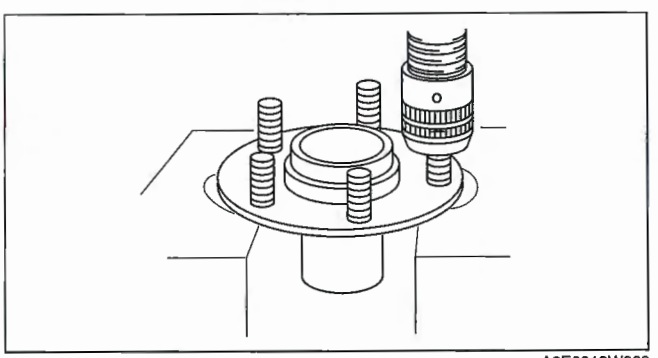


A6E6314

Wheel Hub Bolt Removal Note

Note
- The wheel hub bolts do not need to be removed unless they are being replaced.

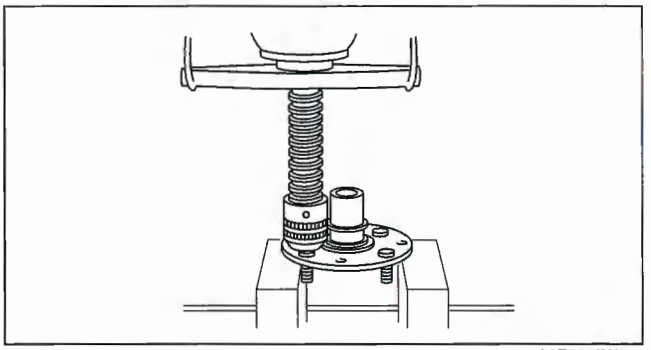
1. Remove the wheel hub bolts from the wheel hub using a press.



A6E6312W003

Wheel Hub Bolt Installation Note

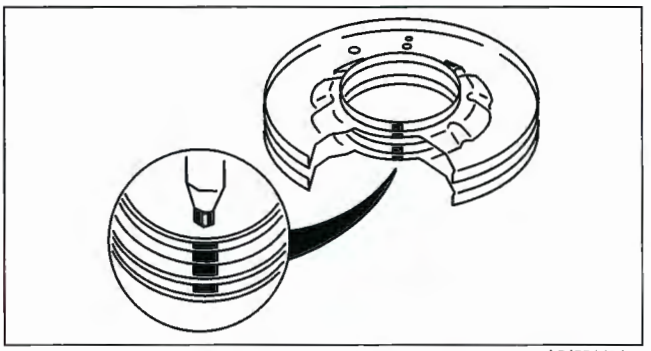
1. Install the new wheel hub bolts to the wheel hub using a press.



A6E6312W004

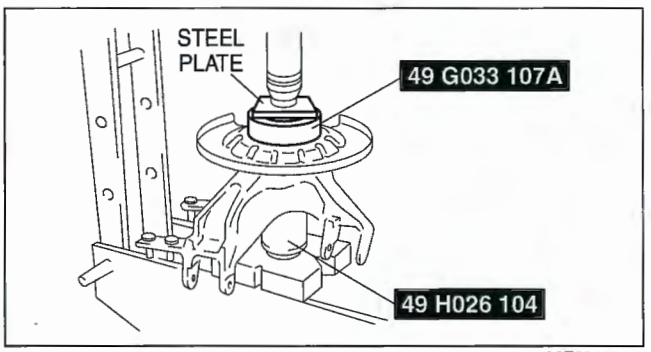
Dust Cover Installation Note

1. Mark the new dust cover in the same way as the removed one.
2. Align the marks of the new dust cover and the knuckle.



A6J63142107

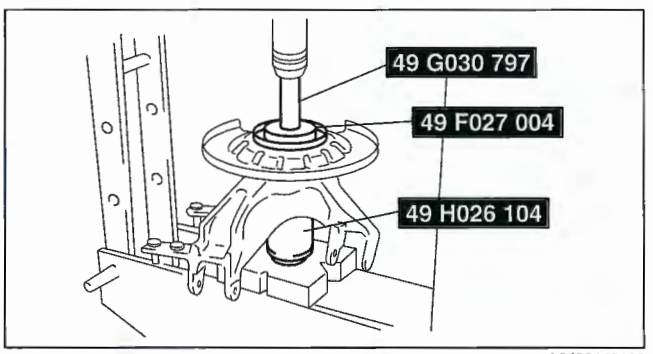
3. Install the new dust cover to the knuckle using the **SSTs**.



A6E63142105

Wheel Bearing Installation Note

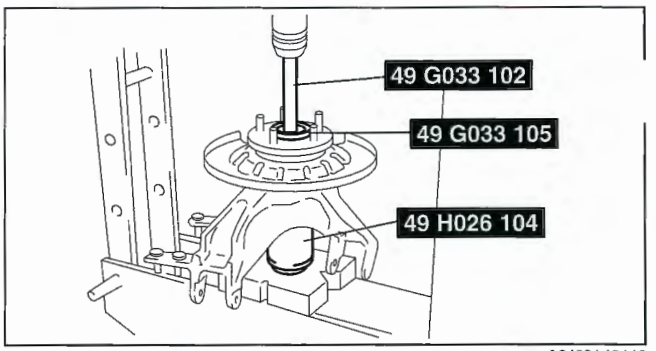
1. Install the new wheel bearing to the knuckle using the **SSTs**.



A6J63142109

Wheel Hub Installation Note

1. Install the wheel hub to the knuckle using the **SSTs**.



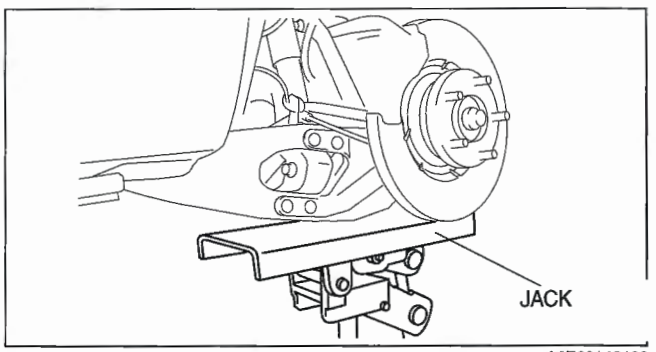
A6J63142110

Bolt (Trailing Link (Front)) Installation Note

Warning

- **Be sure that the trailing link and the knuckle component are supported securely with a jack. Otherwise, the trailing link and/or the knuckle component may fall, causing death or injury, or vehicle damage.**

1. Support the trailing link and the knuckle component with a jack.
2. Tighten the bolts at the trailing link (front).



A6E63142103

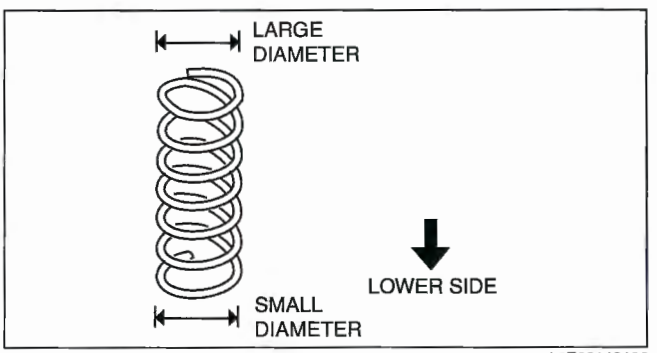
Rear Coil Spring Installation Note

1. Install the coil spring so that its small diameter end points downward.
2. Set a jack to the bottom of the lower arm, and jack it up gradually.

Warning

- **Be careful when installing the coil spring, as it may fly out by spring force, causing death or injury, or vehicle damage.**

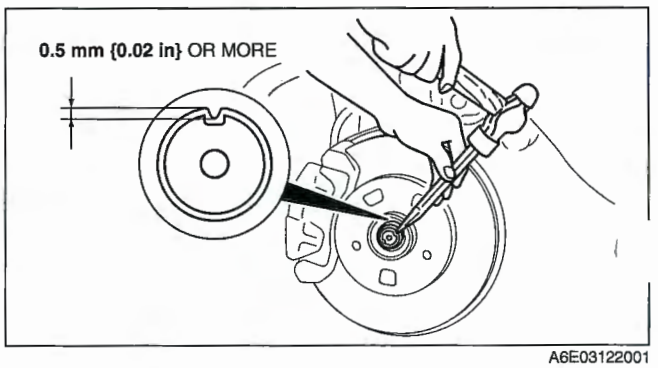
3. Install the lower arm bolts (outer).



A6E63142106

Locknut Installation Note

1. Install a new locknut and stake it as shown.



A6E03122001

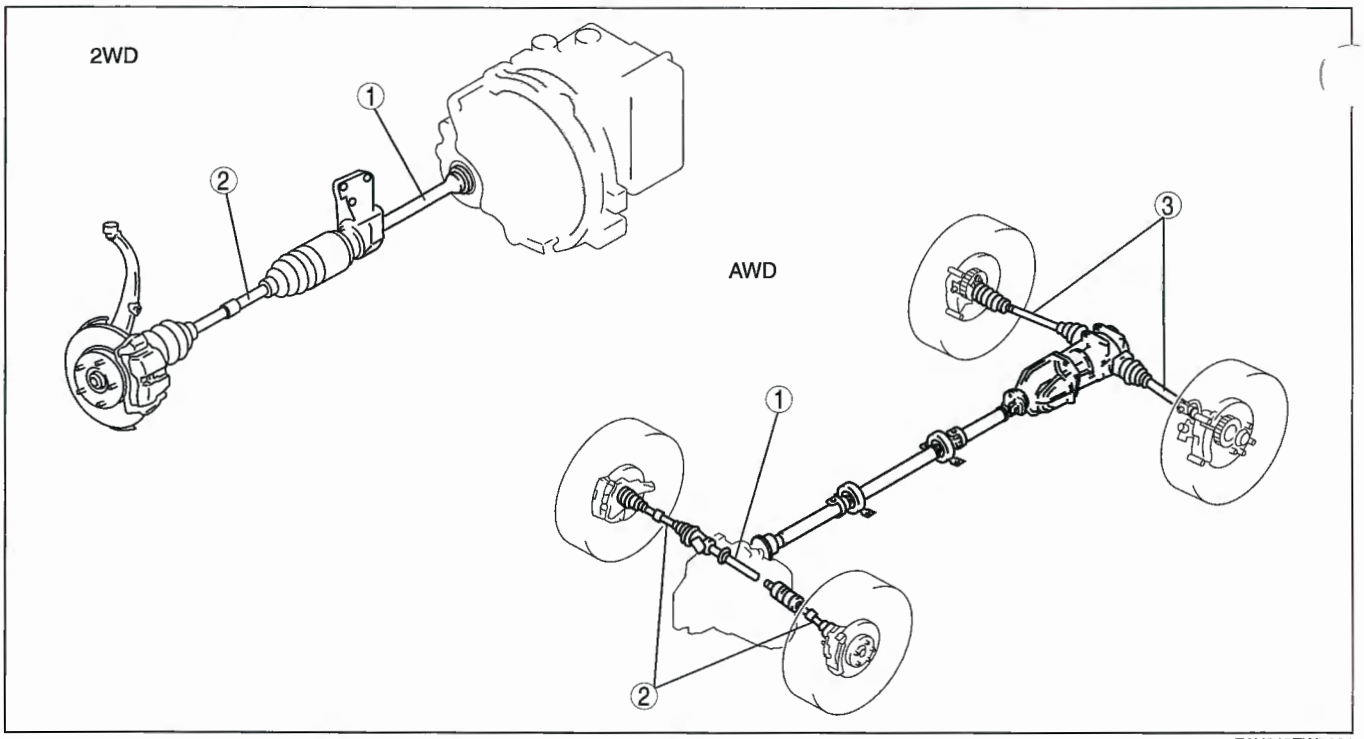
DRIVE SHAFT LOCATION INDEX

E6U031325500W02



E6U313ZW7001

1	Joint shaft (See 03–13–3 JOINT SHAFT PRE-INSPECTION) (See 03–13–3 JOINT SHAFT REMOVAL/ INSTALLATION [L3]) (See 03–13–5 JOINT SHAFT REMOVAL/ INSTALLATION [AJ]) (See 03–13–7 JOINT SHAFT REMOVAL/ INSTALLATION [L3 WITH TC]) (See 03–13–8 JOINT SHAFT DISASSEMBLY/ ASSEMBLY [L3]) (See 03–13–11 JOINT SHAFT DISASSEMBLY [AJ]) (See 03–13–12 JOINT SHAFT ASSEMBLY [AJ]) (See 03–13–13 JOINT SHAFT DISASSEMBLY [L3 WITH TC]) (See 03–13–14 JOINT SHAFT ASSEMBLY [L3 WITH TC])

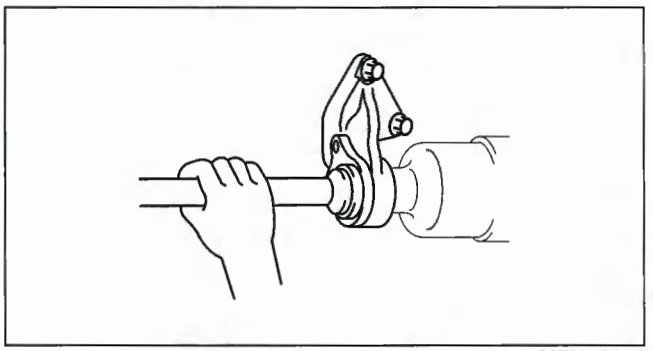
2	Front drive shaft (See 03–13–15 FRONT DRIVE SHAFT PRE-INSPECTION) (See 03–13–16 FRONT DRIVE SHAFT REMOVAL/ INSTALLATION [L3, L3 WITH TC]) (See 03–13–19 FRONT DRIVE SHAFT REMOVAL/ INSTALLATION [AJ]) (See 03–13–21 FRONT DRIVE SHAFT DISASSEMBLY/ASSEMBLY [ATX]) (See 03–13–27 FRONT DRIVE SHAFT DISASSEMBLY/ASSEMBLY [MTX])
3	Rear drive shaft (AWD) (See 03–13–30 REAR DRIVE SHAFT PRE-INSPECTION) (See 03–13–30 REAR DRIVE SHAFT REMOVAL/ INSTALLATION) (See 03–13–31 REAR DRIVE SHAFT DISASSEMBLY/ASSEMBLY)

JOINT SHAFT PRE-INSPECTION

E6U031325700W01

1. Verify that the joint shaft is not twisted or cracked.
   - Replace it as necessary.

Turn the joint shaft by hand and verify that the bearing rotates smoothly and freely.
- Replace it as necessary.



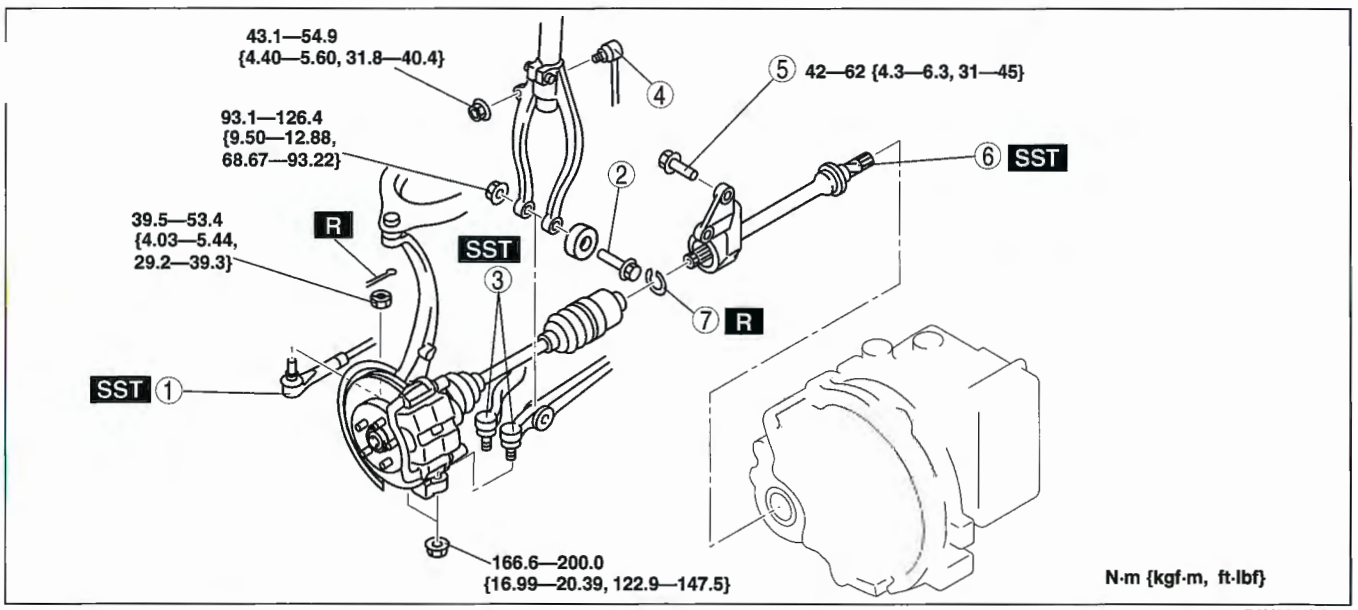
A6E0313W015

JOINT SHAFT REMOVAL/INSTALLATION [L3]

E6U031325700W02

Caution
- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while the vehicle is being serviced.**

1. Drain the transaxle oil. (See 05–17A–12 AUTOMATIC TRANSAXLE FLUID (ATF) REPLACEMENT [FS5A-EL].) (See 05–15A–2 TRANSAXLE OIL REPLACEMENT [G35M-R].)
2. Remove the ABS sensor. (See 04–13–8 FRONT ABS WHEEL-SPEED SENSOR REMOVAL/INSTALLATION.)
3. Remove in the order indicated in the table.
4. Install in the reverse order of removal.



B6U0313W002

1	Tie-rod end ball joint (See 06–12–11 STEERING GEAR AND LINKAGE REMOVAL/INSTALLATION [L3].)
2	Bolt
3	Lower arm (front, rear) ball joint (See 02–13–10 FRONT LOWER ARM (FRONT) REMOVAL/INSTALLATION.) (See 02–13–15 FRONT LOWER ARM (REAR) REMOVAL/INSTALLATION.)
4	Stabilizer control link

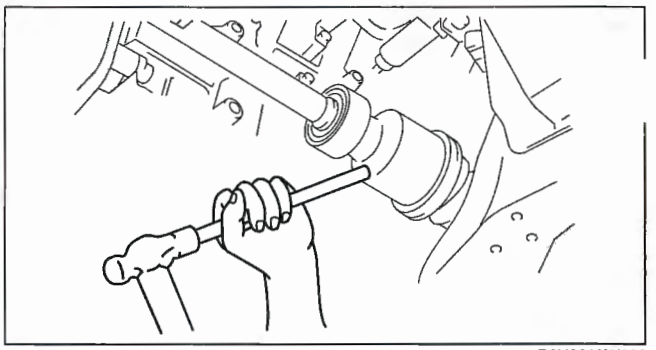
5	Joint shaft bracket bolt
6	Joint shaft (See 03–13–4 Joint Shaft Removal Note.)
7	Clip (See 03–13–4 Clip Installation Note.)

Joint Shaft Removal Note

1. Separate the right side drive shaft from the joint shaft by tapping on a brass bar inserted between them.
2. Separate the joint shaft bracket from cylinder block.
3. Pull the joint shaft straight out.

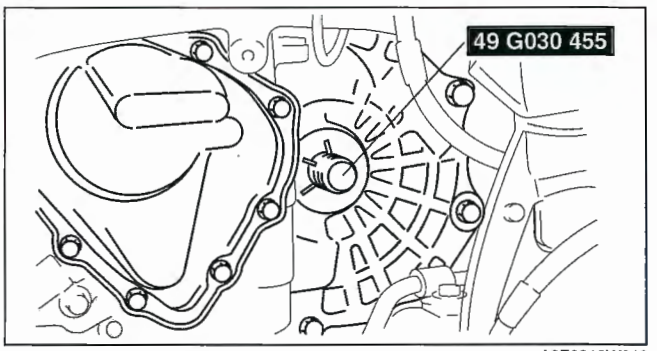
Caution

- **The sharp edges of the joint shaft can slice or puncture the oil seal. Be careful when removing the joint shaft from the transaxle.**



B6U0313W003

4. Install the **SST** into the transaxle to hold the side gears after the joint shaft is removed.

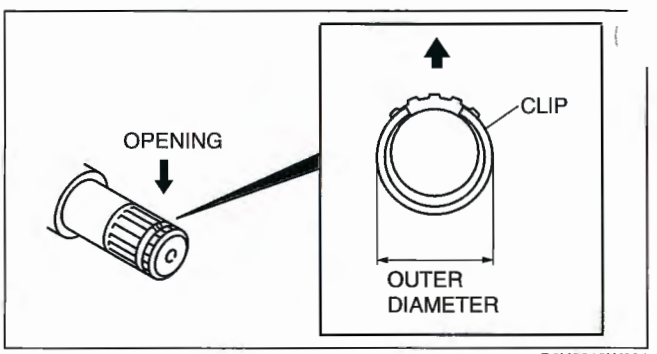


A6E0313W019

Clip Installation Note

1. Install a new clip onto the joint shaft with the opening facing upward. Ensure that the diameter of the clip does not exceed the specification on installation.
2. After installation, measure the outer diameter. If it exceeds the specification, repeat Step 1 using a new clip.

Outer diameter specification
30.0—31.2 mm {1.19—1.23 in}



B6U0313W001

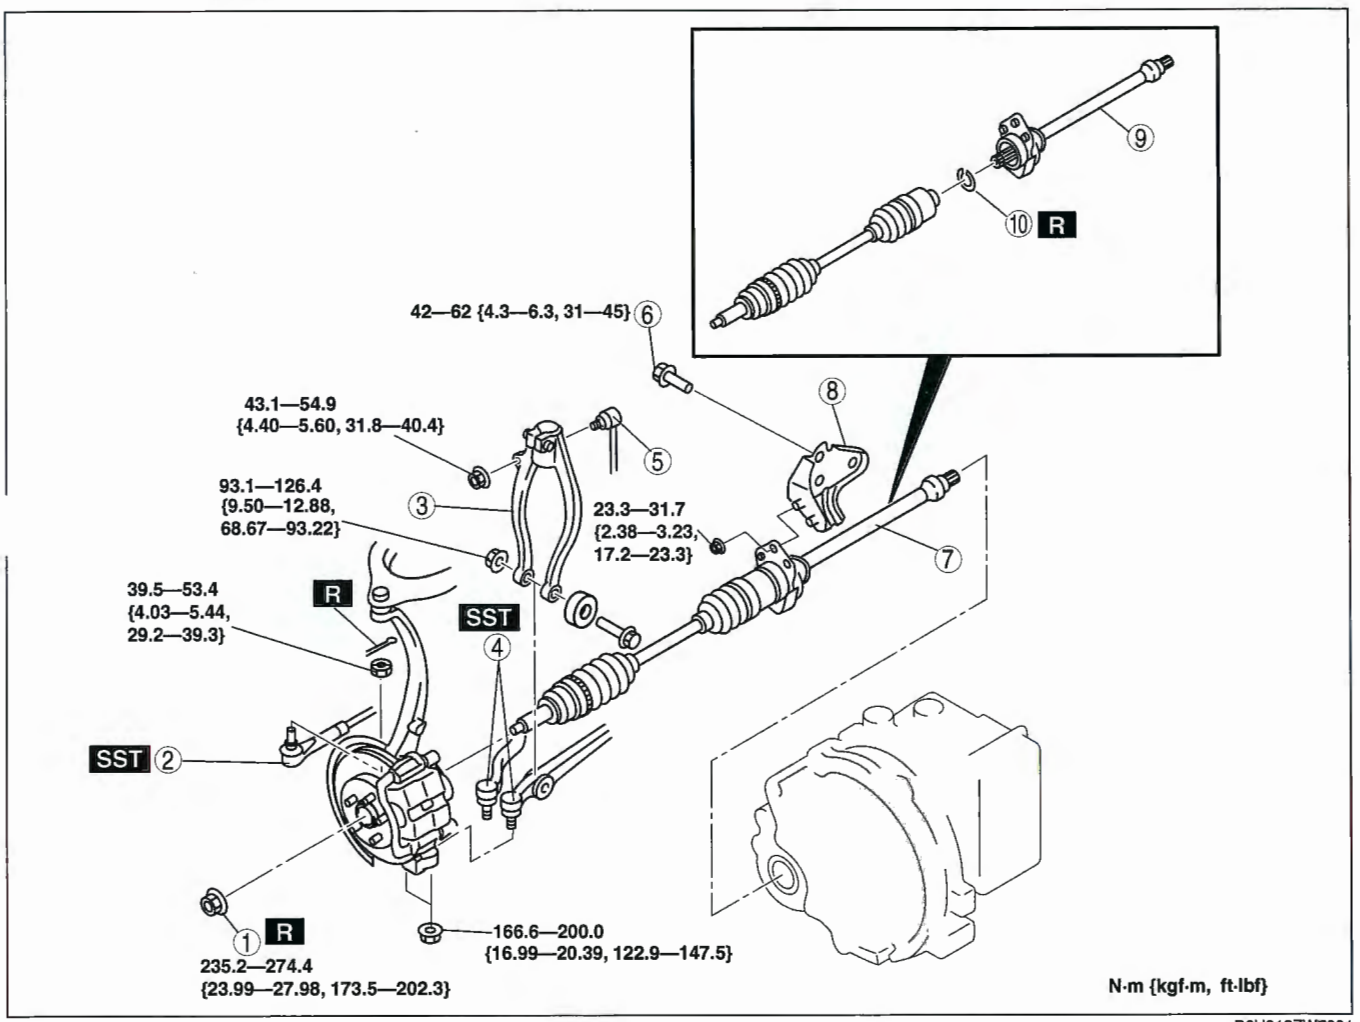
JOINT SHAFT REMOVAL/INSTALLATION [AJ]

E6U031325700W03

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while the vehicle is being serviced.**
- **Removing the drive shaft with the joint shaft bracket installed may cause the deformation of the joint shaft bracket. Therefore remove/install the drive shaft and joint shaft as a component.**

1. Drain the transaxle oil. (MTX only) (See 05–15B–2 TRANSAXLE OIL REPLACEMENT [A65M-R].)
2. Remove the ABS sensor. (See 04–13–8 FRONT ABS WHEEL-SPEED SENSOR REMOVAL/INSTALLATION.)
3. Remove in the order indicated in the table.
4. Install in the reverse order of removal.



D6U312ZW7001

1	Locknut (See 03–11–4 Locknut Removal Note.) (See 03–11–7 Locknut Installation Note.)
2	Tie-rod end ball joint (See 06–12–13 STEERING GEAR AND LINKAGE REMOVAL/INSTALLATION [AJ].)
3	Damper fork
4	Lower arm (front, rear) ball joint (See 02–13–10 FRONT LOWER ARM (FRONT) REMOVAL/INSTALLATION.) (See 02–13–15 FRONT LOWER ARM (REAR) REMOVAL/INSTALLATION.)

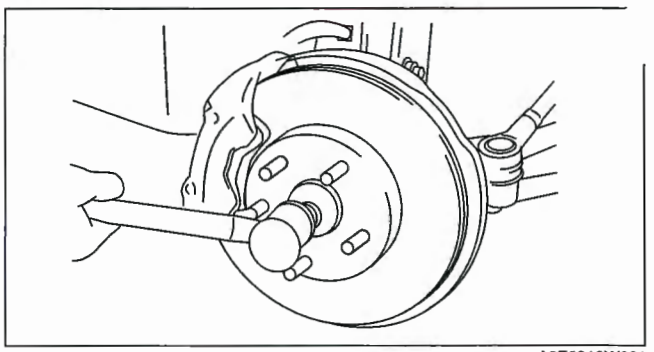
5	Stabilizer control link
6	Joint shaft bracket bolt
7	Drive shaft and joint shaft (See 03–13–6 Drive Shaft And Joint Shaft Removal Note.) (See 03–13–7 Drive Shaft And Joint Shaft Installation Note.)
8	Joint shaft bracket
9	Joint shaft (See 03–13–6 Joint Shaft Removal Note.)
10	Clip (See 03–13–6 Clip Installation Note.)

Drive Shaft And Joint Shaft Removal Note

1. Install a spare nut onto the drive shaft so that the nut is flush with the end of the drive shaft.
2. Tap the nut with a copper hammer to loosen the drive shaft from the front wheel hub.
3. Separate the drive shaft from the wheel hub.

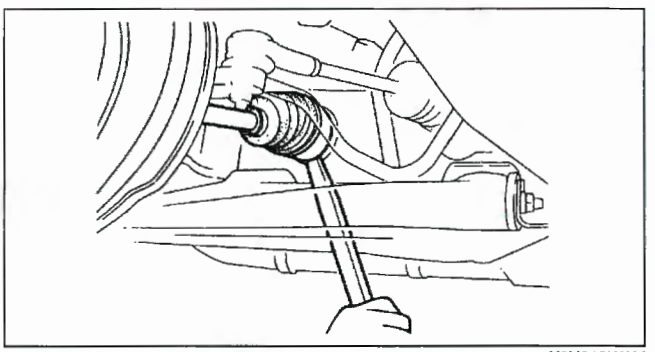
Caution

- **The sharp edges of the drive shaft can slice or puncture the oil seal. Be careful when removing the drive shaft from the transaxle.**



A6E6316W001

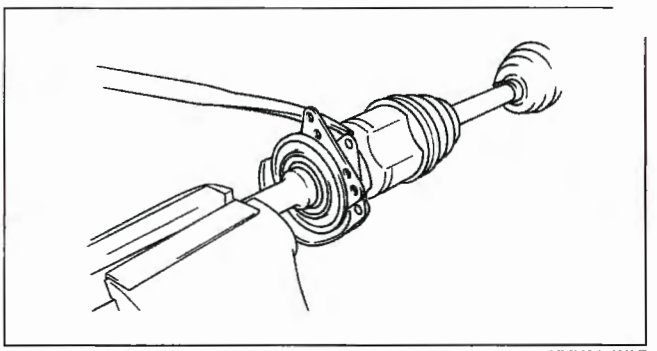
4. Separate the left side drive shaft from the transaxle by prying with a bar inserted between the outer ring and the transaxle, as shown in the figure.



X3U313WAM

Joint Shaft Removal Note

1. Secure the shaft portion of the joint shaft in a vise.
2. As shown in the figure, insert a pry bar between the drive shaft and joint shaft, and tap on the bar to uncouple them.

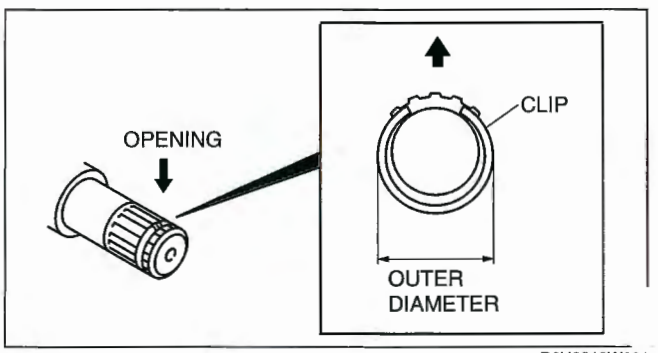


YMU313WAF

Clip Installation Note

1. Install a new clip onto the joint shaft with the opening facing upward. Ensure that the diameter of the clip does not exceed the specification on installation.
2. After installation, measure the outer diameter. If it exceeds the specification, repeat Step 1 using a new clip.

Outer diameter specification
31.2 mm {1.23 in}



B6U0313W001

Drive Shaft And Joint Shaft Installation Note

1. Apply ATF to the oil seal lip.
2. Push the drive shaft and joint shaft into the transaxle.

Caution

- **The sharp edges of the joint shaft can slice or puncture the oil seal. Be careful when installing the joint shaft to the transaxle.**

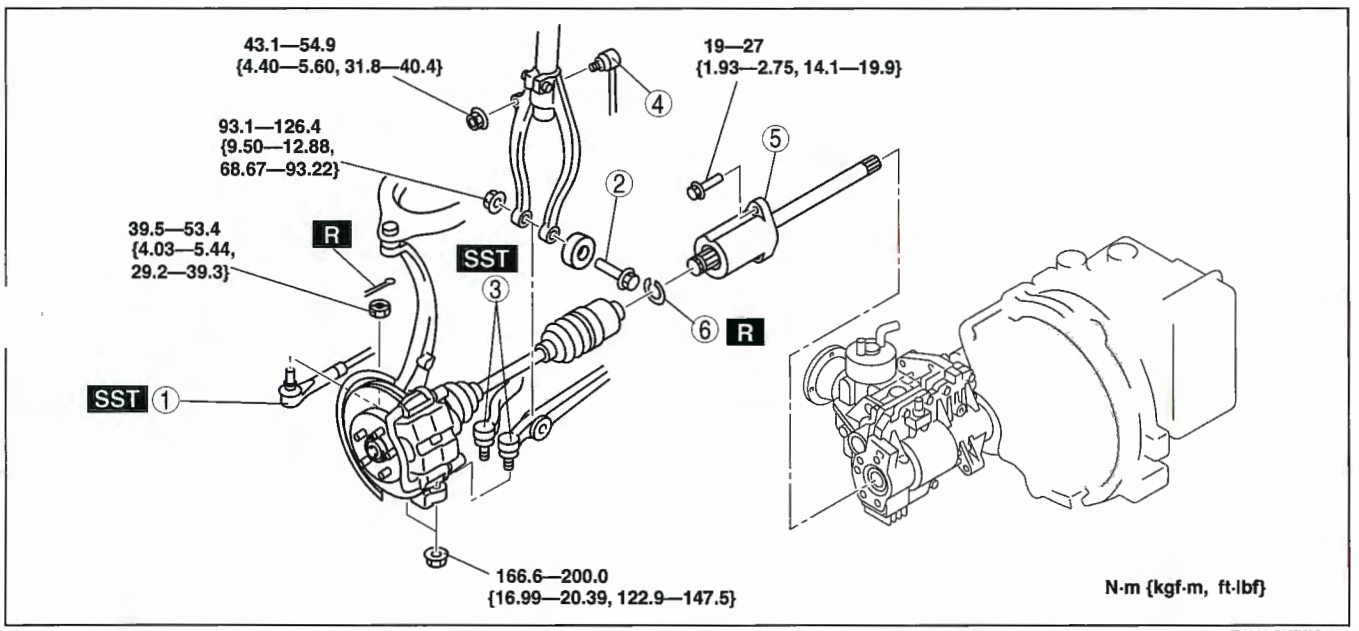
JOINT SHAFT REMOVAL/INSTALLATION [L3 WITH TC]

E6U031325700W07

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while the vehicle is being serviced.**

1. Drain the transaxle oil. (See 05–15C–2 TRANSAXLE OIL REPLACEMENT [A26MX-R].)
2. Remove the ABS sensor. (See 04–13–8 FRONT ABS WHEEL-SPEED SENSOR REMOVAL/INSTALLATION.)
3. Remove in the order indicated in the table.
4. Install in the reverse order of removal.



E6U313ZWC002

1	Tie-rod end ball joint (See 06–12–15 STEERING GEAR AND LINKAGE REMOVAL/INSTALLATION [L3 WITH TC])
2	Bolt
3	Lower arm (front, rear) ball joint (See 02–13–11 Front Lower Arm (Front) Ball Joint Removal Note)

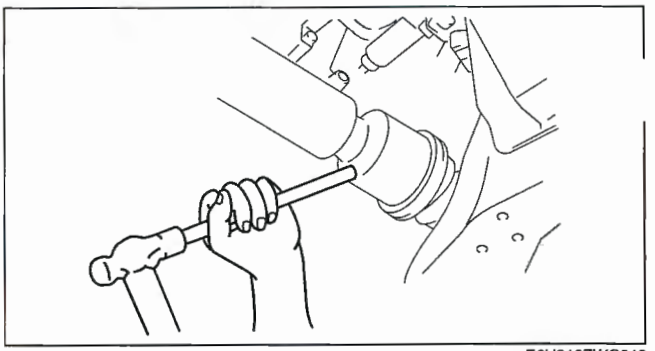
4	Stabilizer control link
5	Joint shaft (See 03–13–8 Joint Shaft Removal Note)
6	Clip (See 03–13–8 Clip Installation Note)

Joint Shaft Removal Note

1. Separate the right side drive shaft from the joint shaft by tapping on a brass bar inserted between them.
2. Remove the bolts.
3. Pull the joint shaft straight out.

Caution

- **The sharp edges of the joint shaft can slice or puncture the oil seal. Be careful when removing the joint shaft from the transaxle.**

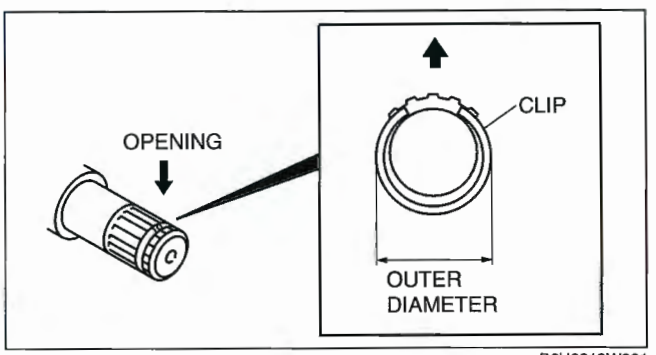


E6U313ZWC013

Clip Installation Note

1. Install a new clip onto the joint shaft with the opening facing upward. Ensure that the diameter of the clip does not exceed the specification on installation.
2. After installation, measure the outer diameter. If it exceeds the specification, repeat Step 1 using a new clip.

Outer diameter specification
34.0 mm {1.34 in} max.

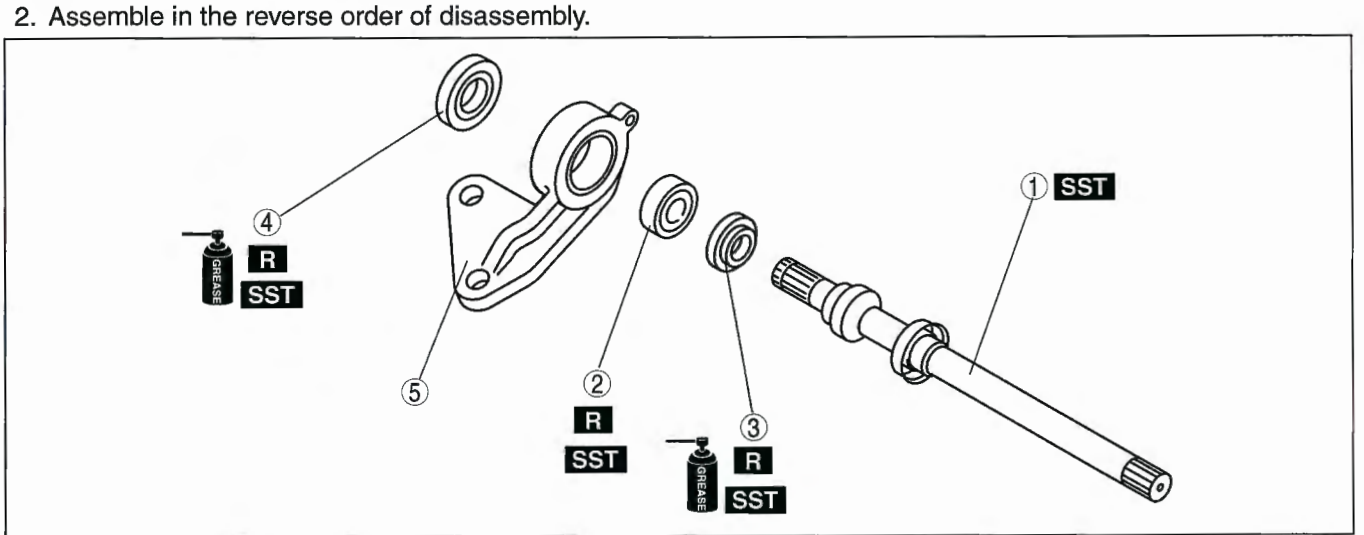


B6U0313W001

JOINT SHAFT DISASSEMBLY/ASSEMBLY [L3]

E6U031325700

1. Disassemble in the order indicated in the table.
2. Assemble in the reverse order of disassembly.

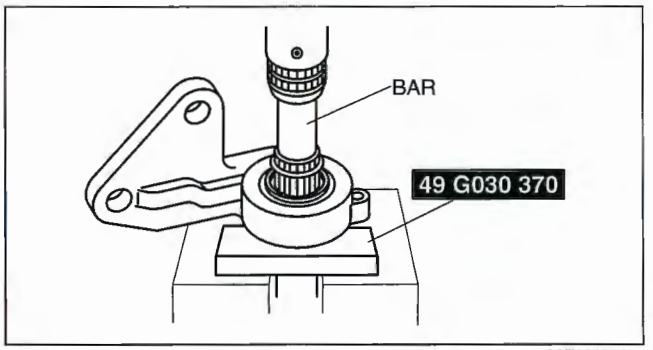


A6J63152001

1	Joint shaft (See 03–13–9 Joint Shaft Disassembly Note.) (See 03–13–10 Joint Shaft Assembly Note.)
2	Bearing (See 03–13–9 Bearing Disassembly Note.) (See 03–13–10 Bearing Assembly Note.)
3	Dust seal (Differential side) (See 03–13–10 Dust Seal (Differential Side) Assembly Note.)
4	Dust seal (Wheel side) (See 03–13–9 Dust Seal (Wheel Side) Assembly Note.)
5	Bracket

Joint Shaft Disassembly Note

1. Disassemble the joint shaft using the **SST**.

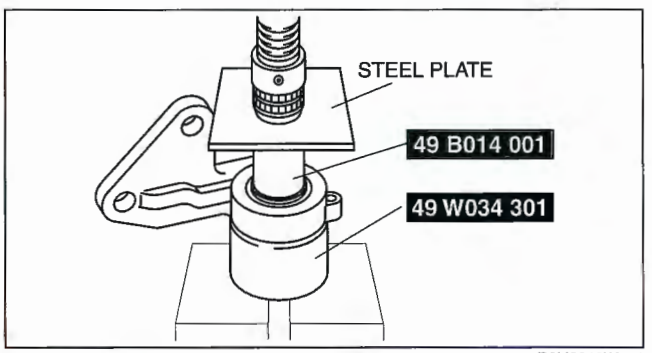


A6E63152102

Bearing Disassembly Note

When the bearing remains on the bracket

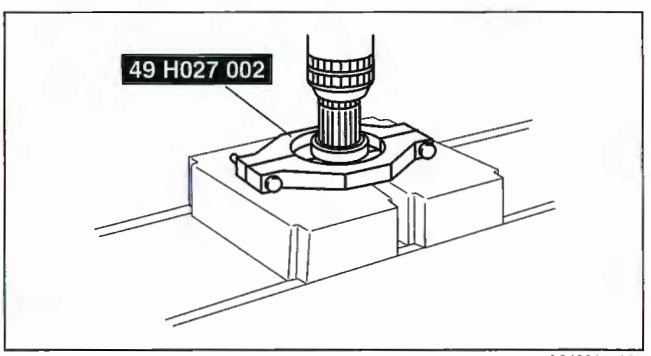
1. Remove the bearing and the dust seals (both differential side and wheel side) using the **SSTs**.



B6U0313W101

When the bearing remains on the shaft

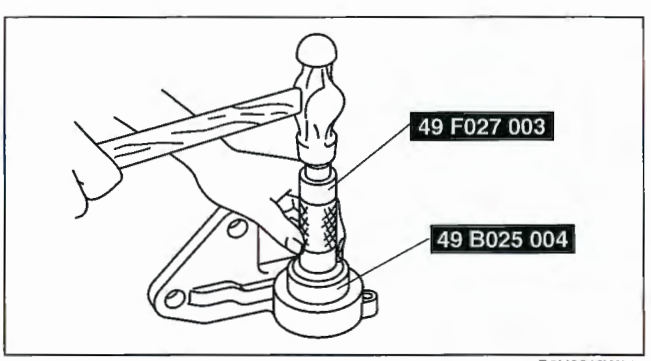
1. Remove the bearing from the joint shaft using the **SST**.



A6J63152003

Dust Seal (Wheel Side) Assembly Note

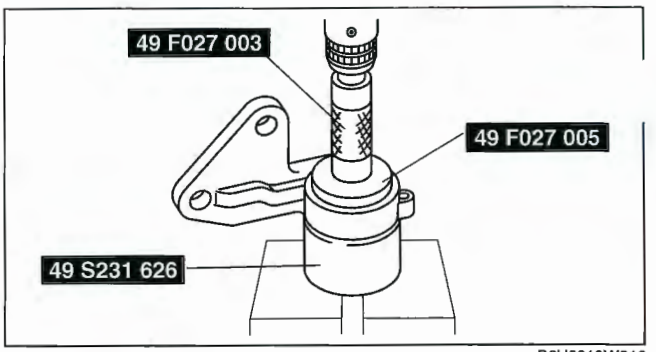
1. Apply grease to the new dust seal lip.
2. Install the new dust seal (wheel side) using the **SSTs**.



B6U0313W015

Bearing Assembly Note

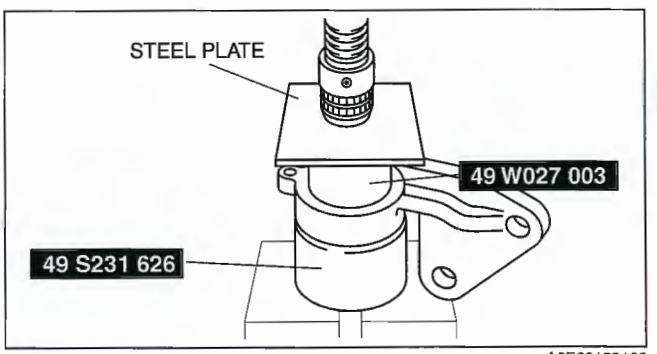
1. Install the new bearing using the **SSTs**.



B6U0313W016

Dust Seal (Differential Side) Assembly Note

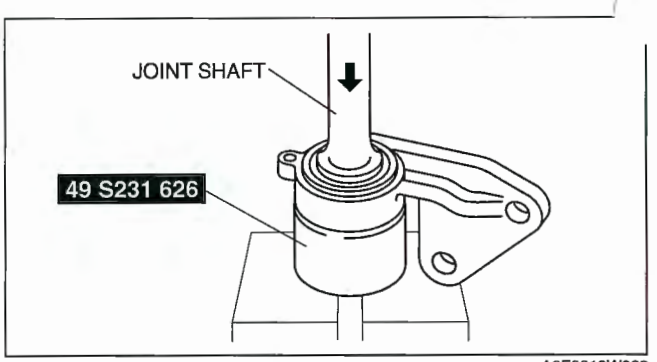
1. Apply grease to the new dust seal lip.
2. Install the new dust seal (differential side) using a steel plate and the **SSTs**.



A6E63152103

Joint Shaft Assembly Note

1. Assemble the joint shaft using a press and the **SST**.

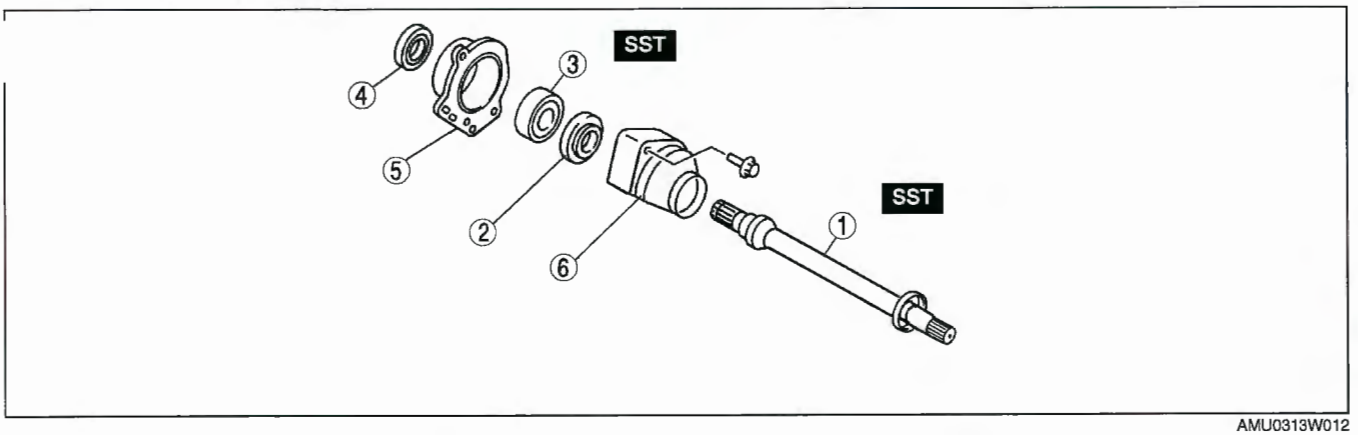


A6E0313W029

JOINT SHAFT DISASSEMBLY [AJ]

E6U031325700W05

1. Disassemble in the order indicated in the table.

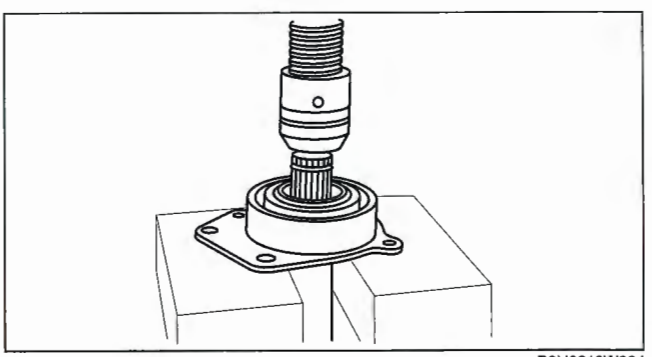


AMU0313W012

1	Joint shaft (See 03–13–11 Joint Shaft Disassembly Note.)
2	Dust seal (differential side) (See 03–13–11 Dust Seal (Differential Side) Disassembly Note.)
3	Bearing (See 03–13–11 Bearing And Dust Seal (Drive Shaft Side) Disassembly Note.)
4	Dust seal (drive shaft side) (See 03–13–11 Bearing And Dust Seal (Drive Shaft Side) Disassembly Note.)
5	Bracket
6	Dust cover

Joint Shaft Disassembly Note

Remove the joint shaft as shown in the figure.



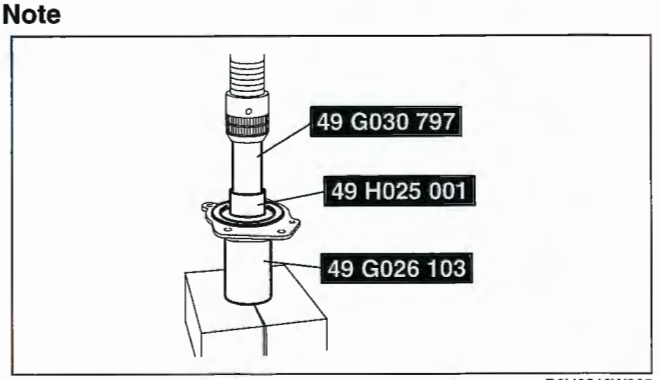
B6U0313W004

Dust Seal (Differential Side) Disassembly Note

1. Remove the dust seal (differential side) using a flathead screwdriver.

Bearing And Dust Seal (Drive Shaft Side) Disassembly Note

1. Remove the bearing using the **SSTs** and a press.

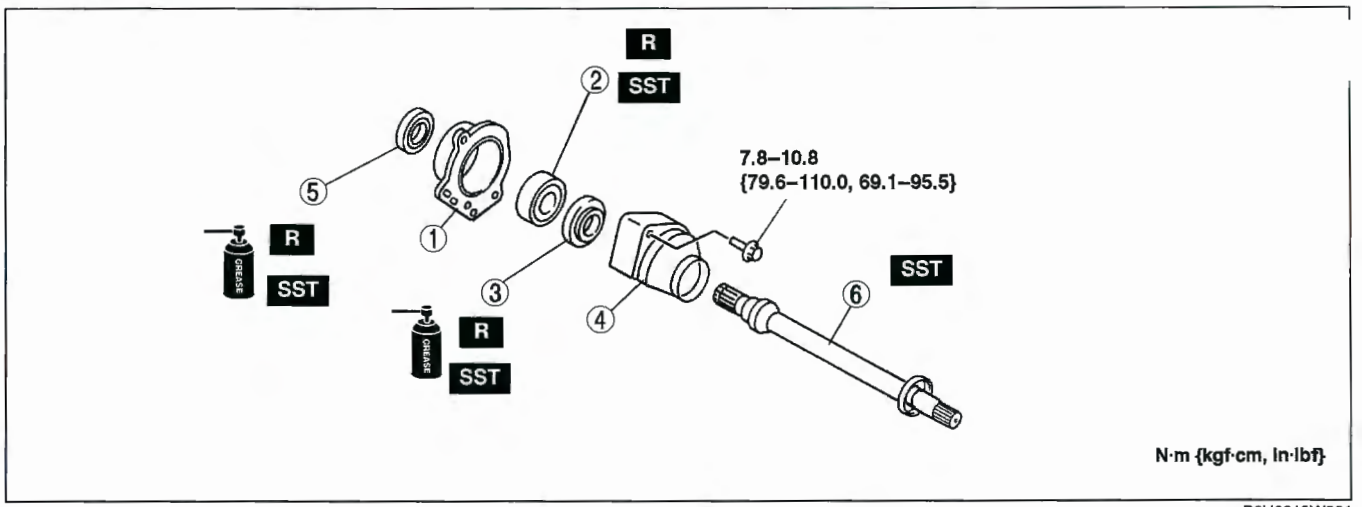


B6U0313W005

JOINT SHAFT ASSEMBLY [AJ]

E6U031325700W06

1. Assemble in the order indicated in the table.



B6U0313W301

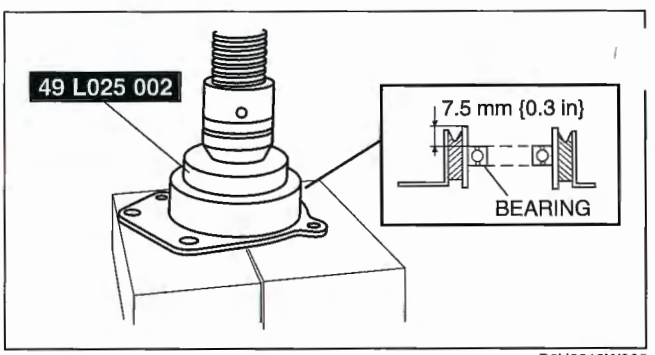
1	Bracket
2	Bearing (See 03–13–12 Bearing Assembly Note.)
3	Dust seal (differential side) (See 03–13–12 Dust Seal (Differential Side) Assembly Note.)
4	Dust cover
5	Dust seal (drive shaft side) (See 03–13–13 Dust Seal (Drive Shaft Side) Assembly Note.)
6	Joint shaft (See 03–13–13 Joint Shaft Assembly Note.)

Bearing Assembly Note

1. Install the new bearing using the **SST** and a press.

Note

- Press the outer race of the bearing.



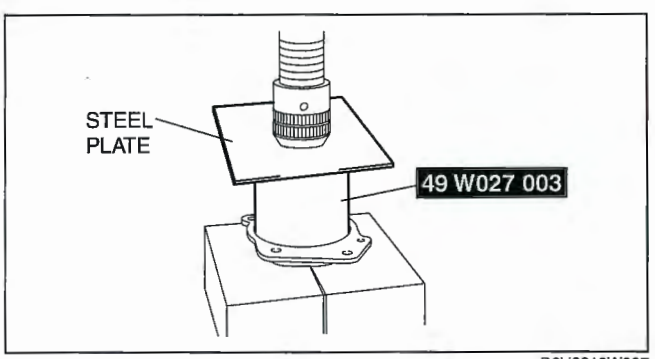
B6U0313W006

Dust Seal (Differential Side) Assembly Note

1. Apply grease to the new dust seal lip.
2. Install the new differential side dust seal using a press, steel plate and the **SST**.

Caution

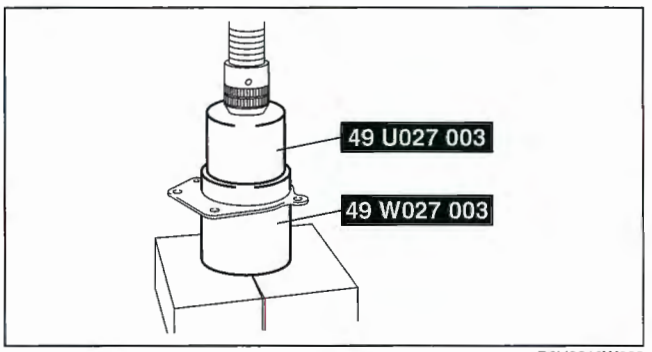
- **Do not damage the rubber part of the dust cover.**



B6U0313W007

Dust Seal (Drive Shaft Side) Assembly Note

1. Apply grease to the new dust seal lip.
2. Install the new drive shaft side dust seal using the **SSTs** and a press.



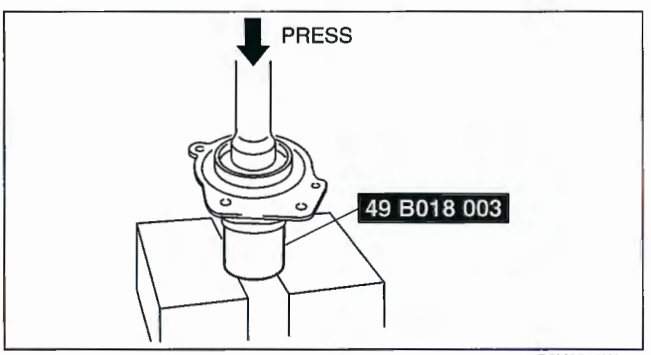
B6U0313W008

Joint Shaft Assembly Note

1. Install the joint shaft using a press and the **SST**.

Note

- Support the inner race of the bearing.

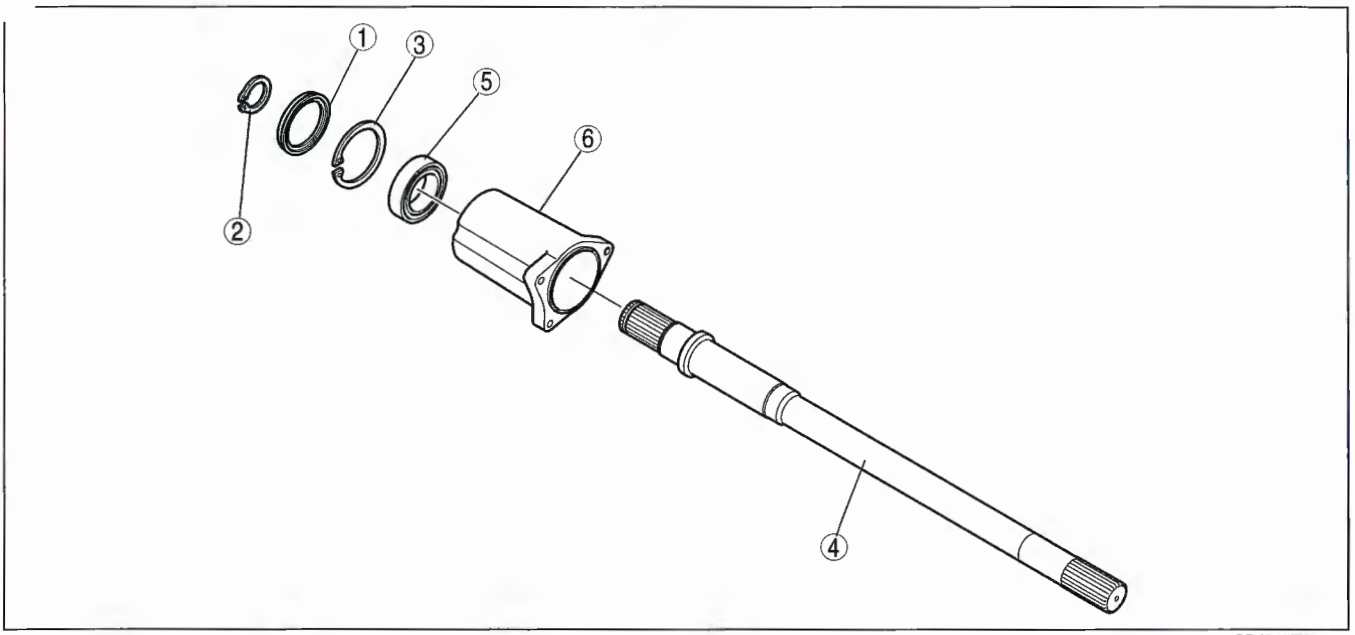


B6U0313W009

JOINT SHAFT DISASSEMBLY [L3 WITH TC]

E6U031325700W08

Disassemble in the order indicated in the table.



CPJ313ZW7005

1	Dust seal
2	Clip
3	Snap ring

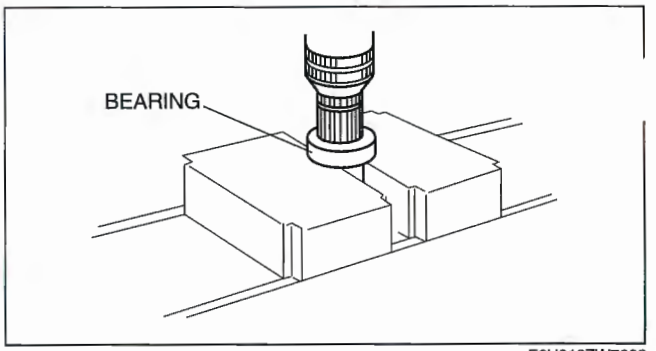
4	Joint shaft (See 03–13–14 Joint Shaft Disassembly Note)
5	Bearing
6	Bracket

Dust Seal Disassembly Note

1. Remove the dust seal using a flathead screwdriver.

Joint Shaft Disassembly Note

1. Remove the joint shaft.

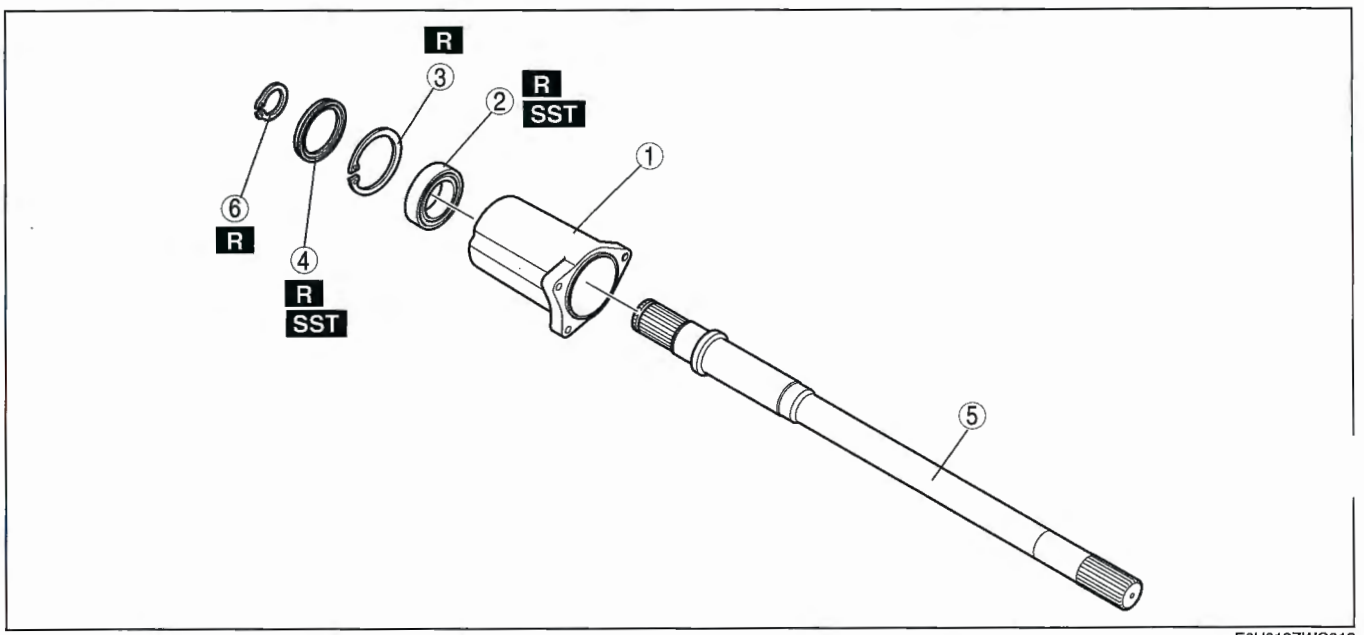


E6U313ZW7002

JOINT SHAFT ASSEMBLY [L3 WITH TC]

E6U031325700W09

1. Assemble in the order indicated in the table.



E6U313ZWC012

1	Bracket
2	Bearing (See 03–13–14 Bearing Assembly Note)
3	Snap ring

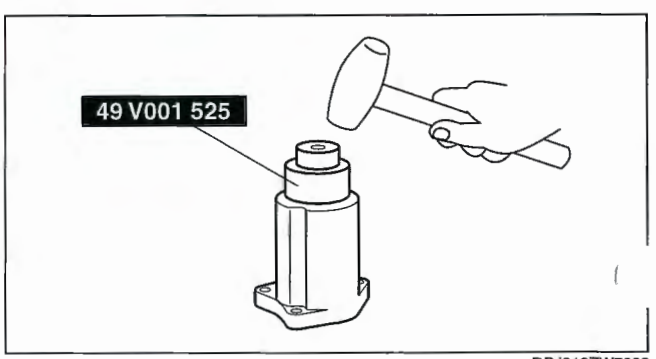
4	Dust seal (See 03–13–15 Dust Seal Assembly Note)
5	Joint shaft (See 03–13–15 Joint Shaft Assembly Note)
6	Snap ring

Bearing Assembly Note

1. Install the new bearing to the bracket.

Note

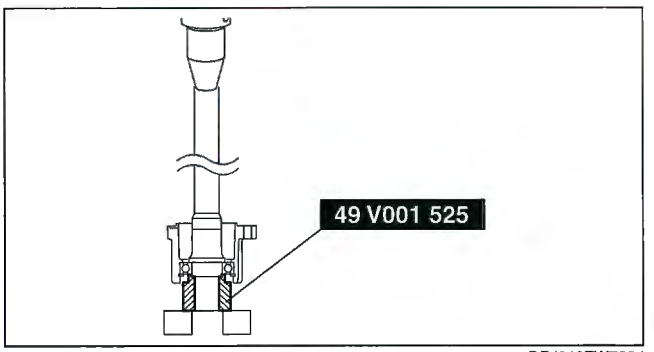
- When the bearing is not installed to the bracket by hand, install it using the **SST**.



DPJ313ZW7002

Joint Shaft Assembly Note

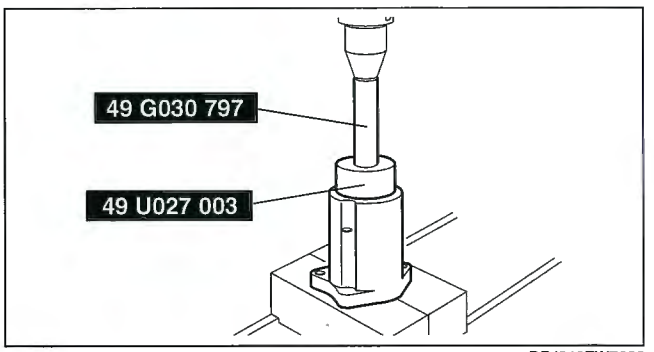
1. Install the joint shaft using a press and the **SST**.



DPJ313ZW7004

Dust Seal Assembly Note

1. Apply grease to the new dust seal lip.
2. Install the new dust seal using a press and the **SST**.



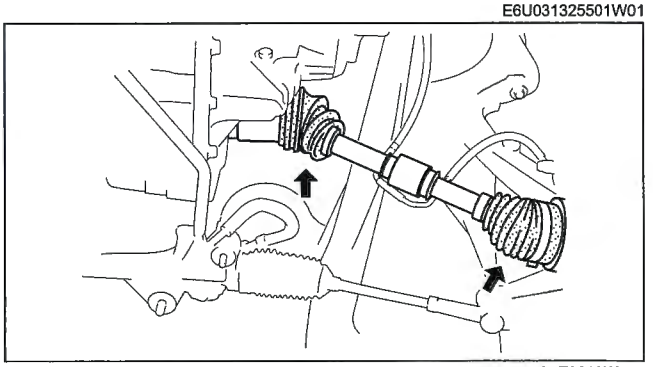
DPJ313ZW7003

FRONT DRIVE SHAFT PRE-INSPECTION

Inspect the dust boot on the drive shaft for cracks, damage, leaking grease, and looseness in the boot band.

2. Inspect the drive shaft for bends, cracks, and wear in the joint or splines.
   - Repair or replace the drive shaft or boot/band as necessary.

E6U031325501W01



A6E0313W033

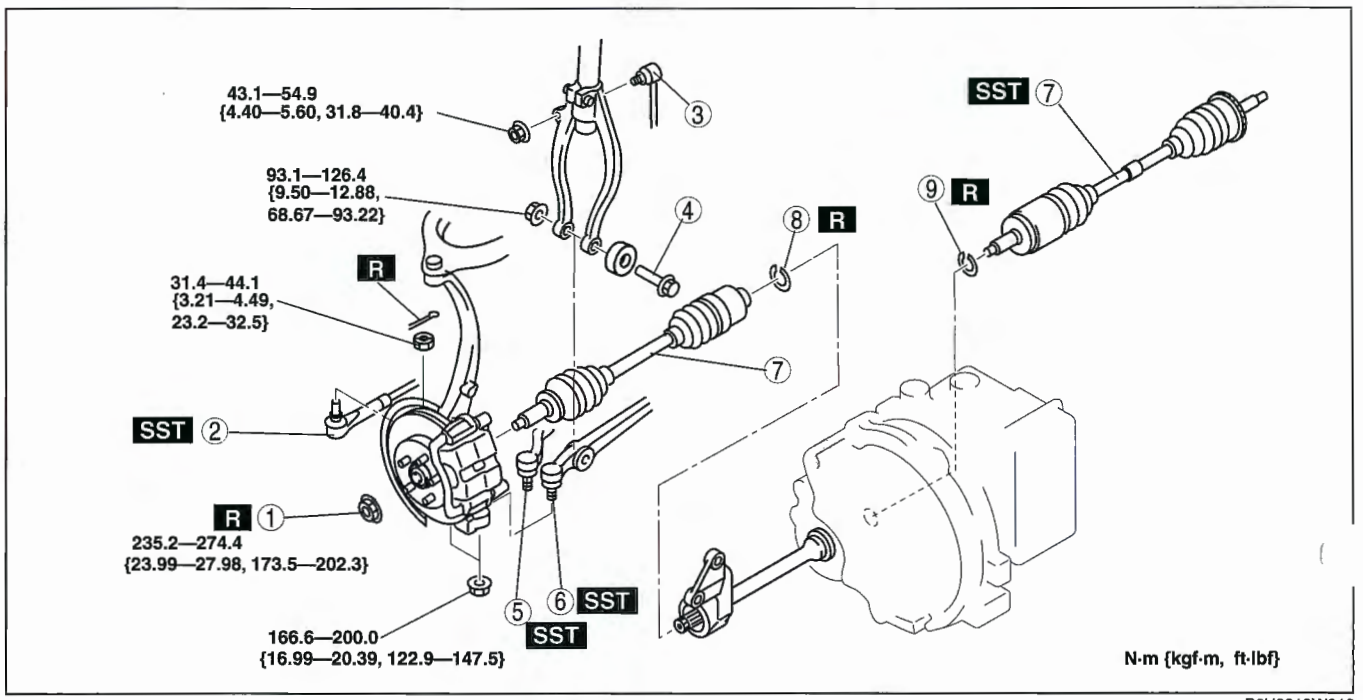
FRONT DRIVE SHAFT REMOVAL/INSTALLATION [L3, L3 WITH TC]

E6U031325501W02

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while the vehicle is being serviced.**

1. Drain the transaxle oil (left side). (See 05–17A–12 AUTOMATIC TRANSAXLE FLUID (ATF) REPLACEMENT [FS5A-EL].) (See 05–15A–2 TRANSAXLE OIL REPLACEMENT [G35M-R].) (See 05–15C–2 TRANSAXLE OIL REPLACEMENT [A26MX-R])
2. Remove in the order indicated in the table.
3. Install in the reverse order of removal.



B6U0313W010

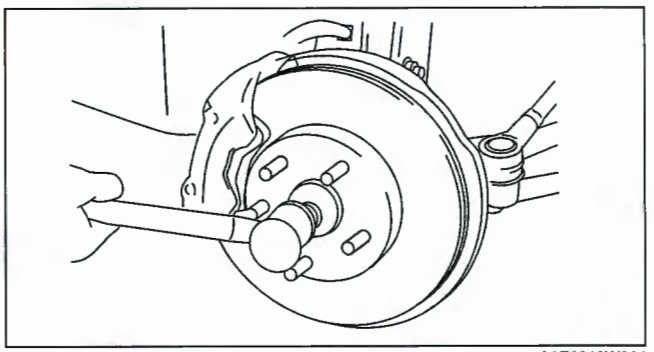
1	Locknut (See 03–11–4 Locknut Removal Note.) (See 03–11–7 Locknut Installation Note.)
2	Tie-rod end ball joint (See 06–12–12 Tie-rod End Ball Joint Removal Note.)
3	Front stabilizer control link (See 02–13–18 FRONT STABILIZER REMOVAL/ INSTALLATION.)
4	Bolt
5	Front lower arm (rear) ball joint (See 02–13–11 Front Lower Arm (Front) Ball Joint Removal Note.)
6	Front lower arm (front) ball joint (See 02–13–11 Front Lower Arm (Front) Ball Joint Removal Note.)
7	Drive shaft (See 03–13–17 Drive Shaft Removal Note.) (See 03–13–18 Drive Shaft Installation Note.)
8	Clip (right side) (See 03–13–4 Clip Installation Note.) (See 03–13–8 Clip Installation Note)
9	Clip (left side) (See 03–13–18 Clip Installation Note.)

Drive Shaft Removal Note

1. Install a spare nut onto the drive shaft so that the nut is flush with the end of the drive shaft.
2. Tap the nut with a copper hammer to loosen the drive shaft from the front wheel hub.
. Separate the drive shaft from the wheel hub.

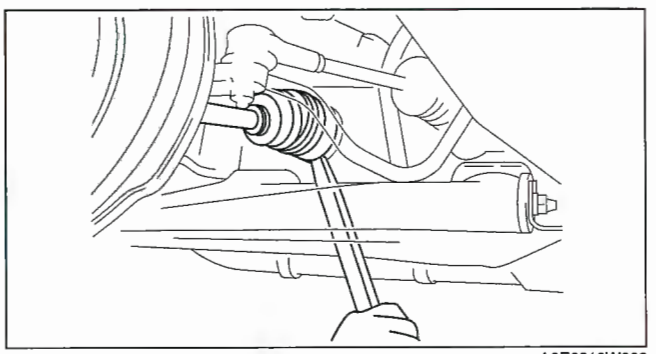
Caution

- **The sharp edges of the drive shaft can slice or puncture the oil seal. Be careful when removing the drive shaft from the transaxle.**



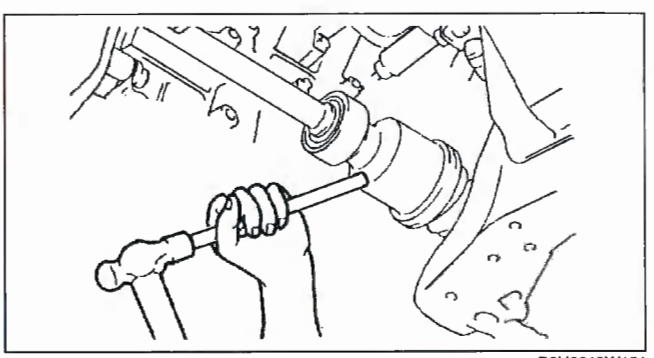
A6E6316W001

4. Separate the left side drive shaft from the transaxle by prying with a bar inserted between the outer ring and the transaxle, as shown in the figure.



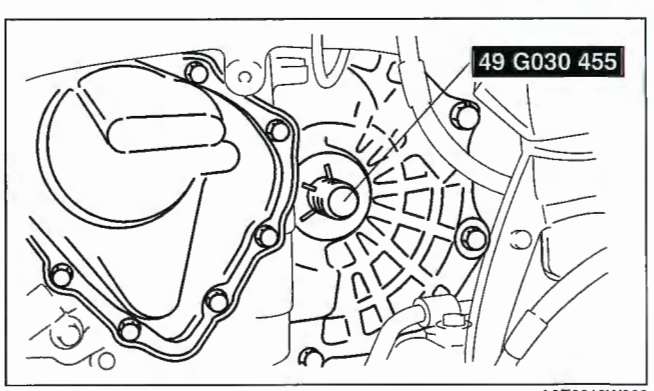
A6E6316W002

5. Separate the right side drive shaft from the joint shaft by tapping on a bar inserted between them.



B6U0313W151

6. Install the **SST** into the transaxle to hold the side gears after the drive shaft is removed.

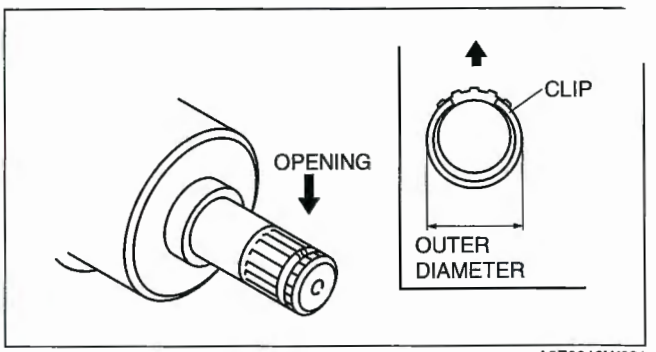


A6E0313W038

Clip Installation Note

1. Install a new clip onto the drive shaft with the opening facing upward. Ensure that the diameter of the clip does not exceed the specification on installation.
2. After installation, measure the outer diameter. If it exceeds the specification, repeat Steps 1—2 using a new clip.

Outer diameter specification
L3: 30.0—31.2 mm {1.19—1.23 in}
L3 with TC: 34.0 mm {1.34 in}

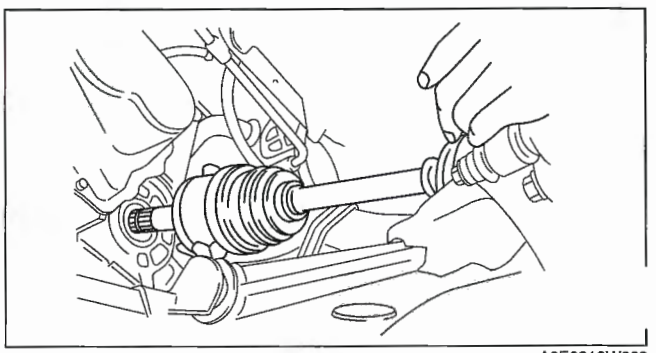


A6E0313W021

Drive Shaft Installation Note

Caution

- **The sharp edges of the drive shaft can slice or puncture the oil seal. Be careful when installing the drive shaft to the transaxle.**
- **The oil seals are damaged easily if this procedure is not done correctly.**



A6E6316W003

Left side

1. Insert the drive shaft into the wheel hub.
2. Apply transaxle oil to the oil seal lip.
3. Push the drive shaft into the transaxle.
4. After installation, pull the transaxle side outer ring forward to confirm that the drive shaft is securely held by the clip.

Right side

1. Insert the drive shaft into the wheel hub.
2. Insert the drive shaft into the joint shaft.
3. After installation, pull the transaxle side outer ring forward to confirm that the drive shaft is securely held by the clip.

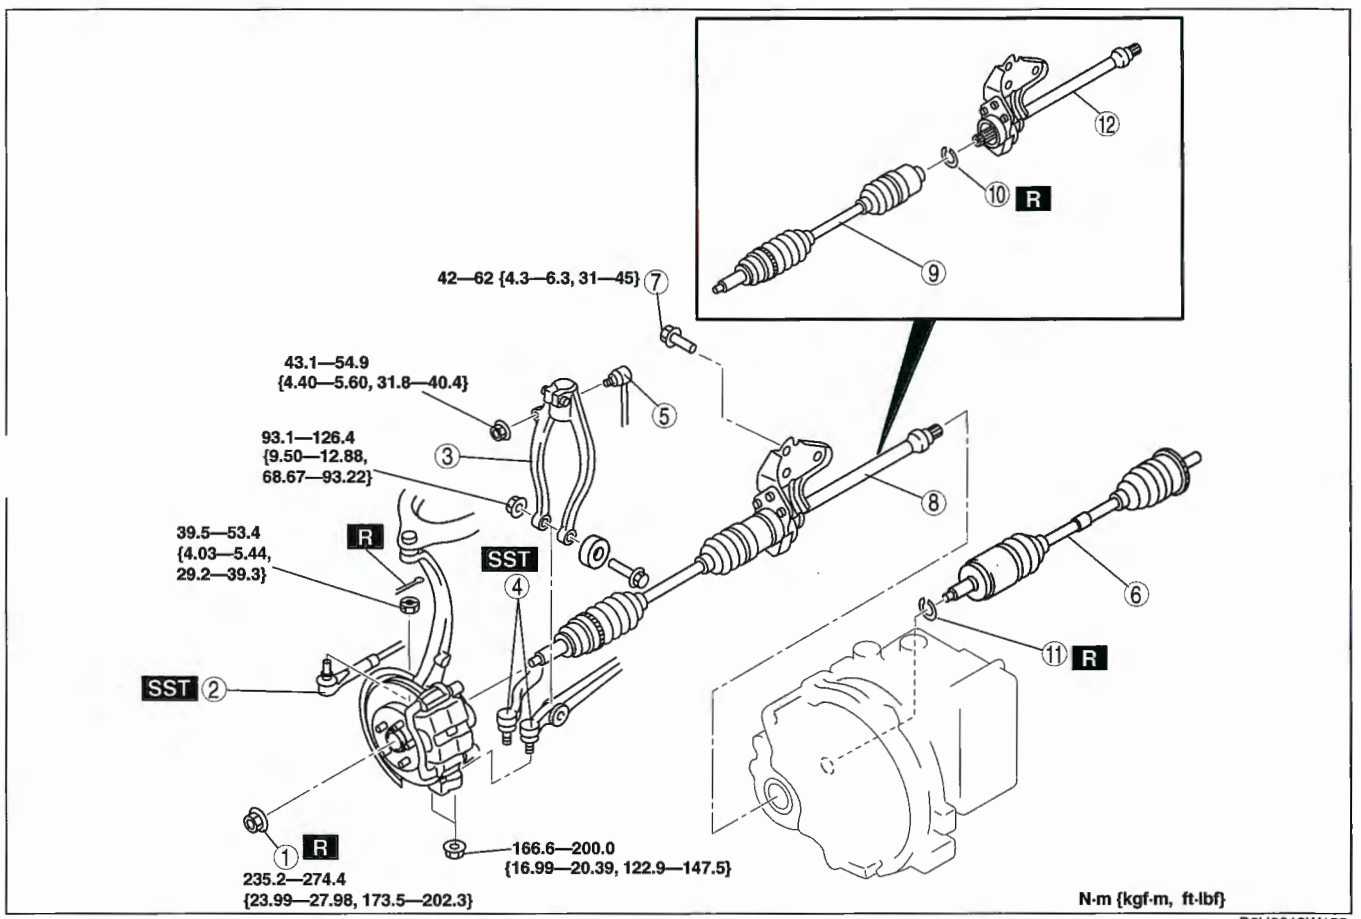
FRONT DRIVE SHAFT REMOVAL/INSTALLATION [AJ]

E6U031325501W03

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor could cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (axle side) and fix it to an appropriate place where the sensor will not be pulled by mistake while servicing the vehicle.**
- **Removing the right side drive shaft with the shaft bracket installed may cause the deformation of the joint shaft bracket. Therefore, remove/install the right side drive shaft and joint shaft as a component.**

1. Drain the transaxle oil. (MTX only) (See 05–15B–2 TRANSAXLE OIL REPLACEMENT [A65M-R].)
2. Remove the steering knuckle, wheel hub and dust cover component. (Right side) (See 03–11–3 WHEEL HUB, STEERING KNUCKLE REMOVAL/INSTALLATION.)
3. Remove in the order indicated in the table.
4. Install in the reverse order of removal.



B6U0313W152

1	Locknut (See 03–11–4 Locknut Removal Note.) (See 03–11–7 Locknut Installation Note.)
2	Tie-rod end (See 06–12–12 Tie-rod End Ball Joint Removal Note.)
3	Damper fork
4	Lower arm (front, rear) ball joint (See 02–13–11 Front Lower Arm (Front) Ball Joint Removal Note.)
5	Stabilizer control link
6	Drive shaft (left side) (See 03–13–20 Drive Shaft (Left Side) Removal Note.) (See 03–13–21 Drive Shaft (Left Side) Installation Note.)

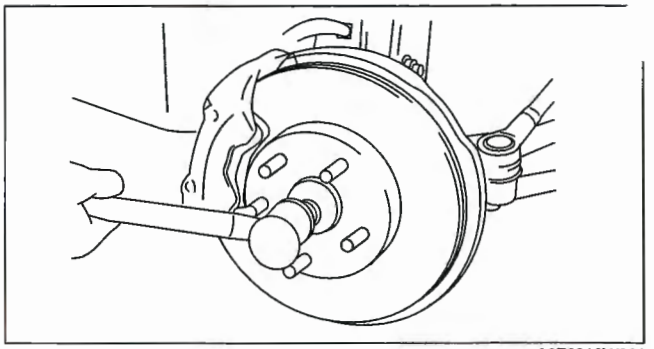
7	Joint shaft bracket bolt
8	Drive shaft (right side) and joint shaft (See 03–13–6 Drive Shaft And Joint Shaft Removal Note.) (See 03–13–7 Drive Shaft And Joint Shaft Installation Note.)
9	Drive shaft (right side) (See 03–13–20 Drive Shaft (Right Side) Removal Note.)
10	Clip (right side) (See 03–13–6 Clip Installation Note.)
11	Clip (left side) (See 03–13–21 Clip Installation Note.)
12	Joint shaft (See 03–13–20 Joint Shaft Installation Note.)

Drive Shaft (Left Side) Removal Note

1. Install a spare nut onto the drive shaft so that the nut is flush with the end of the drive shaft.
2. Tap the nut with a copper hammer to loosen the drive shaft from the front wheel hub.
3. Separate the drive shaft from the wheel hub.

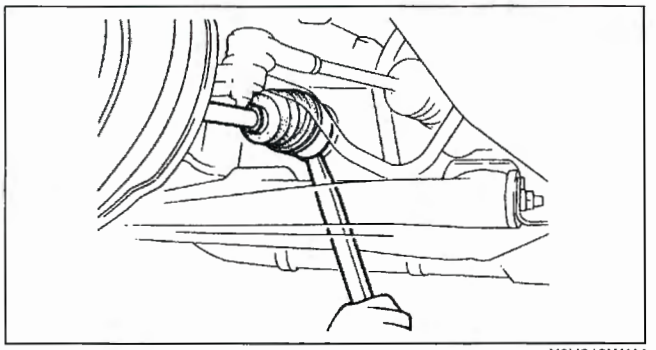
Caution

- **The sharp edges of the drive shaft can slice or puncture the oil seal. Be careful when removing the drive shaft from the transaxle.**



A6E6316W001

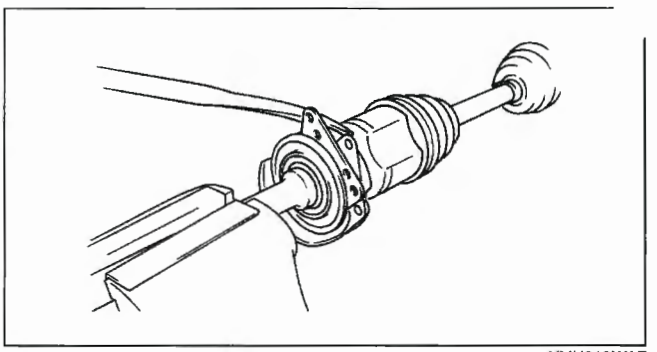
4. Separate the left side drive shaft from the transaxle by prying with a bar inserted between the outer ring and the transaxle, as shown in the figure.



X3U313WAM

Drive Shaft (Right Side) Removal Note

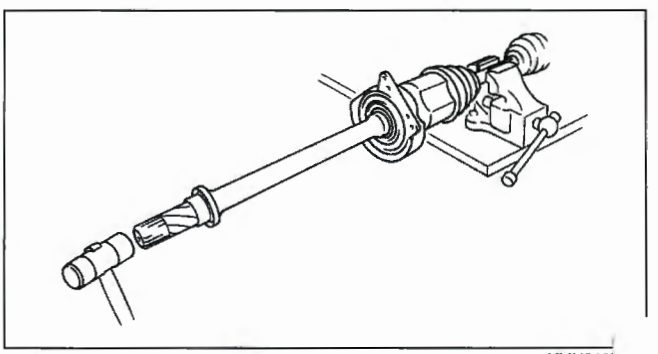
1. Secure the shaft portion of the joint shaft in a vise.
2. As shown in the figure, insert a pry bar between the drive shaft and the joint shaft and tap on the bar to uncouple them.



YMU313WAF

Joint Shaft Installation Note

1. Secure the shaft portion of the drive shaft in a vise.
2. Install the joint shaft using a plastic hammer as shown.

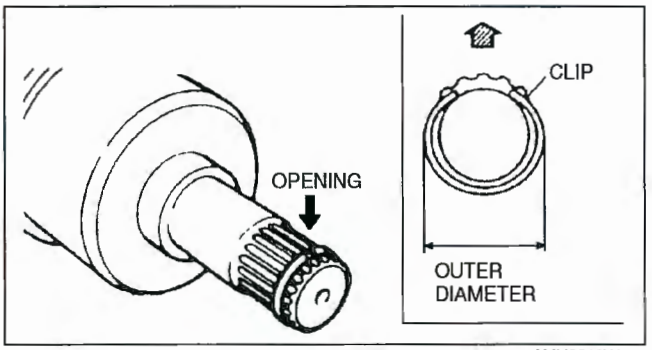


YMU313\

Clip Installation Note

1. Install a new clip onto the drive shaft with the opening facing upward. Ensure that the diameter of the clip does not exceed the specification on installation.
   After installation, measure the outer diameter. If it exceeds the specification, repeat steps 1—2 using a new clip.

   Outer diameter specification
   MTX: 32.1—33.2 mm {1.27—1.30 in}
   ATX: 33.1—34.0 mm {1.31—1.33 in}



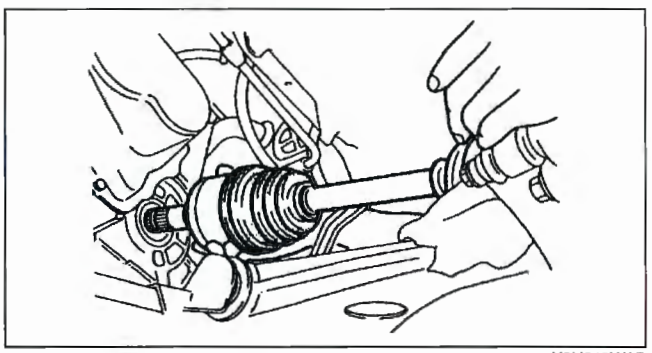
AMU0313W005

Drive Shaft (Left Side) Installation Note

1. Insert the drive shaft into the wheel hub.
2. Apply ATF to the oil seal lip.
3. Push the drive shaft into the transaxle.

   Caution
   - **The sharp edges of the drive shaft can slice or puncture the oil seal. Be careful when installing the drive shaft to the transaxle.**
   - **The oil seals are damaged easily if this procedure is not done correctly.**

4. After installation, pull the transaxle side outer ring forward to confirm that the drive shaft is securely held by the clip.

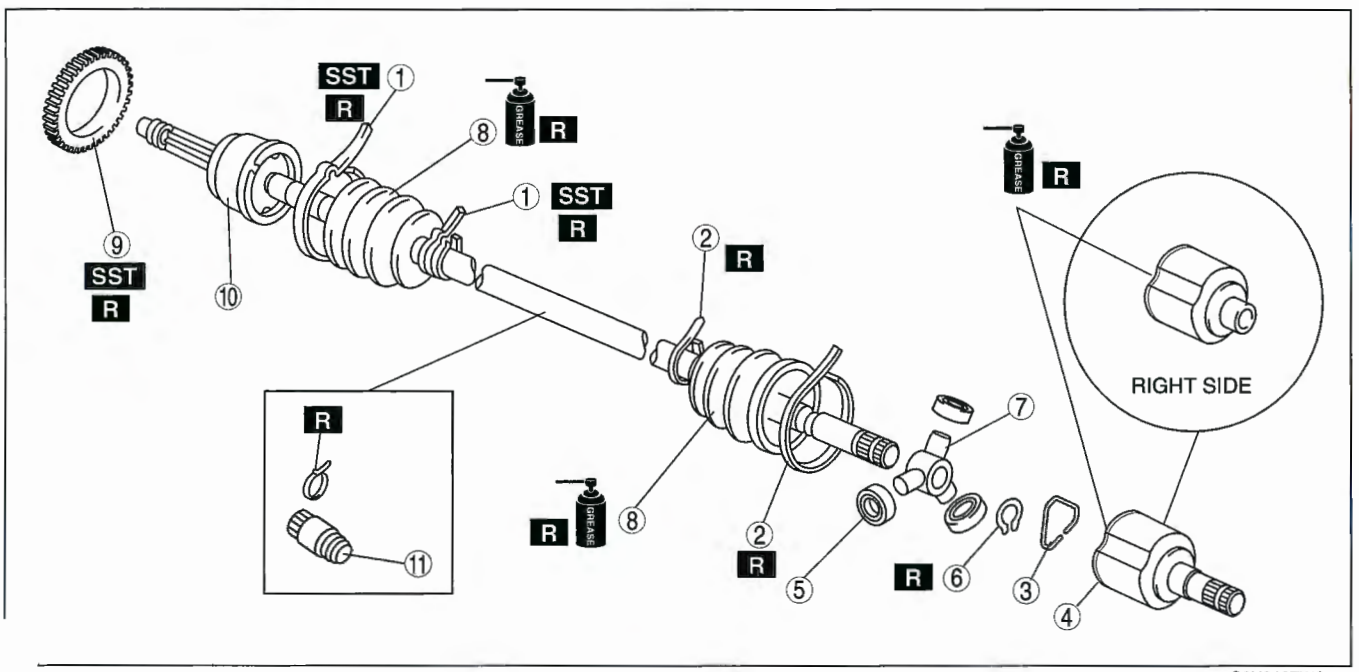


X3U313WAR

FRONT DRIVE SHAFT DISASSEMBLY/ASSEMBLY [ATX]

E6U031325501W04

1. Disassemble in the order indicated in the table.
2. Assemble in the reverse order of disassembly.



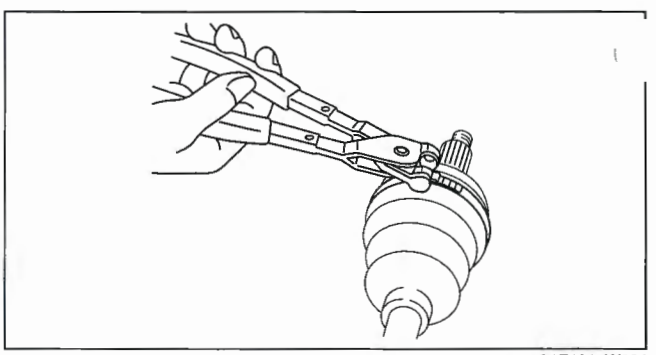
C6U313ZWC001

1	Boot band (wheel side) (See 03–13–22 Boot Band (Wheel Side) Disassembly Note.) (See 03–13–26 Boot Band (Wheel Side) Assembly Note.)
2	Boot band (transaxle side) (See 03–13–22 Boot Band (Transaxle Side) Disassembly Note.) (See 03–13–26 Boot Band (Transaxle Side) Assembly Note.)
3	Clip
4	Outer ring (See 03–13–23 Outer Ring Disassembly Note.) (See 03–13–25 Outer Ring Assembly Note.)
5	Roller cassette
6	Snap ring (See 03–13–23 Snap Ring, Tripod Joint Disassembly Note.) (See 03–13–25 Tripod Joint, Snap Ring Assembly Note.)
7	Tripod joint (See 03–13–23 Snap Ring, Tripod Joint Disassembly Note.) (See 03–13–25 Tripod Joint, Snap Ring Assembly Note.)
8	Boot (See 03–13–23 Boot Disassembly Note.) (See 03–13–24 Boot Assembly Note.)
9	ABS sensor rotor (with ABS) (See 03–13–24 ABS Sensor Rotor (With ABS) Disassembly Note.) (See 03–13–24 ABS Sensor Rotor (With ABS) Assembly Note.)
10	Shaft and ball joint component
11	Dynamic damper (See 03–13–24 Dynamic Damper Assembly Note.)

Boot Band (Wheel Side) Disassembly Note

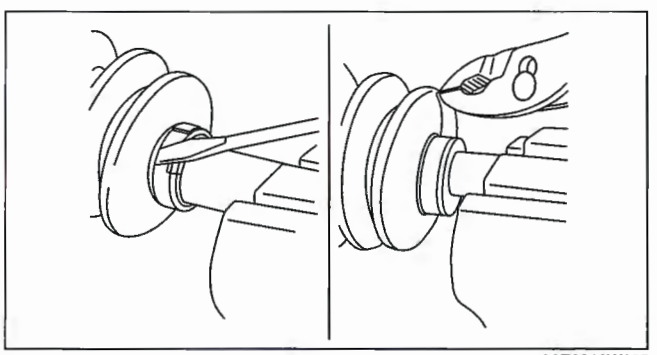
Note
- The boot band does not need to be removed unless it is being replaced.

1. Remove the boot clamp with end clamp pliers as shown and discard the clamp.



A6E6316W004

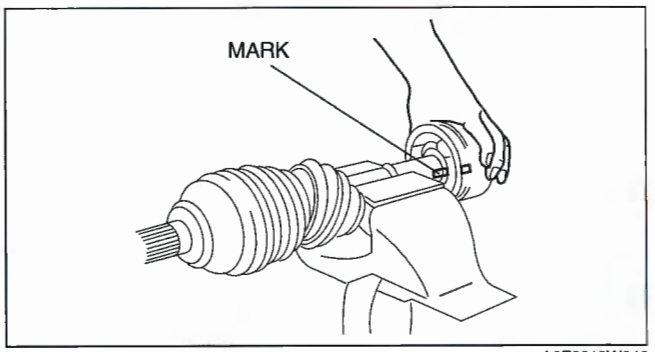
Boot Band (Transaxle Side) Disassembly Note
1. Pry up the locking clips using a screwdriver.
2. Pull back the end of the band.



A6E6316W005

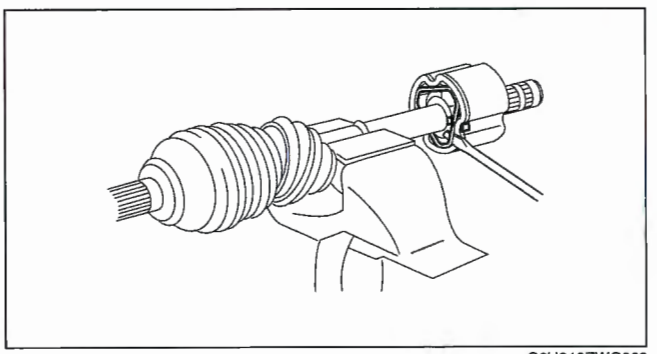
Outer Ring Disassembly Note

1. Mark the outer ring and the shaft for proper assembly.



A6E0313W046

2. Remove the clip.
3. Remove the outer ring.



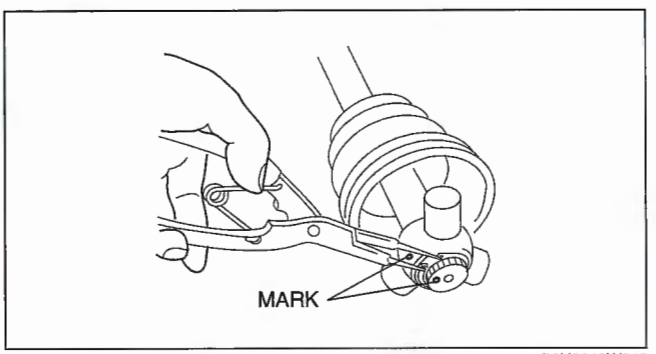
C6U313ZWC002

Snap Ring, Tripod Joint Disassembly Note

1. Mark the shaft and tripod joint for proper assembly.
2. Remove the snap ring using snap-ring pliers. Remove the tripod joint from the shaft.

Caution

- **Do not tap the tripod joint with a hammer.**



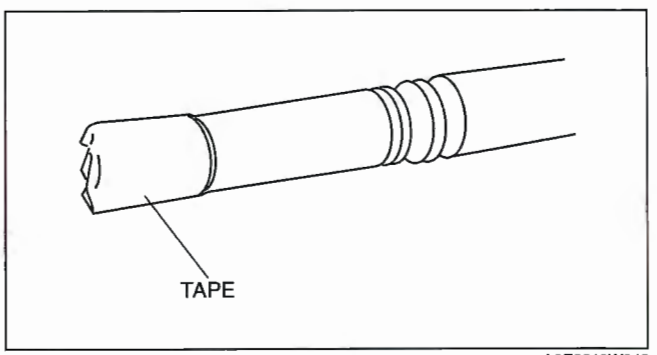
B6U0313W012

Boot Disassembly Note

Note

- The wheel side boot does not need to be removed unless replacing it or the ball joint and shaft component.
- Do not strip the tape until the boot is assembled.

1. Wrap the shaft splines with tape.
2. Remove the boot.

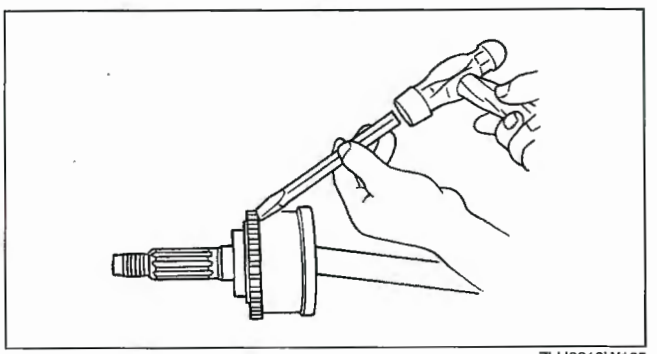


A6E0313W048

ABS Sensor Rotor (With ABS) Disassembly Note

Caution
- **Do not remove the sensor rotor unless it is necessary.**
- **Do not reuse the sensor rotor if removed.**

1. Tap the ABS sensor rotor off the drive shaft using a chisel.



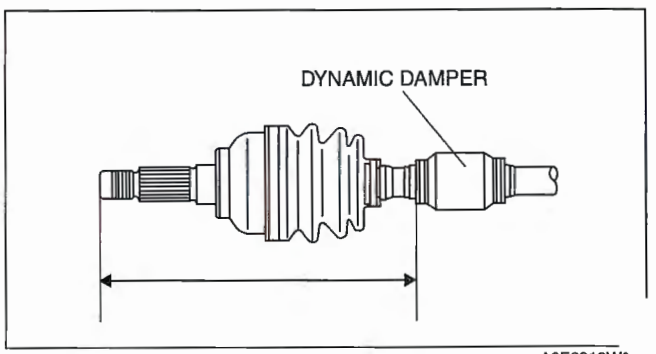
ZLU0313W105

Dynamic Damper Assembly Note

1. Install the dynamic damper as shown in the figure.

   Standard length
   287.7—293.7 mm {11.33—11.56 in}

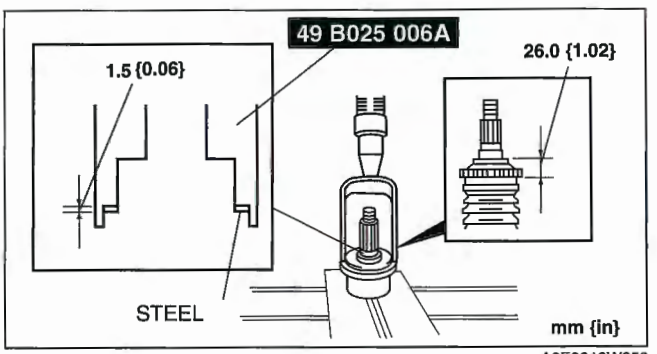
2. Install the new boot band onto the dynamic damper.



A6E6316W0

ABS Sensor Rotor (With ABS) Assembly Note

1. Set a new ABS sensor rotor on the drive shaft and press it on using the **SSTs.**



A6E0313W050

Boot Assembly Note

Note
- The wheel side and transaxle side boots are different.

1. Fill the boot (wheel side) with the specified grease.

Caution
- **Do not touch grease with your hand. Apply it from the tube to prevent foreign matter from entering the boot.**

Grease amount
L3: 85—105 g {3.00—3.70 oz}
AJ: 100—120 g {3.53—4.23 oz}

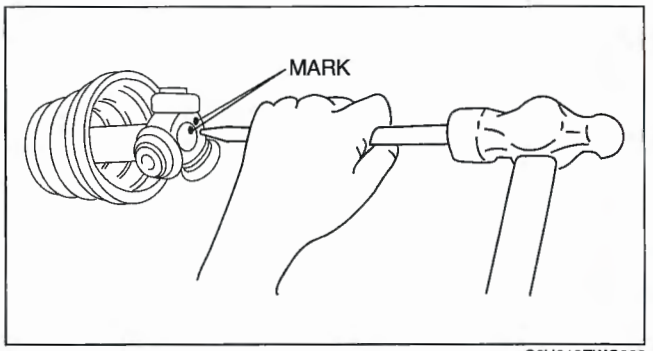
2. With the splines of the shaft still wrapped in tape from disassembly, install the boot.
3. Remove the tape.

Tripod Joint, Snap Ring Assembly Note

1. Align the marks and install the tripod joint using a bar and a hammer.
2. Install the new snap ring using snap-ring pliers.

Caution

- **Be sure the snap ring engages correcting in the groove of the shaft.**



C6U313ZWC003

Outer Ring Assembly Note

1. Fill the outer ring and boot (transaxle side) with the specified grease.

Caution

- **Do not touch grease with your hand. Apply it from the tube to prevent foreign matter from entering the boot.**

Grease amount

200—220 g {7.06—7.76 oz}

2. Install the roller cassettes.
3. Align the marks, and install the outer ring on to the shaft.
4. Install a new clip.
   Install the boot.
5. Set the drive shaft to the standard length.

Front drive shaft length (ATX)

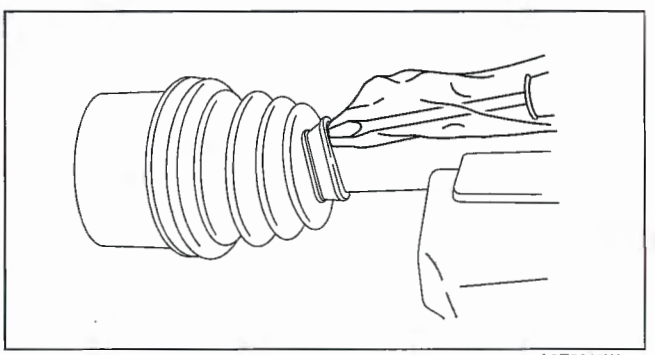
L3 (LH): 674.1—684.1 mm {26.54—26.93 in}
L3 (RH): 630.4—640.4 mm {24.82—25.21 in}
AJ (LH): 617.7—627.7 mm {24.32—24.71 in}
AJ (RH): 597.4—607.4 mm {23.52—23.91 in}

7. Release any trapped air from the boots by carefully lifting up the small end of each boot with a cloth- wrapped flathead screwdriver.

Caution

- **Do not let grease leak.**
- **Do not damage the boot.**

8. Verify that the drive shaft length is within the standard.

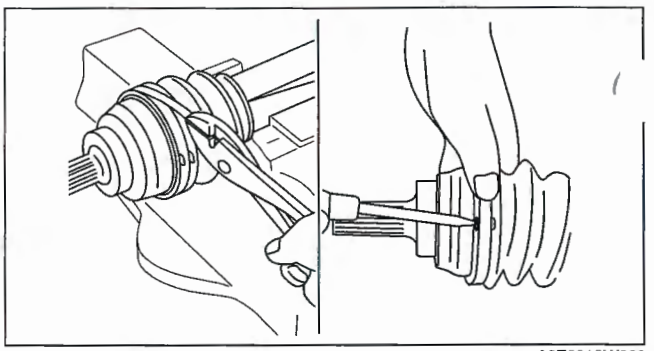


A6E6316W007

Boot Band (Transaxle Side) Assembly Note

1. Fold the band in the direction opposite to the forward revolving direction of the drive shaft and use pliers to pull it tight.
2. Lock the end of the band by bending the locking clips.

Caution
- **Install the band into the groove securely.**

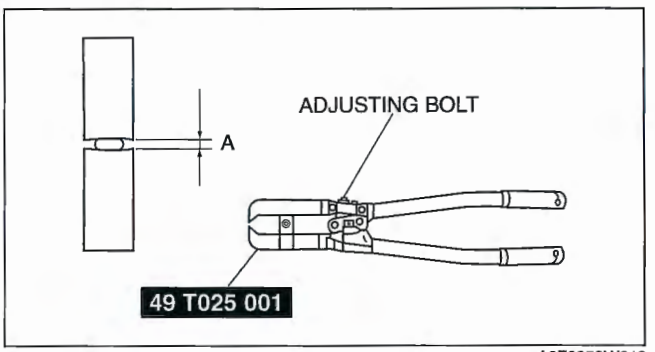


A6E6316W008

Boot Band (Wheel Side) Assembly Note

1. Adjust clearance A by turning the adjusting bolt of the **SST**.

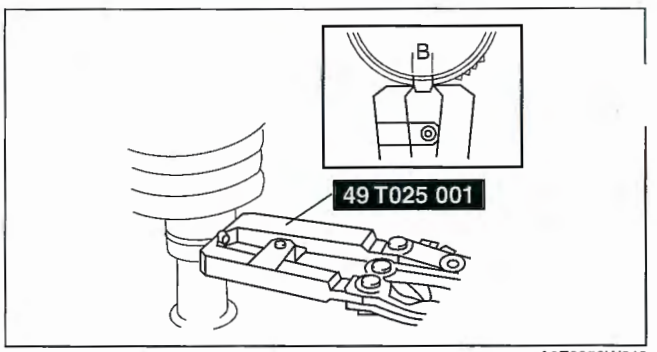
Clearance A
2.9 mm {0.11 in}



A6E0350W012

2. Crimp the wheel side small boot band using the **SST**. Verify that clearance B is within the specification.
   - If clearance B is more than the specification, reduce clearance A of the **SST** and crimp the boot again.
   - If clearance B is less than the specification, replace the boot band, increase clearance A of the **SST**, and crimp the new boot.

Clearance B
2.4—2.8 mm {0.095—0.110 in}



A6E0350W013

3. Verify that the boot band does not protrude from the boot band installation area.
   - If it does, replace the boot band and repeat Steps 2 and 3.
4. Fill the boot with the repair kit grease.
5. Adjust clearance A by turning the adjusting bolt of the **SST**.

Clearance A
3.2 mm {0.13 in}

6. Crimp the wheel side big boot band using the **SST**.
7. Verify that clearance B is within the specification.
   - If clearance B is more than the specification, reduce clearance A of the **SST** and crimp the boot again.
   - If clearance B is less than the specification, replace the boot band, increase clearance A of the **SST** and crimp the new boot.

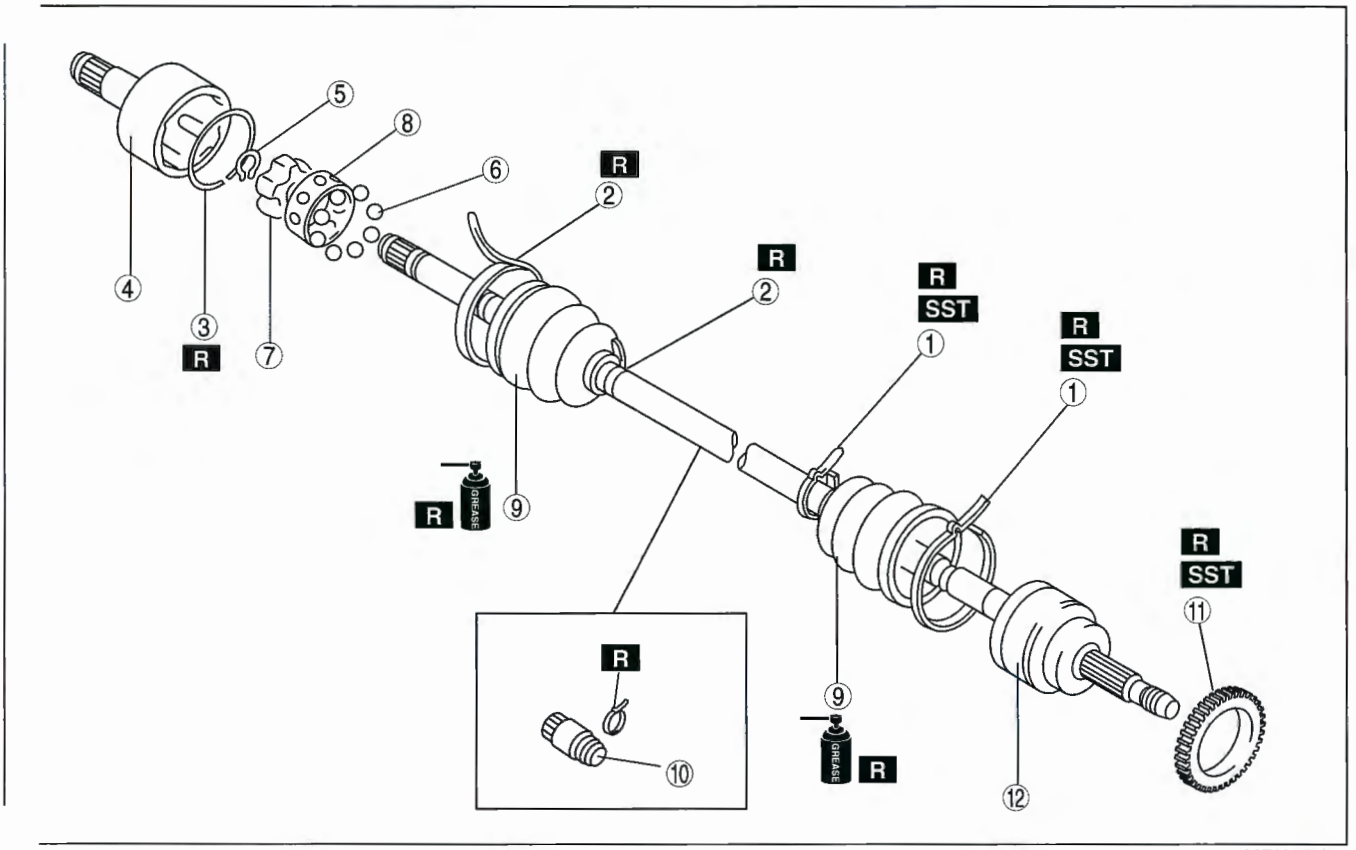
Clearance B
2.4—2.8 mm {0.095—0.110 in}

8. Verify that the boot band does not protrude from the boot band installation area.
   - If it does, replace the boot band and repeat Steps 7 and 8.

FRONT DRIVE SHAFT DISASSEMBLY/ASSEMBLY [MTX]

E6U031325501W05

1. Disassemble in the order indicated in the table.
2. Assemble in the reverse order of disassembly.



A6E6316W009

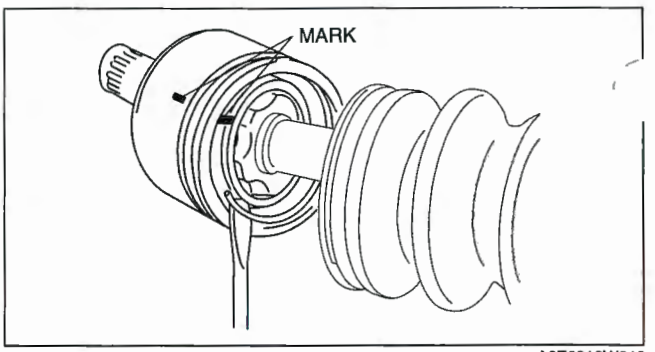
1	Boot band (wheel side) (See 03–13–22 Boot Band (Wheel Side) Disassembly Note.) (See 03–13–26 Boot Band (Wheel Side) Assembly Note.)
2	Boot band (transaxle side) (See 03–13–22 Boot Band (Transaxle Side) Disassembly Note.) (See 03–13–26 Boot Band (Transaxle Side) Assembly Note.)
3	Clip (See 03–13–28 Clip Disassembly Note.) (See 03–13–29 Outer Ring, Clip Assembly Note.)
4	Outer ring (See 03–13–29 Outer Ring, Clip Assembly Note.)
5	Snap ring (See 03–13–29 Cage, Inner Ring, Balls, Snap Ring Assembly Note.)
6	Balls (See 03–13–28 Balls, Inner Ring, Cage Disassembly Note.) (See 03–13–29 Cage, Inner Ring, Balls, Snap Ring Assembly Note.)
7	Inner Ring (See 03–13–28 Balls, Inner Ring, Cage Disassembly Note.) (See 03–13–29 Cage, Inner Ring, Balls, Snap Ring Assembly Note.)
8	Cage (See 03–13–28 Balls, Inner Ring, Cage Disassembly Note.) (See 03–13–29 Cage, Inner Ring, Balls, Snap Ring Assembly Note.)
9	Boot (See 03–13–28 Boot Assembly Note.)
10	Dynamic damper (See 03–13–28 Dynamic Damper Assembly Note.)
11	ABS sensor rotor (See 03–13–24 ABS Sensor Rotor (With ABS) Disassembly Note.) (See 03–13–24 ABS Sensor Rotor (With ABS) Assembly Note.)
12	Shaft and ball joint component

Clip Disassembly Note

1. Mark the drive shaft and outer ring for proper assembly.

   Caution
   - **Mark with paint; do not use a punch.**

2. Remove the clip.



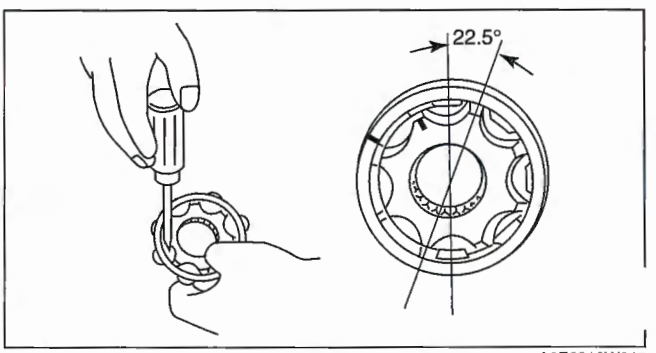
A6E6316W010

Balls, Inner Ring, Cage Disassembly Note

1. Mark the inner ring and cage.

   Caution
   - **Mark with paint; do not use a punch.**

2. Remove the snap ring using snap-ring pliers.
3. Turn the cage **approximately 22.5 degree** and pull the cage and balls away from the inner ring.



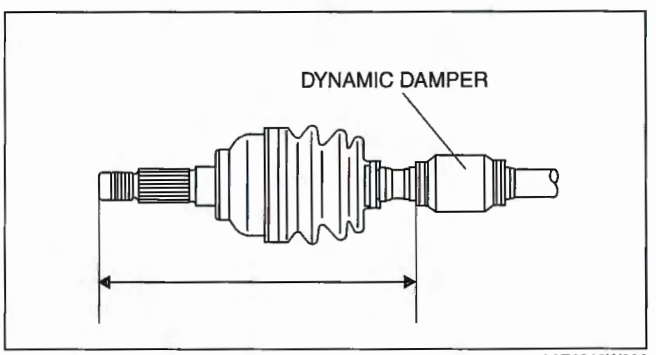
A6E6316W015

Dynamic Damper Assembly Note

1. Install the dynamic damper as shown in the figure.

   Standard length
   L3: 287.7—293.7 mm {11.33—11.56 in}
   L3 with TC: 290.7—298.7 mm {11.45—11.75 in}

2. Install the new boot band onto the dynamic damper.



A6E6316W006

Boot Assembly Note

Note
- The wheel side and transaxle side boots are different.

1. Fill the boot (wheel side) with the specified grease.

   Caution
   - **Do not touch grease with your hand. Apply it from the tube to prevent foreign matter from enteri the boot.**

Grease amount
L3: 100—120 g {3.53—4.23 oz}
L3 with TC: 110—130 g {3.89—4.58 oz}

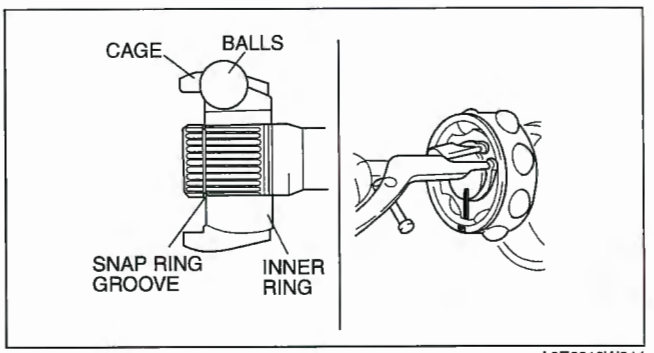
2. With the splines of the shaft still wrapped in tape from disassembly, install the boot.
3. Remove the tape.

'ge, Inner Ring, Balls, Snap Ring Assembly Note

. Align the marks and install the balls and cage to the inner ring in the direction shown in the figure.

Caution
- **Install the cage with the offset facing the snap ring groove. If incorrectly installed, the drive shaft may become disengaged.**

2. Install a new snap ring.



A6E6316W011

Outer Ring, Clip Assembly Note

1. Fill the outer ring and boot (transaxle side) with the specified grease.

Caution
- **Do not touch grease with your hand. Apply it from the tube to prevent foreign matter from entering the boot.**

Grease amount
L3: 120—140 g {4.24—4.94 oz}
L3 with TC: 135—155 g {4.77—5.47 oz}

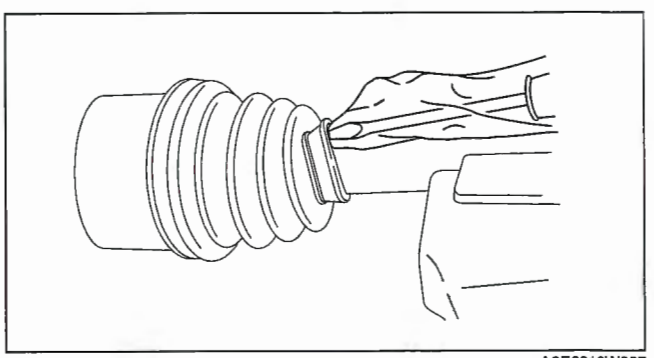
2. Align the marks, and install the outer ring on to the shaft.
3. Install a new clip.
   Install the boot.
. Set the drive shaft to the standard length.

Front Drive shaft length (MTX)
L3 (LH): 676.6—686.6 mm {26.64—27.03 in}
L3 (RH): 628.6—638.6 mm {24.75—25.14 in}
AJ (LH): 664.6—674.6 mm {26.17—26.55 in}
AJ (RH): 595.9—605.9 mm {23.47—23.85 in}
L3 with TC (LH): 640.4—650.4 mm {25.22—25.60 in}
L3 with TC (RH): 584.1—594.1 mm {23.00—23.38 in}

6. Release any trapped air from the boots by carefully lifting up the small end of each boot with a cloth wrapped screwdriver.

Caution
- **Be careful not to allow the grease to leak.**
- **Do not damage the boot.**

7. Verify that the drive shaft length is within the specification.

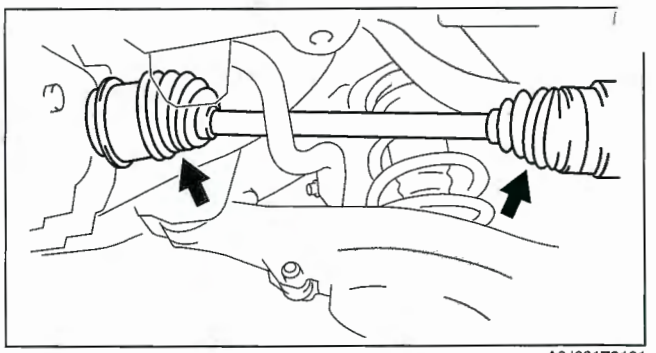


A6E6316W007

REAR DRIVE SHAFT PRE-INSPECTION

E6U031325600W01

1. Inspect each connecting part for looseness.
   - Tighten or replace parts if necessary.
2. Inspect the dust boot on the drive shaft for cracks, damage, leaking grease, and looseness in the boot band.
3. Inspect the drive shaft for bends, cracks, and wear in the joints or splines.
   - Repair or replace the drive shaft or boot band if necessary.



A6J63172101

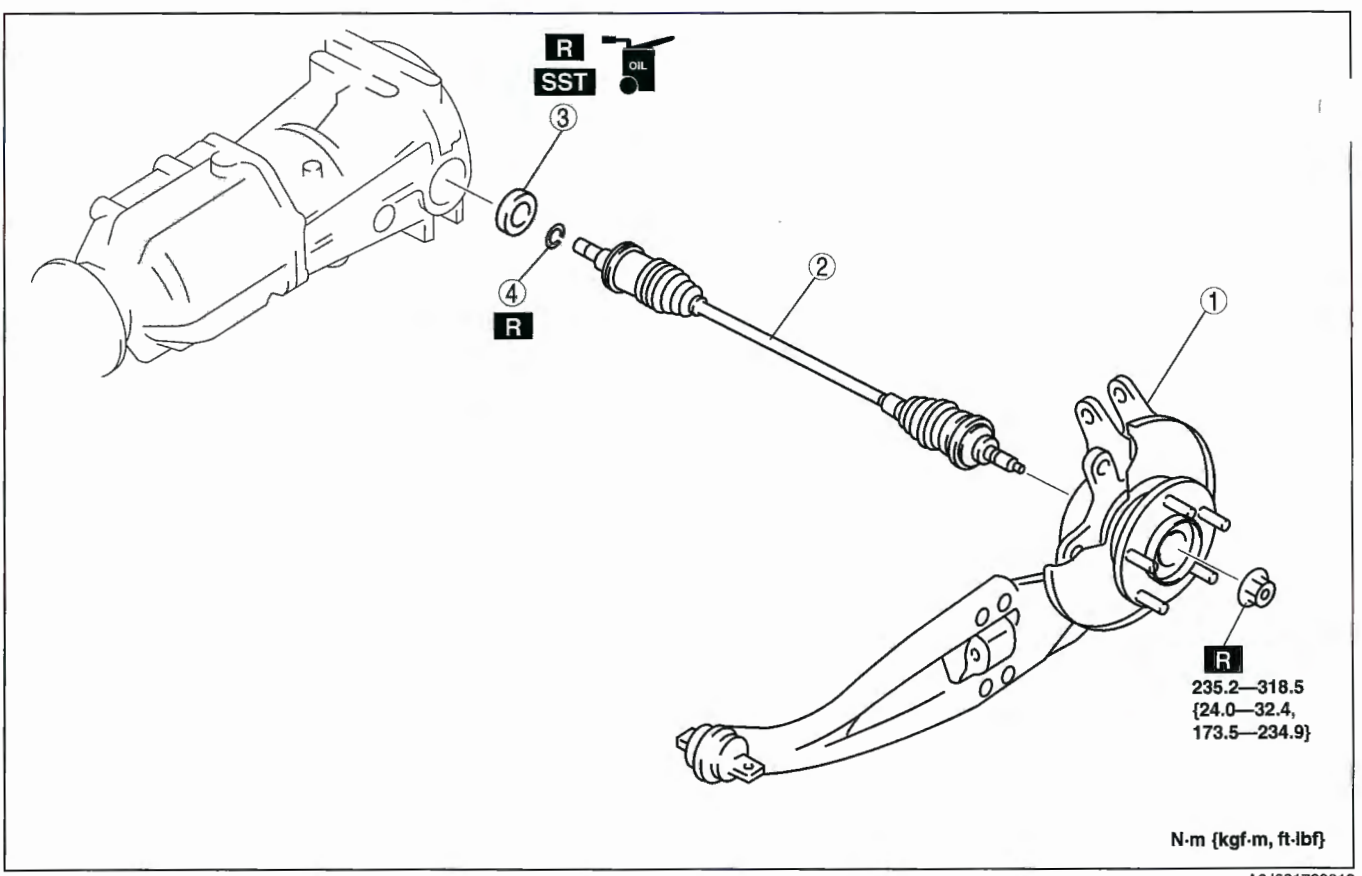
REAR DRIVE SHAFT REMOVAL/INSTALLATION

E6U031325600W02

Caution

- **Performing the following procedures without first removing the ABS wheel-speed sensor may possibly cause an open circuit in the harness if it is pulled by mistake. Before performing the following procedures, remove the ABS wheel-speed sensor (wheel side) and fix it to an appropriate place where the sensor will not be pulled by mistake while the vehicle is being serviced.**

1. Drain the rear differential oil into a container. (See 03–14–2 DIFFERENTIAL OIL REPLACEMENT.)
2. Remove in the order indicated in the table.
3. Install in the reverse order of removal.



A6J631720012

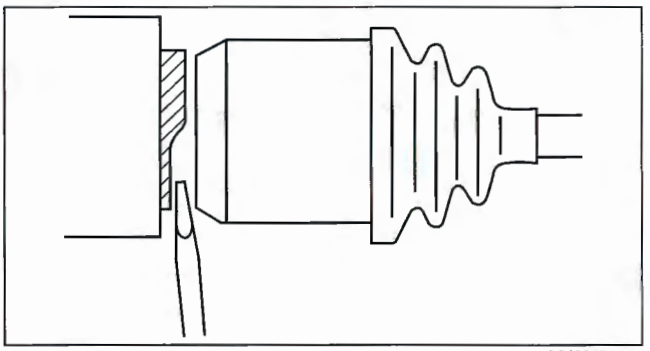
1	Trailing link, knuckle component (See 03–12–5 WHEEL HUB, KNUCKLE REMOVAL/INSTALLATION [AWD])
2	Rear drive shaft (See 03–13–31 Rear Drive Shaft Removal Note)
3	Oil seal (See 03–14–3 OIL SEAL (SIDE GEAR) REPLACEMENT)
4	Clip (See 03–13–31 Clip Installation Note)

Rear Drive Shaft Removal Note

1. Deform the metal cover of the oil seal using a bar, and disengage the drive shaft.

Note

- Oil seal cannot be reused. Always replace the oil seal with a new one.

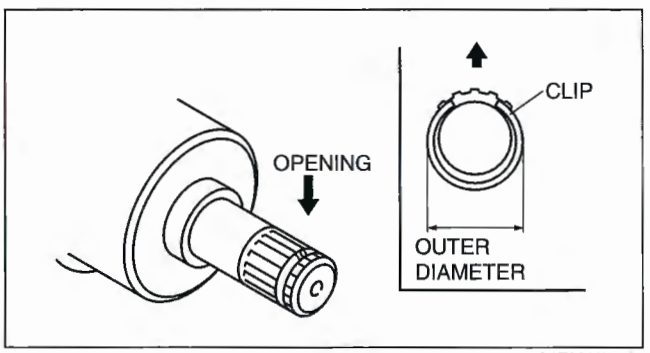


A6J63172201

Clip Installation Note

1. Install a new clip onto the joint shaft with the opening facing upward. Ensure that the diameter of the clip does not exceed the specification on installation.
2. After installation, measure the outer diameter. If it exceeds the specification, repeat Steps 1—2 using a new clip.

Outer diameter specification
26.0 mm {1.02 in} max.

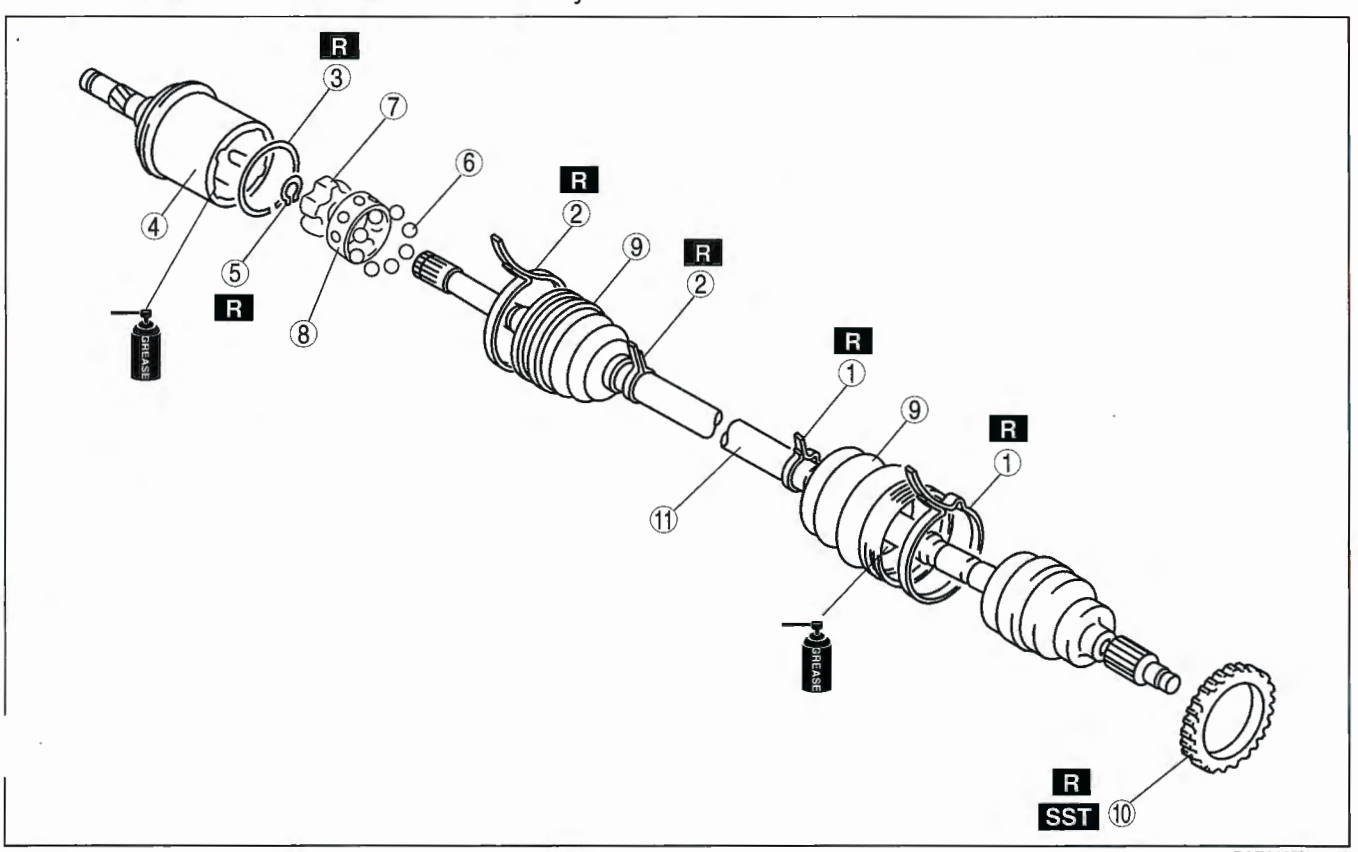


A6E0313W021

REAR DRIVE SHAFT DISASSEMBLY/ASSEMBLY

E6U031325600W03

1. Disassemble in the order indicated in the table.
2. Assemble in the reverse order of disassembly.



D6E313ZW3019

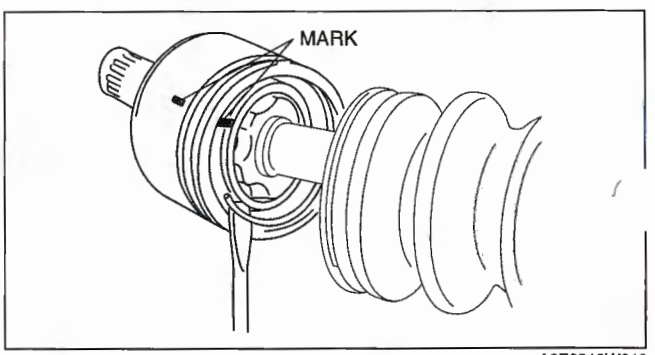
1	Boot band (wheel side) (See 03–13–22 Boot Band (Wheel Side) Disassembly Note) (See 03–13–26 Boot Band (Wheel Side) Assembly Note)
2	Boot band (differential side) (See 03–13–22 Boot Band (Transaxle Side) Disassembly Note) (See 03–13–26 Boot Band (Transaxle Side) Assembly Note)
3	Clip (See 03–13–32 Clip Disassembly Note) (See 03–13–34 Outer Ring, Clip Assembly Note)
4	Outer ring (See 03–13–34 Outer Ring, Clip Assembly Note)
5	Snap ring (See 03–13–32 Snap Ring Disassembly Note) (See 03–13–34 Cage, Inner Ring, Balls, Snap Ring Assembly Note)
6	Balls (See 03–13–33 Balls, Inner Ring, Cage Disassembly Note) (See 03–13–34 Cage, Inner Ring, Balls, Snap Ring Assembly Note)
7	Inner Ring (See 03–13–33 Balls, Inner Ring, Cage Disassembly Note) (See 03–13–34 Cage, Inner Ring, Balls, Snap Ring Assembly Note)
8	Cage (See 03–13–33 Balls, Inner Ring, Cage Disassembly Note) (See 03–13–34 Cage, Inner Ring, Balls, Snap Ring Assembly Note)
9	Boot (See 03–13–33 Boot Assembly Note)
10	ABS sensor rotor (See 03–13–24 ABS Sensor Rotor (With ABS) Disassembly Note) (See 03–13–33 ABS Sensor Rotor Assembly Note)
11	Drive shaft, joint component

Clip Disassembly Note

1. Mark the drive shaft and outer ring for proper assembly.

   Caution
   - **Mark with paint; do not use a punch.**

2. Remove the clip.



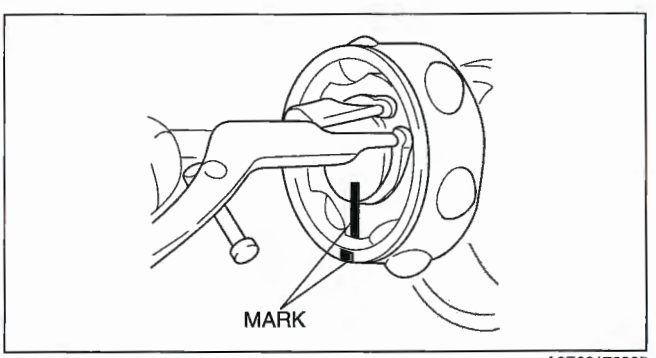
A6E6316W010

Snap Ring Disassembly Note

1. Mark the drive shaft end and inner ring for proper reassembly.

   Caution
   - **Mark with paint; do not use a punch.**

2. Remove the snap ring using snap-ring pliers.



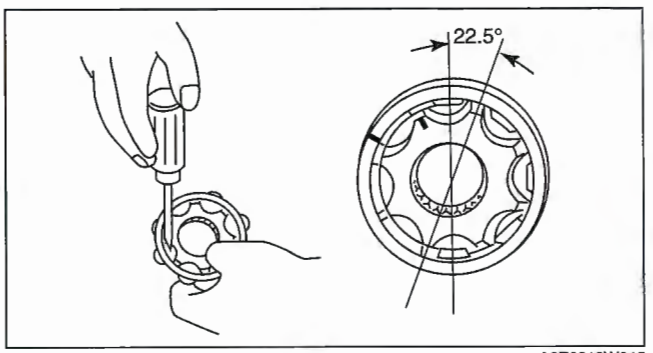
A6E63172005

Balls, Inner Ring, Cage Disassembly Note

1. Mark the inner ring and cage for proper reassembly.

Caution
- **Mark with paint; do not use a punch.**

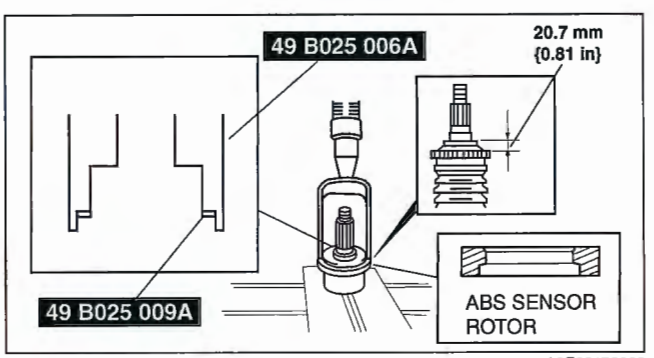
2. Turn the cage **approx. 22.5°** and pull the cage and balls from the inner ring.



A6E6316W015

ABS Sensor Rotor Assembly Note

1. Install the ABS sensor rotor to the drive shaft using the **SSTs**.



A6E63172008

Boot Assembly Note

Note
- The wheel side and differential side boots are different.

1. Fill the wheel side boot with the specified grease.

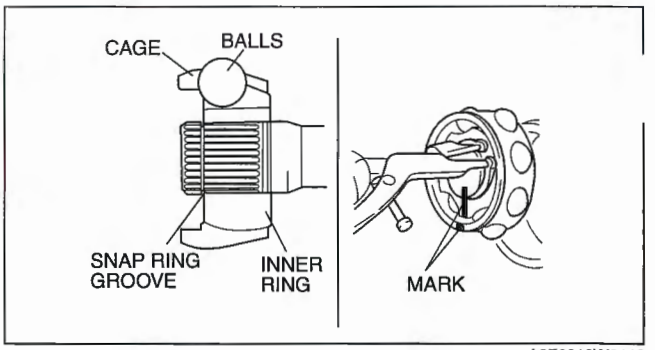
Caution
- **Do not touch grease with your hand. Apply it from the tube to prevent foreign matter from entering the boot.**

Grease amount
75—95 g {2.65—3.35 oz}

2. With the splines of the shaft wrapped in tape, install the boot.
3. Remove the tape.

Cage, Inner Ring, Balls, Snap Ring Assembly Note

1. Align the marks and install the balls and cage to the inner ring in the direction shown in the figure.



A6E6316W0112

Caution
- **Install the cage so that the major diameter is at the same side as the snap ring groove. If incorrectly installed, the drive shaft may become disengaged.**

2. Align the marks and install the inner ring to the shaft.
3. Install a new snap ring.

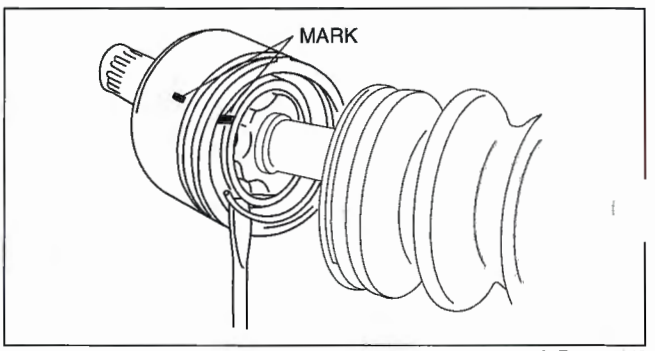
Outer Ring, Clip Assembly Note

1. Fill the outer ring and boot (differential side) with the specified grease.

Caution
- **Do not touch grease with your hand. Apply it from the tube to prevent foreign matter from entering the boot.**

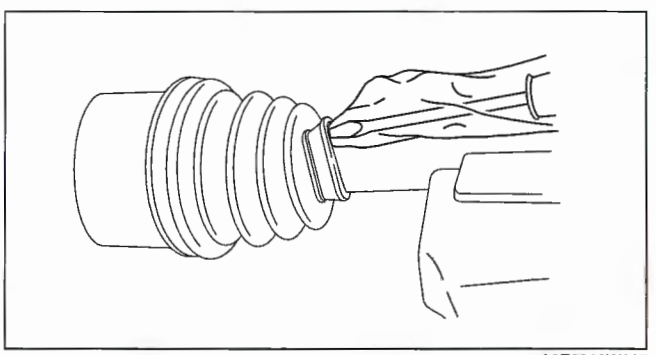
Grease amount
70—90 g {2.5—3.1 oz}

2. Align the marks, and install the outer ring on to the shaft.
3. Install a new clip to the outer ring clip groove.
4. Install the boot.



A6E6316W010

5. Release any trapped air from the boots by carefully lifting up the small end of each boot with a cloth wrapped screwdriver.



A6E6316W007

Caution
- **Do not let grease leak.**
- **Do not damage the boot.**

6. Set the drive shaft to the standard length.

Rear drive shaft standard length
LH: 804.2—814.2 mm {31.67—32.05 in}
RH: 860.7—870.7 mm {33.89—34.27 in}

7. Verify that the drive shaft length is within the standard.
   - If not, repeat from Step 5.

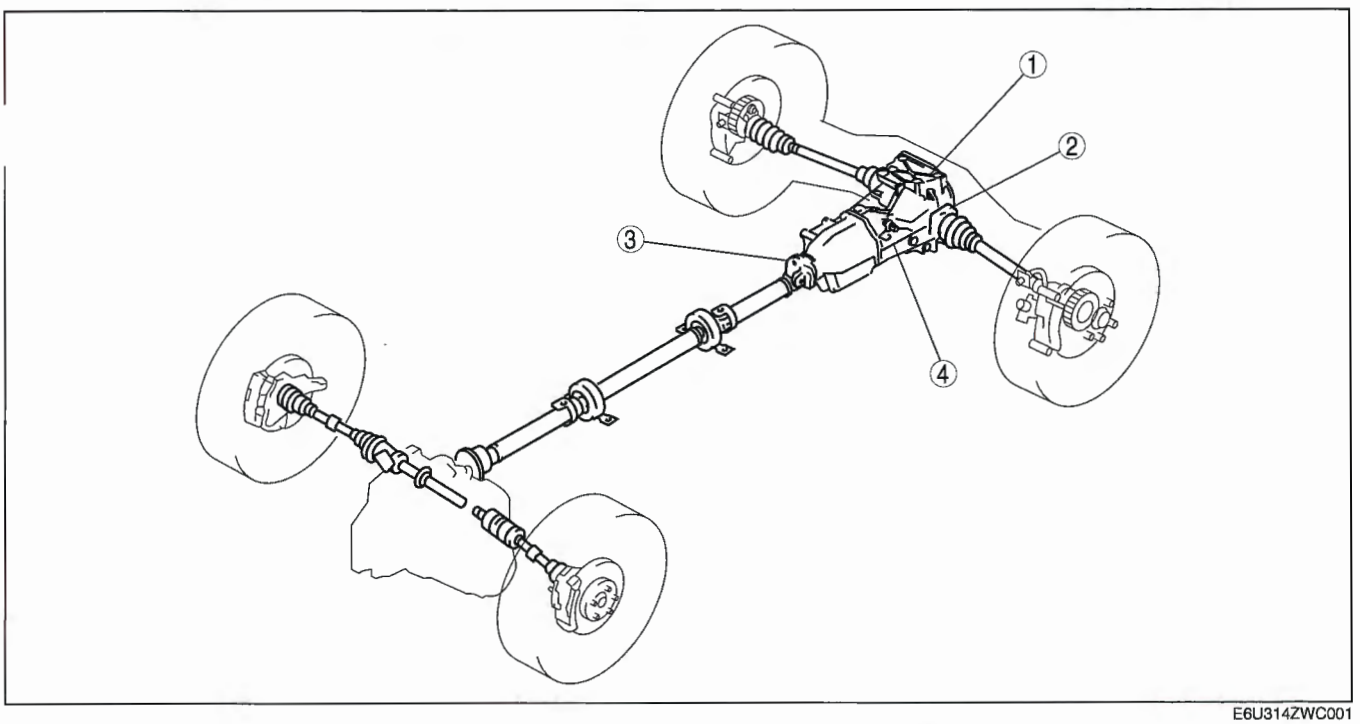
REAR DIFFERENTIAL LOCATION INDEX

E6U031427100W01



E6U314ZWC001

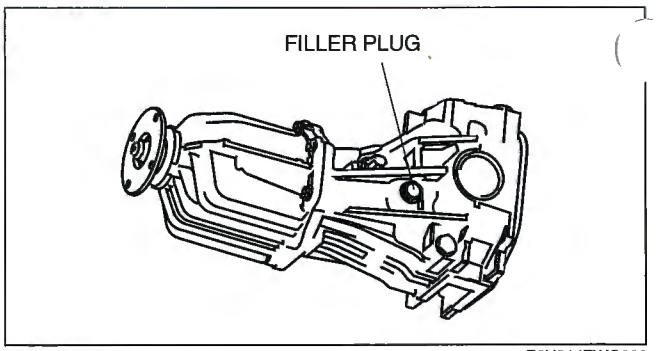
1	Differential oil (See 03–14–2 DIFFERENTIAL OIL INSPECTION) (See 03–14–2 DIFFERENTIAL OIL REPLACEMENT)
2	Oil seal (side gear) (See 03–14–3 OIL SEAL (SIDE GEAR) REPLACEMENT)
3	Oil seal (companion flange) (See 03–14–4 OIL SEAL (COMPANION FLANGE) REPLACEMENT)
4	Rear differential (See 03–14–5 REAR DIFFERENTIAL REMOVAL/INSTALLATION) (See 03–14–6 REAR DIFFERENTIAL DISASSEMBLY) (See 03–14–10 REAR DIFFERENTIAL ASSEMBLY)

DIFFERENTIAL OIL INSPECTION

E6U031427100W02

1. Place the vehicle on level ground.
2. Remove the filler plug and washer.
3. Verify that the oil is at the brim of the filler plug hole.
4. If it is low, add the specified oil.
5. Install a new washer and the filler plug, and tighten.

Tightening torque
39.2—53.9 N·m {4.0—5.4 kgf·m, 29.0—39.7 ft·lbf}



E6U314ZWC009

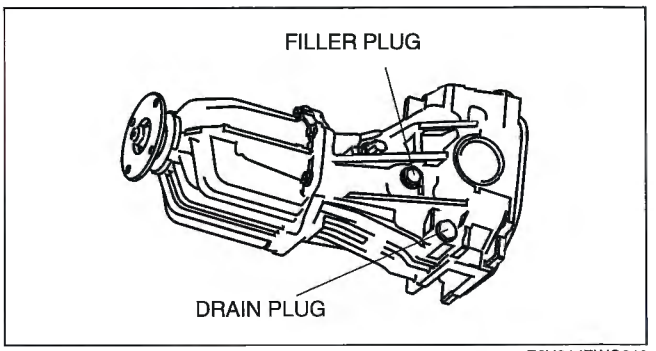
DIFFERENTIAL OIL REPLACEMENT

E6U031427100W03

1. Place the vehicle on level ground.
2. Remove the filler plug.
3. Remove the drain plug and drain the differential oil into a container.
4. Install a new washer and the drain plug, and tighten.

Tightening torque
39.2—53.9 N·m {4.0—5.4 kgf·m, 29.0—39.7 ft·lbf}

5. Add the specified differential oil from the filler plug until the level reaches the brim of the plug hole.



E6U314ZWC010

Rear differential oil type
Grade: API service GL-5
Viscosity: SAE 90, SAE 80W-90, SAE 75W-90 (Not available from Mazda)

Rear differential oil capacity (approximate quantity)
1.00 L {1.06 US qt, 0.88 Imp qt}

6. After filling with differential oil, perform oil level inspection.
7. Install a new washer and the drain plug, and tighten.

Tightening torque
39.2—53.9 N·m {4.0—5.4 kgf·m, 29.0—39.7 ft·lbf}

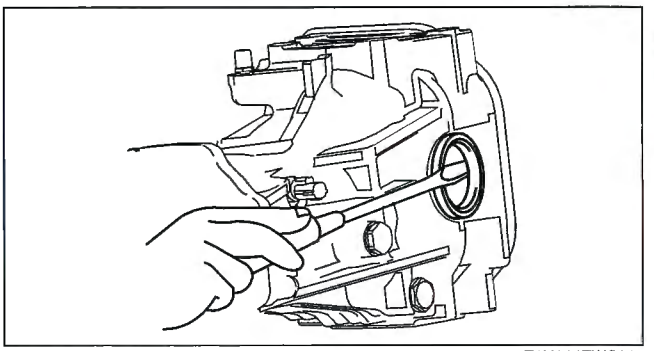
OIL SEAL (SIDE GEAR) REPLACEMENT

E6U031427100W04

1. Remove the drain plug and the drain differential oil into a container.
2. Install a new washer and the drain plug, and tighten.
3. Remove the rear drive shaft. (See 03–13–30 REAR DRIVE SHAFT REMOVAL/INSTALLATION.)
4. Remove the clip from the drive shaft.

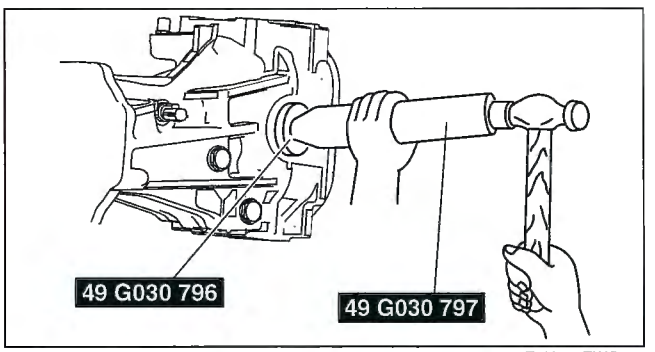
Caution
- **Wrap the end of a screwdriver with cloth to prevent scratches to the inside of the differential casing.**

5. Remove the oil seal from the differential casing using a screwdriver.
6. Apply differential oil to the new oil seal lip.



E6U314ZWC012

7. Install the new oil seal to the differential carrier using the **SSTs**.
8. After installing the new clip onto the drive shaft, insert the drive shaft into the differential. (See 03–13–30 REAR DRIVE SHAFT REMOVAL/ INSTALLATION.)
9. Verify that the drive shaft cannot be pulled out.
10. Add the specified differential oil.
    After adding the oil, perform an oil level inspection. (See 03–14–2 DIFFERENTIAL OIL INSPECTION.)
12. Install a new washer and the oil filler plug, and tighten.



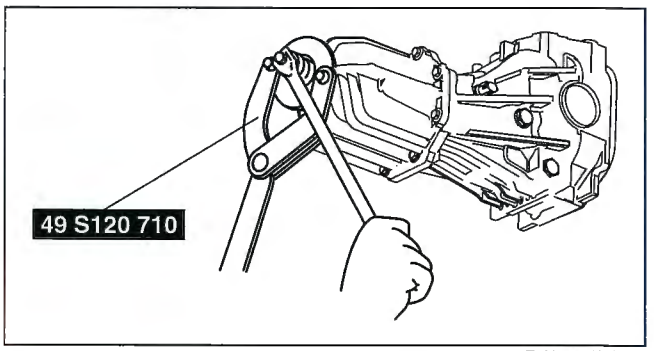
E6U314ZWC013

Tightening torque
39.2—53.9 N·m {4.0—5.4 kgf·m, 29.0—39.7 ft·lbf}

OIL SEAL (COMPANION FLANGE) REPLACEMENT

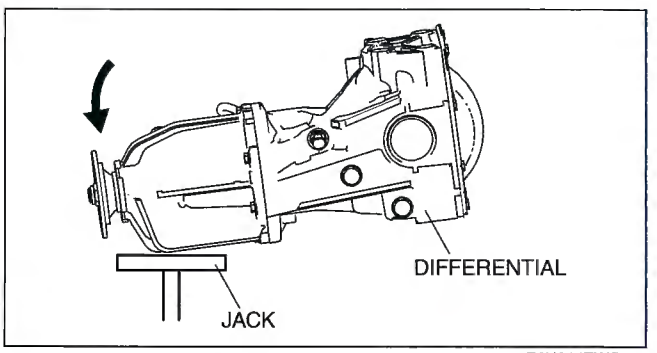
E6U031427100W05

1. Drain the differential oil into a container.
2. Remove the propeller shaft. (See 03–15–4 PROPELLER SHAFT REMOVAL/ INSTALLATION.)
3. Remove the locknut using the **SST**.
4. Support the differential using a jack.



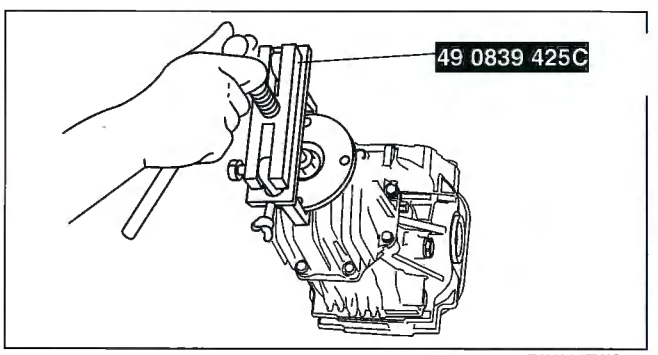
E6U314ZWC014

5. After removing the front side of the differential mount, gradually lower the jack and tilt the front side of the differential downward.



E6U314ZWC011

6. Pull the companion flange off using the **SST**.
7. Remove the oil seal from the differential carrier using a screwdriver or similar tool.
8. Apply differential oil to the new oil seal lip.

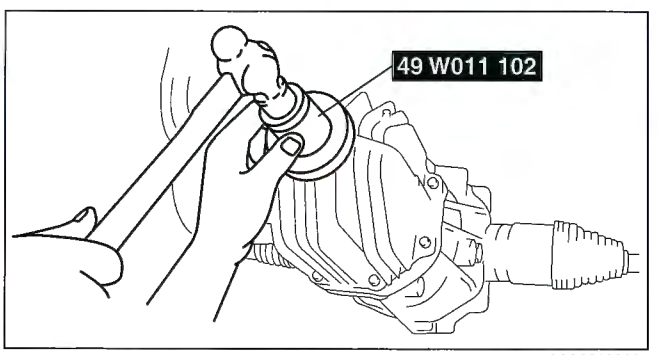


E6U314ZWC015

9. Install the new oil seal to the differential carrier using the **SST**.
10. Install the companion flange to the drive pinion.
11. Jack up the differential and install the front side of the differential mount.

    Tightening torque
    86.5—116.6 N·m {8.79—11.88 kgf·m, 63.58—85.98 ft·lbf}

12. Install the washer and a new locknut.

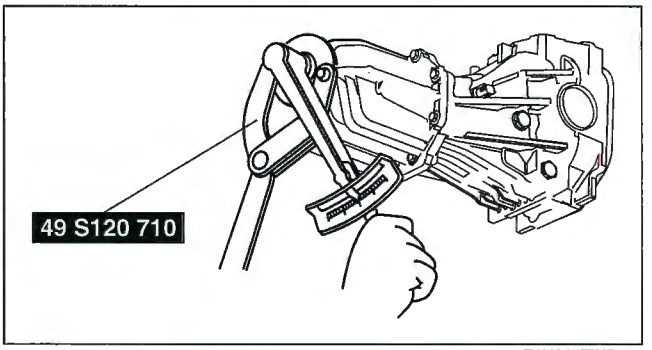


A6A63192006

13. Tighten the locknut to the specified torque using the SST.

    Tightening torque
    167—226 N·m {17.1—23.0 kgf·m, 124—166 ft·lbf}

14. Install the propeller shaft. (See 03–15–4 PROPELLER SHAFT REMOVAL/INSTALLATION.)
15. Add the specified differential oil from the filler plug. (See 03–14–2 DIFFERENTIAL OIL REPLACEMENT.)

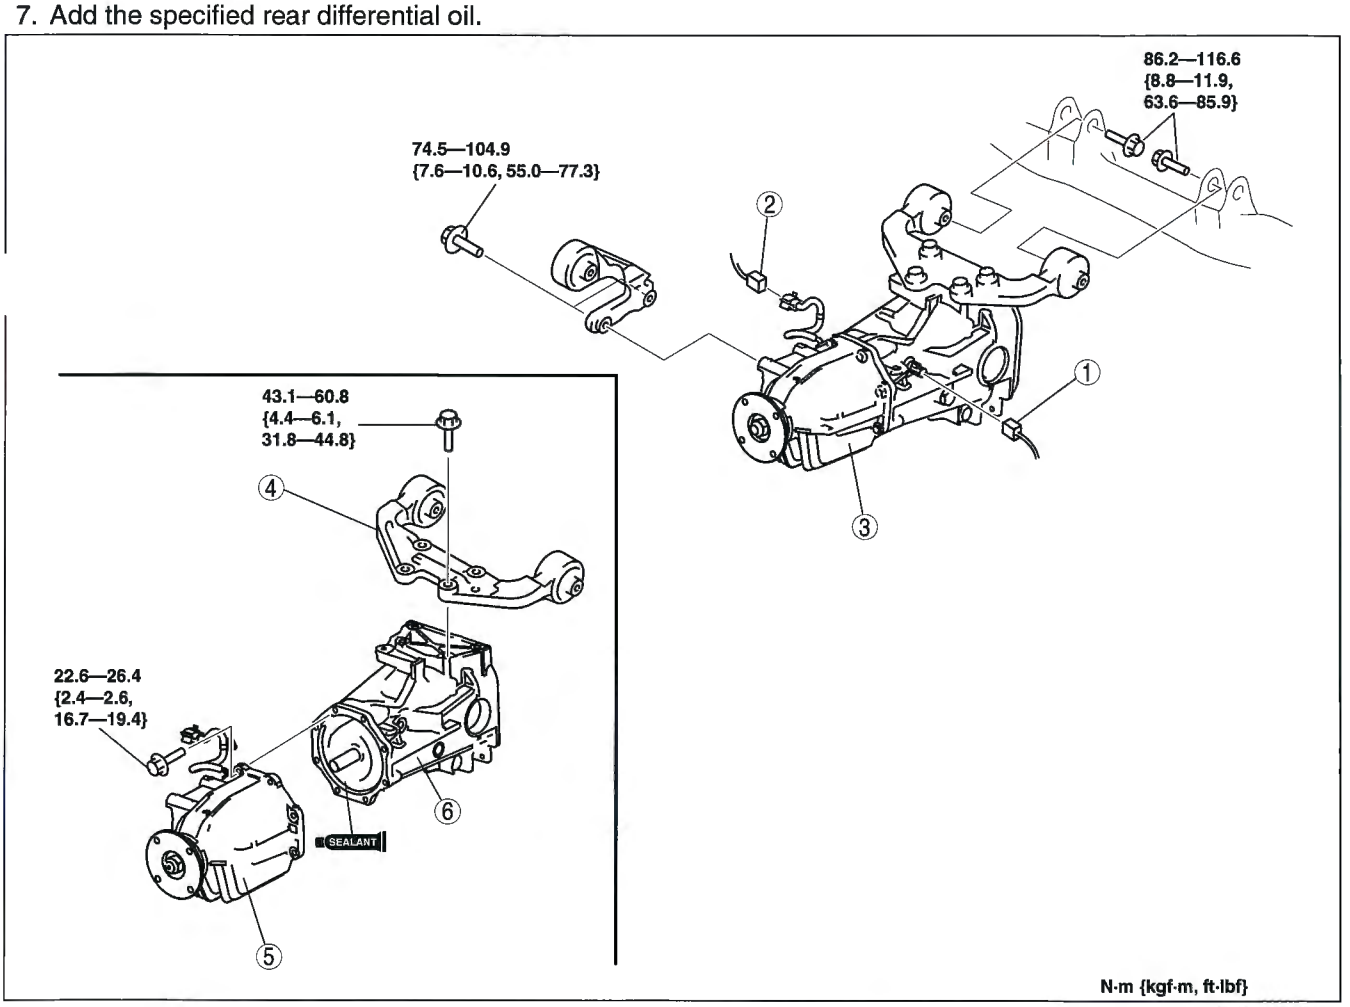


E6U314ZWC016

REAR DIFFERENTIAL REMOVAL/INSTALLATION

E6U031427100W06

1. Drain the rear differential oil into a container.
2. Remove the after silencer, presilencer, and catalytic converter. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
3. Remove the propeller shaft. (See 03–15–4 PROPELLER SHAFT REMOVAL/INSTALLATION.)
4. Remove the rear drive shaft. (See 03–13–30 REAR DRIVE SHAFT REMOVAL/INSTALLATION.)
5. Remove in the order indicated in the table.
6. Install in the reverse order of removal.
7. Add the specified rear differential oil.



E6U314ZWC020

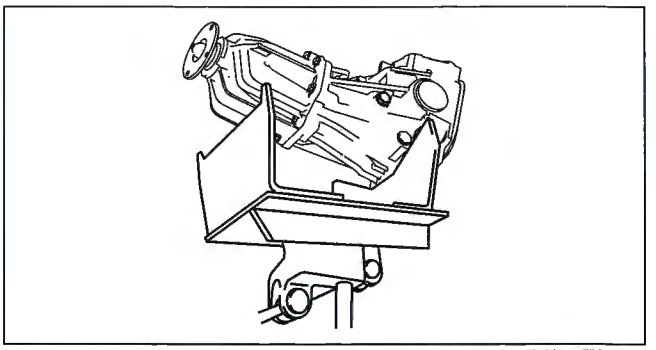
1	Differential oil temperature sensor connector
2	4WD solenoid connector
3	Coupling component and rear differential component (See 03–14–6 Coupling Component and Rear Differential Component Removal/installation Note)
4	Rear differential bracket
5	Coupling component (See 03–19–5 COUPLING COMPONENT REMOVAL/INSTALLATION)
6	Rear differential

Coupling Component and Rear Differential Component Removal/installation Note

Warning

- **Make sure that the coupling component and rear differential component are securely supported by the jack. If the coupling component and rear differential component fall, it could cause death, serious injury, or vehicle damage.**

1. Make sure that the coupling component and rear differential component are securely supported by the jack, and remove/install the component by operating the jack gradually.



E6U314ZWC021

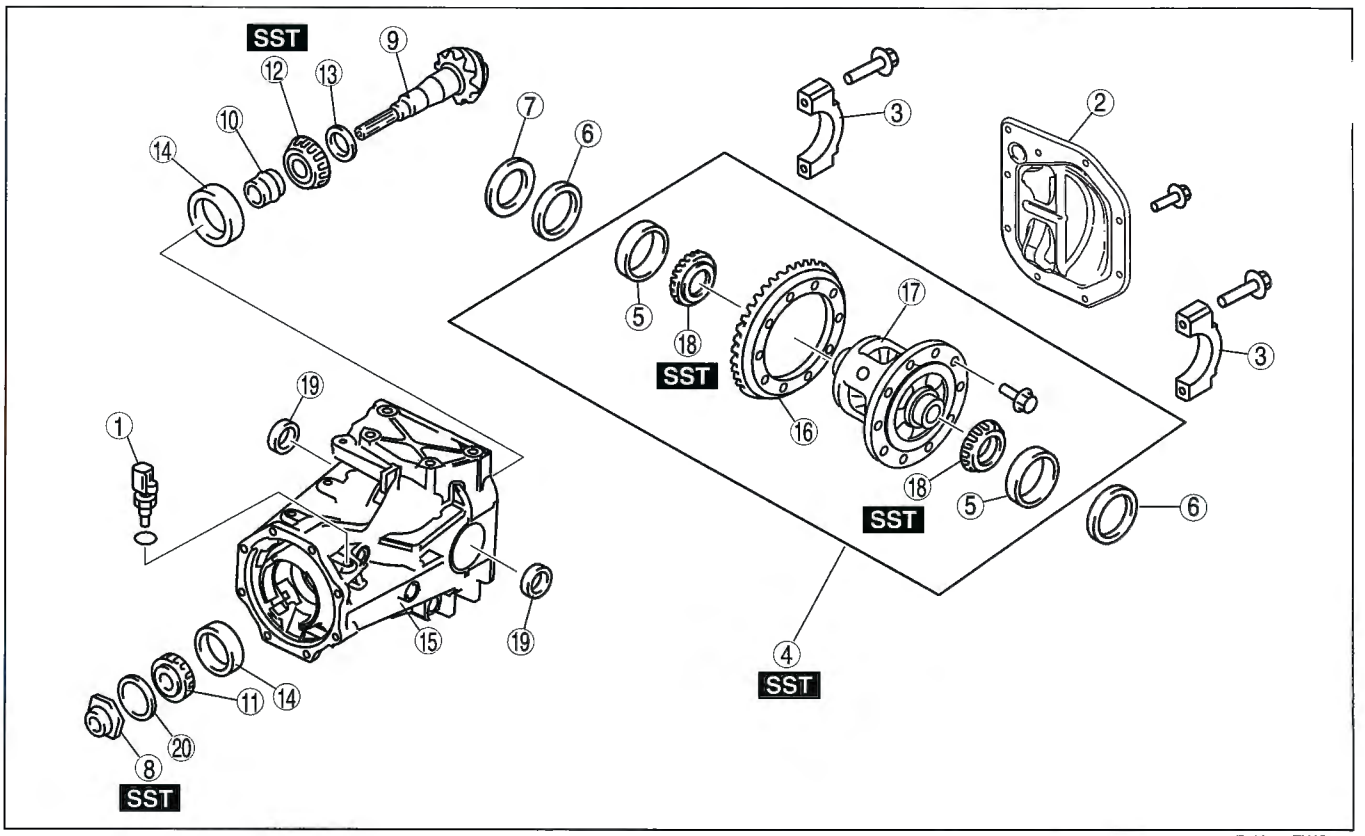
REAR DIFFERENTIAL DISASSEMBLY

E6U031427100W07

Warning

- **The engine stand is equipped with a self-lock mechanism, however, if the rear differential is in a tilted condition, the self-lock mechanism could become inoperative. If the rear differential unexpectedly rotates it could cause injury, therefore do not maintain the rear differential in a tilted condition. When turning the rear differential, grasp the rotation handle firmly.**

1. Disassemble in the order indicated in the table.



E6U314ZWC002

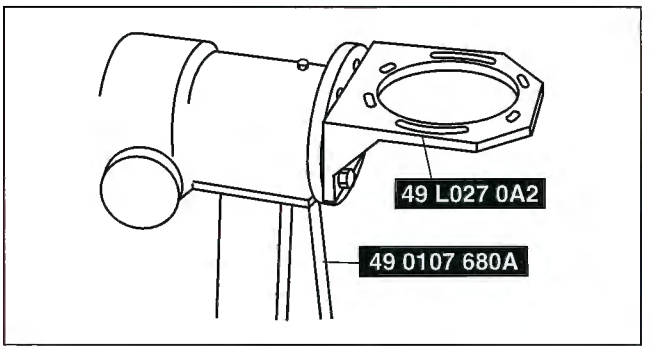
1	Differential oil temperature sensor
2	Rear cover (See 03–14–7 Rear Cover Disassembly Note)
3	Bearing cap (See 03–14–7 Bearing Cap Disassembly Note)

4	Rear differential component (See 03–14–8 Rear Differential Component Disassembly Note)
5	Side bearing outer race
6	Adjusting shim

7	Spacer
8	Locknut (See 03–14–8 Locknut Disassembly Note)
9	Drive pinion (See 03–14–8 Drive Pinion Disassembly Note)
10	Collapsible spacer
11	Bearing inner race (front bearing)
12	Bearing inner race (rear bearing) (See 03–14–8 Bearing Inner Race (Rear Bearing) Disassembly Note)
13	Spacer
14	Bearing outer race (See 03–14–9 Bearing Outer Race Disassembly Note)
15	Differential carrier
16	Ring gear (See 03–14–9 Ring Gear Disassembly Note)
17	Differential gear case component
18	Side bearing inner race (See 03–14–9 Side Bearing Inner Race Disassembly Note)
19	Oil seal

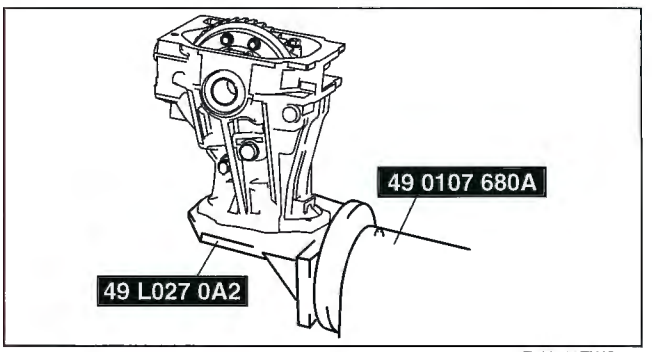
Rear Cover Disassembly Note

1. Install the **SSTs** to the engine stand.



A6A63192009

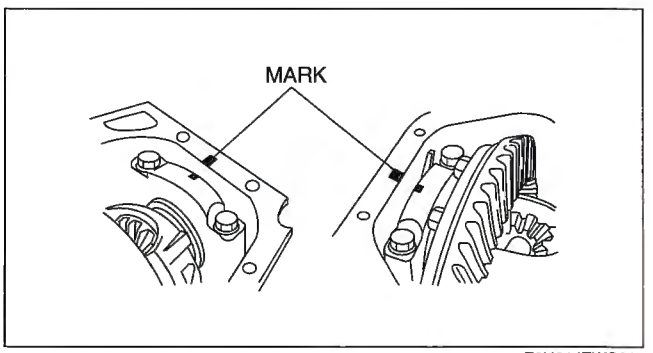
2. Install the rear differential to the **SSTs**.
3. Remove the rear cover using an oil seal cutter.



E6U314ZWC023

Bearing Cap Disassembly Note

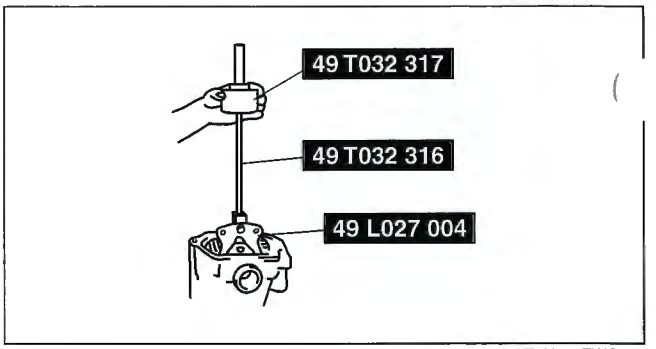
1. Place alignment marks on the bearing cap and carrier.



E6U314ZWC017

Rear Differential Component Disassembly Note

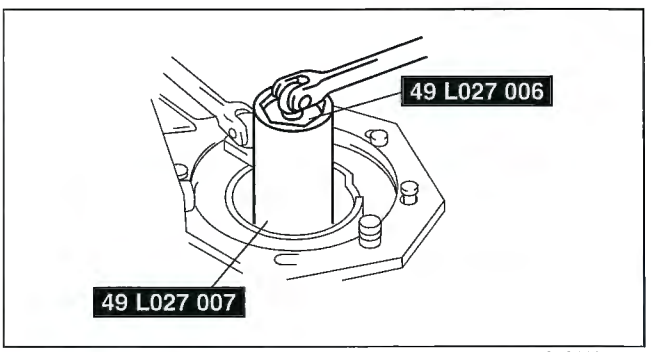
1. Remove the rear differential component using the **SSTs.**
2. Mark or otherwise distinguish between the removed left and right adjusting shims, spacers and side bearing outer races so that they are not mixed up at the time of reassembly.



E6U314ZWC018

Locknut Disassembly Note

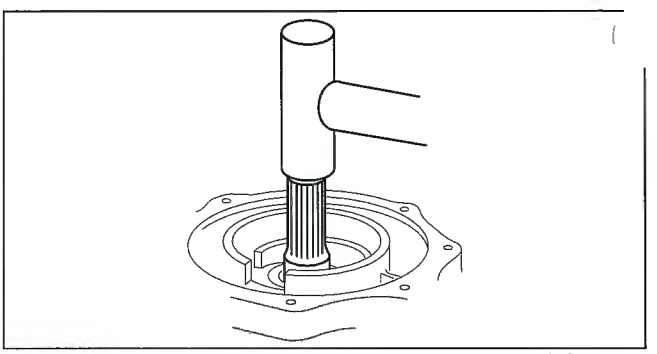
1. Remove the locknut using the **SSTs.**



A6A63192013

Drive Pinion Disassembly Note

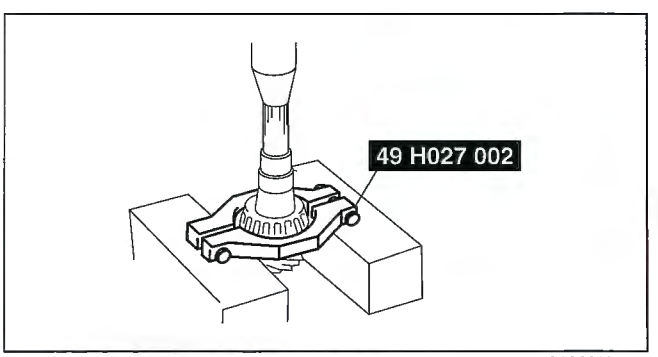
1. Remove the drive pinion by lightly tapping with a copper hammer.



A6A63192014

Bearing Inner Race (Rear Bearing) Disassembly Note

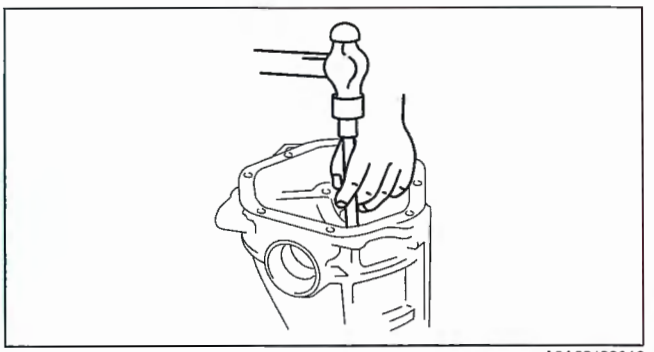
1. Remove the bearing inner races (rear bearing) using the **SST** and a press.



A6A63192015

Bearing Outer Race Disassembly Note

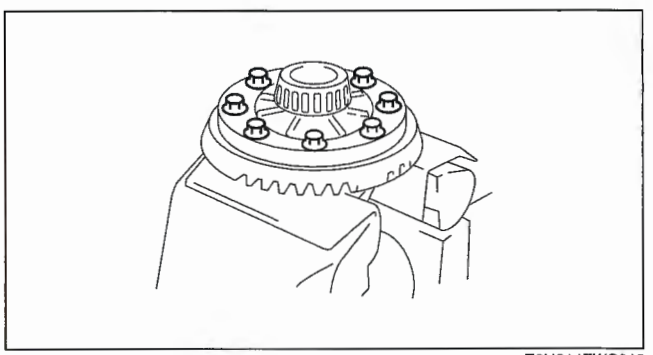
1. Remove the bearing outer races using the 2 grooves in the carrier and alternately tapping the sides of the races with a brass bar.



A6A63192016

Ring Gear Disassembly Note

1. Secure the gear case in a vice and remove the bolts.
2. Lightly tap around the ring gear using a plastic hammer to remove the ring gear from the gear case.



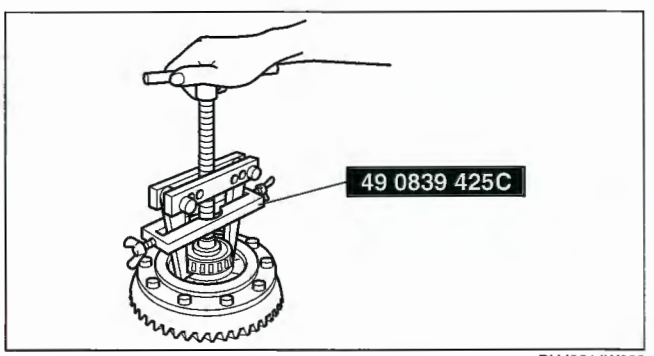
E6U314ZWC019

Side Bearing Inner Race Disassembly Note

Note

- Mark or otherwise distinguish between the left and right side bearings so that they are not mixed up at the time of reassembly.

1. Remove the side bearing inner races from the gear case using the **SST** and a press.



BHJ0314W020

REAR DIFFERENTIAL ASSEMBLY

E6U031427100W08

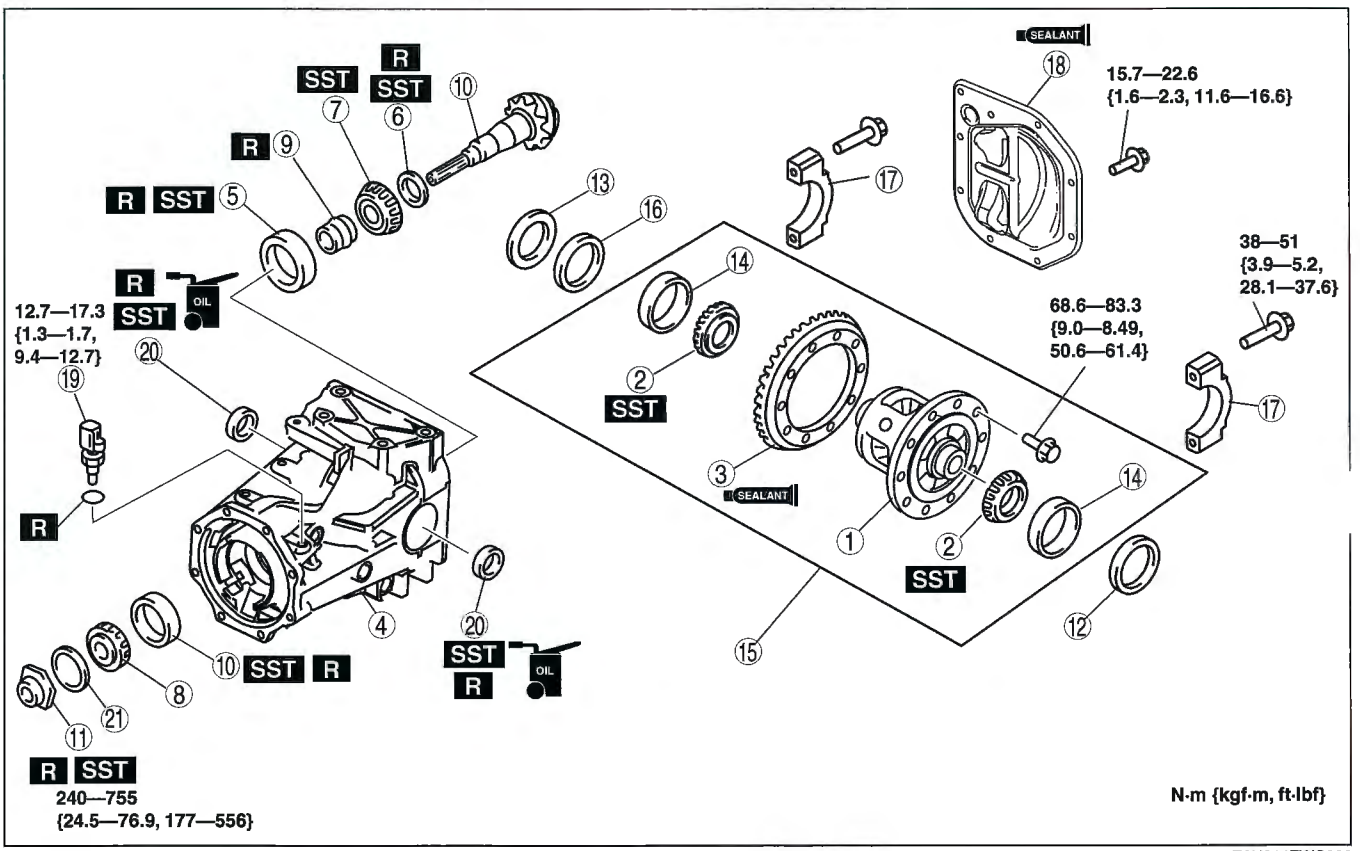
Warning

- **The engine stand is equipped with a self-lock mechanism, however, if the rear differential is in a tilted condition, the self-lock mechanism could become inoperative. If the rear differential unexpectedly rotates it could cause injury, therefore do not maintain the rear differential in a tilted condition. When turning the rear differential, grasp the rotation handle firmly.**

Note

- Clean away the old sealant before applying the new sealant.
- Install the rear cover within **10 minutes** after applying sealant.
- Allow the sealant to set at least **30 minutes** after installation before filling the differential with the specified oil.

1. Assemble in the order indicated in the table.



E6U314ZWC003

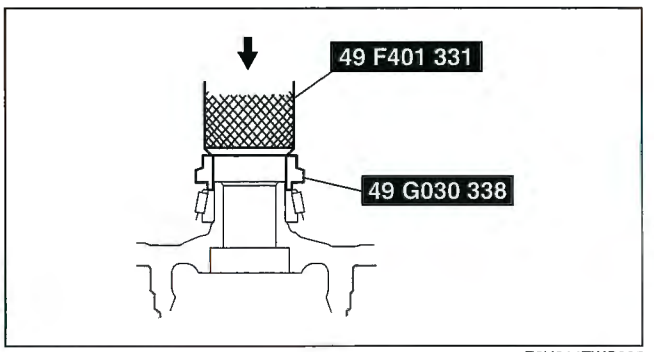
1	Differential gear case component
2	Side bearing inner race (See 03–14–11 Side Bearing Inner Race Assembly Note)
3	Ring gear (See 03–14–11 Ring Gear Assembly Note)
4	Differential carrier
5	Bearing outer race (See 03–14–11 Bearing Outer Race Assembly Note)
6	Spacer (See 03–14–12 Spacer, Bearing Inner Race Assembly Note)
7	Bearing inner race (rear bearing) (See 03–14–12 Spacer, Bearing Inner Race Assembly Note)
8	Bearing inner race (front bearing) (See 03–14–12 Spacer, Bearing Inner Race Assembly Note)

9	Collapsible spacer
10	Drive pinion
11	Locknut (See 03–14–14 Locknut Assembly Note)
12	Adjusting shim (L) (See 03–14–14 Adjusting Shim Assembly Note)
13	Spacer
14	Side bearing outer race
15	Rear differential component
16	Adjusting shim (R)
17	Bearing cap (See 03–14–16 Bearing Cap Assembly Note)
18	Rear cover (See 03–14–17 Rear Cover Assembly Note)
19	Differential oil temperature sensor
20	Oil seal (See 03–14–17 Oil Seal Assembly Note)

Side Bearing Inner Race Assembly Note

Caution
- **Do not mix up the left and right side bearing inner races.**

. Press the side bearing inner races into the gear case using the **SSTs**.



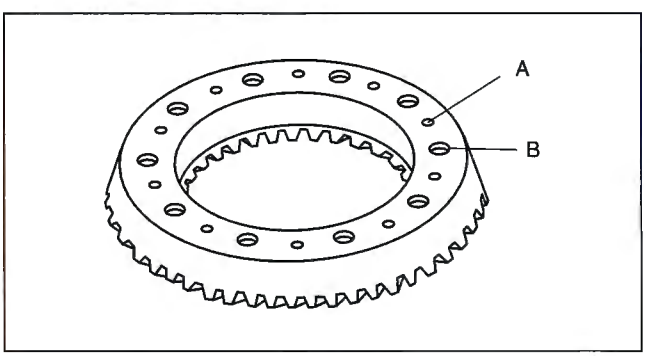
E6U314ZWC005

Ring Gear Assembly Note

Caution
- **The differential gear and ring gear could be damaged if the ring gear is installed with old thread-locking compound remaining on the bolt threads. Before installing the ring gear, completely remove the old thread-locking compound from the bolt threads.**

1. Apply a small amount of thread-locking compound to each of points A on the back of the ring gear, and bolt thread areas B (around the entire ring).

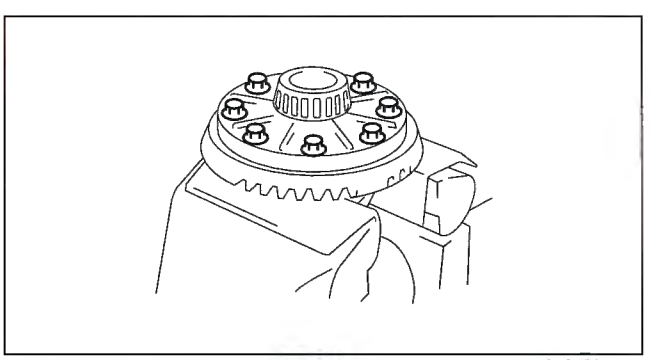
   Application amount
   Back of ring gear:
   Approx. 0.4 ml {0.4 cc, 0.02 cu in}
   Ring gear bolt thread points:
   Approx. 0.4 ml {0.4 cc, 0.02 cu in}
   (0.04 ml {0.04 cc, 0.002 cu in} to each point)



A6A63192022

2. Align the marks placed on the ring gear case at the time of disassembly and tighten the bolts in diagonal order.

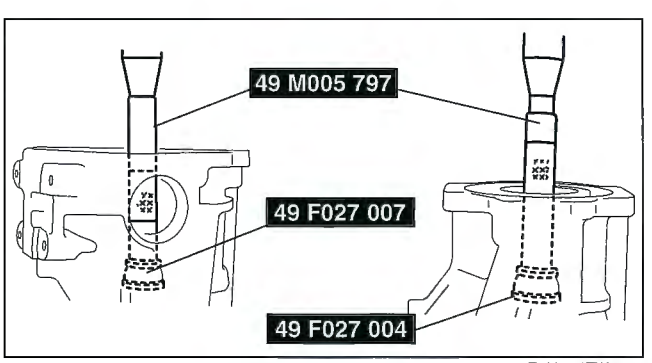
   Tightening torque
   68.6—83.3 N·m {7.00—8.49 kgf·m, 50.6—61.4 ft·lbf}



A6A63192023

Bearing Outer Race Assembly Note

1. Press in the bearing outer race using the **SSTs** and a press.

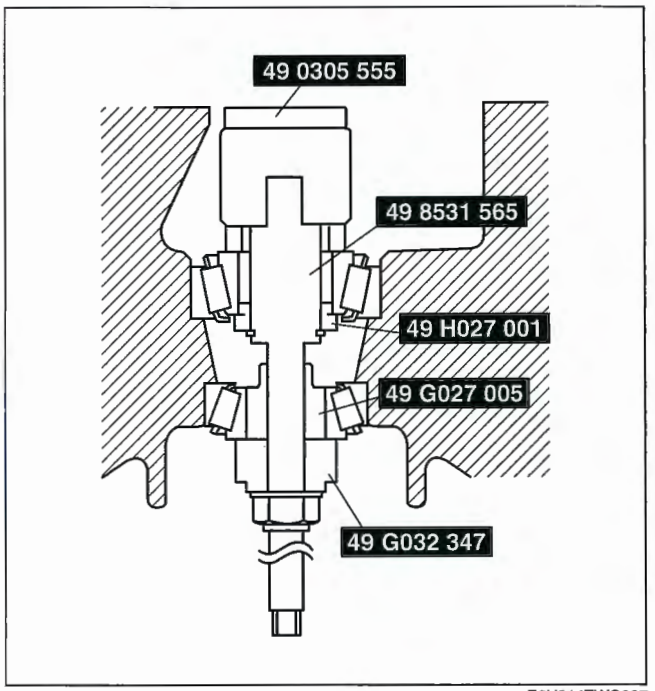


E6U314ZW7002

Spacer, Bearing Inner Race Assembly Note
Pinion height adjustment

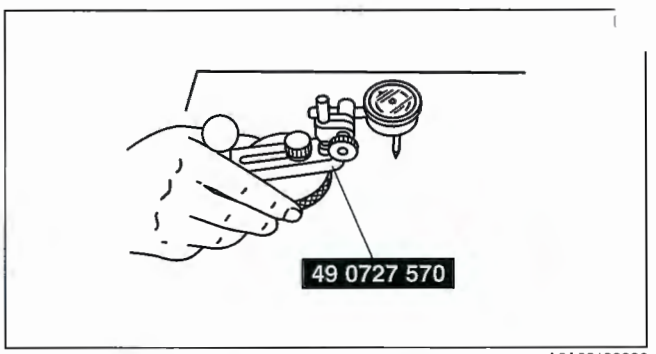
Note
- Use the same spacer.
- Install the spacer with the chamfer on the **SST** side.

1. Assemble the spacer, the bearing inner race (rear bearing), and the **SST** O-ring to the **SST** (49 8531 565) as shown in the figure.
2. Insert the set assembled in Step 1 to the differential gear from the rear.
3. Assemble the bearing inner race (front bearing), **SST** (49 8531 567), companion flange, washer, and locknut from the front of the differential gear.
4. Tighten the locknut to the extent that the **SST** (49 8531 565) can be turned by hand.
5. Place the **SST** (49 0305 555) on top of the **SST** (49 8531 565).



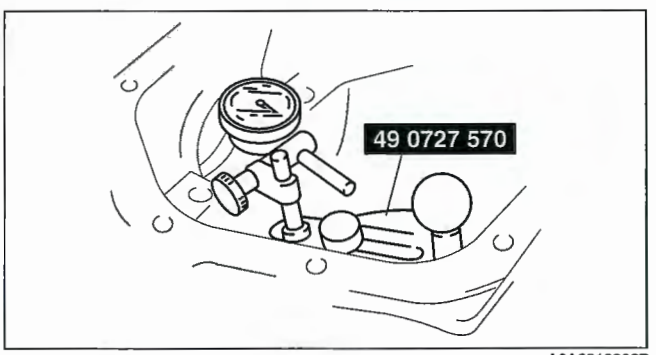
E6U314ZWC007

6. Place the **SST** on the surface plate and set the dial indicator to zero.



A6A63192026

7. Set the **SST** as shown in the figure.
8. Place the measuring probe of the dial indicator so that it contacts the place where the side bearing is installed in the carrier. Then measure the left and right side of the lower position.

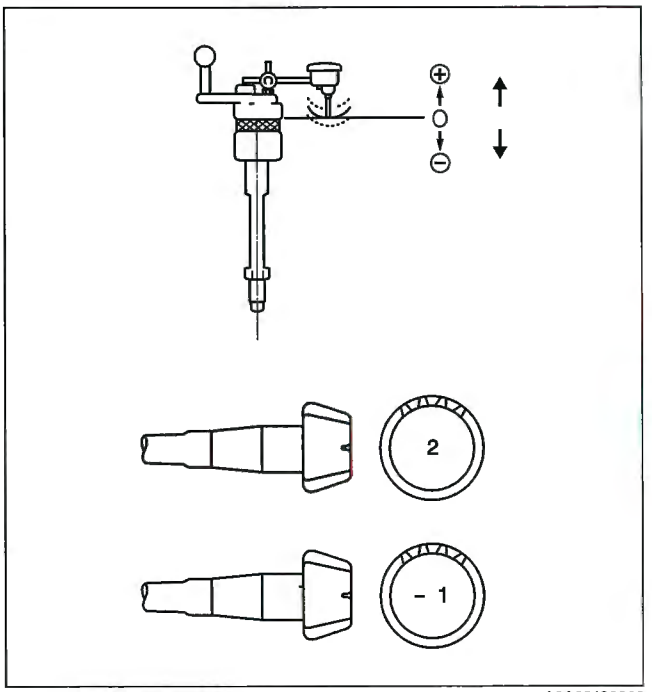


A6A63192027

9. Add the two (left and right) values obtained by the measurements taken in Step 8 and then divide the total by 2. From this result, subtract the result obtained by dividing the number inscribed on the end surface of the drive pinion by 100. (If there is no figure inscribed, use 0.) This is the pinion height adjustment value.

   Rear differential pinion height
   –0.032—0.032 mm {–0.0012—0.0012 in}

   Note
   - For example, the measured results obtained at Step 8 and 9 are 0.06 mm {0.003 in} and 0.04 mm {0.002 in}, and the figure inscribed on the end of the drive pinion is 2:
     ((0.06 mm {0.003 in}+ 0.04 mm {0.002 in}) / 2) – (2/100) = 0.03 mm {0.001 in} (pinion height adjustment value)
     Replace with a spacer 0.03 mm {0.001 in} thicker than the currently used one. Spacer thickness is set at 0.015 mm {0.0006 in} increments, therefore select the closest spacer thickness and assemble.
   - Install the spacer with the chamfer on the **SST** side.

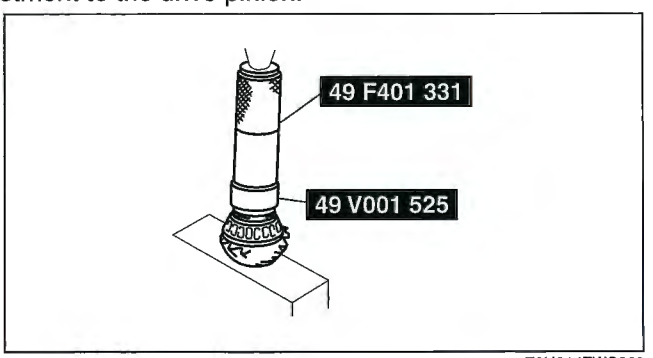


A6A63192028

Spacer thickness

Identification mark	Thickness (mm {in})	Identification mark	Thickness (mm {in})
08	3.08 {0.1213}	29	3.29 {0.1295}
09	3.095 {0.1219}	30	3.305 {0.1301}
11	3.11 {0.1224}	32	3.32 {0.1307}
12	3.125 {0.1230}	33	3.335 {0.1313}
14	3.14 {0.1236}	35	3.35 {0.1319}
15	3.155 {0.1242}	36	3.365 {0.1325}
17	3.17 {0.1248}	38	3.38 {0.1331}
18	3.185 {0.1254}	39	3.395 {0.1337}
20	3.20 {0.1260}	41	3.41 {0.1343}
21	3.215 {0.1266}	42	3.425 {0.1348}
23	3.23 {0.1272}	44	3.44 {0.1354}
24	3.245 {0.1278}	45	3.455 {0.1360}
26	3.26 {0.1283}	47	3.47 {0.1366}
27	3.275 {0.1289}	—	—

10. Assemble the spacer selected for the pinion height adjustment to the drive pinion.
11. Press the bearing inner race (rear bearing) into the drive pinion using the **SSTs** and a press.



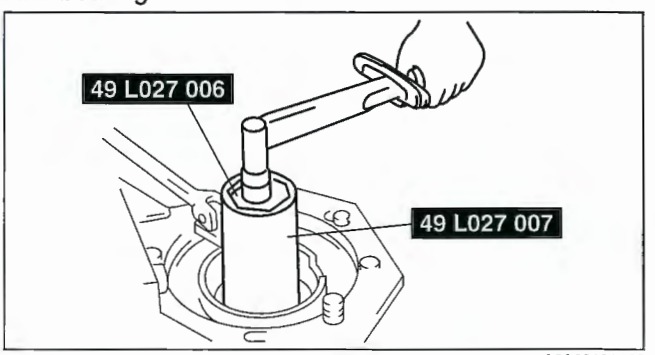
E6U314ZWC008

Locknut Assembly Note
Drive pinion preload adjustment

1. Apply differential oil to a new locknut.
2. Assemble a new collapsible spacer, bearing inner race (front bearing), spacer and locknut to the drive pinion and temporarily tighten the locknut.
3. Turn the serrated part of the drive pinion by hand to seat the bearing.
4. Tighten the locknut temporarily tightened in Step 1 from the lower limit of the specified tightening torque using the **SSTs**, and make this the specified preload.
   - If the specified preload cannot be obtained within the specified tightening torque, replace the collapsible spacer and inspect again.

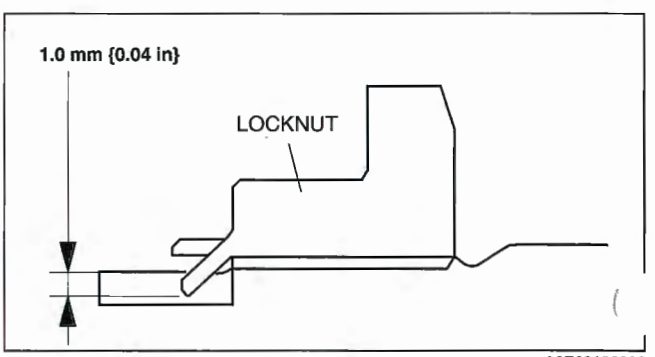
   Tightening torque
   240—755 N·m {24.5—76.9 kgf·m, 177—556 ft·lbf}

   Rear differential drive pinion preload
   1.3—1.8 N·m {13.3—18.2 kgf·cm, 11.5—15.9 in·lbf}



A6A63192030

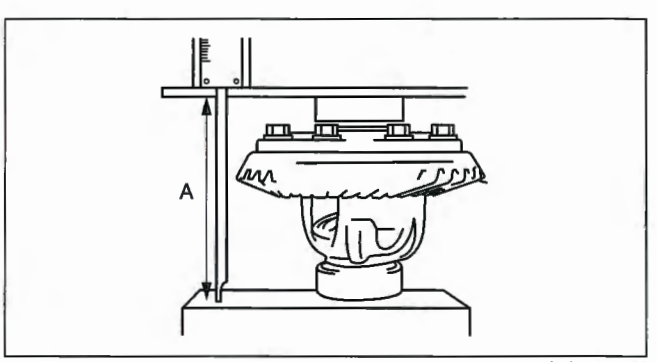
5. Crimp the locknut using a chisel and hammer.



A6E63192032

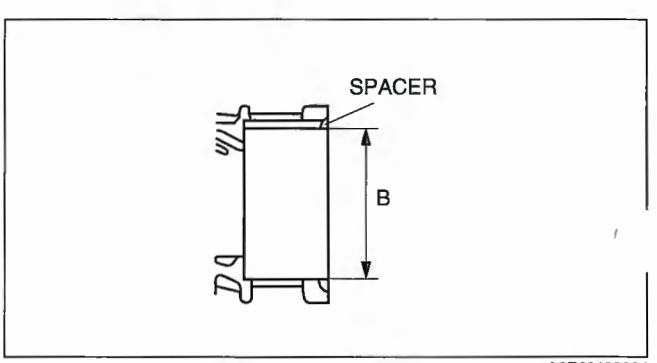
Adjusting Shim Assembly Note

1. Assemble the differential carrier to the **SSTs**.
2. Assemble the spacer to the differential carrier.
3. Stack the side bearing outer race and gear case component on the surface plate as indicated in the figure, and measure the height using a caliper and a ruler. This is value A.



A6A63192033

4. Measure the width of the installed differential in the differential carrier with the spacer installed. This is value B.
5. The combined thickness of the left and right adjusting shims is obtained by the following formula.
   C_1 = B – A + 0.15 mm {0.006 in}
   C_2 = B – A + 0.44 mm {0.017 in}
6. If the combined thickness of the previously installed adjusting shims is between C1 and C2, use the shims as they are.



A6E63192034

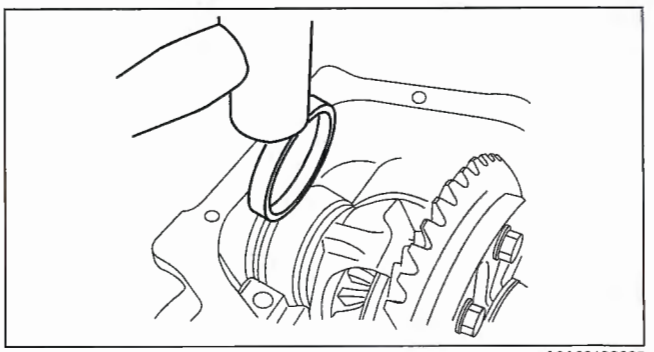
7. If the combined thickness of the previously installed adjusting shims is not between C1 and C2, or if the adjusting shims have to be replaced, select two appropriate adjusting shims from the table below.

Adjusting shim thickness

Identification mark	Thickness (mm {in})	Identification mark	Thickness (mm {in})
350	3.50 {0.137}	410	4.10 {0.161}
355	3.55 {0.139}	415	4.15 {0.163}
360	3.60 {0.141}	420	4.20 {0.165}
365	3.65 {0.143}	425	4.25 {0.167}
370	3.70 {0.145}	430	4.30 {0.169}
375	3.75 {0.147}	435	4.35 {0.171}
380	3.80 {0.149}	440	4.40 {0.173}
385	3.85 {0.151}	445	4.45 {0.175}
390	3.90 {0.153}	450	4.50 {0.177}
395	3.95 {0.155}	455	4.55 {0.179}
400	4.00 {0.157}	460	4.60 {0.181}
405	4.05 {0.159}	—	—

Caution
- **If adjusting shims are to be reused, do not mix up the left and right shims.**
- **Do not mix up the left and right side bearing outer races and spacers.**

8. Assemble the selected adjusting shims to the differential carrier ring gear side, and the spacer to the opposite side.
9. Assemble the differential and bearing outer race to the differential carrier.
10. Tap the selected adjusting shim between the spacer and the bearing race with a plastic hammer as shown in the figure.
11. Align the bearing cap alignment marks to assemble the bearing cap, and temporarily tighten the bolts.
12. Place the dial indicator so that the measuring probe contacts the top surface of one of the ring gear teeth perpendicularly.
13. Secure the drive pinion and measure the backlash from when the ring gear moved.



A6A63192035

Rear differential backlash of drive pinion and ring gear
Standard: 0.09—0.11 mm {0.003—0.004 in}
Minimum value: 0.05 mm {0.002 in}

Note
- Measure the backlash at 4 locations around the ring gear. Make sure one of the 4 locations is within specification, and the minimum value for the 4 locations is **0.5 mm {0.002 in}**or less.

14. If the backlash is not within the specification, adjust the gear case component by moving it in the axial direction.

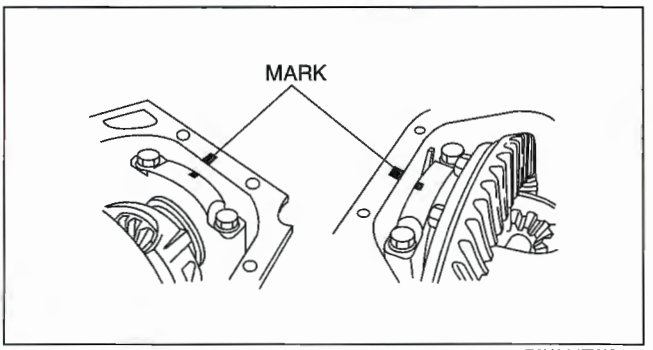
Note
- When moving the gear case component in the axial direction, replace the adjusting shims. If the adjusting shim on the right side is replaced with one that is **0.05 mm {0.002 in}** thicker, replace the one on the left with one that is **0.05 mm {0.002 in}** thinner.

Bearing Cap Assembly Note

1. Align the bearing cap alignment marks to assemble the bearing cap.

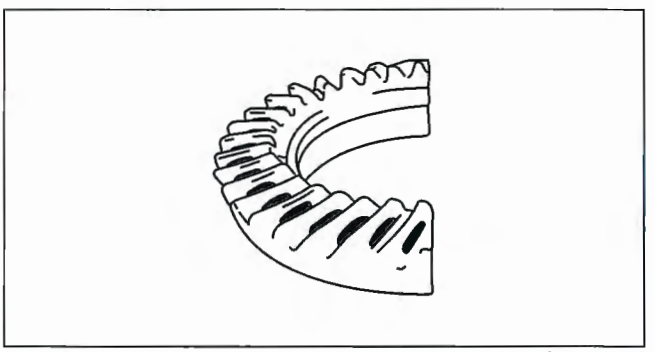
   Tightening torque
   38—51 N·m {3.9—5.2 kgf·m, 28.1—37.0 ft·lbf}

2. Inspect the drive pinion and ring gear teeth contact points.



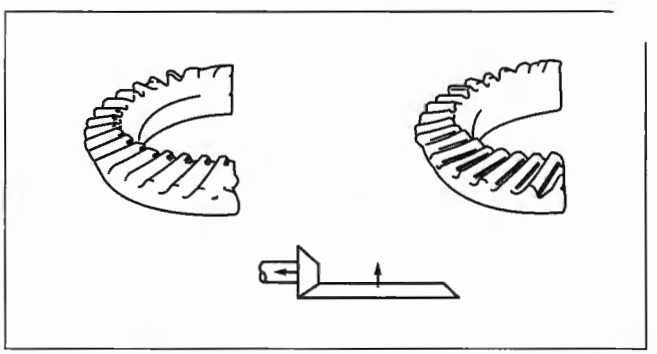
E6U314ZWC017

   (1) Coat both surfaces of the ring gear uniformly with a thin red lead coating.
   (2) While rotating the ring gear back and forth by hand, rotate the drive pinion several times and inspect the tooth contact.
   (3) Inspect the tooth contacts in four locations around the ring gear, and check that the tooth contacts showing the red lead coating are the same as the pattern indicated in the figure.
      - If the tooth contact is good, wipe off the red lead coating.
      - If it is not good, adjust the pinion height, then adjust the backlash.



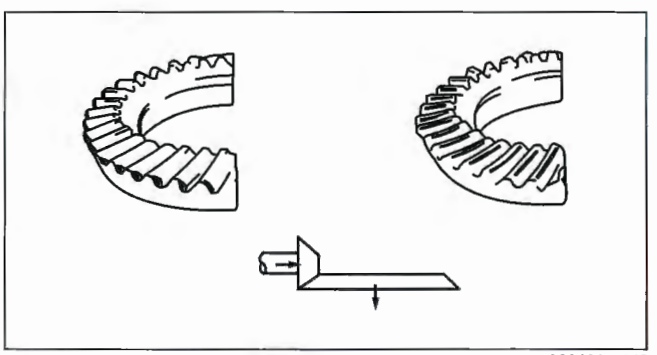
A6A6319203[illegible]

   (4) If toe and flank contact appears as shown in the figure, replace the spacer with a thinner one, and move the drive pinion outward.



A6A63192039

   (5) If heel and face contact appears as indicated in the figure, replace the spacer with a thicker one and move the drive the pinion inward.



A6A63192040

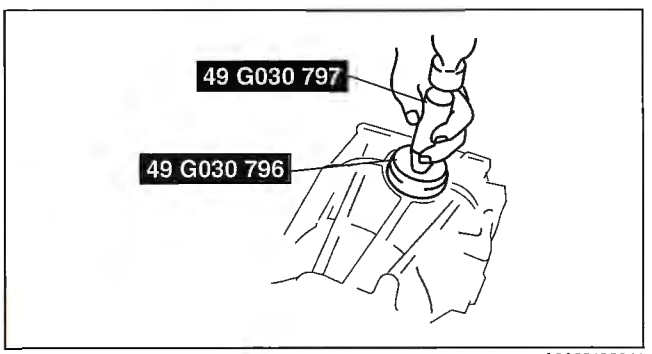
Rear Cover Assembly Note

Caution
- **Clean away the old sealant before applying the new sealant.**
- **Install the rear differential within 10 minutes after applying sealant.**
- **Allow the sealant to set at least 30 minutes after installation before filling the differential with the specified oil.**

1. Clean the alignment surface of the carrier and rear cover, and apply a thin coat of sealant.
2. Install the rear cover.

Tightening torque
15.7—22.6 N·m {1.6—2.3 kgf·m, 11.6—16.6 ft·lbf}

Oil Seal Assembly Note
1. Apply differential oil to the new oil seal lip.
2. Assemble the oil seal using the **SSTs**.



A6A63192041

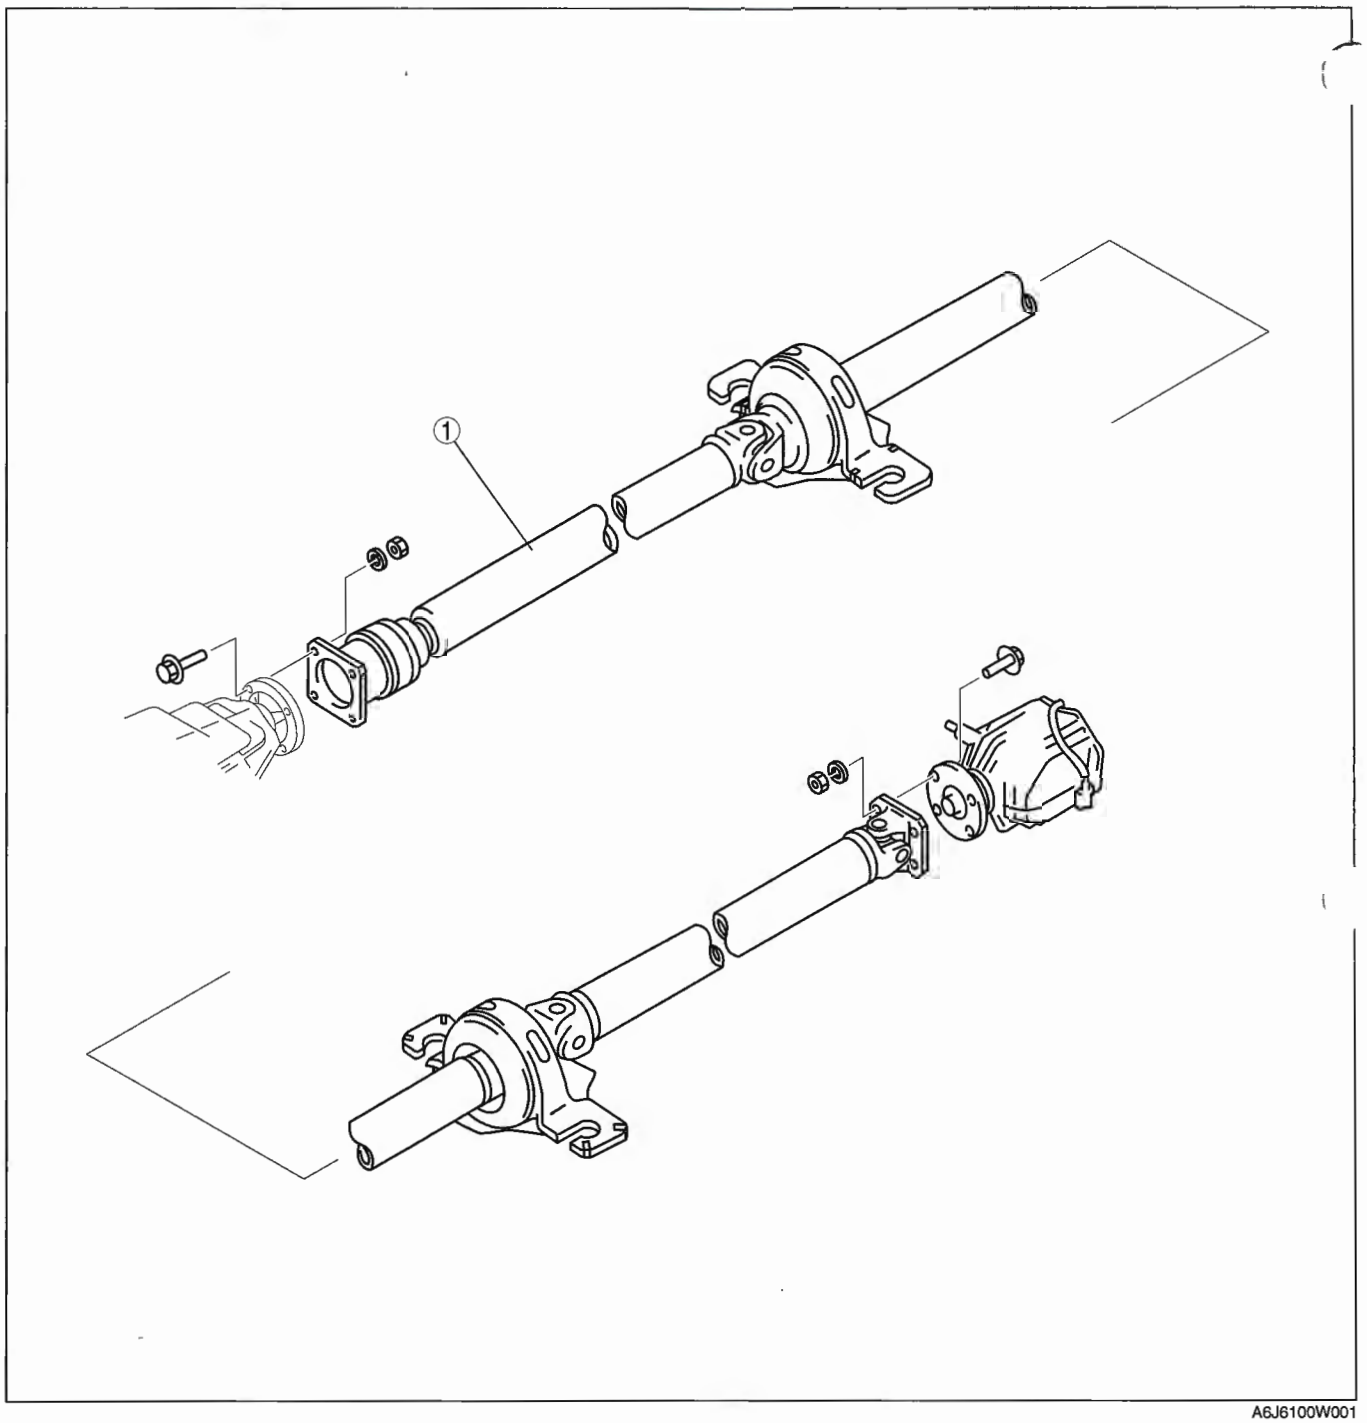
PROPELLER SHAFT LOCATION INDEX

E6U031525002W01



A6J6100W001

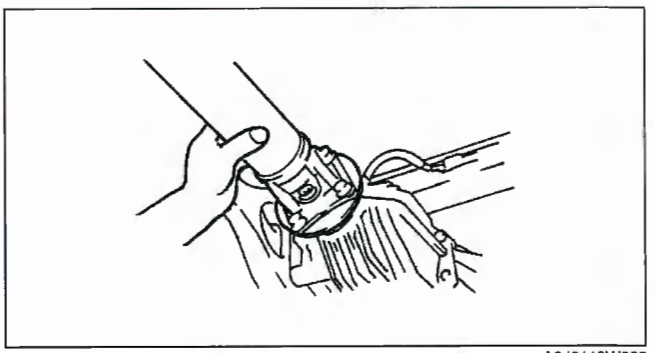
1	Propeller shaft (See 03–15–3 PROPELLER SHAFT ON-VEHICLE INSPECTION.) (See 03–15–4 PROPELLER SHAFT REMOVAL/INSTALLATION.) (See 03–15–7 PROPELLER SHAFT DISASSEMBLY/ASSEMBLY.) (See 03–15–12 PROPELLER SHAFT INSPECTION.)

PROPELLER SHAFT ON-VEHICLE INSPECTION

E6U031525002W02

Joint Area Excessive Play Inspection

1. Shake the universal joint by hand and verify that there is no excessive play.
2. If there is any excessive play, replace as follows:
   - Constant velocity joint: Replace the propeller shaft
   - Yoke: Replace the universal joint



A6J6110W002

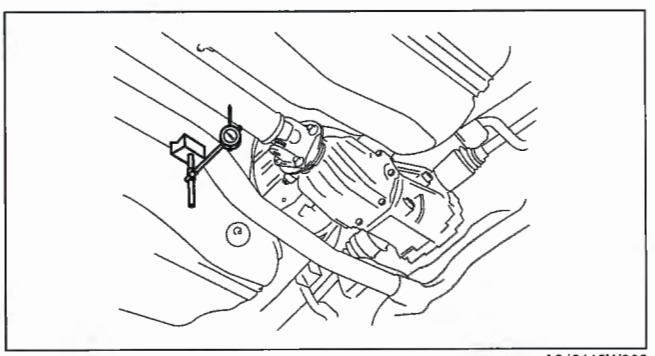
Propeller Shaft Runout Inspection

Caution

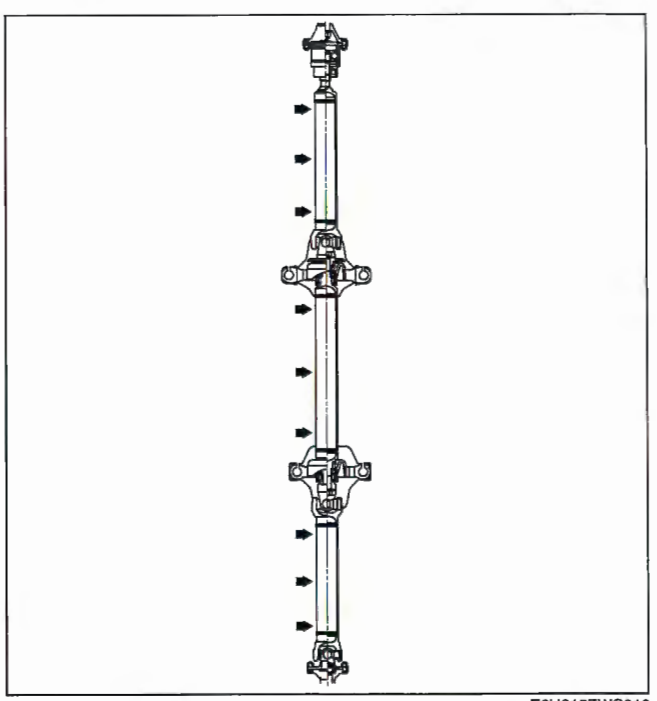
- **Do not rotate the propeller shaft using engine force when inspecting.**

1. Shift to neutral position and release the parking brake.
2. Rotate the rear wheel by hand and inspect the propeller shaft runout at the nine locations shown in the figure.
   - If it exceeds the standard specification, replace the propeller shaft.

Standard propeller shaft runout (on-vehicle)
0.4 mm {0.016 in}



A6J6110W003

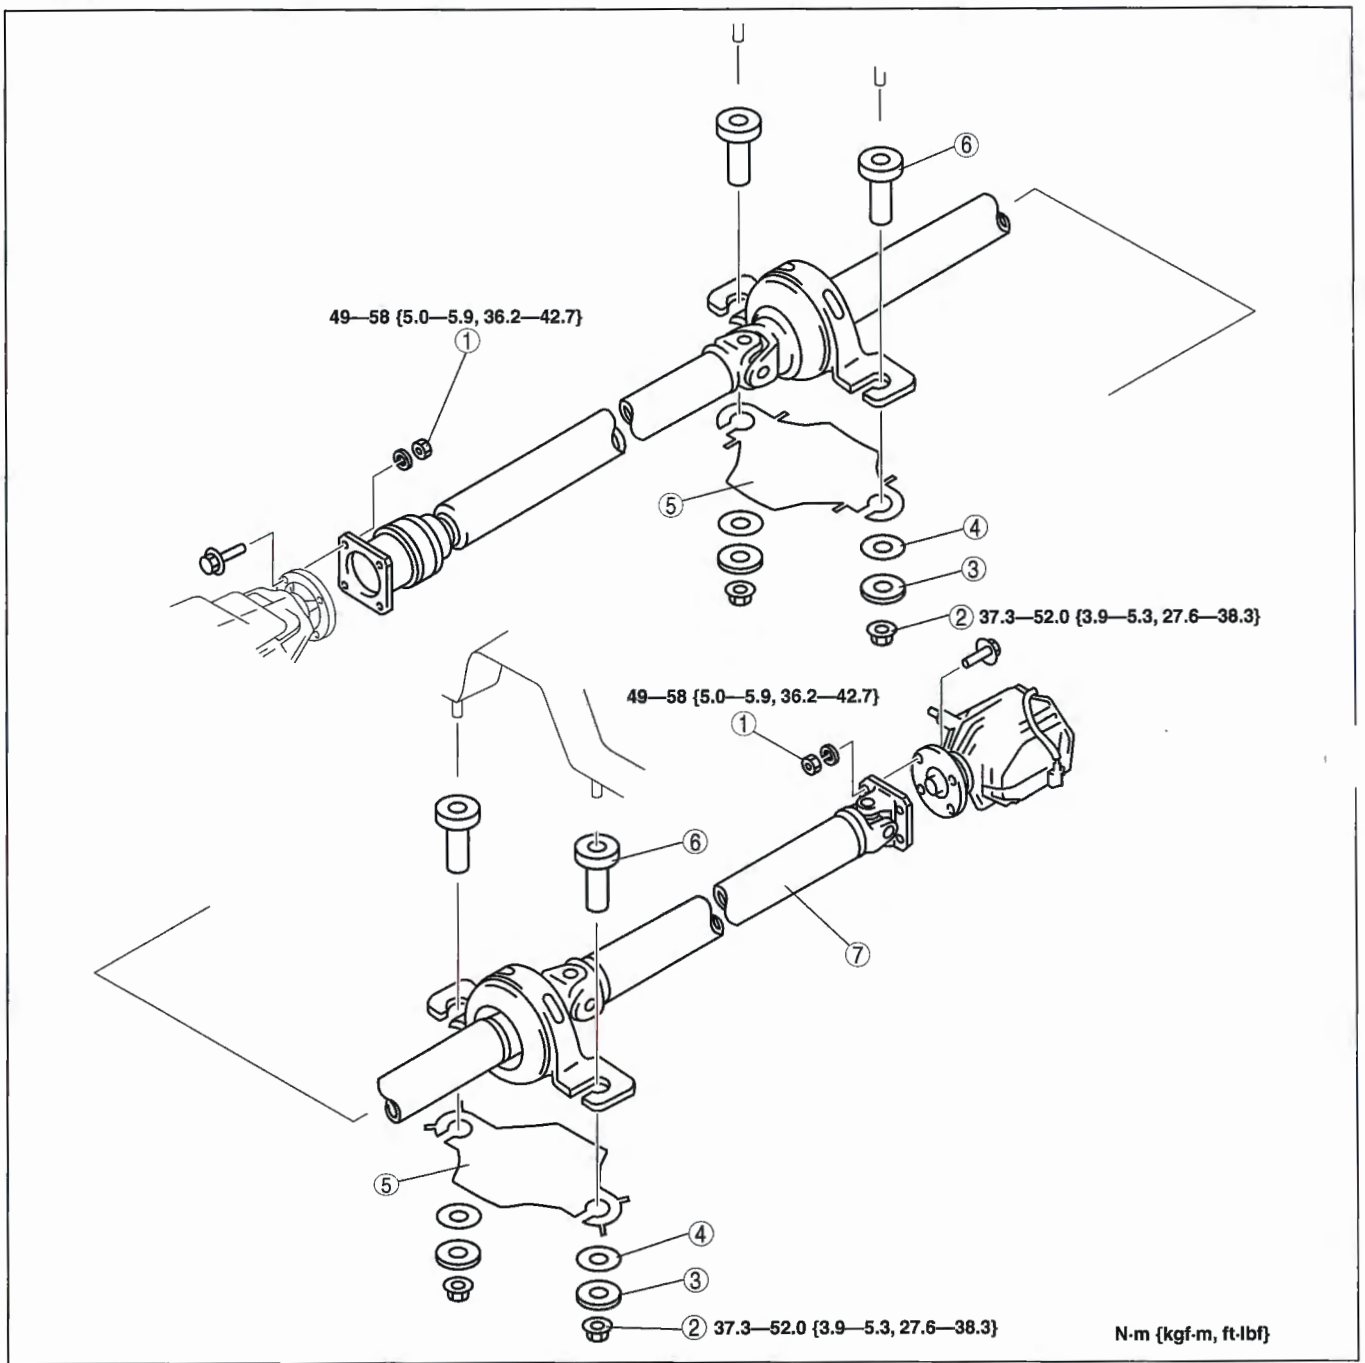


E6U315ZWC010

PROPELLER SHAFT REMOVAL/INSTALLATION

E6U031525002W03

1. Remove the negative battery cable.
2. Remove the middle pipe, TWC and front pipe. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
3. Remove in the order indicated in the figure.
4. Install in the reverse order of removal.



E6U315ZWC001

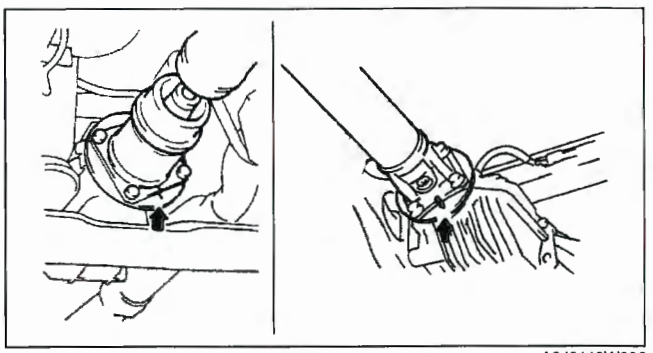
1	Nut (See 03–15–5 Nut Removal Note.)
2	Nut
3	Bush, spacer
4	Washer

5	Propeller shaft heat shield (See 03–15–6 Propeller Shaft Heat Shield Installation Note.)
6	Bush, spacer
7	Propeller shaft (See 03–15–5 Propeller Shaft Installation Note.)

Nut Removal Note

Caution
- **Do not mark with a punch to prevent imbalance.**

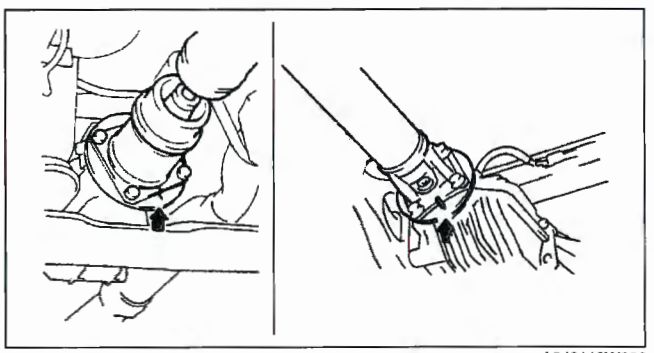
1. Before removing the nut, place alignment marks on the companion flange (front) and constant velocity joint, and on the companion flange (rear) and yoke.



A6J6110W006

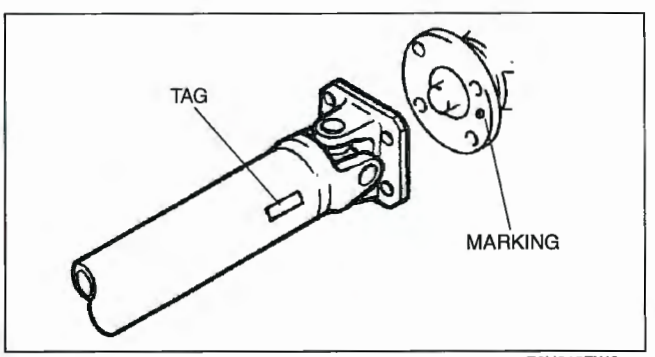
Propeller Shaft Installation Note

1. Align the alignment marks and install the propeller shaft.



A6J6110W006

2. When installing a new propeller shaft, align the rear differential companion flange mark with the tag on the propeller shaft so that they are at the nearest position, and assemble.
3. Perform a road test and verify that there is no abnormal vibration or noise.

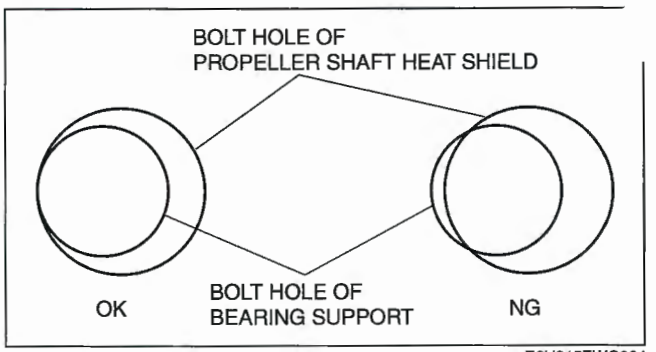


E6U315ZWC003

Propeller Shaft Heat Shield Installation Note

Caution

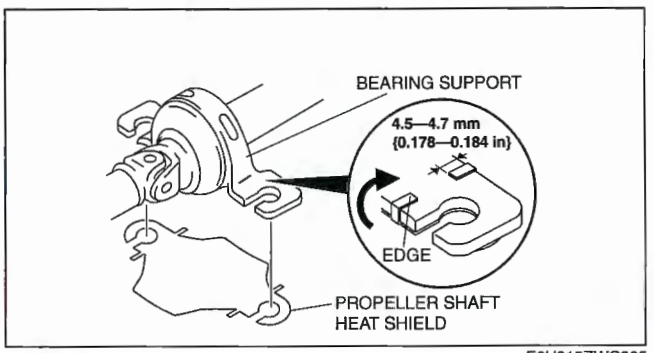
- **The serviceability may be negatively affected if the bolt hole is blocked when assembling the propeller shaft heat shield to the bearing support. When assembling, be careful that the rim of the propeller shaft heat shield bolt hole does not cover the bearing support bolt hole.**



E6U315ZWC004

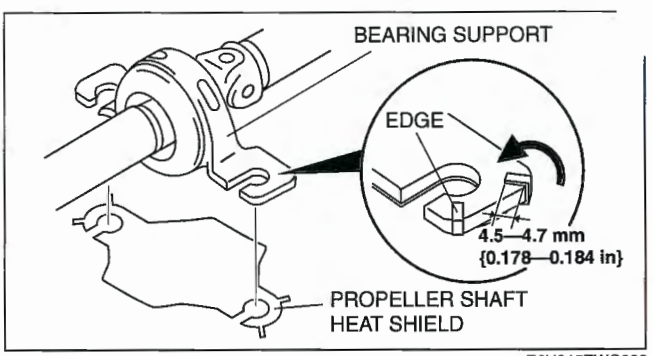
1. Assemble the propeller shaft heat shield to the bearing support.

Front



E6U315ZWC005

Rear



E6U315ZWC006

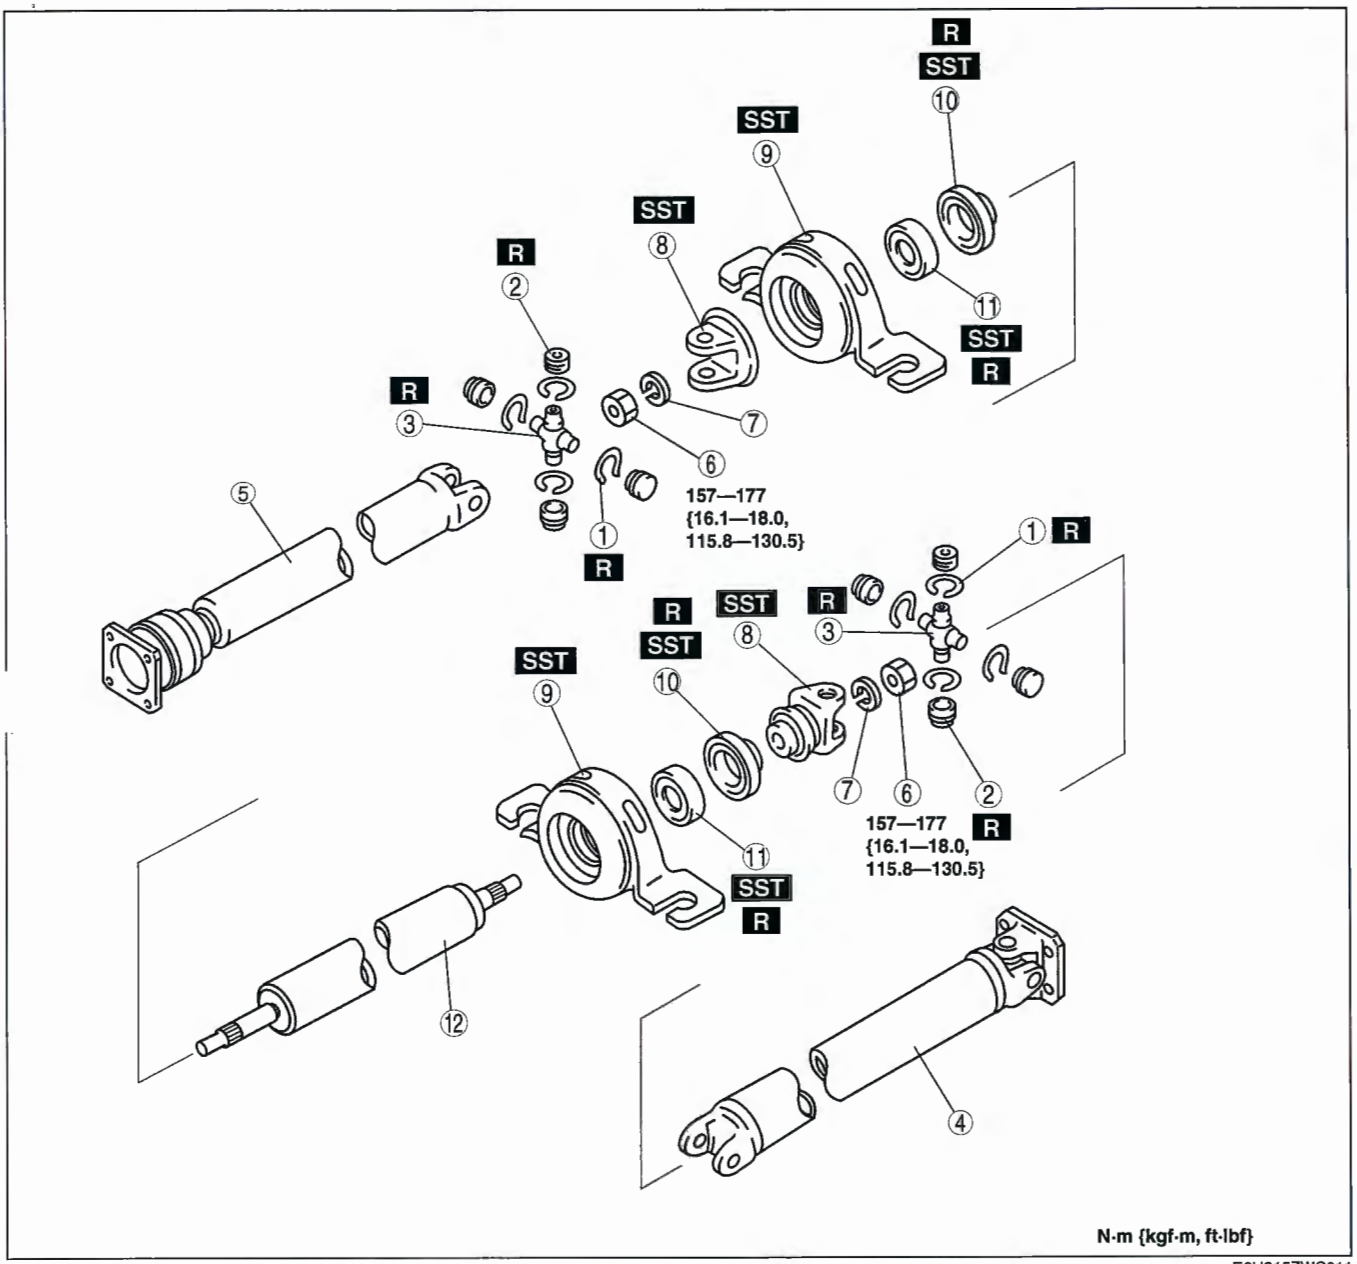
2. Fold back the propeller shaft heat shield tab as shown in the figure.

PROPELLER SHAFT DISASSEMBLY/ASSEMBLY

E6U031525002W04

Caution
- **If using a vise, always secure the component using an aluminum plate to prevent component damage.**

1. Disassemble in the order indicated in the table.
2. Assemble in the reverse order of disassembly.



E6U315ZWC011

1	Snap ring (See 03–15–8 Snap Ring Disassembly Note.) (See 03–15–11 Bearing Cup, Snap Ring Assembly Note.)
2	Bearing cup (See 03–15–8 Bearing Cup Disassembly Note.) (See 03–15–11 Bearing Cup, Snap Ring Assembly Note.)
3	Spider
4	Rear propeller shaft
5	Front propeller shaft

6	Locknut (See 03–15–9 Locknut Disassembly Note.) (See 03–15–11 Locknut Assembly Note.)
7	Spring washer
8	Yoke (See 03–15–9 Yoke Disassembly Note.)
9	Bearing support (See 03–15–9 Bearing Support Disassembly Note.) (See 03–15–11 Bearing Support Assembly Note.)

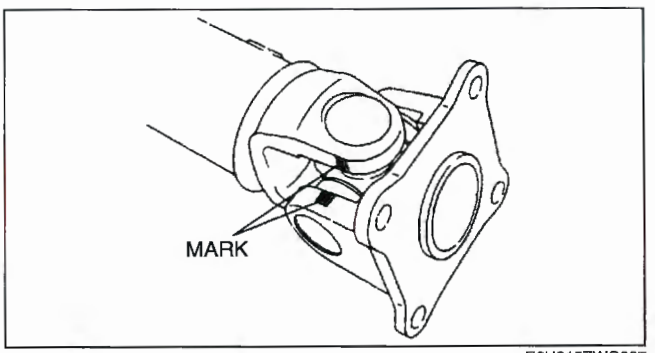
10	Dust cover (bearing support side) (See 03–15–10 Dust Cover (Bearing Support Side), Bearing Disassembly Note.) (See 03–15–10 Dust Cover Assembly Note.)

11	Bearing (See 03–15–10 Dust Cover (Bearing Support Side), Bearing Disassembly Note.) (See 03–15–10 Bearing Assembly Note.)
12	Center propeller shaft

Note
Rear Differential side universal joint can not be disassembled.

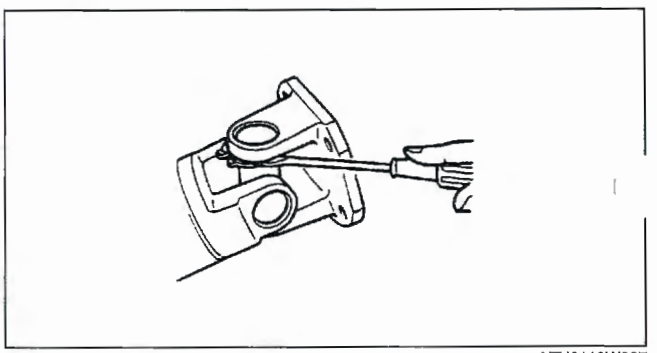
Snap Ring Disassembly Note

1. Place an alignment mark on the yoke and front propeller shaft, or on the yoke and rear propeller shaft.
2. Secure the propeller shaft to the vise.



E6U315ZWC007

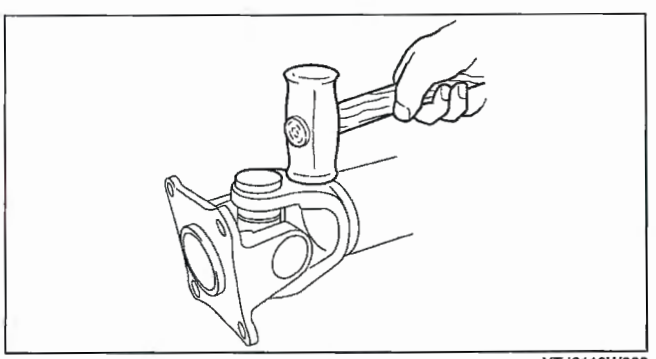
3. Remove the snap ring using a flathead screwdriver.



YTJ6110W007

Bearing Cup Disassembly Note

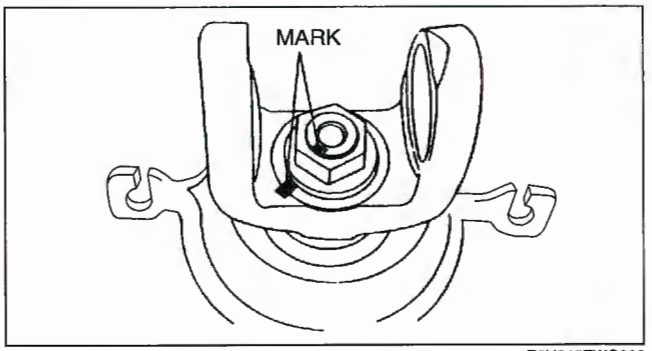
1. Using a copper hammer, raise the propeller shaft bearing cup and remove.
2. Remove the bearing cup on the opposite side by following the same procedure.
3. Remove the front propeller shaft from the yoke.
4. Secure the yoke on a vise, and remove the bearing cup by following Steps 1 and 2.



YTJ6110W008

Locknut Disassembly Note

1. Place alignment marks on the yoke and center propeller shaft.
   Secure the yoke on the vise.
2. Remove the locknut and washer.
3. Remove the yoke using the **SSTs**.

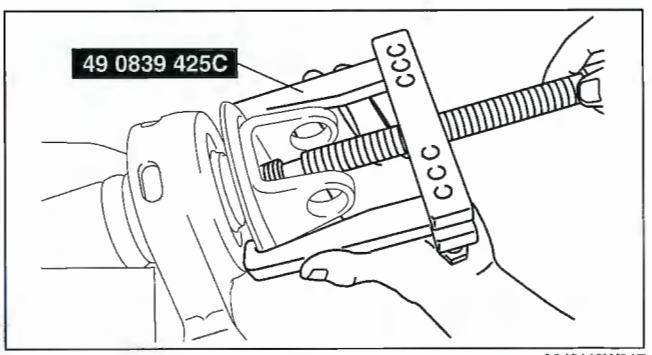


E6U315ZWC008

Yoke Disassembly Note

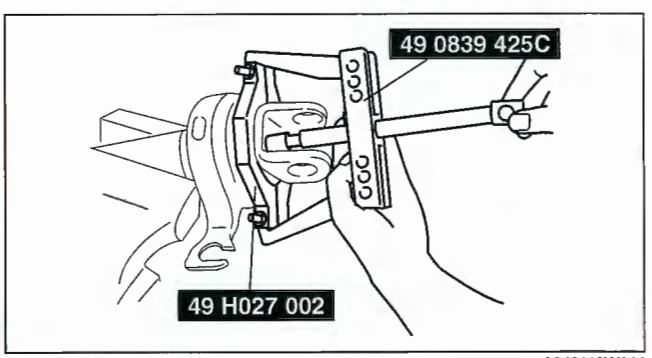
1. Remove the yoke using the **SST**.

Front



A6J6110W017

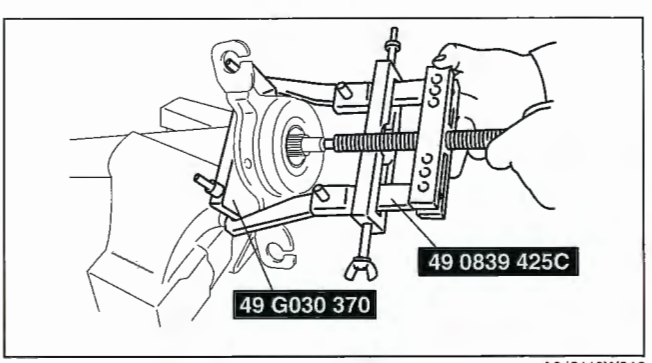
Rear



A6J6110W011

Bearing Support Disassembly Note

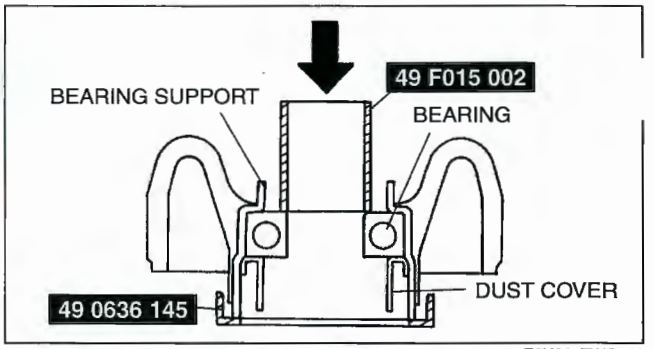
1. Remove the bearing support using the **SSTs**.



A6J6110W012

Dust Cover (Bearing Support Side), Bearing Disassembly Note

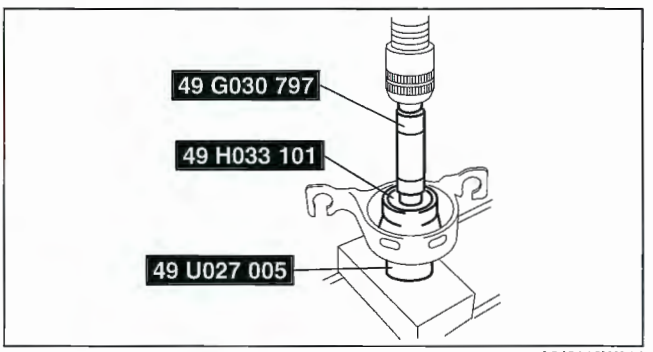
1. Remove the bearing and dust cover (bearing support side) from the bearing support using the **SSTs** and a press.



E6U315ZWC009

Bearing Assembly Note

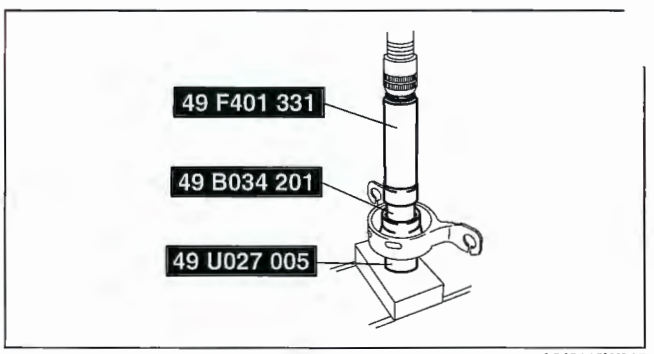
1. Assemble the bearing to the bearing support using the **SSTs**.



A6J6110W014

Dust Cover Assembly Note

1. Assemble the dust cover to the bearing support using the **SSTs** and a press.

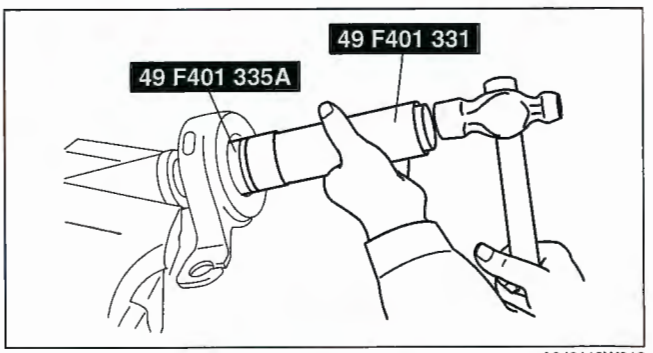


A6J6110W015

Bearing Support Assembly Note

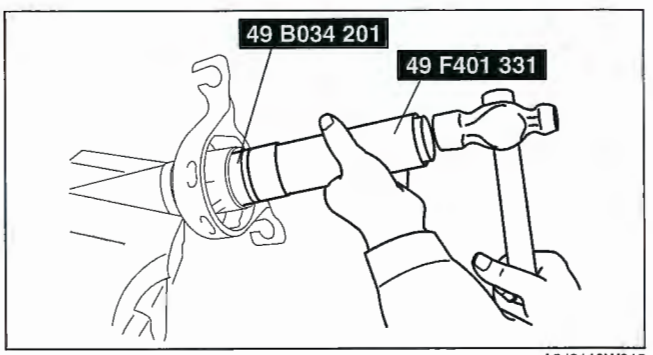
1. Assemble the bearing support to the propeller shaft using the **SSTs**.

Front



A6J6110W018

Rear

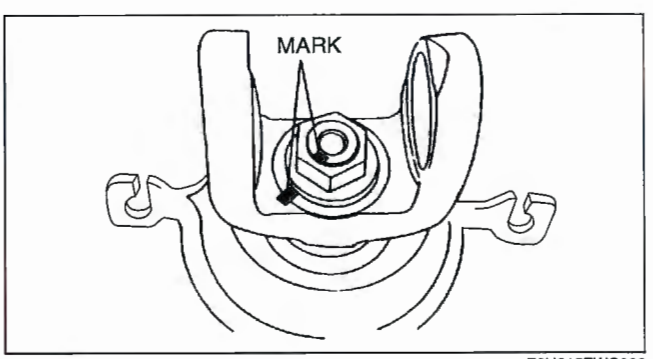


A6J6110W019

Locknut Assembly Note

1. Align the alignment marks on the propeller shaft and yoke, and assemble.

Tightening Torque
157—177 N·m
{16.1—18.0 kgf·m, 115.8—130.5 ft·lbf}

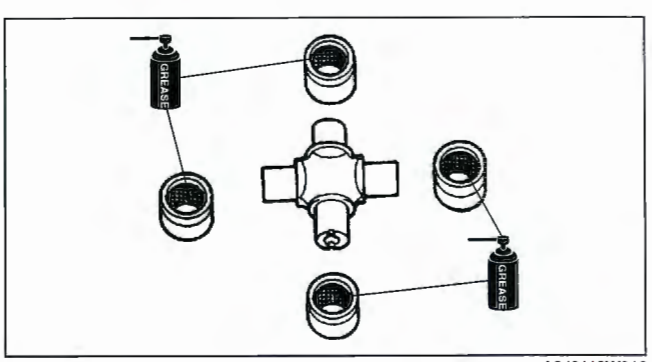


E6U315ZWC008

Bearing Cup, Snap Ring Assembly Note

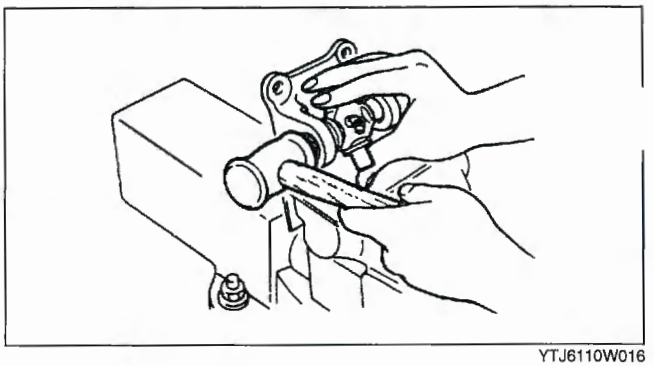
1. Set the new spider on the yoke and assemble a new bearing cup until the snap ring groove can be seen.
2. Assemble the opposite side by following the same procedure.
3. Insert the bearing cup and adjust it so that the snap ring groove has the largest width and both sides have the same groove width.

Caution
- **Use snap rings with the same thickness on both sides.**



A6J6110W016

4. Measure the bearing cup groove width and install a new snap ring of the proper size.



YTJ6110W016

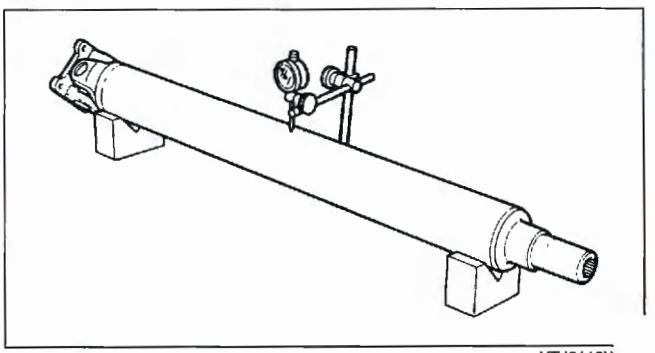
Snap ring thickness
1.45 mm {0.0571 in}, 1.48 mm {0.0583 in}, 1.51 mm {0.0594 in}, 1.54 mm {0.0606 in}, 1.57 mm {0.0618 in}, 1.60 mm {0.0630 in}, 1.63 mm {0.0642 in}

5. Lightly tap the yoke using a copper hammer and press the snap ring to the yoke.
6. Verify that the spider has no excessive play.
7. Align the propeller shaft and yoke with the alignment mark and install.
8. Assemble the bearing cup and snap ring by following Steps 1-6.
9. Lightly tap the universal joint outer edge using a plastic hammer to adjust the component to the proper position. (See 03–15–12 PROPELLER SHAFT INSPECTION.)

PROPELLER SHAFT INSPECTION

E6U031525002W05

1. Disassemble the propeller shaft.
2. Measure the propeller shaft center runout using the dial gauge.
   - If it exceeds the maximum specification, replace the propeller shaft as a single component.

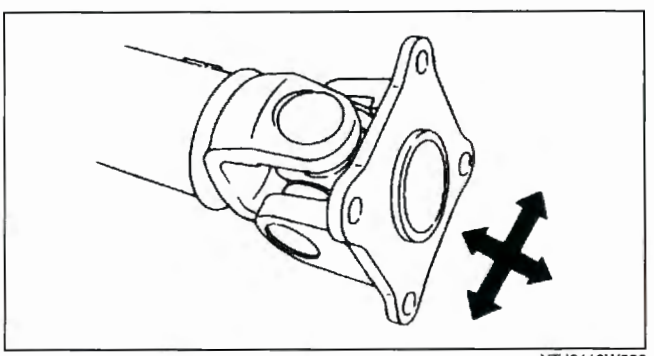


YTJ6110W

Maximum propeller shaft runout
0.3 mm {0.012 in}

3. Inspect the play and rotation of the joint by turning the universal joint in the directions shown by the arrows.
   Rear Differential side
   - If it is not within the specification, replace the rear propeller shaft.

   Others
   - If it is not within the specification, adjust by choosing the proper snap ring.



YTJ6110W020

Propeller shaft starting torque
Rear Differential side: 0.29—0.98 N·m {3.0—9.9 kgf·cm, 2.6—8.6 in·lbf}
Others: 0.29—1.18 N·m {3.0—12.0 kgf·cm, 2.6—10.4 in·lbf}

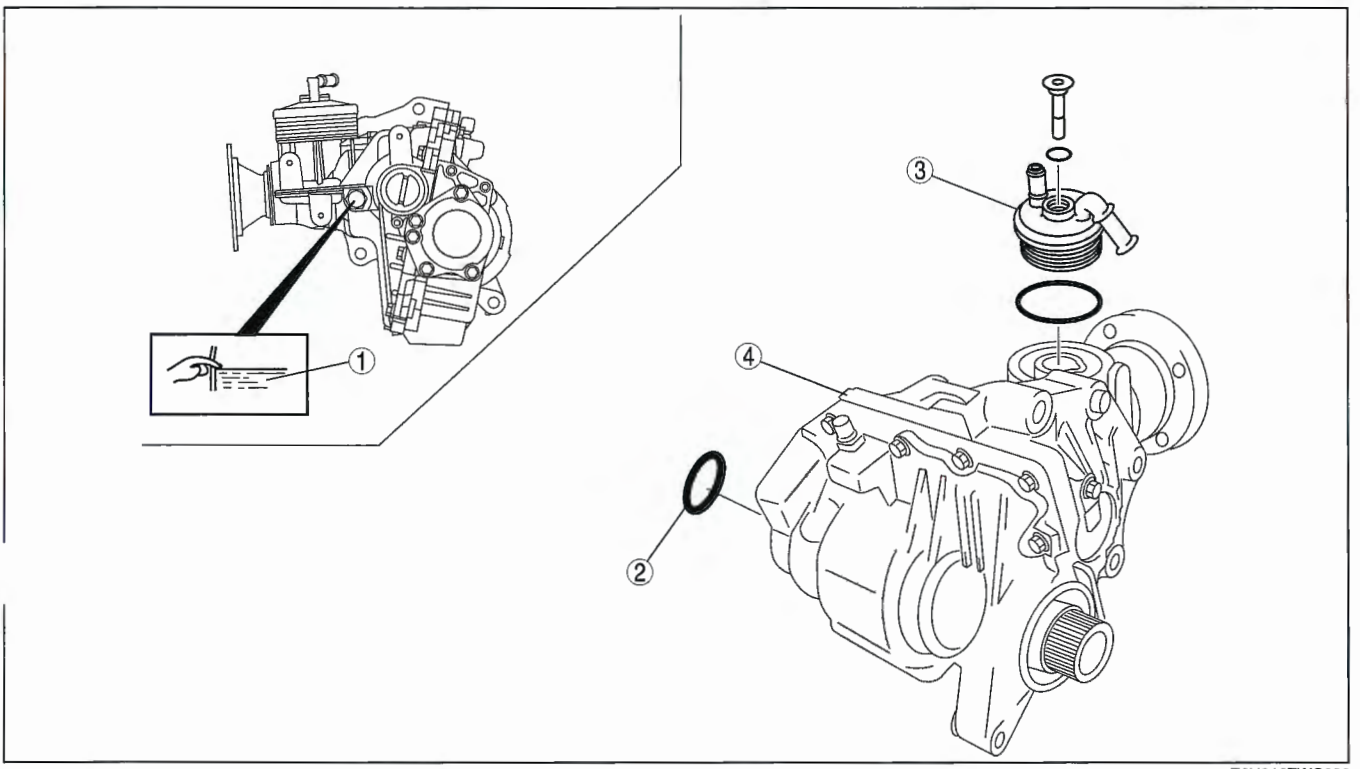
TRANSFER LOCATION INDEX

E6U031600000W01



E6U316ZWC006

1	Transfer oil (See03–16–2 TRANSFER OIL INSPECTION.) (See03–16–2 TRANSFER OIL REPLACEMENT.)
2	Transfer Oil seal (See03–16–2 TRANSFER OIL SEAL REPLACEMENT.)

3	Transfer oil cooler (See03–16–3 TRANSFER OIL COOLER REMOVAL/INSTALLATION.)
4	Transfer (See03–16–3 TRANSFER REMOVAL/INSTALLATION.)

TRANSFER OIL INSPECTION

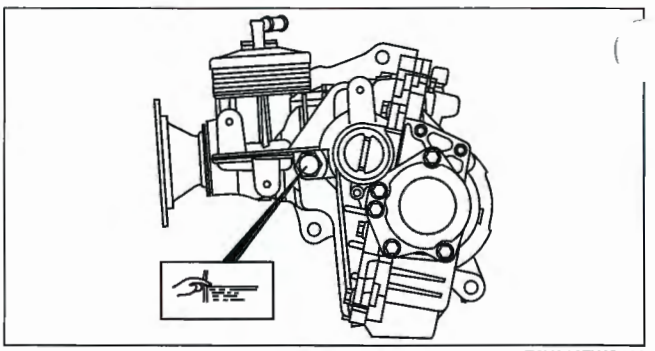
E6U031600000W02

1. Park the vehicle on level ground.
2. Remove the oil level plug and with the washer.
3. Verify that the oil is near the brim of the plug port.
   - If the oil level is low, add the specified amount and type of oil through the oil level plug hole.

Transfer oil
Specified oil grade: API Service GL-5
Specified oil viscosity: SAE 80W-90

4. Tighten the oil level plug with a new washer.

Tightening torque
39.2—58.8 N·m {4.0—5.9 kgf·m, 29.0—43.3 ft·lbf}



E6U316ZWC002

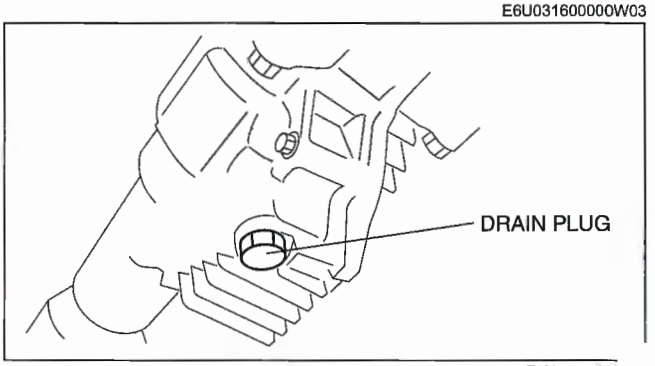
TRANSFER OIL REPLACEMENT

E6U031600000W03

1. Remove the drain plug with the washer.
2. Drain the oil into a suitable container.
3. Tighten the drain plug with a new washer.

Tightening torque
39.2—58.8 N·m {4.0—5.9 kgf·m, 29.0—43.3 ft·lbf}

4. Remove the oil level plug with the washer and add the specified amount and type of oil through the oil level plug hole until the level reaches the bottom of the oil level plug hole.



E6U316ZWC

Transfer oil
Specified oil grade: API Service GL-5
Specified oil viscosity: SAE 80W-90
Capacity (approximate quantity): 1.2 L {1.3 US qt, 1.1 Imp qt}

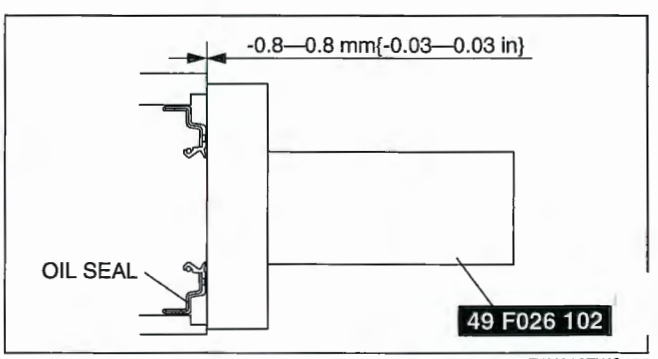
5. Tighten the oil level plug with a new washer.

Tightening torque
39.2—58.8 N·m {4.0—5.9 kgf·m, 29.0—43.3 ft·lbf}

TRANSFER OIL SEAL REPLACEMENT

E6U031600000W04

1. On level ground, jack up the vehicle and support it evenly on safety stands.
2. Drain the oil from the transfer. (See 03–16–2 TRANSFER OIL REPLACEMENT.)
3. Remove the joint shaft. (See 03–13–7 JOINT SHAFT REMOVAL/INSTALLATION [L3 WITH TC])
4. Remove the oil seals using a screwdriver.
5. Using the **SST** and a hammer, tap each new oil seal.
6. Coat the lip of each oil seal with transfer oil.
7. Install the joint shaft. (See 03–13–7 JOINT SHAFT REMOVAL/INSTALLATION [L3 WITH TC])
8. Add the specified amount and type of oil. (See 03–16–2 TRANSFER OIL REPLACEMENT.)

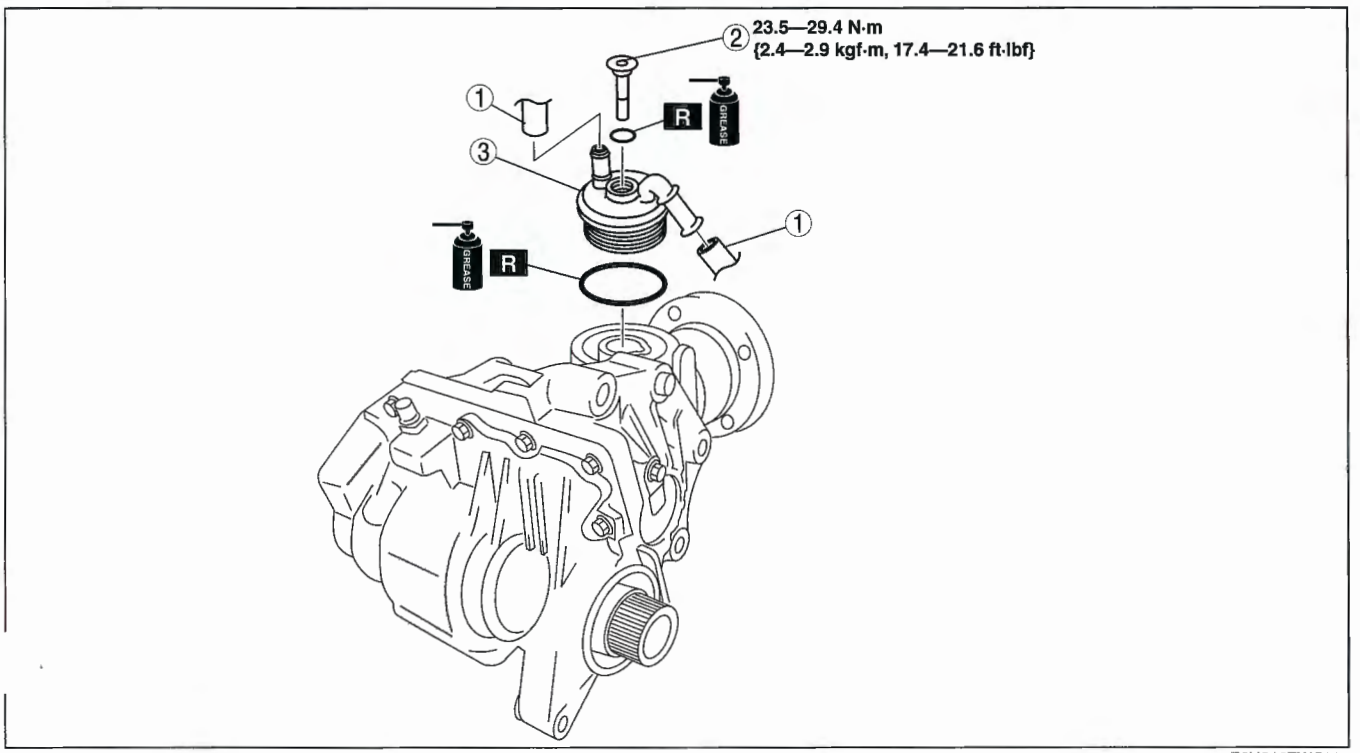


E6U316ZWC005

TRANSFER OIL COOLER REMOVAL/INSTALLATION

E6U031600000W05

1. Disconnect the propeller shaft from the transfer side. (See 03–15–4 PROPELLER SHAFT REMOVAL/INSTALLATION.)
   Drain the engine coolant. (See 01–12B–4 ENGINE COOLANT REPLACEMENT [L3 WITH TC].)
3. Drain the transfer oil into a suitable container. (See 03–16–2 TRANSFER OIL REPLACEMENT.)
4. Remove in the order indicated in the figure.
5. Install in the reverse order of removal.
6. Perform the following procedure, if the transfer has been overhauled and installed to the vehicle.
   (1) After warming up the engine, drive the vehicle and inspect for oil leakage and abnormal noise.



E6U316ZWC007

1	Water hose
2	Transfer oil cooler installation bolt
3	Transfer oil cooler

TRANSFER REMOVAL/INSTALLATION

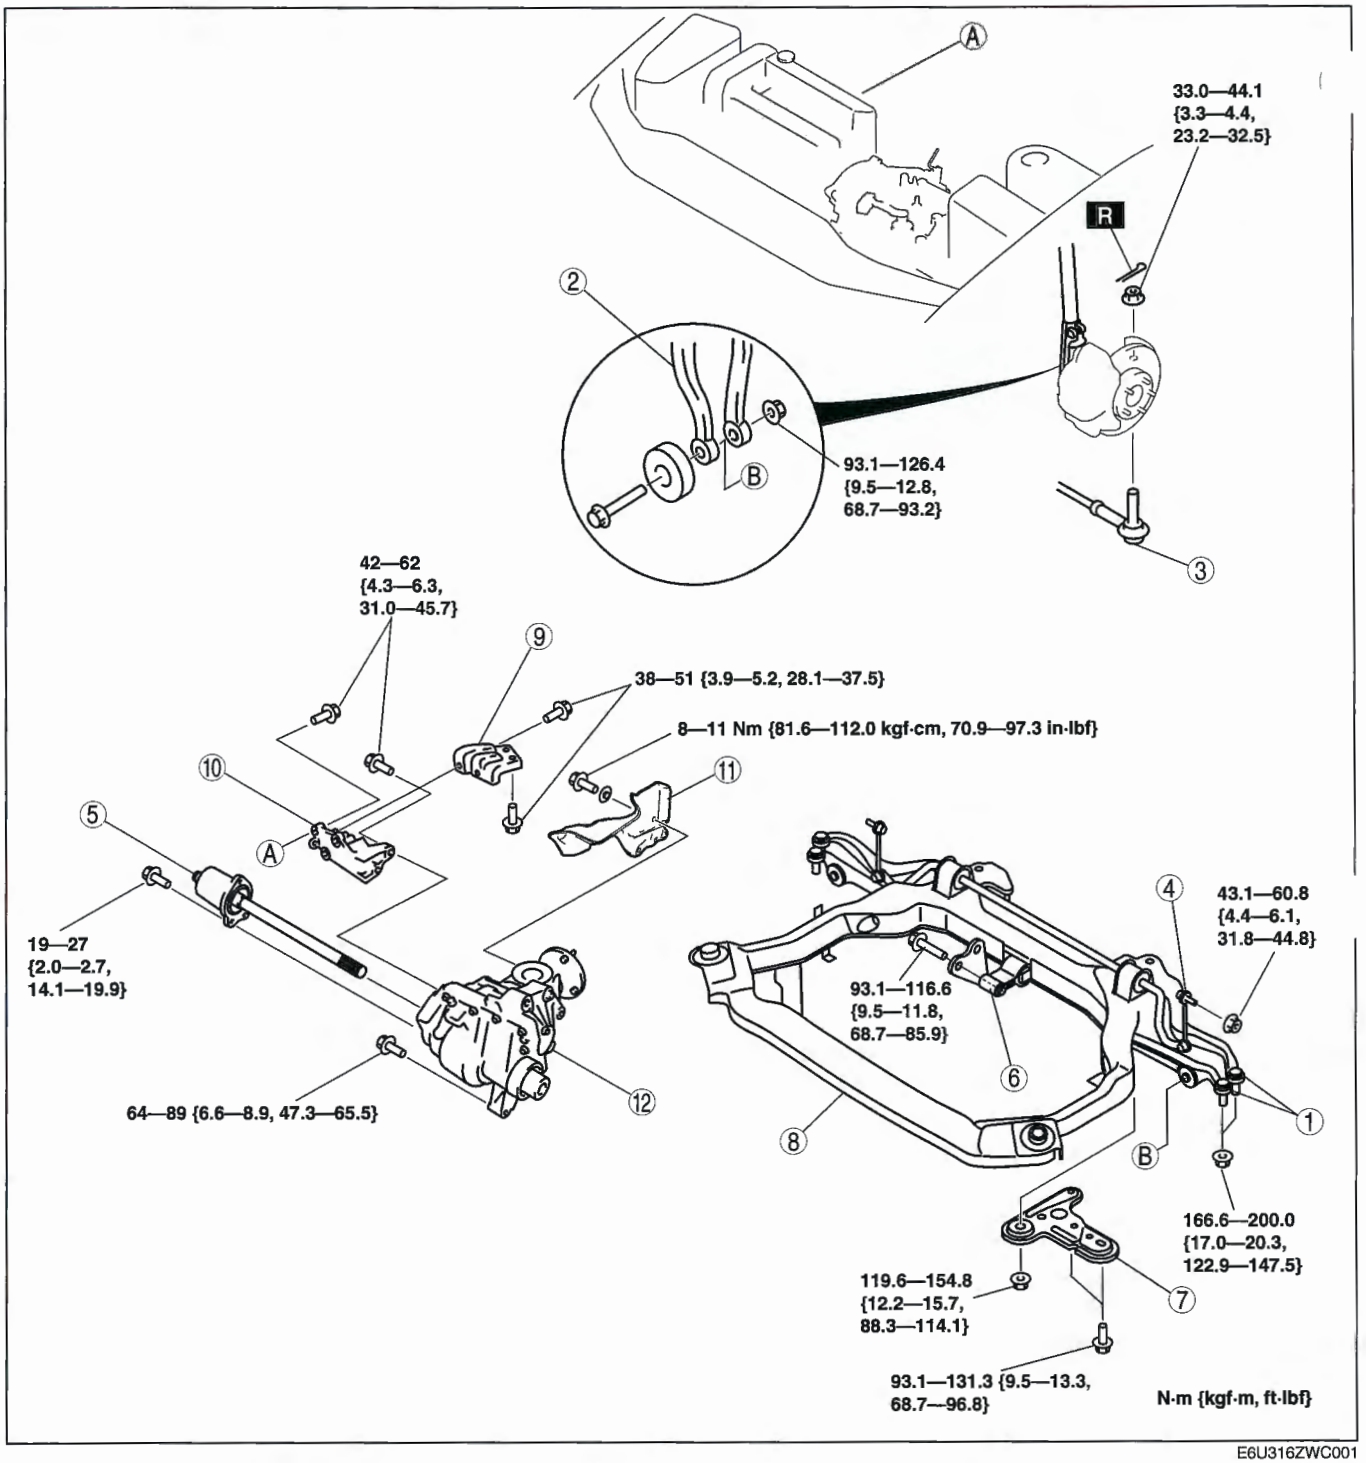
E6U031600000W06

1. Disconnect the negative battery cable.
2. Remove the battery and battery tray.
3. Remove the wheels, tires and splash shields.
4. Remove the under cover.
5. Remove the steering gear and linkage, and pipe assembly installation bolts from the front crossmember, then suspend the steering gear and linkage with a cable. (See 06–12–15 STEERING GEAR AND LINKAGE REMOVAL/INSTALLATION [L3 WITH TC].)

   Pipe assembly tightening torque
   7.8—10.8 N·m {79.6—110.0 kgf·cm, 69.1—95.5 in·lbf}

6. Drain the transfer oil into a suitable container. (See 03–16–2 TRANSFER OIL REPLACEMENT.)
7. Remove the front pipe. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
8. Disconnect the propeller shaft from the transfer side. (See 03–15–4 PROPELLER SHAFT REMOVAL/INSTALLATION.)
9. Remove the transfer oil cooler withe the hose still connected. (See 03–16–3 TRANSFER OIL COOLER REMOVAL/INSTALLATION.)
10. Remove in the order indicated in the table.
11. Install in the reverse order of removal.
12. Add the specified amount of specified transaxle oil and transfer oil.(See 03–16–2 TRANSFER OIL INSPECTION.)

13. Warm up the engine and transaxle, inspect for oil leakage, and inspect the transfer operation.



E6U316ZWC001

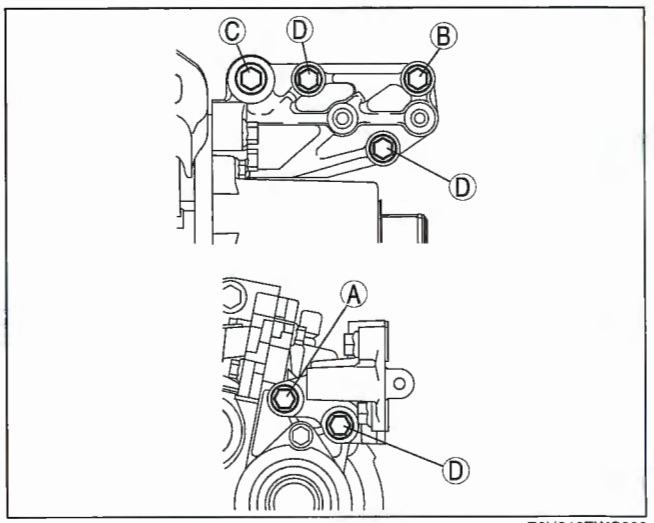
1	Lower arm (front, rear) ball joint (See 02–13–11 Front Lower Arm (Front) Ball Joint Removal Note)
2	Damper fork
3	Tie-rod end ball joint (See 06–12–15 STEERING GEAR AND LINKAGE REMOVAL/INSTALLATION [L3 WITH TC])
4	Stabilizer control link
5	Joint shaft (See 03–13–7 JOINT SHAFT REMOVAL/ INSTALLATION [L3 WITH TC])

6	No.1 engine mount (See 03–16–5 No.1 Engine Mount Installation Note)
7	Crossmember bracket
8	Crossmember component (See 02–13–20 FRONT CROSSMEMBER REMOVAL/INSTALLATION)
9	Catalytic converter bracket
10	Transfer bracket (See 03–16–5 Transfer Bracket Installation Note)
11	Transfer heat insulator
12	Transfer

Transfer Bracket Installation Note

1. Hand-tighten the bolt A and B.
2. Tighten the bolts in order of C, A, B, D.

Tightening torque
42—62 N·m {4.3—6.3 kgf·m, 31.0—45.7 ft·lbf}



E6U316ZWC008

No.1 Engine Mount Installation Note

1. Align the hole of the No.1 engine mount rubber with the bolt hole of transaxle.
2. Hand-tighten the bolt A, B, and C.
3. Tighten the bolts in order of A, B, C.

Tightening torque
93.1—116.6 N·m {9.5—11.8 kgf·m, 68.7—85.9 ft·lbf}

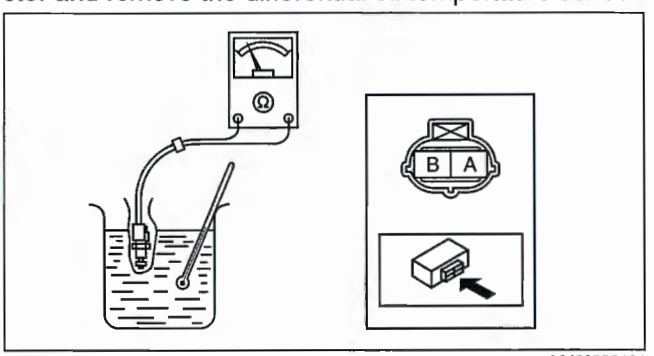
DIFFERENTIAL OIL TEMPERATURE SENSOR INSPECTION

E6U031927100W02

Warning
- **Hot differential oil may cause severe burns. Do not perform maintenance while differential oil is hot.**

1. Disconnect the negative battery cable.
2. Disconnect the differential oil temperature sensor connector and remove the differential oil temperature sensor.
3. Wrap the differential oil temperature sensor with plastic wrap and immerse it into a beaker filled with water. Gradually raise the water temperature, and measure resistance between differential oil temperature sensor terminals A and B.
   - If not as specified, inspect the harness for continuity. If there is normal continuity between the terminals, replace the differential oil temperature sensor.



A6J63222101

Differential oil temperature sensor specification

Water temperature (°C {°F})	Resistance (kirohm)
0 {32}	91—100
10 {50}	56—61
20 {68}	35—39
30 {86}	23—25
40 {104}	14—17
50 {122}	10—11
60 {140}	7.1—7.9
70 {158}	5.0—5.6
80 {176}	3.6—4.0

4. Install the differential oil temperature sensor and connect the connector.
5. Connect the negative battery cable.

DIFFERENTIAL OIL TEMPERATURE SENSOR REMOVAL/INSTALLATION

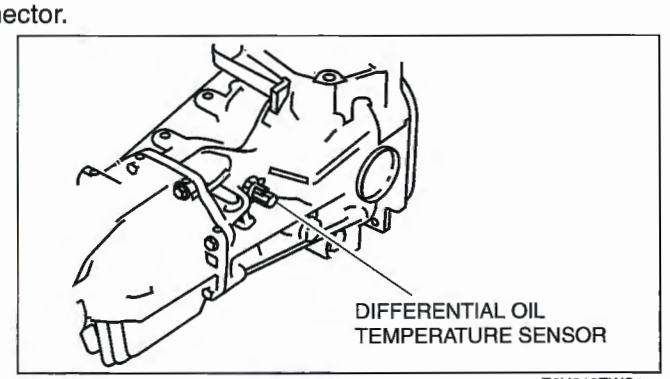
E6U031927100W03

Warning
- **Hot differential oil may cause severe burns. Do not perform maintenance while differential oil is hot.**

1. Disconnect the negative battery cable.
2. Disconnect the differential oil temperature sensor connector.
3. Remove the differential oil temperature sensor.
4. Apply differential oil to the O-ring.
5. Install the differential oil temperature sensor.

   Tightening torque
   12.7—17.3 N·m {1.3—1.7 kgf·m, 9.4—12.7 ft·lbf}

6. Connect the differential oil temperature sensor connector.
7. Connect the negative battery cable.



E6U318ZWC

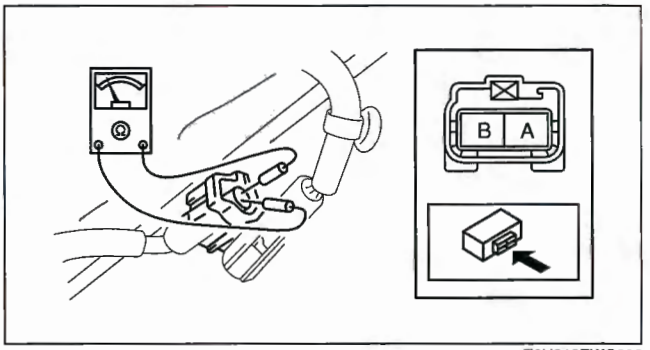
AWD SOLENOID INSPECTION

E6U031927100W04

1. Disconnect the negative battery cable.
2. Disconnect the AWD solenoid connector. Measure resistance between AWD solenoid connector terminals A and B.
   - If the resistance is not within the specification, replace the coupling unit.

   AWD solenoid resistance
   1.5—2.0 ohms
   (Rear differential oil temperature at 20°C {68°F})

4. Connect the AWD solenoid connector.
5. Connect the negative battery cable.



E6U318ZWC003

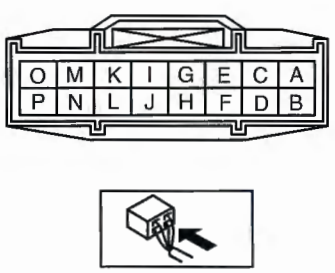
AWD CONTROL MODULE INSPECTION

E6U031927100W05

Note
- AWD CM terminal voltage can vary depending on measuring conditions and vehicle aging, resulting in misdiagnosis. Therefore, it is necessary to perform an overall inspection of the input/output systems and AWD CM to determine which part is malfunctioning.
- With the AWD CM connector connected, measure voltage by connecting the voltmeter negative (-) lead to the body ground and positive (+) lead to each AWD CM terminal.

1. Measure voltage or resistance at each AWD CM terminal using a voltmeter and an ohmmeter.
   - If not as specified, replace the AWD CM.

Terminal Voltage List (Reference)



A6J63222104

Terminal	Signal	Input/ output	Connected to	Measuring item	Test condition		Voltage (V)/ Continuity	Inspection location in case of failure
A	Differential oil temperature sensor signal	Input	Differential oil temperature sensor	Voltage	Ignition key ON	Differential oil temperature 20°C {68°F}	3.0	• Inspect differential oil temperature sensor • Inspect related harness

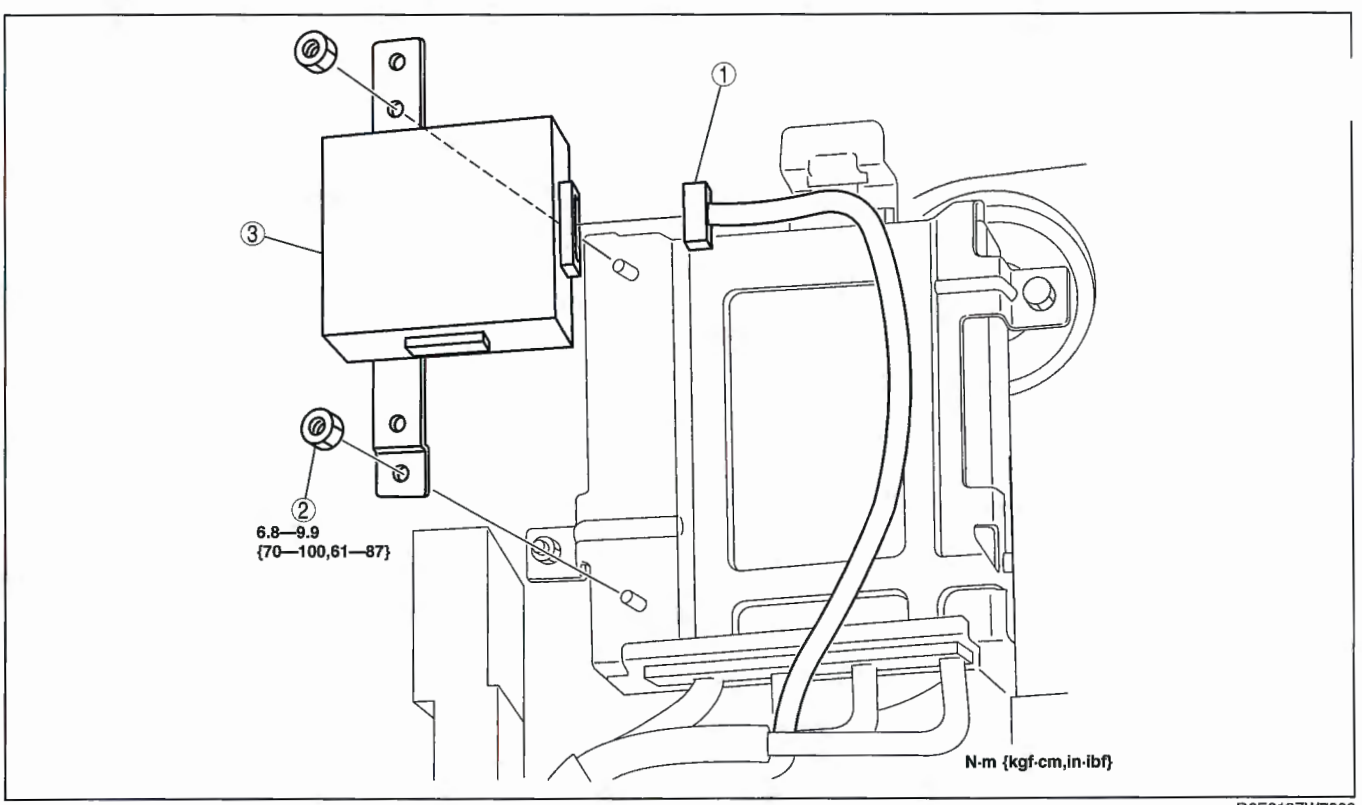
AWD CONTROL MODULE REMOVAL/INSTALLATION

E6U031927100W06

1. Disconnect the negative battery cable.
2. Remove the lower panel.
3. Remove in the order indicated in the table.
4. Install in the reverse order of removal.



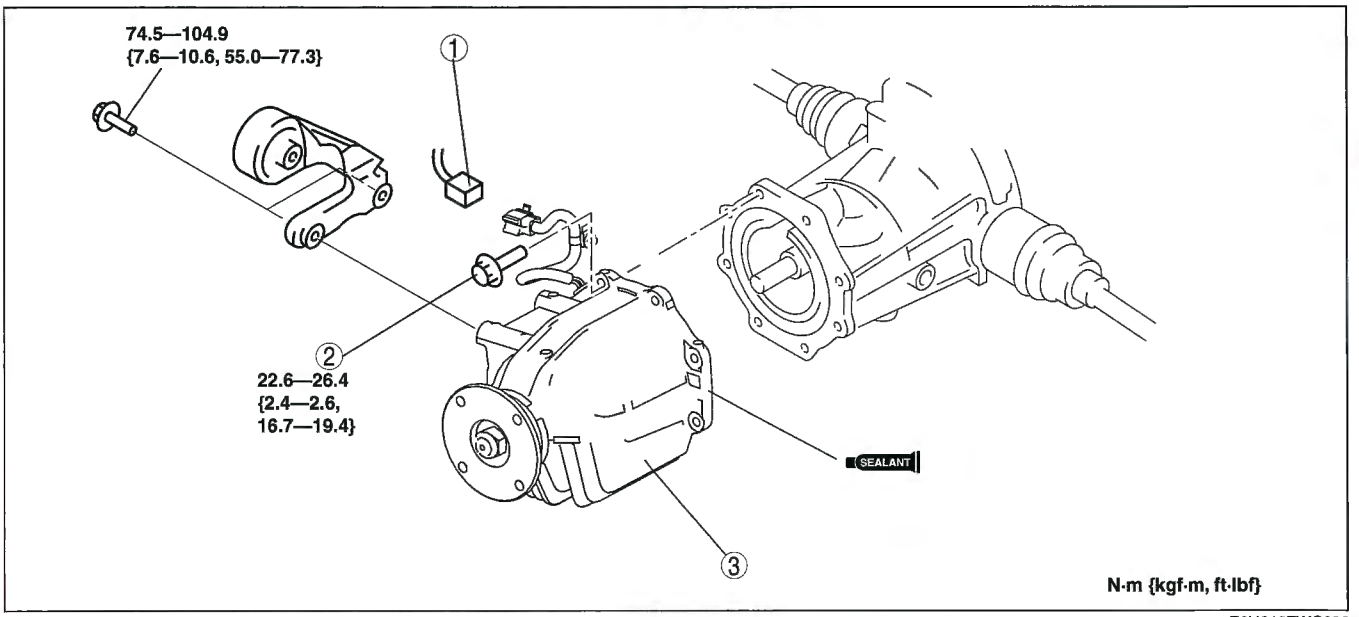
D6E318ZW7003

1	Connector
2	Nut
3	AWD CM

COUPLING COMPONENT REMOVAL/INSTALLATION

E6U031927100W07

1. Drain the differential oil into a container.
2. Remove the after silencer, presilencer, and the catalytic converter. (See 01–15B–2 EXHAUST SYSTEM REMOVAL/INSTALLATION [L3 WITH TC].)
3. Remove the propeller shaft. (See 03–15–4 PROPELLER SHAFT REMOVAL/INSTALLATION.)
4. Remove in the order indicated in the table.
5. Install in the reverse order of removal.
6. Add differential oil.



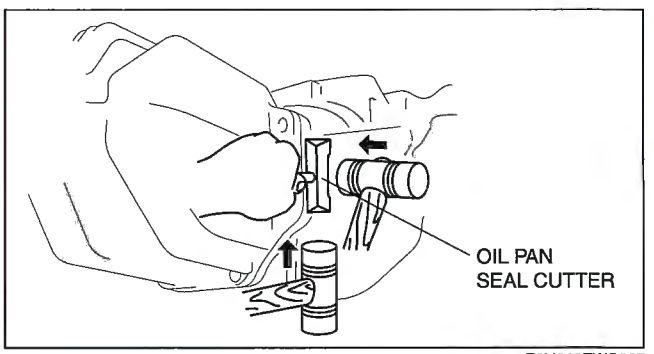
E6U318ZWC006

1	AWD solenoid connector
2	Bolt

3	Coupling component (See 03–19–5 Coupling Component Removal Note) (See 03–19–6 Coupling Component Installation Note)

Coupling Component Removal Note

1. Support the coupling unit with a transmission jack.
2. Cut away the coupling unit using an oil pan seal cutter.



E6U318ZWC007

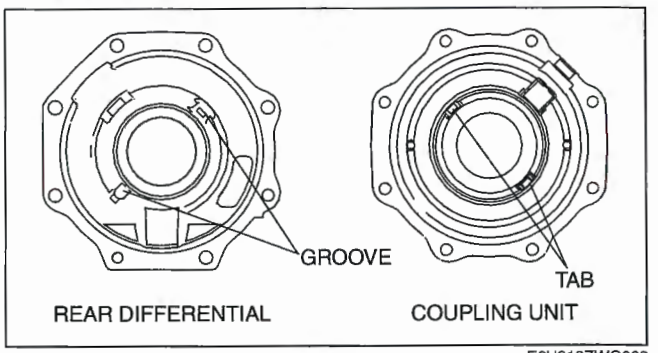
Coupling Component Installation Note

Note

- Clean away the old sealant before applying the new sealant.
- Install the coupling unit within **10 min** after applying sealant.
- Allow the sealant to set at least **30 min** after installation before filling the differential with the specified oil.

1. Apply sealant to the coupling case surface that contacts the rear differential case.
2. Install the coupling unit to the rear differential so that the two tabs on the coupling unit engage the rear differential grooves (two locations).

Tightening torque
22.6—26.4 N·m {2.4—2.6 kgf·m, 16.7—19.4 ft·lbf}



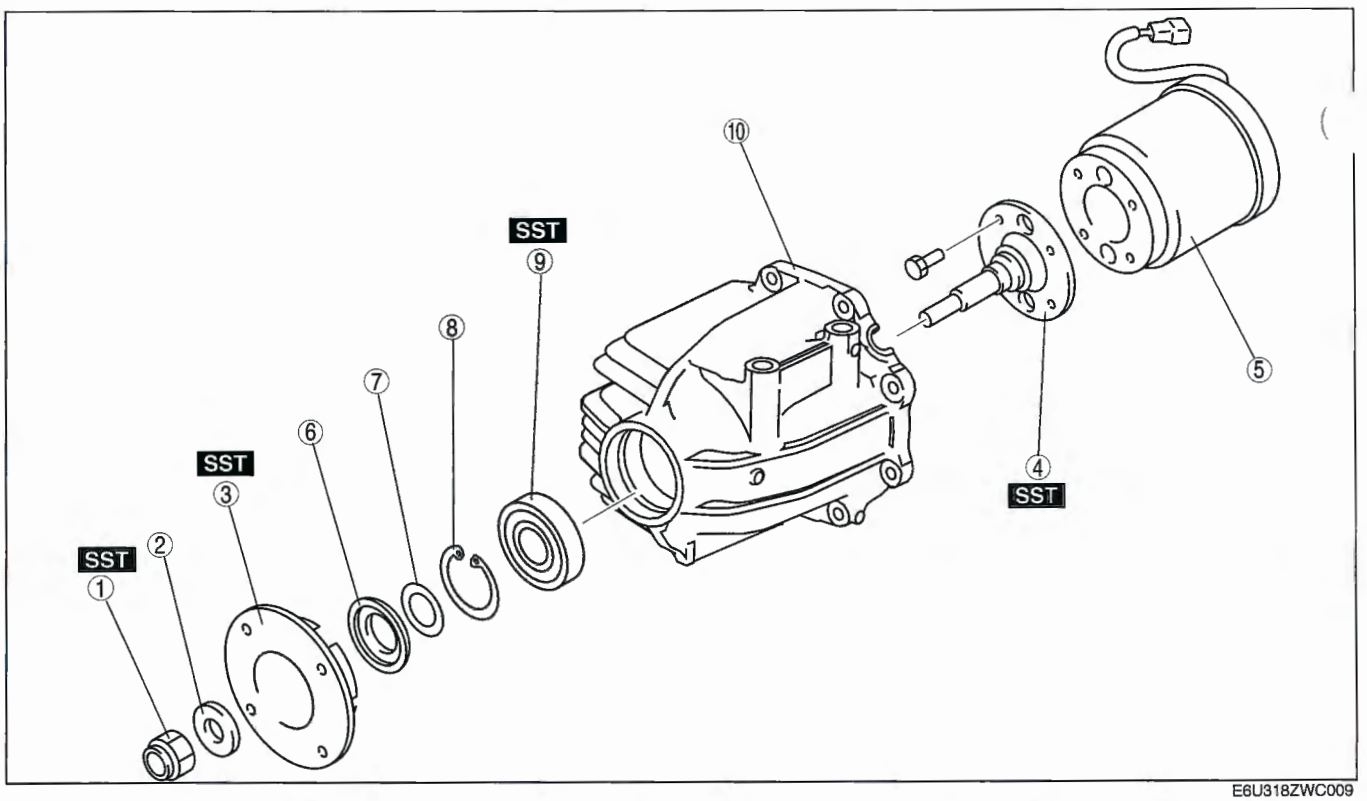
E6U318ZWC008

COUPLING COMPONENT DISASSEMBLY

E6U031927100W08

Warning

- **The engine stand is equipped with a self-lock mechanism, however, if the coupling unit is in a tilted condition, the self-lock mechanism could become inoperative. If the coupling unit unexpectedly rotates it could cause injury, therefore do not maintain the coupling unit in a tilted condition. When turning the coupling unit, grasp the rotation handle firmly.**



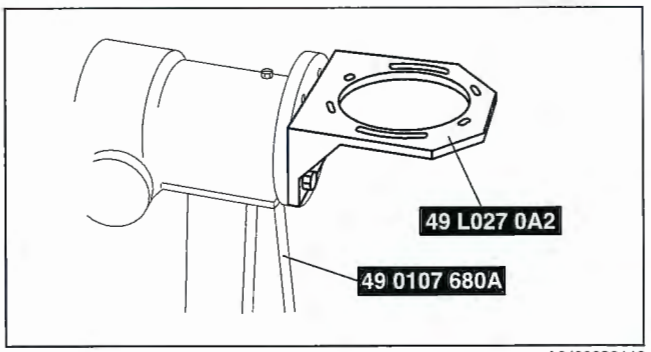
E6U318ZWC009

1	Locknut (See 03–19–7 Locknut Disassembly Note)
2	Washer
3	Companion flange (See 03–19–7 Companion Flange Disassembly Note)
4	Output shaft (See 03–19–8 Output Shaft Disassembly Note)

5	Coupling component
6	Oil seal
7	Shim
8	Retaining ring
9	Bearing (See 03–19–8 Bearing Disassembly Note)
10	Coupling case

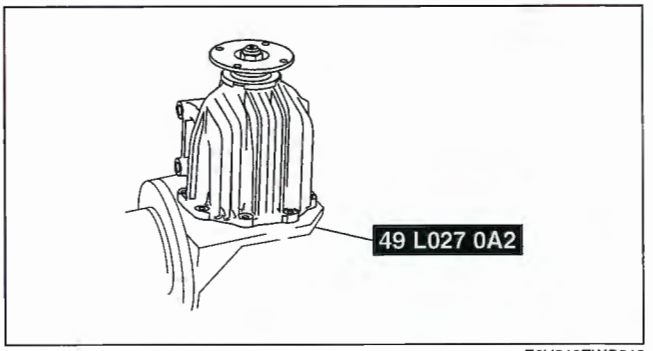
Locknut Disassembly Note

1. Assemble the **SSTs** to the engine stand.



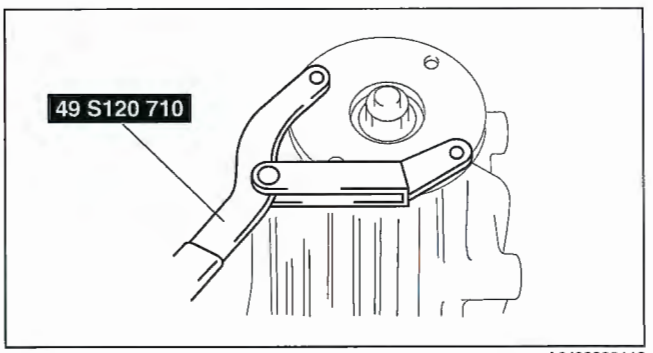
A6J63222110

2. Install the coupling unit to the **SSTs** as shown.



E6U318ZWC010

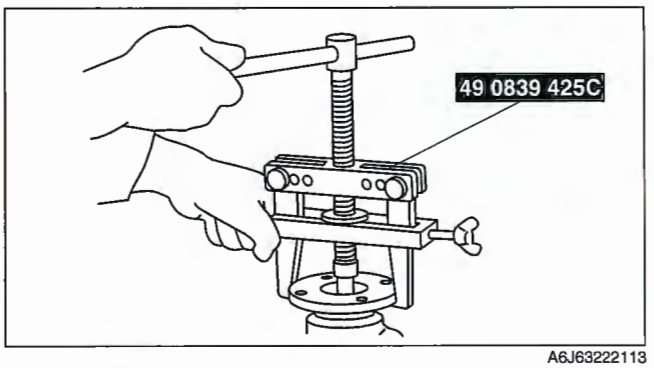
3. Secure the companion flange using the **SST**, and remove the locknut.



A6J63222112

Companion Flange Disassembly Note

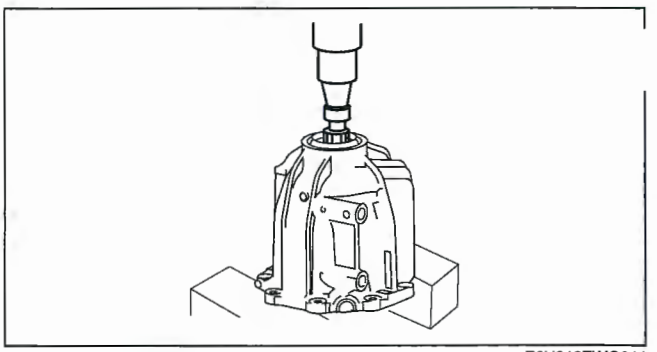
1. Remove the companion flange using the **SST**.



A6J63222113

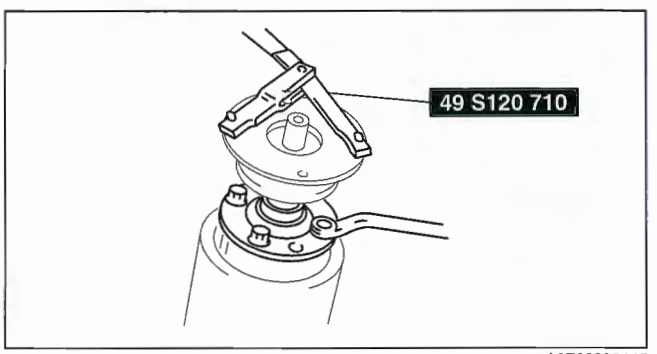
Output Shaft Disassembly Note

1. Remove the coupling unit from the **SST**.
2. Install the coupling unit to the press as shown, and remove the output shaft together with the coupling unit.
3. Install the companion flange to the output shaft.



E6U318ZWC011

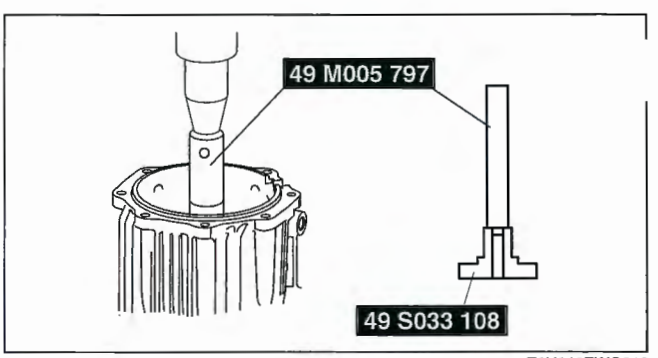
4. Secure the companion flange using the **SST**, and remove the bolts.
5. Remove the output shaft.



A6E63222115

Bearing Disassembly Note

1. Remove the bearing using the **SSTs** and a press.



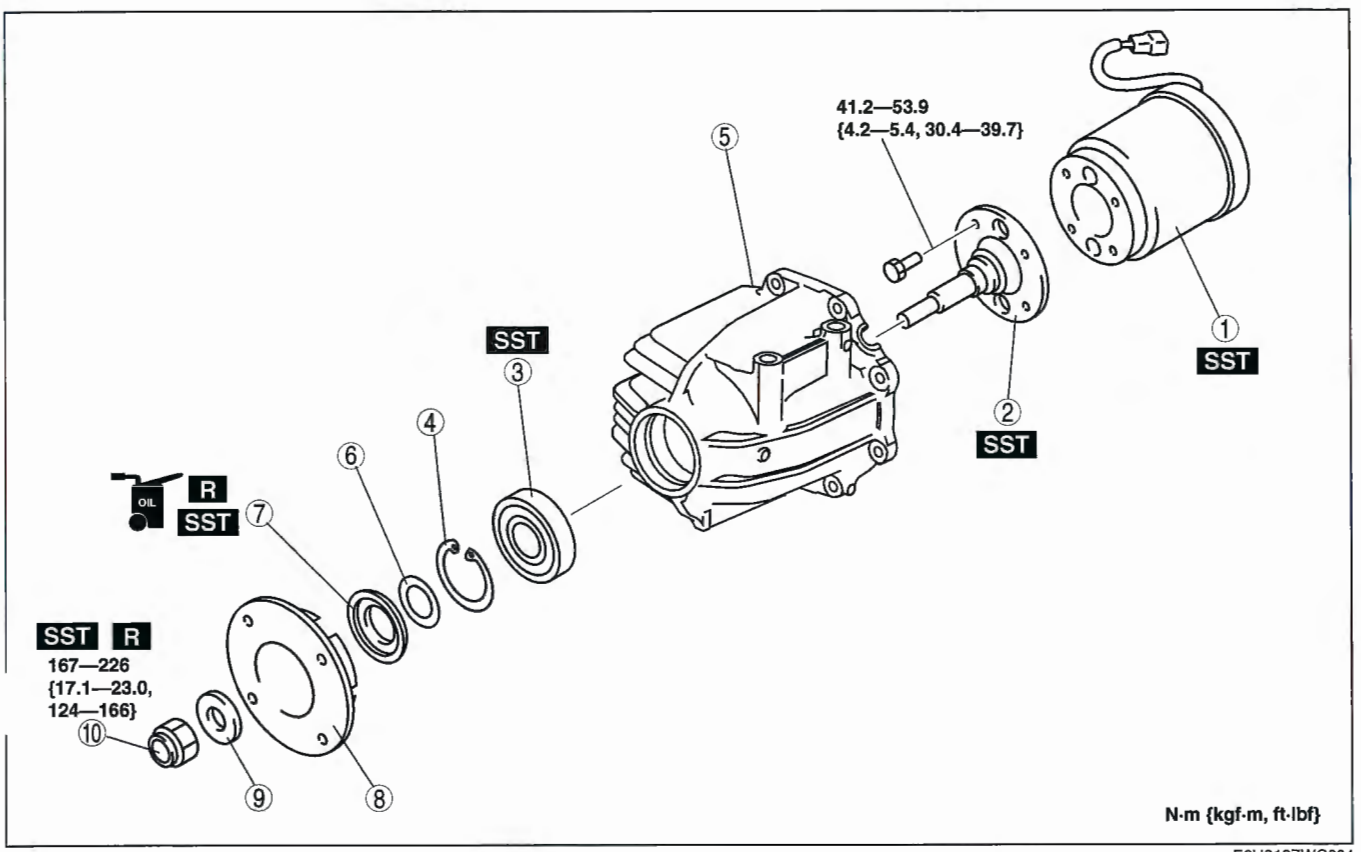
E6U318ZWC012

COUPLING COMPONENT ASSEMBLY

E6U031927100W09

Warning

- **The engine stand is equipped with a self-lock mechanism, however, if the coupling unit is in a tilted condition, the self-lock mechanism could become inoperative. If the coupling unit unexpectedly rotates it could cause injury, therefore do not maintain the coupling unit in a tilted condition. When turning the coupling unit, grasp the rotation handle firmly.**



E6U318ZWC004

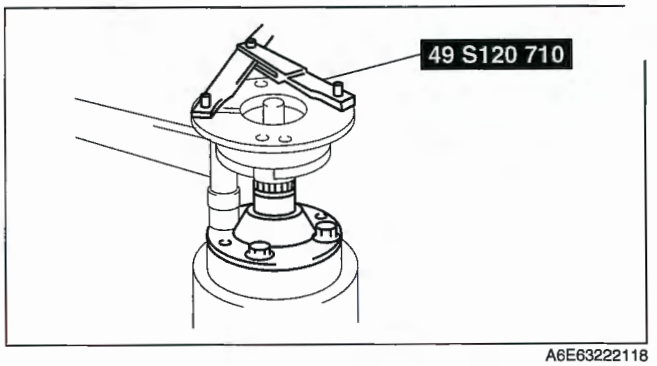
1	Coupling component
2	Output shaft (See 03–19–10 Output Shaft Assembly Note)
3	Bearing (See 03–19–10 Bearing Assembly Note)
4	Retaining ring
5	Coupling case (See 03–19–10 Coupling Case Assembly Note)

6	Shim
7	Oil seal (See 03–19–10 Oil Seal Assembly Note)
8	Companion flange (See 03–19–11 Companion Flange Assembly Note)
9	Washer
10	Locknut (See 03–19–11 Locknut Assembly Note)

Output Shaft Assembly Note

1. Install the output shaft to the coupling unit and partially tighten the bolts.
2. Install the companion flange to the output shaft.
3. Secure the companion flange using the **SST**, and tighten the bolts.

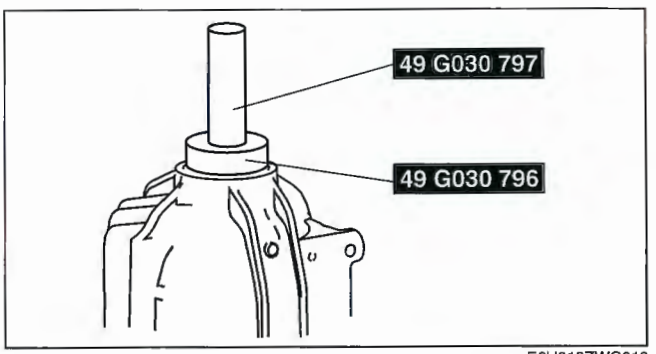
Tightening torque
41.2—53.9 N·m {4.2—5.4 kgf·m, 30.4—39.7 ft·lbf}



A6E63222118

Bearing Assembly Note

1. Assemble the bearing to the coupling case using the **SSTs**.

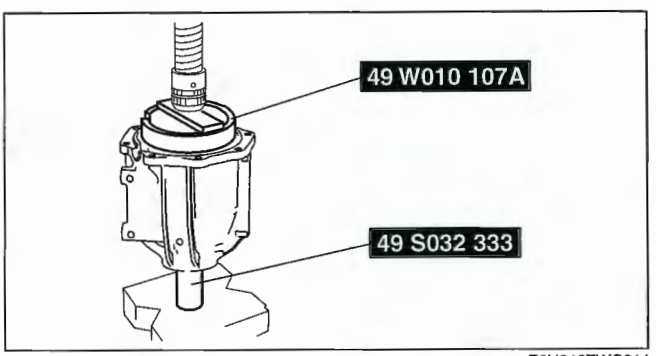


E6U318ZWC013

Coupling Case Assembly Note

Caution
- **The coupling unit will be damaged if it is pressed directly by a press. Always press the coupling unit into the coupling case using the SST.**

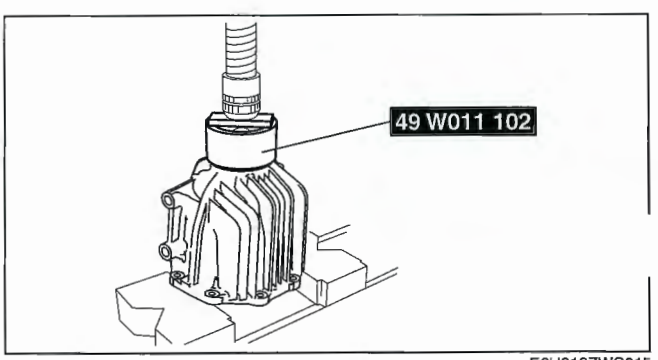
1. Assemble the coupling unit to the coupling case using the **SSTs** and a press.



E6U318ZWC014

Oil Seal Assembly Note

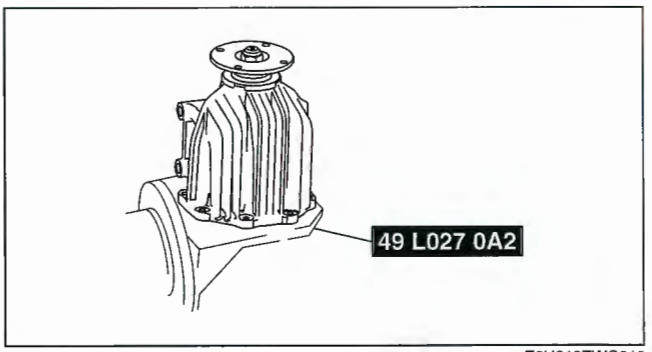
1. Apply the specified oil to a new oil seal lip.
2. Install the oil seal to the coupling case using the **SST**.



E6U318ZWC015

Companion Flange Assembly Note

1. Install the coupling case to the **SSTs** as shown.
2. Install the companion flange.

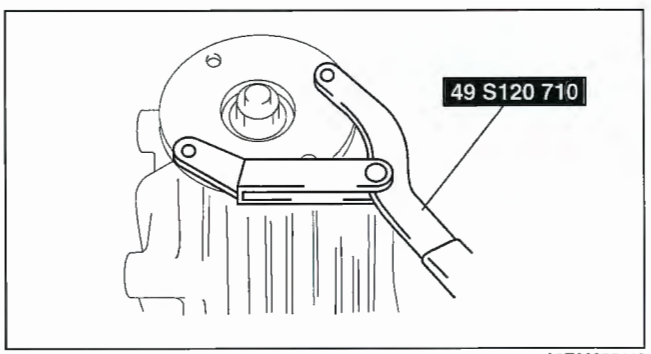


E6U318ZWC010

Locknut Assembly Note

1. Secure the companion flange using the **SST**, and tighten a new locknut.

   Tightening torque
   167—226 N·m {17.1—23.0 kgf·m, 124—166 ft·lbf}



A6E63222119

ABS/TCS ON-BOARD DIAGNOSIS

E6U040200000W02

On-Board Diagnostic (OBD) Test Description

- The OBD test inspects the integrity and function of the ABS/TCS and outputs the results when requested by the specific tests.
- On-board diagnostic test also:
  - — Provides a quick inspection of the ABS/TCS usually performed at the start of each diagnostic procedure.
  - — Provides verification after repairs to ensure that no other faults occurred during service.
- The OBD test is divided into 3 tests:
  - — Read/clear diagnostic results, PID monitor and record and active command modes.

Read/clear diagnostic results

- This function allows you to read or clear DTCs in the ABS/TCS HU/CM memory.

PID/Data monitor and record

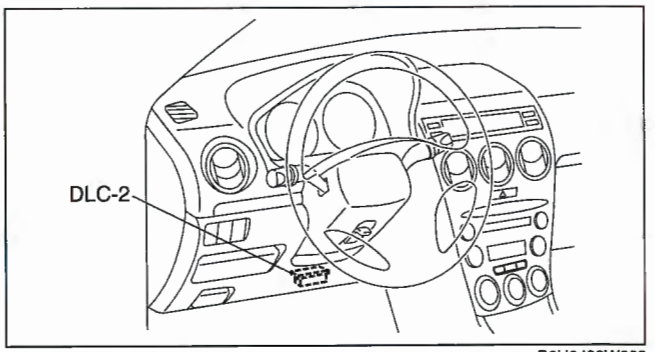
- This function allows you to access certain data values, input signals, calculated values, and system status information.

Active command modes

- This function allows you to control devices through the WDS or equivalent.

Reading DTCs Procedure

1. Connect WDS or equivalent to the vehicle DLC-2 connector.
   Retrieve DTC using the WDS or equivalent.



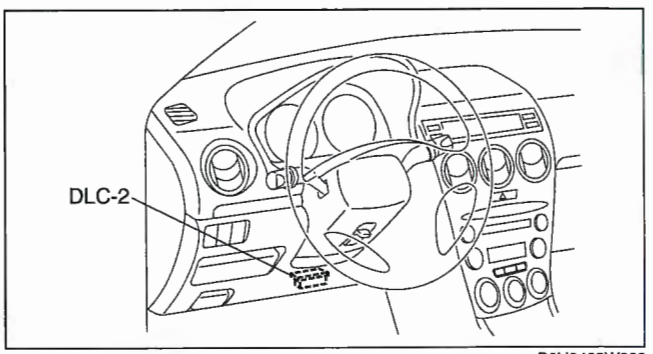
B6U0402W002

Clearing DTCs Procedures

1. After repairs have been made, perform the **DTCs reading procedure**.
2. Erase DTC using the WDS or equivalent.
3. Ensure that the customer's concern has been resolved.

PID/Data Monitor and Record Procedure

1. Connect WDS or equivalent to the vehicle DLC-2 connector.
2. Access and monitor PIDs using the WDS or equivalent.



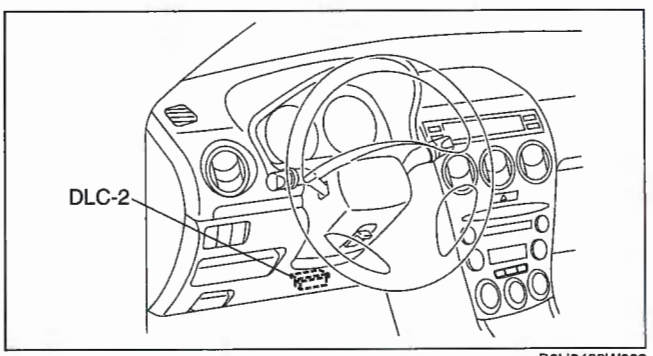
B6U0402W002

Active Command Modes Procedure

Note

- When driving, the ABS motor and each valve automatically turn ABS_POWER on, and then each command on. ABS_POWER regulates the power supply for the ABS motor and 8 valves.

1. Connect WDS or equivalent to the vehicle DLC-2 16-pin connector.
2. Turn the ignition key to ON (engine off) or start engine.
3. Activate active command modes using the WDS or equivalent.



B6U0402W002

DTC Table

DTC WDS or equiva-lent	Diagnosis system component	Page
B1318	ABS/TCS power supply	(See 04–02A–8 DTC B1318 [ABS/TCS])
B1342	ABS/TCS HU/CM	(See 04–02A–9 DTC B1342 [ABS/TCS])
B2477	Module configuration	(See 04–02A–9 DTC B2477 [ABS/TCS])
C1095	Motor relay, pump motor	(See 04–02A–10 DTC C1095, C1096 [ABS/TCS])
C1096	Motor relay, pump motor	(See 04–02A–10 DTC C1095, C1096 [ABS/TCS])
C1119	Engine control system, torque reduction inhibit signal line	(See 04–02A–12 DTC C1119 [ABS/TCS])
C1140	ABS/TCS HU/CM (pump)	(See 04–02A–13 DTC C1140 [ABS/TCS])
C1145	Right front ABS wheel-speed sensor	(See 04–02A–14 DTC C1145, C1155, C1165, C1175 [ABS/TCS])
C1148	Right front ABS wheel-speed sensor/sensor rotor	(See 04–02A–16 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [ABS/TCS])
C1155	Left front ABS wheel-speed sensor	(See 04–02A–14 DTC C1145, C1155, C1165, C1175 [ABS/TCS])
C1158	Left front ABS wheel-speed sensor/sensor rotor	(See 04–02A–16 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [ABS/TCS])
C1165	Right rear ABS wheel-speed sensor	(See 04–02A–14 DTC C1145, C1155, C1165, C1175 [ABS/TCS])
C1168	Right rear ABS wheel-speed sensor/sensor rotor	(See 04–02A–16 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [ABS/TCS])
C1175	Left rear ABS wheel-speed sensor	(See 04–02A–14 DTC C1145, C1155, C1165, C1175 [ABS/TCS])
C1178	Left rear ABS wheel-speed sensor/sensor rotor	(See 04–02A–16 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [ABS/TCS])
C1186	Fail-safe relay	(See 04–02A–18 DTC C1186, C1266 [ABS/TCS
C1194	Left front pressure reduction solenoid valve	(See 04–02A–19 DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254 [ABS/TCS])
C1198	Left front pressure retention solenoid valve	(See 04–02A–19 DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254 [ABS/TCS])
C1210	Right front pressure reduction solenoid valve	(See 04–02A–19 DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254 [ABS/TCS])
C1214	Right front pressure retention solenoid valve	(See 04–02A–19 DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254 [ABS/TCS])
C1233	Left front ABS wheel-speed sensor/sensor rotor	(See 04–02A–16 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [ABS/TCS])
C1234	Right front ABS wheel-speed sensor/sensor rotor	(See 04–02A–16 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [ABS/TCS])
C1235	Right rear ABS wheel-speed sensor/sensor rotor	(See 04–02A–16 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [ABS/TCS])
C1236	Left rear ABS wheel-speed sensor/sensor rotor	(See 04–02A–16 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [ABS/TCS])
C1242	Left rear pressure reduction solenoid valve	(See 04–02A–19 DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254 [ABS/TCS])
C1246	Right rear pressure reduction solenoid valve	(See 04–02A–19 DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254 [ABS/TCS])
C1250	Left rear pressure retention solenoid valve	(See 04–02A–19 DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254 [ABS/TCS])
C1254	Right rear pressure retention solenoid valve	(See 04–02A–19 DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254 [ABS/TCS])
C1266	Fail-safe relay	(See 04–02A–18 DTC C1186, C1266 [ABS/TCS])
C1414	ABS/TCS HU/CM	(See 04–02A–20 DTC C1414 [ABS/TCS])
C1508	TCS control	(See 04–02A–20 DTC C1508 [ABS/TCS])

DTC WDS or equivalent	Diagnosis system component	Page
C1510	Right front solenoid valve, motor or ABS wheel-speed sensor/sensor rotor	(See 04–02A–21 DTC C1510, C1511, C1512, C1513 [ABS/TCS])
C1511	Left front solenoid valve, motor or ABS wheel-speed sensor/sensor rotor	(See 04–02A–21 DTC C1510, C1511, C1512, C1513 [ABS/TCS])
C1512	Right rear solenoid valve, motor or ABS wheel-speed sensor/sensor rotor	(See 04–02A–21 DTC C1510, C1511, C1512, C1513 [ABS/TCS])
C1513	Left rear solenoid valve, motor or ABS wheel-speed sensor/sensor rotor	(See 04–02A–21 DTC C1510, C1511, C1512, C1513 [ABS/TCS])
U0073	CAN system communication error	(See 09–02A–4 DTC TABLE [MULTIPLEX COMMUNICATION SYSTEM (L3, AJ)])
U0100	Communication error to PCM	(See 09–02A–4 DTC TABLE [MULTIPLEX COMMUNICATION SYSTEM (L3, AJ)])
U0101	Communication error to TCM	(See 09–02A–4 DTC TABLE [MULTIPLEX COMMUNICATION SYSTEM (L3, AJ)])
U0155	Communication error to instrument cluster	(See 09–02A–4 DTC TABLE [MULTIPLEX COMMUNICATION SYSTEM (L3, AJ)])
U2021	Engine coolant temperature	(See 04–02A–21 DTC U2021[ABS/TCS])

PID/DATA Monitor Table

PID Name (Definition)	Unit/Condition	Condition/Specification	Action	ABS/TCS HU/CM terminal
RPM (Engine speed signal input)	RPM	• Engine is stopped: **0 RPM** • Engine is running: Indicates engine speed	Inspect PCM. (See 01–40A–9 PCM INSPECTION [L3].) (See 01–40C–6 PCM INSPECTION [AJ].)	—
CNTABS (Number of continuous codes)	—	• DTC is detected: **1—255** • DTC is not detected: **0**	Perform inspection using appropriate DTC.	—
PMPSTAT (Pump motor output state)	On/Off	• Pump motor is activated: On • Pump motor is deactivated: Off	Inspect ABS/TCS HU/CM. (See 04–13–3 ABS/TCS HU/CM SYSTEM INSPECTION.)	—
BOO_ABS (Brake pedal switch input)	On/Off	• Brake pedal is depressed: On • Brake pedal is released: Off	Inspect brake switch.	—
ABS_LAMP (ABS warning light driver output state)	On/Off	• ABS warning light is illuminated: On • ABS warning light is not illuminated: Off	Inspect ABS warning light.	—
BRAKE_LMP (BRAKE system warning light output state)	On/Off	• BRAKE system warning light is illuminated: On • BRAKE system warning light is not illuminated: Off	Inspect BRAKE system warning light.	—
ABSRR_O (Right rear ABS pressure reduction solenoid valve output state)	On/Off	• During ABS or EBD control: On/Off (solenoid valve is activated/deactivated) • No ABS and EBD control: Off (solenoid valve is deactivated)	Internal fault of ABS/TCS HU/CM. Replace ABS/TCS HU/CM. (See 04–13–4 ABS/TCS HU/CM REMOVAL/ INSTALLATION.)	—

PID Name (Definition)	Unit/Condition	Condition/Specification	Action	ABS/TCS HU/CM terminal
ABSLR_O (Left rear ABS pressure reduction solenoid valve output state)	On/Off	• During ABS or EBD control: On/Off (solenoid valve is activated/deactivated) • No ABS and EBD control: Off (solenoid valve is deactivated)	Internal fault of ABS/TCS HU/CM. Replace ABS/TCS HU/CM. (See 04–13–4 ABS/TCS HU/CM REMOVAL/ INSTALLATION.)	—
ABSRF_O (Right front ABS pressure reduction solenoid valve output state)	On/Off	• During ABS control: On/Off (solenoid valve is activated/deactivated) • No ABS control: Off (solenoid valve is deactivated)	Internal fault of ABS/TCS HU/CM. Replace ABS/TCS HU/CM. (See 04–13–4 ABS/TCS HU/CM REMOVAL/ INSTALLATION.)	—
ABSLF_O (Left front ABS pressure reduction solenoid valve output state)	On/Off	• During ABS control: On/Off (solenoid valve is activated/deactivated) • No ABS control: Off (solenoid valve is deactivated)	Internal fault of ABS/TCS HU/CM. Replace ABS/TCS HU/CM. (See 04–13–4 ABS/TCS HU/CM REMOVAL/ INSTALLATION.)	—
ABSRR_I (Right rear ABS pressure retention solenoid valve output state)	On/Off	• During ABS or EBD control: On/Off (solenoid valve is activated/deactivated) • No ABS and EBD control: Off (solenoid valve is deactivated)	Internal fault of ABS/TCS HU/CM. Replace ABS/TCS HU/CM. (See 04–13–4 ABS/TCS HU/CM REMOVAL/ INSTALLATION.)	—
ABSLR_I (Left rear ABS pressure retention solenoid valve output state)	On/Off	• During ABS or EBD control: On/Off (solenoid valve is activated/deactivated) • No ABS and EBD control: Off (solenoid valve is deactivated)	Internal fault of ABS/TCS HU/CM. Replace ABS/TCS HU/CM. (See 04–13–4 ABS/TCS HU/CM REMOVAL/ INSTALLATION.)	—
ABSRF_I (Right front ABS pressure retention solenoid valve output state)	On/Off	• During ABS control: On/Off (solenoid valve is activated/deactivated) • No ABS control: Off (solenoid valve is deactivated)	Internal fault of ABS/TCS HU/CM. Replace ABS/TCS HU/CM. (See 04–13–4 ABS/TCS HU/CM REMOVAL/ INSTALLATION.)	—
ABSLF_I (Left front ABS pressure retention solenoid valve output state)	On/Off	• During ABS control: On/Off (solenoid valve is activated/deactivated) • No ABS control: Off (solenoid valve is deactivated)	Internal fault of ABS/TCS HU/CM. Replace ABS/TCS HU/CM. (See 04–13–4 ABS/TCS HU/CM REMOVAL/ INSTALLATION.)	—
ABSVLVRLY (Fail-safe relay output state)	On/Off	• Fail-safe relay is activated: On • Fail-safe relay is deactivated: Off	Inspect ABS/TCS HU/CM. (See 04–13–6 ABS/TCS HU/CM INSPECTION)	—
ABSPMPRLY (Motor relay output state)	On/Off	• Motor relay is activated: On • Motor relay is deactivated: Off	Inspect ABS/TCS HU/CM. (See 04–13–6 ABS/TCS HU/CM INSPECTION)	—
LF_WSPD (Left front ABS wheel-speed sensor input)	KPH, MPH	• Vehicle is stopped: **0 KPH {0 MPH}** • Vehicle is driving: Indicates vehicle speed	Inspect ABS wheel-speed sensor/sensor rotor.	I, E
RF_WSPD (Right front ABS wheel-speed sensor input)	KPH, MPH	• Vehicle is stopped: **0 KPH {0 MPH}** • Vehicle is driving: Indicates vehicle speed	Inspect ABS wheel-speed sensor/sensor rotor.	G, D

PID Name (Definition)	Unit/Condition	Condition/Specification	Action	ABS/TCS HU/CM terminal
R_WSPD (Left rear ABS wheel-speed sensor input)	KPH, MPH	• Vehicle is stopped: **0 KPH {0 MPH}** • Vehicle is driving: Indicates vehicle speed	Inspect ABS wheel-speed sensor/sensor rotor.	C, F
RR_WSPD (Right rear ABS wheel-speed sensor input)	KPH, MPH	• Vehicle is stopped: **0 KPH {0 MPH}** • Vehicle is driving: Indicates vehicle speed	Inspect ABS wheel-speed sensor/sensor rotor.	A, B
ABS_VOLT (System battery voltage value)	V	• Ignition key at ON: **B+** • Idle: **Approx. 14—16 V**	Inspect power supply circuit. (See 04–13–6 ABS/TCS HU/CM INSPECTION.)	Z
PCM_MSG (Missing message from the PCM)	Present/ Not Present	• Present: Circuit in the PCM is normal. • Not Present: Circuit in the PCM is abnormal.	Inspect PCM. (See 01–40A–9 PCM INSPECTION [L3].) (See 01–40C–6 PCM INSPECTION [AJ].) Inspect ABS/TCS HU/CM. (See 04–13–6 ABS/TCS HU/CM INSPECTION.)	—
TCM_MSG (Missing message from the TCM)	Present/ Not Present	• Present: Circuit in the TCM is normal. • Not Present: Circuit in the TCM is abnormal.	Inspect TCM. (See 05–17A–33 TCM INSPECTION [FS5A-EL]) (See 05–17B–21 TCM INSPECTION [AW6A-EL]) Inspect ABS/TCS HU/CM. (See 04–13–6 ABS/TCS HU/CM INSPECTION)	—

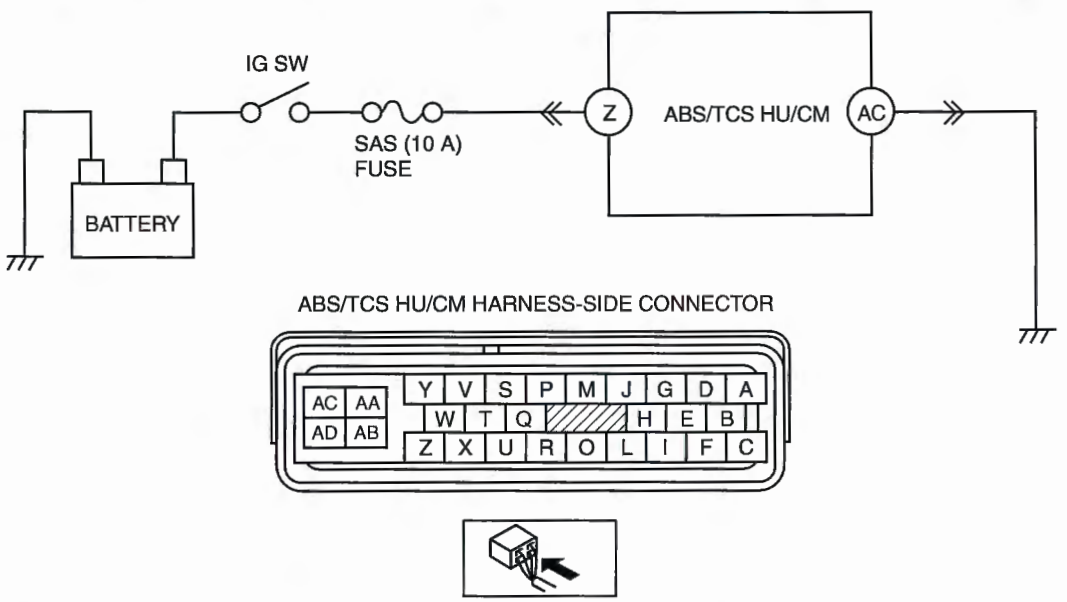
Active Command Modes Table

Command Name	Definition	Operation	Note
BS_POWER	Fail-safe relay	On/Off	Ignition key at ON (Engine running, vehicle is not moving)
LR_OUTLET	Left rear ABS pressure reduction solenoid valve	On/Off	
LR_INLET	Left rear ABS pressure retention solenoid valve	On/Off	
RR_INLET	Right rear ABS pressure retention solenoid valve	On/Off	
RR_OUTLET	Right rear ABS pressure reduction solenoid valve	On/Off	
LF_INLET	Left front ABS pressure retention solenoid valve	On/Off	
LF_OUTLET	Left front ABS pressure reduction solenoid valve	On/Off	
RF_INLET	Right front ABS pressure retention solenoid valve	On/Off	
RF_OUTLET	Right front ABS pressure reduction solenoid valve	On/Off	

DTC B1318 [ABS/TCS]

E6U040200000W03

DTC B1318	ABS/TCS power supply
DETECTION CONDITION	• Low voltage is detected at the voltage monitor of solenoid valve monitor, or the motor monitor
POSSIBLE CAUSE	• Malfunction of fuse (SAS 10 A) • Open circuit or short to power supply in harness between ABS/TCS HU/CM terminal Z and battery positive terminal • Open circuit in harness between body ground and ABS/TCS HU/CM terminal AC • Battery and/or generator malfunction



Diagnostic procedure

STEP	INSPECTION		ACTION
1	**INSPECT BATTERY VOLTAGE** • Is battery terminal voltage normal?	Yes	Make sure that battery terminal connection is normal. Go to the next step.
		No	Charge or replace battery, then go to Step 6.
2	**INSPECT BATTERY GRAVITY** • Is battery specific gravity as specified?	Yes	Go to the next step.
		No	Replace battery, then go to Step 6.
3	**INSPECT CHARGING SYSTEM** • Are generator and drive belt tensions normal?	Yes	Go to the next step.
		No	Adjust drive belt tension as necessary. Replace generator and/or drive belt as necessary.
4	**INSPECT ABS/TCS HU/CM POWER SUPPLY CIRCUIT FOR OPEN CIRCUIT** • Start engine. • Measure voltage between ABS/TCS HU/CM terminal Z and ground. • Is voltage **above 10 V**?	Yes	Go to the next step.
		No	Go to Step 6.
5	**INSPECT ABS/TCS HU/CM GROUND CIRCUIT FOR POOR GROUND OR OPEN CIRCUIT** • Turn the ignition switch off. • Measure resistance between ground and ABS/TCS HU/CM terminal AC. • Is resistance **within 0—1 ohm**?	Yes	Go to the next step.
		No	If there is no continuity: • Repair or replace harness for open circuit between ABS/TCS HU/CM and ground, then go to the next step. If resistance is not **within 0—1 ohm**: • Repair or replace harness for poor ground then go to the next step.
6	**VERIFY TROUBLESHOOTING COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear the DTC from the memory. (See 04–02A–3 Clearing DTCs Procedures.) • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Go to the next step.
7	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection. (See 04–02A–4 DTC Table.)
		No	Troubleshooting completed.

DTC B1342 [ABS/TCS]

E6U040200000W04

DTC B1342	ABS/TCS HU/CM
DETECTION CONDITION	The on-board diagnostic function detects control module malfunction.
POSSIBLE CAUSE	• Malfunction of ABS/TCS HU/CM

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY CURRENT STATUS OF MALFUNCTION** • Clear the DTC from the memory. (See 04–02A–3 Clearing DTCs Procedures.) • Start engine and drive vehicle at **10 km/h {6.2 mph}** or above. • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Inspect intermittent concern using the same procedure as engine control system.
2	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection. (See 04–02A–4 DTC Table.)
		No	Troubleshooting completed.

DTC B2477 [ABS/TCS]

E6U040200000W05

DTC B2477	Module configuration
DETECTION CONDITION	• Configuration write failure is detected
POSSIBLE CAUSE	• Module configuration procedure is not done properly.

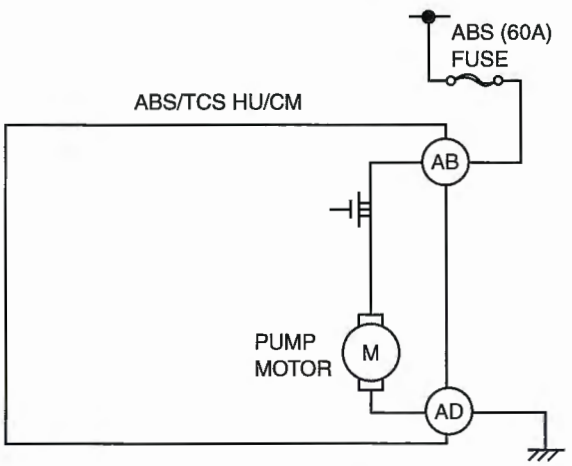
ıgnostic procedure

TEP	INSPECTION		ACTION
1	**CHECK WHETHER ABS/TCS HU/CM IS CONFIGURED** • Is ABS/TCS HU/CM configured?	Yes	Go to the next step.
		No	Configurate ABS/TCS using the WDS or equivalent. (See 04–13–6 ABS/TCS HU/CM CONFIGURATION)
2	**VERIFY TROUBLESHOOTING COMPLETED** • Clear the DTC from the memory. (See 04–02A–3 Clearing DTCs Procedures) • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Go to the next step.
3	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection.
		No	Troubleshooting completed.

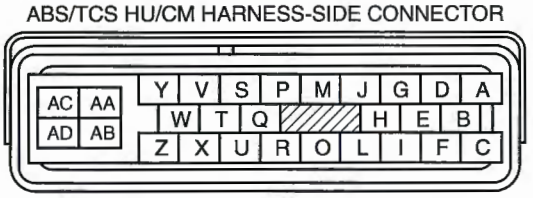
DTC C1095, C1096 [ABS/TCS]

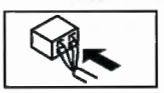
E6U040200000W06

DTC C1095, C1096	Motor relay, pump motor
DETECTION CONDITION	• C1095: — ABS motor stuck OFF when vehicle is started or during ABS/TCS operation, ABS motor ON is commanded. • C1096: — ABS motor stuck OFF when vehicle is started or during ABS/TCS operation, ABS motor ON is commanded. — Motor monitor ON signal is not input after specified time when the motor signal is switched from ON to OFF by ABS/TCS HU/CM.
POSSIBLE CAUSE	• Open circuit, or short to power supply or short to ground of motor relay and/or ABS motor in ABS/TCS HU/CM • Stuck motor relay and/or ABS motor • Open circuit of ABS motor power supply • Open circuit of ABS motor ground



ABS/TCS HU/CM HARNESS-SIDE CONNECTOR





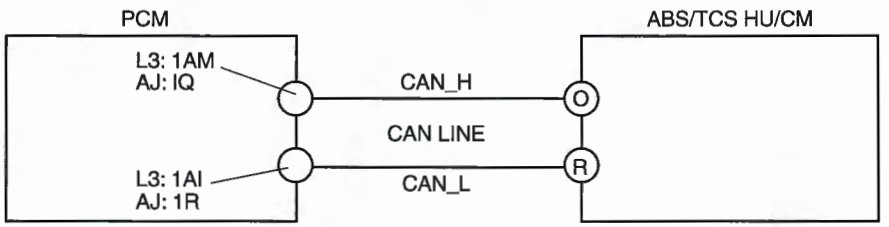
Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY OTHER DTC HAS BEEN RECORDED** • Has DTC C1186 and/or C1266 also been stored?	Yes	Go to the applicable DTC inspection.
		No	Go to the next step.
2	**INSPECT ABS FUSE CONDITION** • Is ABS fuse (60 A) normal?	Yes	Go to the next step.
		No	Replace fuse, then go to Step 6.
3	**INSPECT MOTOR RELAY POWER SUPPLY CIRCUIT FOR OPEN CIRCUIT** • Turn the ignition switch off. • Disconnect ABS/TCS HU/CM connector. • Turn the ignition switch to the ON position (engine off). • Measure voltage between ABS/TCS HU/CM terminal AB (harness-side) and ground. • Is voltage **B+**?	Yes	Go to the next step.
		No	Repair or replace harness for open circuit between battery positive terminal and ABS/TCS HU/CM terminal AC, then go to Step 6.
4	**INSPECT PUMP MOTOR GROUND CIRCUIT FOR OPEN CIRCUIT** • Turn the ignition switch off. • Inspect continuity between ABS/TCS HU/CM terminal AD (harness-side) and ground. • Is there continuity?	Yes	Go to the next step.
		No	Repair or replace harness for open circuit between ABS/TCS HU/CM terminal AB and ground, then go to Step 6.
5	**VERIFY PUMP MOTOR OPERATION** • Turn the ignition switch off. • Connect WDS or equivalent to DLC-2. • Turn the ignition switch to the ON position (engine off). • Access ABS_POWER and PMP_MOTOR active command modes using the WDS or equivalent. • Does pump motor operate?	Yes	Go to the next step.
		No	Repair ABS/TCS HU/CM, then go to the next step.
6	**VERIFY TROUBLESHOOTING COMPLETED** • Clear the DTC from the memory. (See 04–02A–3 Clearing DTCs Procedures.) • Start engine and drive vehicle at **10 km/h {6.2 mph}** or above. • Gradually slow down and stop vehicle. • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Go to the next step.
7	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection. (See 04–02A–4 DTC Table.)
		No	Troubleshooting completed.

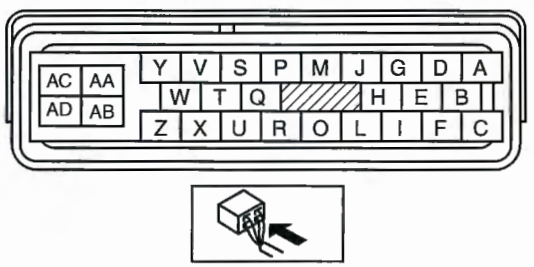
DTC C1119 [ABS/TCS]

E6U040200000W07

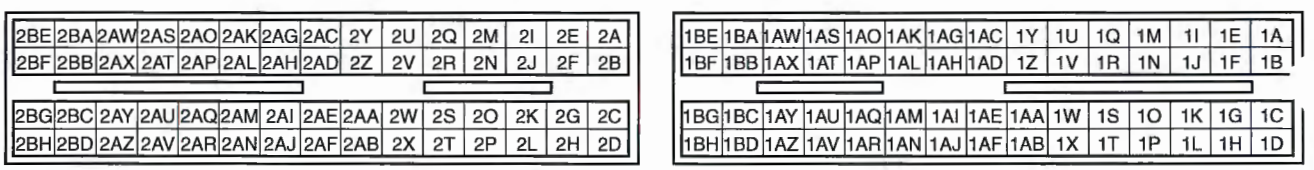
DTC C1119	Engine control system, torque reduction inhibit signal line
DETECTION CONDITION	• Engine RPM information through CAN is out of specification or invalid value. • Throttle information through CAN is out of specification or invalid value. • Received control prohibition signal from PCM through CAN.
POSSIBLE CAUSE	• Malfunction of PCM

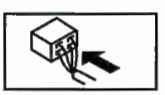


ABS/TCS HU/CM HARNESS-SIDE CONNECTOR



PCM HARNESS-SIDE CONNECTOR





Diagnostic procedure

STEP	INSPECTION		ACTION
1	**INSPECT FOR PCM FOR DTCs** • Turn the ignition switch off. • Connect WDS or equivalent to DLC-2 • Turn ignition key to ON (engine off). • Is DTC for engine control system obtained?	Yes	Follow inspection procedures for engine control system.
		No	Go to the next step.
2	**VERIFY TROUBLESHOOTING COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear the DTC from the memory. (See 04–02A–3 Clearing DTCs Procedures • Start engine.) • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Go to the next step.
3	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection.
		No	Troubleshooting completed.

DTC C1140 [ABS/TCS]

E6U040200000W08

DTC C1140	ABS/TCS HU/CM (pump)
DETECTION CONDITION	Right front and left rear wheels, or left front and right rear wheel-lock is detected during ABS/TCS operation.
POSSIBLE CAUSE	Stuck pump motor in ABS/TCS HU/CM

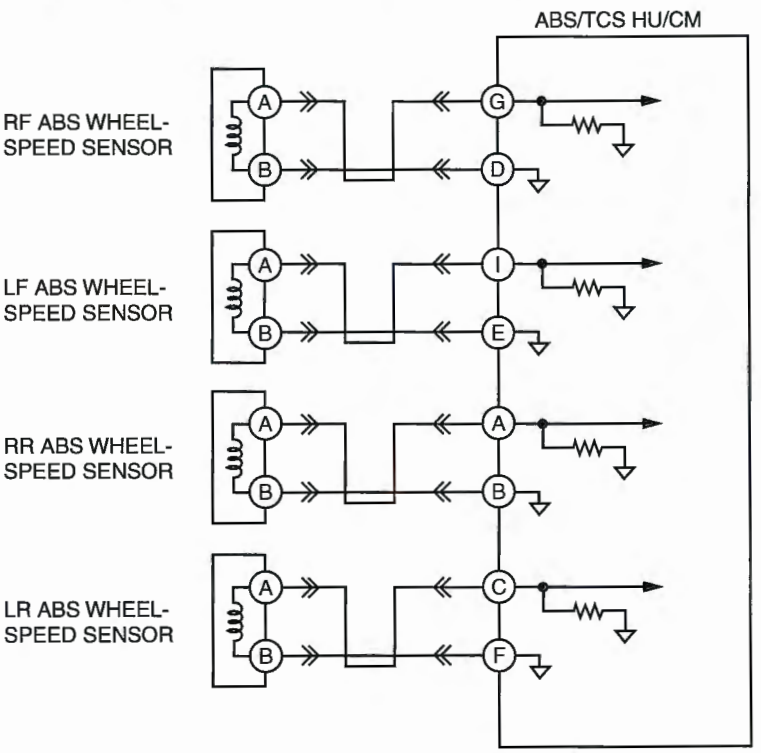
Diagnostic procedure

STEP	INSPECTION		ACTION
1	**INSPECT ABS/TCS HU/CM OPERATION** • Perform ABS/TCS HU/CM system inspection. (See 04–13–3 ABS/TCS HU/CM SYSTEM INSPECTION) • Is it normal?	Yes	Go to the next step.
		No	Replace ABS/TCS HU/CM, then go to Step 4.
2	**INSPECT CONVENTIONAL BRAKE OPERATION** • Inspect brake fluid level. • Start engine. • Perform a road test to verify conventional vehicle braking performance. • Is there any concern.	Yes	Inspect conventional brake line, then go to Step 4.
		No	Go to the next step.
3	**INSPECT REAR BRAKE DRAGGING** • Turn the ignition switch off. • Jack-up vehicle and support it with safety stand. • Release parking brake. • Turn rear wheel by hand and inspect for rear brake drag. • Is rear brake dragging?	Yes	Repair parking brake system, then go to the next step.
		No	Go to the next step.
4	**VERIFY TROUBLESHOOTING COMPLETED** • Clear the DTC from the memory. (See 04–02A–3 Clearing DTCs Procedures) • Start engine and drive vehicle at **10 km/h {6.2 mph}** or above at least one minute. • Gradually slow down vehicle and stop. • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Go to the next step.
5	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection.
		No	Troubleshooting completed.

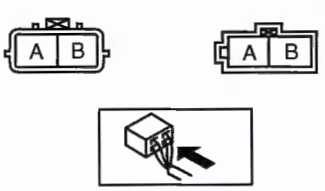
DTC C1145, C1155, C1165, C1175 [ABS/TCS]

E6U040200000W09

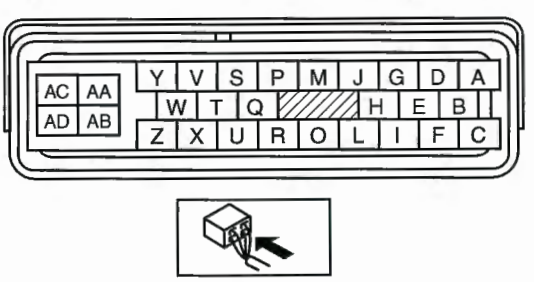
DTC	C1145 C1155 C1165 C1175	RF ABS wheel-speed sensor LF ABS wheel-speed sensor RR ABS wheel-speed sensor LR ABS wheel-speed sensor
DETECTION CONDITION	• Abnormal input is detected.	
POSSIBLE CAUSE	• Open circuit or short to ground in harness between ABS/TCS HU/CM terminal and ABS wheel-speed sensor (s) terminals indicated below: — ABS/TCS HU/CM terminal G—RF ABS wheel-speed sensor terminal A — ABS/TCS HU/CM terminal D—RF ABS wheel-speed sensor terminal B — ABS/TCS HU/CM terminal I—LF ABS wheel-speed sensor terminal A — ABS/TCS HU/CM terminal E—LF ABS wheel-speed sensor terminal B — ABS/TCS HU/CM terminal A—RR ABS wheel-speed sensor terminal A — ABS/TCS HU/CM terminal B—RR ABS wheel-speed sensor terminal B — ABS/TCS HU/CM terminal C—LR ABS wheel-speed sensor terminal A — ABS/TCS HU/CM terminal F—LR ABS wheel-speed sensor terminal B • ABS wheel-speed sensor (s) malfunction	



ABS WHEEL-SPEED SENSOR HARNESS-SIDE CONNECTOR



ABS/TCS HU/CM HARNESS-SIDE CONNECTOR



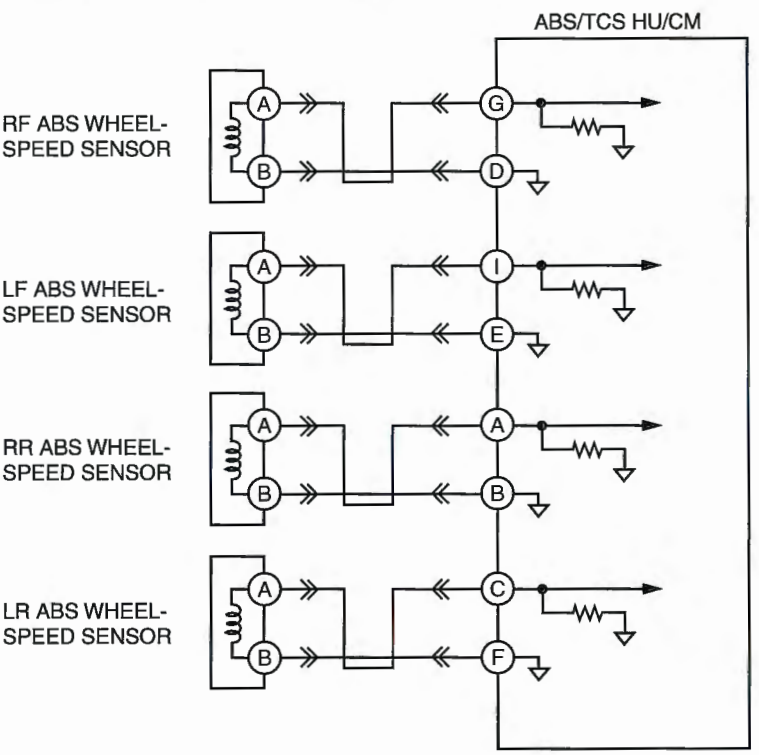
Diagnostic procedure

STEP	INSPECTION		ACTION
1	**INSPECT ABS WHEEL-SPEED SENSOR CIRCUIT FOR OPEN CIRCUIT** • Turn the ignition switch off. • Disconnect ABS/TCS HU/CM connector. • Measure resistance between suspected sensor terminals of ABS/TCS HU/CM connector (harness-side). — RF ABS wheel-speed sensor: G—D — LF ABS wheel-speed sensor: I—E — RR ABS wheel-speed sensor: A—B — LR ABS wheel-speed sensor: C—F • Is resistance **within 1.3—1.7 kilohm**?	Yes	Go to the next step.
		No	Go to Step 3.
2	**INSPECT ABS WHEEL-SPEED SENSOR CIRCUIT FOR SHORT TO GROUND** • Turn the ignition switch off. • Inspect continuity between suspected sensor terminal (s) of ABS/TCS HU/CM connector (harness-side) and ground (s). — RF ABS wheel-speed sensor (+): G — RF ABS wheel-speed sensor (–): D — LF ABS wheel-speed sensor (+): I — LF ABS wheel-speed sensor (–): E — RR ABS wheel-speed sensor (+): A — RR ABS wheel-speed sensor (–): B — LR ABS wheel-speed sensor (+): C — LR ABS wheel-speed sensor (–): F • Is there continuity?	Yes	Repair or replace harness for short to ground circuit between ABS/TCS HU/CM and ABS wheel-speed sensor (s), then go to Step 5.
		No	Go to Step 5.
3	**INSPECT ABS WHEEL-SPEED SENSOR** • Turn the ignition switch off. • Disconnect suspected sensor connector (s) and inspect resistance between sensor terminals (part side). • Is resistance **within 1.3—1.7 kilohm**?	Yes	Go to the next step.
		No	Replace ABS wheel-speed sensor, then go to Step 5.
4	**INSPECT ABS/TCS HU/CM TO ABS WHEEL-SPEED SENSOR CIRCUIT FOR OPEN CIRCUIT** • Inspect continuity between suspected sensor terminal (s) of ABS/TCS HU/CM connector (harness-side) and ABS wheel-speed sensor connector. (vehicle harness-side) — RF ABS wheel-speed sensor (+): G—A — RF ABS wheel-speed sensor (–): D—B — LF ABS wheel-speed sensor (+): I—A — LF ABS wheel-speed sensor (–): E—B — RR ABS wheel-speed sensor (+): A—A — RR ABS wheel-speed sensor (–): B—B — LR ABS wheel-speed sensor (+): C—A — LR ABS wheel-speed sensor (–): F—B • Is there continuity?	Yes	Repair or replace poor connections of ABS/TCS HU/CM connector and/or ABS wheel-speed sensor connector (s), then go to the next step.
		No	Repair or replace harness for open circuits between ABS/TCS HU/CM and ABS wheel-speed sensor (s), then go to the next step.
5	**VERIFY TROUBLESHOOTING COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear the DTC from the memory (See 04–02A–3 Clearing DTCs Procedures.) • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Go to the next step.
6	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection. (See 04–02A–4 DTC Table.)
		No	Troubleshooting completed.

DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [ABS/TCS]

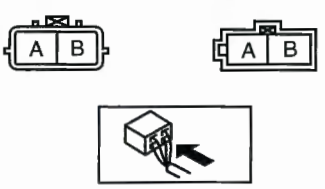
E6U040200000W10

DTC	C1148, C1234 C1158, C1233 C1168, C1235 C1178, C1236	**RF ABS wheel-speed sensor/sensor rotor** **LF ABS wheel-speed sensor/sensor rotor** **RR ABS wheel-speed sensor/sensor rotor** **LR ABS wheel-speed sensor/sensor rotor**
DETECTION CONDITION	• C1148, C1158, C1168, C1178: — Abnormal sensor output is detected on any of four vehicle wheels when the vehicle goes from start to a speed of **10 km/h {6.2 mph}** — Greater than specified amount of ABS demand occurs from front ABS wheel sensors when vehicle is started • C1234, C1233, C1235, C1236: — Abnormal sensor output due to chipping of sensor rotor teeth, etc. is detected — ABS control operates for **60 s or more**	
POSSIBLE CAUSE	• Short to ground circuit of ABS wheel-speed sensor (s) circuit • Malfunction of ABS wheel-speed sensor (s) • Damaged sensor rotor (s) • Incorrect clearance between ABS wheel-speed sensor and sensor rotor • Poor installation of ABS wheel speed sensor and/or sensor rotor (If the sensor rotor is installed twisted, it may cause output of abnormal wave form at high speeds) • ABS/TCS HU/CM internal damage (Solenoid valve malfunction, pump motor malfunction, or pipe clogging)	

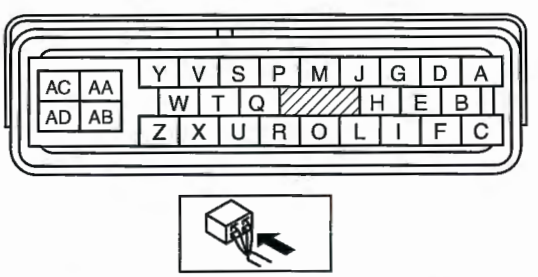


ABS WHEEL-SPEED SENSOR HARNESS-SIDE CONNECTOR

FRONT REAR



ABS/TCS HU/CM HARNESS-SIDE CONNECTOR



Diagnostic procedure

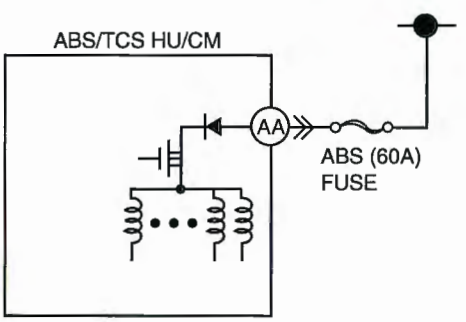
STEP	INSPECTION		ACTION
1	**VERIFY OTHER DTC HAS BEEN RECORDED** • Have DTCs related to solenoid valve, pump motor, or pump motor relay been stored?	Yes	Go to the applicable DTC inspection.
		No	Go to the next step.
2	**VERIFY IF CURRENT CONCERNED INPUT SIGNAL STATUS IS INTERMITTENT OR CONSTANT** • Turn the ignition switch off. • Connect WDS or equivalent to DLC-2. • Start engine and drive vehicle. • Access LF_WSPD, LR_WSPD, RF_WSPD and RR_WSPD using the WDS or equivalent • Do vehicle speeds correspond approximately to the four PIDs above?	Yes	Go to Step 8.
		No	If there is a difference in speed of four wheels: Go to the next step. If any wheel speed is **0 km/h {0 mph}**: Go to Step 4.
3	**INSPECT ABS WHEEL-SPEED SENSOR OUTPUT PULSE** • Start engine and drive vehicle. • Inspect output voltage pattern using an oscilloscope.  • Is output voltage pattern okay?	Yes	Go to Step 9.
		No	Go to Step 6.
4	**INSPECT ABS WHEEL-SPEED SENSOR CIRCUIT FOR SHORT TO GROUND** • Turn the ignition switch off. • Disconnect ABS/TCS HU/CM and ABS wheel-speed sensor connectors. • Inspect continuity between suspected sensor terminal (s) of ABS/TCS HU/CM connector (harness side) and ground (s). — RF ABS wheel-speed sensor: G—ground — LF ABS wheel-speed sensor: I—ground — RR ABS wheel-speed sensor: A—ground — LR ABS wheel-speed sensor: C—ground • Is there continuity?	Yes	Repair or replace harness for short to ground circuit between ABS/TCS HU/CM and ABS wheel-speed sensor, then go to Step 9.
		No	Go to the next step.
5	**INSPECT ABS WHEEL-SPEED SENSOR** • Turn the ignition switch off. • Disconnect suspected ABS wheel-speed sensor connector (s) and inspect resistance between ABS wheel-speed sensor terminal (s) (part side). • Is resistance **within 1.3—1.7 kilohm**?	Yes	Go to the next step.
		No	Replace ABS wheel-speed sensor (s), then go to Step 9.
6	**INSPECT SENSOR ROTOR CLEARANCE** • Jack-up vehicle and support it with safety stands. • Remove suspected wheel (s). • Inspect clearance between ABS wheel-speed sensor and sensor rotor. • Is clearance **within 0.3—1.1 mm {0.012—0.043 in}**?	Yes	Go to the next step.
		No	Replace ABS wheel-speed sensor (s), then go to Step 9.

STEP	INSPECTION		ACTION
7	**INSPECT SENSOR ROTOR FOR DAMAGE** • Jack-up vehicle and support it with safety stands. • Remove suspected wheel (s). • Visually inspect sensor rotor for missing, deformed and obstructed teeth. **Number of teeth: 44** • Is sensor rotor okay?	Yes	Go to the next step.
		No	Replace sensor rotor, then go to Step 9.
8	**INSPECT ABS/TCS HU/CM OPERATION** • Perform ABS/TCS HU/CM system inspection. (See 04–13–3 ABS/TCS HU/CM SYSTEM INSPECTION) • Is it normal?	Yes	Go to the next step.
		No	Replace ABS/TCS HU/CM, then go to the next step.
9	**VERIFY TROUBLESHOOTING COMPLETED** • Make sure to reconnect all disconnected connectors. • Clear the DTC from the memory (See 04–02A–3 Clearing DTCs Procedures) • Start engine and drive vehicle at **10 km/h {6.2 mph}** or above. • Gradually slow down vehicle and stop. • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Go to the next step.
10	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection.
		No	Troubleshooting completed.

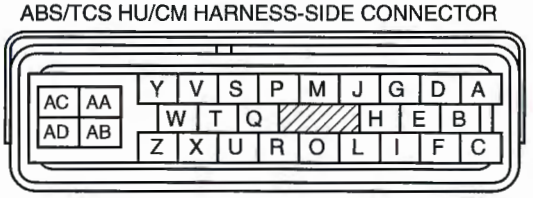
DTC C1186, C1266 [ABS/TCS]

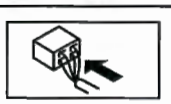
E6U040200000W11

DTC C1186, C1266	Fail-safe relay
DETECTION CONDITION	• C1186: — Fail-safe relay in ABS/TCS HU/CM stuck OFF when ignition key is turned ON, fail-safe relay ON is commanded. • C1266: — Fail-safe relay in ABS/TCS HU/CM stuck ON when ignition key is turned ON, fail-safe relay OFF is commanded.
POSSIBLE CAUSE	• Malfunction of fuse (ABS 60 A) • Open circuit in harness between ABS/TCS HU/CM terminal AA and battery positive terminal • Open circuit or short of fail-safe relay in ABS/TCS HU/CM • Stuck fail-safe relay in ABS/TCS HU/CM



ABS/TCS HU/CM HARNESS-SIDE CONNECTOR





Diagnostic procedure

STEP	INSPECTION		ACTION
1	**INSPECT ABS FUSE CONDITION** • Is ABS fuse (60 A) normal?	Yes	Go to the next step.
		No	Replace fuse, then go to Step 4.
2	**INSPECT FAIL-SAFE RELAY POWER SUPPLY CIRCUIT FOR OPEN CIRCUIT** • Turn the ignition switch off. • Disconnect ABS/TCS HU/CM connector. • Turn the ignition switch to the ON position (engine off). • Measure voltage between ABS/TCS HU/CM terminal AA (harness-side) and ground. • Is voltage **B+**?	Yes	Go to the next step.
		No	Repair or replace harness for open circuit between battery positive terminal and ABS/TCS HU/CM terminal AA, then go to Step 4.
3	**VERIFY FAIL-SAFE OPERATION** • Turn the ignition switch off. • Connect WDS or equivalent to DLC-2. • Turn the ignition switch to the ON position (engine off). • Access ABS_VOLT using the WDS or equivalent. • Does fail-safe relay operate?	Yes	Go to the next step.
		No	Replace ABS/TCS HU/CM, then go to the next step.
4	**VERIFY TROUBLESHOOTING COMPLETED** • Clear the DTC from the memory. (See 04–02A–3 Clearing DTCs Procedures) • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Go to the next step.
5	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection. (See 04–02A–4 DTC Table.)
		No	Troubleshooting completed.

DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254 [ABS/TCS]

E6U040200000W12

DTC	**C1210**	**RF pressure reduction solenoid valve**
	C1214	**RF pressure retention solenoid valve**
	C1194	**LF pressure reduction solenoid valve**
	C1198	**LF pressure retention solenoid valve**
	C1246	**RR pressure reduction solenoid valve**
	C1254	**RR pressure retention solenoid valve**
	C1242	**LR pressure reduction solenoid valve**
	C1250	**LR pressure retention solenoid valve**
DETECTION CONDITION	• Solenoid monitor signal does not track in response to solenoid ON/OFF command.	
POSSIBLE CAUSE	• Open circuit, short to power supply, or short to ground circuit in ABS/TCS HU/CM • Stuck solenoid valve in ABS/TCS HU/CM	

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY SOLENOID VALVE OPERATION** • Turn the ignition switch off. • Connect WDS or equivalent to DLC-2. • Turn the ignition switch to the ON position (engine off). • Access solenoid valve (s) PIDs using the WDS or equivalent. • Does solenoid valve operate?	Yes	Go to the next step.
		No	Repair ABS/TCS HU/CM, then go to the next step.
2	**VERIFY TROUBLESHOOTING COMPLETED** • Clear the DTC from the memory. (See 04–02A–3 Clearing DTCs Procedures) • Start engine and drive vehicle at **10 km/h {6.2 mph}** or above. • Gradually slow down and stop vehicle. • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Go to the next step.
3	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection. (See 04–02A–4 DTC Table.)
		No	Troubleshooting completed.

DTC C1414 [ABS/TCS]

E6U040200000W13

DTC C1414	ABS/TCS unit mismatched installation
DETECTION CONDITION	• Detection of situation where vehicle-type or drive system input signal and ABS/TCS HU/CM informatic remains incongruent through CAN information
POSSIBLE CAUSE	• Mismatched installation of ABS/TCS HU/CM

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**INSPECT ABS/TCS HU/CM FOR MISMATCHED INSTALLATION** • Verify ABS/TCS HU/CM part number • Has a ABS/TCS HU/CM with the correct part number been installed?	Yes	Go to the next step.
		No	Replace with correct ABS/TCS HU/CM part number, then go to Step 7.
2	**INSPECT RELATED WIRING HARNESS FOR MISMATCHED INSTALLATION** • Verify wiring harness part number • Has a wiring harness with the correct part number been installed?	Yes	Go to the next step.
		No	Replace with correct ABS/TCS HU/CM part number, then go to next Step.
3	**Configulate ABS/TCS HU/CM** • Can ABS/TCS HU/CM configulate properly?	Yes	Go to the next step.
		No	Replace ABS/TCS HU/CM
4	**VERIFY TROUBLESHOOTING COMPLETED** • Make sure to reconnected all disconnect connectors. • Clear the DTC from the memory. See 04–02A–3 Clearing DTCs Procedures • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Go to the next step.
5	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection.
		No	Troubleshooting completed.

DTC C1508 [ABS/TCS]

E6U040200000W14

DTC C1508	TCS control
DETECTION CONDITION	• TCS control continues operation for **60 seconds or more**.
POSSIBLE CAUSE	• System is normal. For protection of solenoid valves in the ABS/TCS HU/CM, or protection of the engine, sustained and continual control of TCS is inhibited.

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY CURRENT STATUS OF MALFUNCTION** • Clear the DTC from the memory. (See 04–02A–3 Clearing DTCs Procedures) • Start engine and drive vehicle at **10 km/h {6.2 mph}** or above. • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Inspect intermittent concern using the same procedure as engine control system.
2	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection.
		No	Troubleshooting completed.

DTC C1510, C1511, C1512, C1513 [ABS/TCS]

E6U040200000W15

DTC		
	C1510	RF solenoid valve, motor or RF ABS wheel-speed sensor/ABS sensor rotor.
	C1511	LF solenoid valve, motor or LF ABS wheel-speed sensor/ABS sensor rotor.
	C1512	RR solenoid valve, motor or RR ABS wheel-speed sensor/ABS sensor rotor.
	C1513	LR solenoid valve, motor or LR ABS wheel-speed sensor/ABS sensor rotor.
DETECTION CONDITION	• Wheel lock is detected during ABS operation (pressure reduction inoperative). • Pressure reduction on a single wheel continues for **more than 20 seconds**.	
POSSIBLE CAUSE	• Malfunction of solenoid valve in ABS/TCS HU/CM • Malfunction of ABS wheel-speed sensor • Damaged sensor rotor • Stuck pump motor in ABS/TCS HU/CM	

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**VERIFY OTHER DTC HAS BEEN RECORDED** • Has any ABS wheel-speed sensor, sensor rotor, solenoid valve, pump motor, or motor relay related DTC been output?	Yes	Go to the applicable DTC inspection.
		No	Go to the next step.
2	**INSPECT ABS/TCS HU/CM OPERATION** • Perform ABS/TCS HU/CM system inspection. (See 04–13–3 ABS/TCS HU/CM SYSTEM INSPECTION) • Is it normal?	Yes	Go to the next step.
		No	Replace ABS/TCS HU/CM, then go to the next step.
3	**VERIFY CURRENT STATUS OF MALFUNCTION** • Clear the DTC from the memory. (See 04–02A–3 Clearing DTCs Procedures) • Start engine and drive vehicle at **10 km/h {6.2 mph}** or above at least one minute. • Gradually slow down and stop vehicle. • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Go to the next step.
4	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection.
		No	Troubleshooting completed.

DTC U2021[ABS/TCS]

E6U040200000W16

Note

- To warm up the engine completely, idle the engine and wait for **more than 5 minutes**.

DTC U2021		Engine coolant temperature
DETECTION CONDITION	• After engine is warmed up, engine coolant temperature is **0 °C {32 °F}** or less, and TCS operation is inhibited by PCM.	
POSSIBLE CAUSE	• System is normal. When engine coolant temperature rises, TCS operation is executed by PCM.	

Diagnostic procedure

STEP	INSPECTION		ACTION
1	**INSPECT WHETHER ENGINE HAS WARMED UP** • Has engine warmed up?	Yes	Go to the next step.
		No	Warm up the engine. If TCS OFF light goes out, system is normal.
2	**VERIFY THAT MALFUNCTION SYMPTOM OCCURS AFTER ENGINE IS WARMED UP** • Warm up the engine. • Is TCS indicator light also illuminated and DTC C1119 obtained?	Yes	Go to DTC C1119 chart.
		No	If TCS OFF light goes out, system is normal. If TCS OFF light does not goes out, go to the next step.
3	**VERIFY TROUBLESHOOTING COMPLETED** • Clear the DTC from the memory. (See 04–02A–3 Clearing DTCs Procedures) • Is same DTC present?	Yes	Replace ABS/TCS HU/CM, then go to the next step.
		No	Go to the next step.
4	**VERIFY AFTER REPAIR PROCEDURE** • Is there any other DTC present?	Yes	Go to the applicable DTC inspection.
		No	Troubleshooting completed.

DSC ON-BOARD DIAGNOSIS

E6U040200000W18

On-Board Diagnostic (OBD) Test Description

- The OBD test inspects the integrity and function of the DSC and outputs the results when requested by the specific tests.
- On-board diagnostic test also:
  - — Provides a quick inspection of the DSC usually performed at the start of each diagnostic procedure.
  - — Provides verification after repairs to ensure that no other faults occurred during service.
- The OBD test is divided into 3 tests:
  - — Read/clear diagnostic results, PID monitor and record and active command modes.

Read/clear diagnostic results

- This function allows you to read or clear DTCs in the DSC HU/CM memory.

PID/data monitor and record

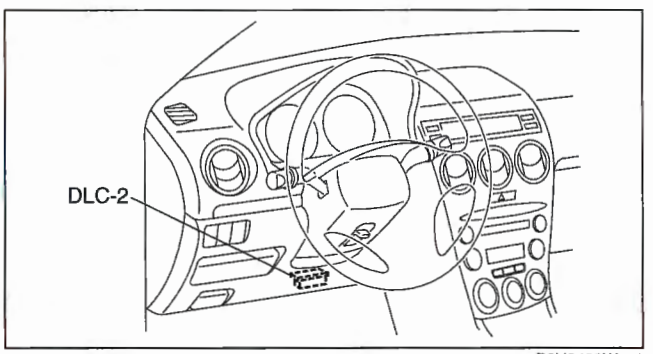
- This function allows you to access certain data values, input signals, calculated values, and system status information.

Active command modes

- This function allows you to control devices through the WDS or equivalent.

Reading DTCs Procedure

1. Connect WDS or equivalent to the vehicle DLC-2 connector.
2. Retrieve DTC by WDS or equivalent.



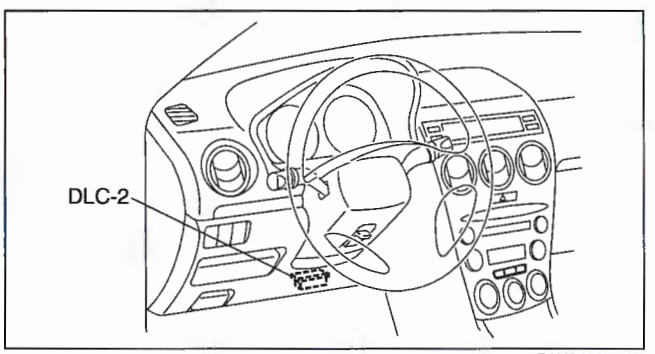
B6U0402W002

Clearing DTCs Procedures

1. After repairs have been made, perform the **DTCs reading procedure**.
2. Erase DTC by WDS or equivalent.
3. Ensure that the customer's concern has been resolved.

PID/Data Monitor and Record Procedure

1. Connect WDS or equivalent to the vehicle DLC-2 connector.
2. Access and monitor PIDs by WDS or equivalent.

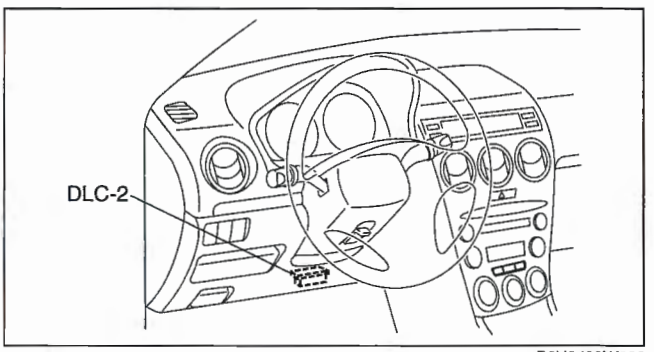


B6U0402W002

Active Command Modes Procedure

Note
- When driving, the ABS motor and each valve automatically turn ABS_POWER on, and then each command on. ABS_POWER regulates the power supply for the ABS motor and 8 valves.

1. Connect WDS or equivalent to the vehicle DLC-2 16-pin connector.
2. Turn the ignition switch to ON (Engine OFF) or start engine.
3. Activate active command modes using WDS or equivalent.



B6U0402W002

DTC Table

DTC WDS or equivalent	Diagnosis system component	Page
B1318	DSC power supply	(See 04–02B–10 DTC B1318 [DSC].)
B1342	DSC HU/CM	(See 04–02B–11 DTC B1342 [DSC].)
B1483	Brake switch signal	(See 04–02B–12 DTC B1483, B1484, B1486 [DSC].)
B1484	Brake switch signal	(See 04–02B–12 DTC B1483, B1484, B1486 [DSC].)
B1486	Brake switch signal	(See 04–02B–12 DTC B1483, B1484, B1486 [DSC].)
B1627	Reverse signal	(See 04–02B–14 DTC B1627 [DSC].)
B2477	Module configuration	(See 04–02B–15 DTC B2477 [DSC].)
C1095	Motor relay, pump motor	(See 04–02B–15 DTC C1095, C1096 [DSC].)
C1096	Motor relay, pump motor	(See 04–02B–15 DTC C1095, C1096 [DSC].)
C1119	Engine control system	(See 04–02B–17 DTC C1119 [DSC].)
C1125	Brake fluid level sensor	(See 04–02B–18 DTC C1125 [DSC].)
C1140	DSC HU/CM (pump)	(See 04–02B–19 DTC C1140 [DSC].)
C1145	Right front ABS wheel-speed sensor	(See 04–02B–20 DTC C1145, C1155, C1165, C1175 [DSC].)
C1148	Right front ABS wheel-speed sensor/sensor rotor	(See 04–02B–22 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [DSC].)
C1155	Left front ABS wheel-speed sensor	(See 04–02B–20 DTC C1145, C1155, C1165, C1175 [DSC].)
C1158	Left front ABS wheel-speed sensor/sensor rotor	(See 04–02B–22 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [DSC].)
C1165	Right rear ABS wheel-speed sensor	(See 04–02B–20 DTC C1145, C1155, C1165, C1175 [DSC].)
C1168	Right rear ABS wheel-speed sensor/sensor rotor	(See 04–02B–22 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [DSC].)
C1175	Left rear ABS wheel-speed sensor	(See 04–02B–20 DTC C1145, C1155, C1165, C1175 [DSC].)
C1178	Left rear ABS wheel-speed sensor/sensor rotor	(See 04–02B–22 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [DSC].)
C1186	Fail-safe relay	(See 04–02B–24 DTC C1186, C1266 [DSC].)
C1194	Left front pressure reduction solenoid valve	(See 04–02B–25 DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254, C1400, C1410, C1957, C1958 [DSC].)

DTC WDS or equivalent	Diagnosis system component	Page
C1198	Left front pressure retention solenoid valve	(See 04–02B–25 DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254, C1400, C1410, C1957, C1958 [DSC].)
C1210	Right front pressure reduction solenoid valve	(See 04–02B–25 DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254, C1400, C1410, C1957, C1958 [DSC].)
C1214	Right front pressure retention solenoid valve	(See 04–02B–25 DTC C1194, C1198, C1210, C1214, C1242, C1246, C1250, C1254, C1400, C1410, C1957, C1958 [DSC].)
C1233	Left front ABS wheel-speed sensor/sensor rotor	(See 04–02B–22 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [DSC].)
C1234	Right front ABS wheel-speed sensor/sensor rotor	(See 04–02B–22 DTC C1148, C1158, C1168, C1178, C1233, C1234, C1235, C1236 [DSC].)
